LIVERPOOL.

The *Timber Trades Journal* of May 12, says : Whilst there has been a fair amount of business done in a retail way during the week, there has been an absence of liveliness in all articles, if we except the mahogany and fancy woods branch of the trade, on which there will be found some remarks below.

The spruce deal market has been dull, but the remainders of the various cargoes which have from time to time been withdrawn from the auctions have been placed by private treaty at prices equivalent to those obtained by auction.

Next week will be as usual in Whitsuntide, in this part of the country, chiefly devoted to holiday-making, and, in point of fact, there will be little, if any, business done, hence the desire of those who had cargoes to offer for sale by public auction to force them into last and this week.

On Thursday last, the 3rd inst., Messrs. Farnworth & Jardine offered one cargo of St. John, N. B., spruce deals, of last season's import, stored and piled in their yards, of which about one-half was sold by auction and the remainder withdrawn ; but most, if not all, was subsequently sold by private treaty. The following were the prices realized :—

Spruce deals, St. John, N. B.—

		£	s.	d.
21 ft. and up	3×11	8	0	0
16 to 20 ftt.	3×11	7	15	0

16 " 25 "	3×7	6	17	6
12 " 15 "	3×7	6	17	6
9 " 11 "	3×7	6	15	0

To-day, the 9th inst., Messrs. A. F. & D. Mackay offered a cargo of St. John, N. B., spruce deals, birch, &c., timber just arrived, and sundry parcels of Miramichi, Quebec, and other descriptions of pine and spruce deals. The newly-arrived cargo sold fairly well, but the birch brought out the most competition, although it was bought principally by local dealers. The prices realized were for

GLASGOW.

The *Timber Trades Journal* of May 12 says : Imports for the past week have again been almost entirely confined to what has come per steam traders from New York, say 150 logs Cuba mahogany, also walnut, oak planks and scantlings, &c.

On Tuesday, the 8th inst., a public sale was

held in Yorhill Yards here, when a cargo of Minatitlan mahogany was sold, prices as undernoted; also 75 logs American walnut ex sundry steamers, a portion of this wood being culls.

For hardwoods there is at present a decidedly healthy demand, especially for mahogany, of which there has been but a sparing supply to this market. Shipbuilding orders continue to come to Clyde. We note that at Greenock two more steamships of 5,000 tons each are to be built for the P. & O. Steamship Company.

A request for an advance of wages was lately made by the operative house builders, but the masters have unanimously agreed that no advance is to be given meantime, as the labour market is well supplied, and it was also resolved to adhere to the system of fortnightly "pays," as at present.

AUCTION SALES.

Several parcels American black walnut were sold by Messrs. Edmiston & Mitchells, viz:—
33 logs (av. sq. 16½ in.) at an avg. of 5s. 4½d. per c. ft.
18 logs (do) at an avg. of 5s. 0½d. per c. ft.
24 " (do, 14 in., inferior) at an avg. of 3s. 9½d. per c. ft.

Following the above Messrs. Allison, Cousland & Hamilton sold—
3 logs whitewood, 2s. 5d. to 2s. 8d. per c. ft.

LONDON.

The *Timber Trades Journal* of May 12, says: The importation appears to have experienced a considerable falling off during the month of April as compared with last year, and it would seem as if some recovery in prices of wood was not far off, were it not for the continuation of the dulness, still so marked, in the commercial world.

There is apparently nothing of moment stirring in the timber trade, which but reflects the state of affairs in other branches of commerce throughout the country generally, and it is high time an alteration took place. We are all waiting, Micawber-like, for something to turn up, for with the least revival of activity a general improvement of prices all around is confidently anticipated; but when will this revival come?

OTTAWA NOTES.

The *Monetary Times* says:—The lumber trade of the Ottawa is opening rather quietly, this season being a backward one and the mills being some two weeks later in starting. However several pretty large sales have been made to outside parties, at prices on the whole a shade lower than a year ago. This is an unfortunate, and indeed an unexpected feature of the trade, especially in view of the alleged fact that each successive year the quality of the lumber got out is not quite equal to that of previous years, and of the future fact that the expense of procuring the logs and getting them down the streams is increasing. The larger concerns such as J. R. Booth & Co., Bronson Weston & Co., Eddy & Co., etc., expended last year, we are told, from $60,000 to $80,000 more in getting out the same quality of lumber, than they did in the years 1879 or 1800. It is quite true that there has been a considerable advance in prices when compared with these years, but this advance is not at all in proportion to the increase in the cost of production. Manufacturers of lumber are consequently obliged to be satisfied with less profit.

OUR FOREST PRODUCTS.

It appears by the census returns that the development or destruction, as one may happen to regard it, of the forest wealth of Canada has gone on apace during the last decade. In the four old provinces the comparative figures of production are as follows:—

	1871.	*1881.*
Square white pine, cubic feet	24,236,821	17,358,245
Square red pine, cubic feet	1,954,372	2,571,328
Square oak, cubic feet	3,302,643	5,734,042
Tamarac, cubic feet	5,695,963	4,585,563
Birch and maple, cubic feet	1,959,357	4,294,926
Elm, cubic feet	1,832,654	3,092,224
Walnut, cubic feet	220,570	808,250
Hickory, cubic feet	197,827	336,429
All other timber, cubic feet	29,290,264	47,045,450

The only classes of wood of which the production has decreased are white pine and tamarac, and in each case the falling off occurs in the Province of Quebec, where the output of pine has decreased from 8,876,060 feet in 1871 to 4,840,462 feet in 1881, and of tamarac from 3,994,878 feet in 1871 to 2,707,745 feet in 1881. The chief lumber producing province is Ontario in which the output of all woods except white pine has considerably enlarged during the decade. How large a proportion of the whole production in the four old provinces is made in Ontario may be learned from the fact that in 1881 the cut of white pine there was 12,262,570 feet, of square oak 5,448,263 feet, of elm 2,925,382 feet, of walnut 741,431 feet, and of other timber 26,200,058 feet. Quebec holds the leading position in respect to the production of tamarac and birch and maple only. Taking the new provinces we find British Columbia far in the van with an output of 23,348,500 feet of white pine, while of unenumerated woods Prince Edward Island is credited with 797,851 feet, Manitoba 622,059 feet, British Columbia 436,792 feet, and the Territories 54,806 feet. In the four old provinces the output of logs, &c., was as follows:—

	1871.	*1881.*
Pine logs	12,416,408	21,501,128
Other logs	9,314,557	23,055,706
Masts, spars, &c.	121,685	191,078
Tanbark, cords	162,521	398,239
Firewood, cords	8,713,083	10,493,155

The comparatively small increase in the production of firewood is somewhat remarkable, showing very plainly that the consumption of wood has about reached its limit, and that coal is becoming generally a substitute by reason of its economy in cities and towns.—*Montreal Gazette.*

Sale of Timber.

The Kingston *Whig* says:—W. C. Caldwell, who is to became a citizen of Kingston, has sold all his timber to Messrs. Calvin & Son, to be delivered as soon as possible. It is now on Clyde river. Mr. Caldwell is at present taking out a large amount of cedar, which has been contracted for by Chilion Jones, of Brockville, to be used in the breakwater in connection with the new island works at Toronto.

Mr. Caldwell's steam saw mills at Carleton Place may possibly open for a few weeks, beginning next month. It will not take long to put the Clyde cut through the saws. Some thousands of logs are on the brink of the High Falls detained only by a single boom. The *Carleton Canadian* says if loosened they would every one sweep over and come down in fine swift style, so great is the rush of water. They are held there as if by a small cord which a penkife could free, but Mr. Caldwell is bound that the Supreme Court enactment shall be observed, and will not move a jot to bring them on.

RATHBUN & SONS, of Deseronto, have secured the contract to supply 250,000 ties to the Canada Southern. The steam barge Tecumseh has has landed at Courtright dock with 17,000 ties, being the first consignment, which were nearly all loaded, and partly distributed along the line Tuesday. The schooner Peerless also arrived with a cargo of the same description, but during the terrible storm coming down Lake Huron she lost most of her deck-load, which is estimated at 200 ties. A large *posse* of men are engaged unloading the boats and loading cars for distribution. The contract price for ties, which are cedar and come from St. Joseph's, Cove Island, Georgian Bay, was four cents apiece, and loaded at Courtright, representing a total outlay of $10,000.

MANY years ago Sir Henry Stewart made a plantation of large trees in the moist climate of Scotland, but they made little growth and had a sickly appearance. It was then that Loudon, with his long and extensive experience as a landscape gardener, offered to make a public test with any one who would try large trees, he himself planting small and thrifty ones with full roots, in rich, deeply-trenched and well-cultivated ground, with the confident assurance that in a given number of years he would show trees not only larger but immeasureably finer in appearance. The above is but a corroboration of the experiments made by all tree planters. With the smaller trees more roots can be transplanted, they require no staking and will grow more rapidly than larger ones.

JONES & SON,

Wholesale Lumber & Timber Dealers

RAFTS ARRIVED AT QUEBEC.

The Quebec *Chronicle* gives the following list of rafts, &c., that have arrived:—

May 17—H. E. Hall, deals, Hall's booms.
Ritchie Bros., deals, New Liverpool.
Ross & Co., (Gordon & Lot,) white pine, &c., Dalhousie cove.
P. H. Grandbois, deals, St. Casimir,
Geo. Baptist, Son & Co., deals, Three Rivers.
May 21—D. D. Calvin & Co., (2), oak, etc., sundry coves.

Rafting Timber.

R. & G. Strickland are now rafting at Port Hope a quantity of timber, 150,000 cubic feet, brought from the Township of Oakley, via Black River and Longford. It is five weeks today (May 26) since they commenced driving. It is a splendid lot of timber, averaging 65 feet.

A TOOTH-PICK factory at Sebec, Me., consumes annually 1,000 cords of poplar and birch, turning out a two-cord load of splinters per day. The factory is owned by Charles Foster, the same gentleman having a similar establishment at Buckfield.

THE *Northwestern Lumberman* says:—J. H. Chapman, Oxford, Me., turns out 1,000 dozen shovel handles per month, consuming annually from 250,000 to 300,000 feet of ash. The entire product has for nearly 20 years been taken by a Gananoque, Ont., gentleman. This season 400,000 shingles and a lot of basswood clapboards will be manufactured.

Convincing Proof.

Having suffered from rheumatism for a long time I was induced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to buisness, thanks to your wonderful medicine.

I am yours truly,
W. H. DICKISON,
218 St. Constant St., Montreal.

To Henry, Johnsons & Lord, Montreal.

Arnica and Oil Liniment is sold by all Druggists.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

NEVER ALLOW IT.—Never allow the bowels to remain in a torpid condition, as it leads to serious results, and ill health is sure to follow. Burdock Blood Bitters is the most perfect regulator of the bowels, and the best blood purifier known.

HIGHLY SATISFACTORY.—Impure blood and low vitality are the great sources of most diseases for which Burdock Blood Bitters is the specific. S. Perrin, Druggist, of Lindsay, writes that Burdock Blood Bitters give more general satisfaction than any blood purifier in the market.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

$500 Reward!

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C. WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. ORMOND & WALSH, sole authorized Agents for Peterborough Ont. w46d112L22

FITS EPILEPSY
OR
FALLING SICKNESS

Permanently Cured—No Humbug—by one Month's usage of Dr. Goulard's Celebrated Infallible Fit Powder. To convince sufferers that these powders will do all we claim for them we will send them by mail, **post paid, a free Trial Box.** As Dr. Goulard is the only physician that has ever made this disease a special study, and as to our knowledge thousands have been **permanently** cured by the use of these **Powders. We will guarantee a permanent** cure in every case **or refund you all money expended.** All sufferers should give these powders an early trial, and be convinced of their curative powers.

Price for large box $3.00, or 4 boxes for $10.00, sent by mail to any part of the United States or Canada on receipt of price, or by express, C. O. D. Address

One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by us for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by ORMOND & WALSH, sole authorized Agents for Peterborough, Ont. JOHN C. WEST & CO., Sole Proprietors, Toronto

THE DAWN OF A BETTER DAY.

There are few industries, we might say scarcely any, which in their retail transactions are so steady as the timber trade. A builder's price-book, for instance, of ten years ago will give you a valuation of the timber you have occasion for in the construction of a house which will be pretty nearly as good a guide now as if it were published yesterday ; and when we speak of the fluctuation in prices we must be chiefly understood as referring to the import department of the business, and the relative value of the goods at the landing wharves in this country, in comparison of those current at the shipping ports abroad, with the freight and charges added to them ; and this is the question with which the magnates of the trade are chiefly concerned at the present time.

Turning to the timber trade, its proceedings are quite assimilated to the tone of business generally—it rather plods than presses forward along the even tenor of its way, but it may be said of it, as our aforesaid contemporary speaks of the iron trade, that "a better feeling is shortly expected." It is not impossible that this may come soon, for it has been "shortly expected" for a long time back, and we must in the natural course be much nearer now to the good time coming than we were then.

In dull times like these, London and Liverpool look at each other across the midland counties for something to indicate a trade revival that may serve to hang new hopes upon, and the better prospect seems at the present to be found here. Liverpool, rejoicing also in fine weather, moderate stocks of most kinds of wood, and a fair amount of building going on in the suburbs, complains that there are no large works in hand "likely to influence the future of the timber trade" ; and, therefore, that "business on the spot is not very extensive, and prices do not improve." It seems to have established a small advance on pitch pine, but not sufficient to cover the advance of freight, "so that the shipper is really in a worse position now than before." Neither has the importation of Liverpool yet come up to its last year's figures at a similar date, which remark applies to almost all the ports except those which require large quantities of pitwood, such as Cardiff, Swansea, and Newport, Sunderland, and Shields, all of which have exceeded (some of them considerably so) their import of last year up to date, while on the other hand, Liverpool, Hull, Newcastle, Hartlepool, and Grimsby are much behind, which augurs well for the summer trade. Even London does not come up to its last year's figures yet, though it is but a fraction in arrear. Trade, however, has continued comparativoly stagnant here as elsewhere, as we have had painfully to notice, when remarking hebdomadally on our dock deliveries. But all at once, and commencing a fortnight ago, a larger demand has sprung up, apparently in good earnest, for in two weeks the deliveries have exceeded those at the same time in 1881 by more than 2,600 Petersburg standards, a rather remarkable spring forward after a long period of retrogression ; and at this rapid rate room will soon be made at the docks for the new arrivals without any crowding. The total deliveries for the two weeks including square timber amounting to nearly 11,000 standards, a rate of progress which we cannot expect to see maintained for any length of time, but none the less satisfactory as long as it lasts. Nor must it be forgotten that these are only the public deliveries, while those from the many large private timber yards and wharves of the Thames are unchronicled, though they would swell the returns to something considerable ; and it must be evident that the quantity of imported wood gone into consumption during the past fortnight from the various depots in London cannot have been less than 60 to 70 cargoes, averaging 200 standards each. We need not expatiate on the immense amount of profitable labour which would be set at work by the distribution of this vast amount of wood in so short a time among consumers, for it will readily be conceived that there can be no want of employment in the building trade in and around the metropolis while so much business is done in delivering timber for use there.

We are quite aware that it may be argued that there is no evidence that the timber sold and delivered in London, according to the figures produced, is not still lying unused on the premises of the dealer who bought it ; but we do not see that the assumption of returning activity in trade is in any manner impaired by that possibility. The timber yards of the dealers have been remakably well supplied all the winter, and if in a fortnight they have suddenly found room for 12,000 to 15,000 standards more, it shows that they have been doing a trade to that extent with the public as certainly as if the Dock deliveries aforesaid went directly to the consumers instead of to those that are in the habit of supplying them. The gap made among the Surrey Dock piles went to replenish the ground of the private timber yards, but not till the public demand had cleared the needful open spaces to store them. Whichever way we look at it, the fact remains that nothing but an active revival of business can account for the removal of so large a quantity, we may say of so unusual a quantity, of timber from the docks in so short a time, for it is quite apart from the normal condition of things during the foregone portion of the present year, and we may fairly regard it as the precursor of a good healthy reanimation of the trade throughout the land.

What we have of late been suffering from may be traced to our indefatigable national industry. We appear to have been producing too much from abroad, till at last the supply overtook the demand at both ends. Then came a pause, and a cry of dull trade arose. There was still an immense business doing, but it was not enough for everybody, and productive works gradually reduced their establishments, because at their full strength they ceased to be profitable. So in the timber trade people continued to import freely while they saw a great trade in prospect. But by-and-by the demand fell off ; failures among builders and other buyers, and the consequent decay of trade, threw a gloom over the latter part of last year, and almost every timber merchant fancied he had laid in too much stock. The idea grew more confirmed when a sloppy winter supervened, and it is only now, after the spring has returned in all its glory, that the trade is showing symptoms of a decided rally, which is not unlikely before long to pervade every branch of it. London has, at any rate, set the example of shaking off the apathy which has ruled evrywhere latterly. Let us hope that the same spirited revival will, in like manner, soon show itself in the provinces. —*London Timber Trades Journal.*

ARBOR DAY A SUCCESS.

QUEBEC, May 16.—The first celebration of Arbor Day here to-day was a most gratifying success, far surpassing, as admitted by Montreal visitors, the celebration in that city. Everything combined, including the weather, to render it a most enjoyable gathering of the promoters of the movement, their friends, and the citizens generally. The Lieutenant-Governor and his Cabinet, the heads of the public departments, mayor, aldermen, and councillors, the ecclesiastical dignitaries, foreign consuls, the citizens' committee, the convents, seminaries, orphans', and other charitable and educational institutions all joined together to make Arbor Day one to be remembered in local and provincial annals. The day was also pretty much observed as a general holiday, and an immense crowd, including many strangers, assembled to witness the ceremonies, which were duly opened by the Lieutenant Governor planting a tree in the grounds of the new departmental buildings, followed by the Hon. Mr. Joly, the soul and leader of the movement ; Crown Lands Commissioner Lynch, who has ably helped it on from the start ; Archbishop Taschereau, the Anglican Bishop, the Quebec Premier and his Cabinet ; the Rev. Dr. Cook, of St. Andrew's ; Rev. Dr. Clark, of Chalmers' ; the Speakers of both Houses, the commandant of garrison, the Mayor and a large number of notable personages, ecclesiastical, civil, and military, not omitting the press. In this way some sixty fine oaks were planted when, headed by the baud and a detachment of "A" battery, and the fire brigade in uniform, a procession moved off to the espalande, where a hundred beautiful maples, elms, and silver birches were put in. Three of them were specially named after Lord Dufferin and the present Ministers of Militia and Public Works. A double row of trees was next planted on the road leading to the citadel, after which the Corporation plantation took place on Dufferin terrace, The magnificent elms presented by the Hon. Mr. Joly being put down, besides many others in the names of the Queen, the Governor General and Princess Louise, amid enthusiastic cheers of the members and officers of the City Council. A silver pick with ebony handle, was presented to the Mayor, and a silver spade similiarly mounted to Madame Langelier, as *souvenirs* of the occasion. The official ceremony closed with addresses from the Lieutenant Governor, Commissioner Lynch, Mr. Joly, Ald. Rheaume and the Mayor, congratulating the citizens upon the enthusiastic manner in which the day was celebrated. A considerable plantation was also made during the day by the different schools, hospitals, and other public institutions, as well as by many private citizens.

THE ENGLISH WOOD MARKET.

James, Smith & Co.'s Liverpool Wood Circular dated May 2nd says :—The arrivals since our last have been 41 vessels, 20,755 tons, against 50 vessels, 25,197 tons, in the corresponding period last year, and 27 vessels, 14,365 tons, in 1881.

FROM 26TH JANUARY TO 30TH APRIL, 1883.

Quebec	nil	vessels.	nil tons.
St. John, N. B., &c.	4	"	3,843 "
United States	23	"	16,345 "
Baltic	64	"	26,941 "

St. John, N. B., &c.,	4	"	3,734 "
United States	39	"	26,445 "
Baltic	22	"	9,371 "
Total	66	"	40,471 "

Since our last issue there has been no change in our market. The import has been moderate and the consumption unusually dull and languid ; fortunately the stocks are not heavy, and there can be little chance of any improvement until the general trade of the country shows more activity. The money market remains quiet. Freights are slightly easier, with more tonnage offering, with the exception of pitch pine, rates for which from Pensacola are still high.

COLONIAL WOODS.—Yellow pine timber : The stock is light and sales have been by retail from the yard only. A parcel of fair average square pine is reported sold at from 2s. 1d. to 2s. 2d. per foot. Red pine is without change and the demand is fair. Of ash the sales have been by private only, with the exception of a few logs sold at auction, which realized 2s. ½d. Elm is light in stock, and prices are fully maintained. Birch has been sold by auction at an average of 19d. for 712 logs ex Director, from St. John, N. B., all fresh, new wood. The consumption has been very good, and the stock is small. Oak—The stock is 171,000 against 243,000 feet, aud the consumption has fallen off as compared with the same period last year ; a parcel of mixed quality is reported at 2s. 7d. per foot. The demand for oak scantling continues good, and two cargoes are reported sold at 2s. 6d. to 2s. 7d. per foot, ex quay, and small parcels of prime quality at about 3s. per foot, also a small lot of ordinary quality at 2s. 5d. per foot, ex quay ; the stock is nearly double that of last year. N. B. and N. S. spruce deals : The stock is now reduced to a moderate quantity, although somewhat larger than that of last year ; there have been no fresh arrivals, and the cousumption has reached 3,076 standards against 3,012 last year. There have been several sales at auction and the cargo ex Minnie Swift, from St. John averaged £7 6s. 6d., but a large proportion of the 11 in. and 7 in, was unsold ; the cargo ex John Brice, from St. John, was sold at from £7 to £8 per standard, and ex Victoria, from St. John, at from £7 to £8 15s., but a considerable portion of both cargoes was withdrawn unsold. Several other yarded cargoes were offered for sale and partly sold at similar prices. By private, a cargo of Miramichi has been sold to arrive at £7 2s. 6d. c. i. f., and a large cargo of St. John, good specification, at about the same figure. Quebec pine deals : The stock is now 5,316 standards against 4,769 standards, and the consumption has been equal to the same period last year, viz., 1,071 against 1,079 standards. There have been no fresh arrivals and sales have been by private. Quebec staves : No sales are reported. Palings and laths are in fair request.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

EARS FOR THE MILLION

Foo Choo's Balsam of Shark's Oil

Positively Restores the Hearing, and is the only Absolute Cure for Deafness known.

This Oil is abstracted from peculiar species of small **White Shark,** caught in the Yellow Sea, known as CARCHARODON RONDELETII. Every Chinese fisherman knows it. Its virtues as a restorative of hearing were discovered by a Buddhist Priest abont the year 1410 Its cures were so numerous and **many so seemingly miraculous,** that the remedy was officially proclaimed over the entire Empire. Its use became so universal that for **over 300 years no Deafness has Existed among the Chinese People.** Sent, charges prepaid, to any address at $1.00 a bottle.

Hear What the Deaf say!

It has performed a miracle in my case.
I have no unearthly noises in my head and near much better.
I have been greatly benefited.
My deafness helped a great deal—think another bottle will cure me.

"Its virtues are UNQUESTIONABLE and its CURATIVE CHARACTER ABSOLUTE, AS THE WRITER CAN PERSONALLY TESTIFY, BOTH FROM EXPERIENCE AND OBSERVATION. Write at once to HAYLOCK & JENNEY, 7 Dey Street New York, enclosing $1.00, and you will receive by return a remedy that will enable you to hear like any body else, and whose curative effects will be permanent. You will never regret doing so."—*Editor of Mercantile Review.*

☞To avoid loss in the Mails, please send money by REGISTERED LETTER.

TREE PLANTING.

The Chatham (N.B.) *World* says:—"Few more honorable things can be inscribed on a man's tomb, or mentioned in his obituary, than that he has been a planter of trees. With the feeling that life is uncertain, added to the knowledge that trees are of very slow growth, the man who plants trees is practically working for the benefit of posterity, and is, therefore entitled to the credit of being a philanthropist. Nothing adds to the charm of a cultivated landscape like rows and clumps of trees. Nothing gives so much attractiveness to a house as trees that are not too close and too thick to keep the sunshine from it. Nothing so improves a highway as shade trees by the roadside. Trees afford shade when the sun shines and shelter when the wind blows. They attract the birds and they please the eye. In nine cases out of ten when we analyze the feeling that makes us say a place is beautiful we find that its trees are its chief claims to superiority over hundreds of other places which appear tame and uninspiring.

People—that is, such good people as do not die young—should line the roadside in front of their lands, and border the brooks that cross their fields, and surround the springs on their property, with trees, and plant groves here and there for purely ornamental purposes. The appearance of the country would be agreeably changed in the course of time if this were done.

Quebec, far from being the slowest of the Provinces, is one of the very foremost to take hold of new ideas and put them into practice. There is the Arbor Day idea, for instance. This was originated in a Western State, where one day in the year has been set apart for the planting of trees, and Quebec has laid hold up it and instituted an Arbor Day of her own. Monday was proclaimed for the purpose in some sections of the Province, and trees were planted in Montreal and elsewhere with great ceremony. Trees were named after persons planting them, and the Montreal papers have trees named after them. Trees were planted by members of the Councils of Arts and Manufacturers in the Exhibition grounds, by the members of Parliament and of the press, by the cemetery trustees, and by snow-shoe and athletic clubs and national socities. Besides these society efforts, which were attended by more or less ceremony, the whole force of city laborers was employed at the same work, and many private individuals made a point of planting a tree in their own or public grounds. The Indians of Caughnawaga caught the inspiration and planted trees enough to make their desolate reserve a very different looking place in the course of time.

We hope our readers will imbibe the tree-planting spirit, and make it a rule to do something in the way of beautifying their fields and the highways every year. Every farmer, and every owner of a house lot, should remember that he not only beautifies the landscape but adds to the value of his property by judicious planting of useful and ornamental trees.

A BIG CHUTE.

The *Northwestern Lumberman* has the following particulars from a member of a firm which owns timber on Black mountain, in the Black mountain group, at Asheville, N. C,, a region whore the scenery is of the most rugged and picturesque naturo, and tho climate remarkably promotive of health. The bulk of the timber is cherry, which is quite plentiful through that locality, and of excellent quality and large size. At the foot of the mountains whitewood is the most plenty, with a liberal sprinkling of ash, the latter prevailing higher up. Above the ash line the cherry is found, which grows better in quality as it reaches further up the mountain. The timber is found in covos, or valleys, formed by the ridge-like elevations on the mountains. On Black mountain a chute or slide is arranged, constructed from logs and saplings, down which the heavy logs speed their way. The main chute is over a mile and a half in length, with a side chuto a half or three quartors of a mile loug. The timber is cut as high up the mountain side as two miles, and that felled within a radius of half a mile is conveyed to the chute. The latter follows the coutour of the mountain, and the momentum the logs attain, where the descent is more or less abrupt, is snfficient to easily carry them over the level places or ledges. When a log gets out of its course, its force is so great as to drive one end two or three feet into the ground. The logs are rarely injured much, and are not apt to splinter, except where a small log is in advance of a large one. Mr. Weston has measured trees on Black mountain that were as large as nine feet and nine inches in circumference, that being an exceptional size. He states that properly selected patches of trees would average from 20 to 24 inches in diameter. Some of the trees are 60 feet below the limbs. Walnut grows scatteringly through North Carolina, and very little is found in the Black mountains. After being conveyed to the base of the mountain, the timber is cut for the firm by contract, at a mill conveniently adjacent.

NEW SAW FACTORY.

The property around Charlotte street extension bids fair to become the seat of great manufacturing industries. The works of the Canada Rolling Stock Company, it is to be hoped, will soon be heard in full swing around that neighborhood, but in the meantime, another important factory has been completed, which will, in the course of the next few weeks, be in operation. Mr. James Robertson has finished building his saw factory; the main premises are brick built, three stories high and 100x50 feet. The boiler house and tempering shop cover ground to the extent of 100x80 feet. The factory has been exceedingly well erected by Messrs. Cassidy & Steen. The ground floor is used for an engine room and for the manufacture of saws. The engine was manufactured by Messrs. John McDougall & Co., of the Caledonia Works, Montreal. It is 60 horse-power, the cylinder is 14 inches in diameter, the length of stroke 30 inches, with a driving wheel 5 feet 6 inches in diameter, and 2 feet face. The main shaft runs along the northern end of the building and is connected on the ground floor with three large stones; the first is used for sharpening long saws, the next for circular saws, and the end one for hand work. Connected with the main shaft is the counter shaft, which drives the vertical (used for drilling holes); a machine for cutting the teeth of saws; two ordinary polishing machines; a polishing machine for long saws, and an emery wheel.

In the annex is the tempering furnace, which is 24x20 feet and eight feet high. An oil tank 8 feet deep has been sunk in the ground for dipping the circular saws in, and another tank 3x14 feet, for dipping ordinary saws, is being placed in position. The boiler is at the western end of this building; it is 12 feet 6 inches by 4 feet 6 inches, and is fitted with all the latest improvements. A very large coal and wood shed is also attached.

The second floor of the main building will be used for the manufacture of white lead and putty, and in it have been fixed two putty machines, also two white lead machines, which are connected by a belt with the main shaft on the floor below. This room is splendidly lighted, there being twelve windows on the south, six on the west and six on the north side. The floor above, which is also lighted in a like manner, will be used as a store room. A very fine elevator, manufactured and patented by George Brush, of Montreal, has been fixed on the premises; it is connected with the engine and has been tested to carry two tons.

The engine and greater part of the machinery are in working order, and when worked on Friday the large grindstone made 109 revolutions to the minute. Mr. James Robertson obtains all the steel plates from which the saws will be made from Sheffield, England.—*St. John, N.B., Sun.*

LUMBERING ROADS.

The construction of tram roads, laid with steel rails, becoming quite common in the Southern pine forests, taking the place of the pole road, which is a simple tramway of poles flattened for the car wheels and placed end to end along the surface of the ground. This kind of road has been much used in the South; the ordinarily level and even surface of our pine lands permitting their construction easily and at a minimun cost. Notwithstanding their rudoness they bear immense loads of logs; but as time is a matter of much importance in the hauling of logs as in the transportation of other materials the steel rail tramways are being substituted, and instead of roads only two or three miles long they are being lengthened into the tens and twenties, and reach far into the interior of forests remote from the streams. The extension of tram roads in the comparatively new forests of the South, is indicative of the fact that even here the timber along many of the logging streams is rapidly getting scarcer, and the denudation of the long-leaf pine forests is progressing at a faster rate than it might be naturally supposed. The cheapness with which the logs can be transported on these roads adds materially to the value of the lands in the interior. Recognizing this, parties who have entered large bodies of land arrange their entries so that they will be in contiguous sections, so that extremities can be reached without having to pass through lands belonging to others, and thus place all their lands within easy reach of their mills, which are located at points convenient for shipment by rail and water.—*American Lumberman.*

PULP FROM SPRUCE.

It was with a view to learn something about paper made of wood, and the manner in which the wood is prepared, that the writer accompanied Capt. C. C. Markle to his pulp factories at Markleton, on the Baltimore and Ohio road ninety-five miles from Pittsburg.

They do not use axes or cross-cut saws up there in cutting down trees. The "feller," bores a hole in the base of the tree with an inch auger. The hole is driven in about ten inches the chips removed, and a dynamite cartridge inserted. The dynamite used comes in sticks like a candle, and resembles moist brown sugar. A fuse is attached to the charge, and after it is lighted the men seek a place of safety. In a few seconds there is a mighty roar, and the great tree is lifted into the air, splintered half-way up the trunk.

The trees are cut and split into pieces like cordwood. Almost any kind of timber could be used for making pulp, but the fibre of spruce and hemlock is so straight and soft that it can be worked more speedily and economically than an other available wood. The process is briefly this: The sticks of wood are brought into the mill and thrown into a large funnel which feeds a clipping machine. This machine consists of a large wheel furnished with five knife-blades, and the blades chip the wood off just as the knives of a fodder machine cut straw. The chips are conveyed by an elevator to the second story of the mill, and are dumped into "digestors." They resemble verticle boilers. The chips are fed into the digestors from openings in the top, and then a preparation of soda ash and lime is poured upon them and they are boiled. The pressure of the chips as they spread apart and the fibres separate is immense, and the digestors have to be made to resist a pressure of one hundred and fity pounds to the inch. In a short time the chips become a stringy pulp, and the liquid is run off by a pump and conveyed to the evaporator, of which we will speak later. The pulp next goes through a wet machine where it is strained and cooled. It then passes between rollers and is made into sheets like pasteboard.

The evaporator is supplied with a long battery of small furnaces, above which are the retorts, into which the alkali is pumped from the mill. It is then evaporated until soda ash is the result, and this ash is again used in preparing pulp. There is but a trifling loss in evaporation, and the same alkali is used again and again. A cord of wood will make 1,200 pounds of pulp. About five tons of the pulp will make three tons of paper.—*Pittsbury Times.*

A PORTLAND despatch says that the whole log crop in Maine the past winter amounted to 600,000,000 feet.

"THE CANADA LUMBERMAN,"

PETERBOROUGH, ONTARIO.

EMERY WHEELS FOR SAW GUMMING.

In order to remove the difficulties connected with the importation of TANITE GOODS in small quantities, and to bring such goods within easier reach of

CONSUMERS IN CANADA,

we have arranged with the well-known firm of

FROTHINGHAM & WORKMAN

MONTREAL,

To take our sole Agency for the Provinces of ONTARIO and QUEBEC. By this means consumers who want only single wheels, or goods in small quantity, can supply themselves easily and avoid the trouble of special importations, while dealers can secure the most liberal terms, fully equal to those they could obtain by buying of us direct.

Messrs. Frothingham & Workman will carry a full stock of TANITE EMERY WHEELS, and a sample line of Machines, and can fill all orders promptly.

The Tanite Company, Stroudsburg, Monroe Co. Pa.

September 28th, 1882. lyt13

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

READY-MADE HOUSES.

The ready-made house business has been mentioned in these columns several times, for the reason that it is a growing industry, and one that will eventually consume a large amount of lumber. The inquiries regarding them are numerous. A gentleman visited the *Lumberman* recently who wanted from twenty-five to fifty houses for a colony that is about starting to Dakota. Such houses for the people settling in that territory, and often in other sections, are just what is needed. In many parts of Dakota it is impossible to buy lumber, and often when lumber can be obtained the services of a carpenter are hard to secure. A ready-made house can be shipped to its destination and erected by any man of ordinary ingenuity. It saves all bother of running around the country after building material and men to put it together. A gentleman called at the office of this paper a few days ago who wanted a house to set up on a lot in the city limits. He could rent the lot during the summer for a small sum, and thus avoid paying big rent, and at the same time have a house of his own to live in that could be handily moved whenever it was desirable to do so. A late inquiry from Philadelphia was made regarding ready-made houses for export, and the same day there came letters of inquiry relating to the same subjcct from West Virginia and New York. These letters, and hundreds of others, show that the ready-made house business is not carried on extensively enough to meet the demand. There is no good reason why a manufacturer of knock-down houses should not use 100,000,000 feet of lumber yearly in this city alone.—*Northwestern Lumberman.*

BEECH CHARCOAL.

The *Northwestern Lumberman* says:—The alue of beech continues to come to the surface. While never esteemed of great importance among the numerous American hardwoods, it has held a high place in foreign countries. It is reckoned in Germany as next to oak in value, and about on a par with Scotch pine. It is prefered there for wagon stock, woodenware, etc. It makes thoroughly odorless butter-tubs. Beech is also an excellent charcoal wood. Thousands of tons of beech charcoal are consumed in European distilleries annually, and distiller's charcoal needs to be a very superior article. Charcoal from beech is also a superior fuel for iron smelting. Some retorts in use for 10 years in Germany, for making wood vinegar are thus described:

The retorts are simply boiler-like iron cylinders three feet in diameter and nine feet long, horizontally placed in ovens like common flue boilers. In front is the door for charging, at the back the opening for the gases to escape into the condenser. Each cylinder contains a basket made of iron bars, for the purpose of quickly withdrawing the charcoal into an iron box, which, to effect gradual cooling, is made air-tight by the use of clay. There are 24 retorts in use, which produce yearly at least 1,200 tons of beech charcoal. The wood used is made three feet long, and all dimensions, even stocks and roots are used—the latter give the same quantity of distillates, but require longer time for charring than the ordinary cord-wood. Each retort is charged with about one-half cord of split wood. Duration of process, 18 to 20 hours, (formerly 12 to 14 hours with less favorable results); temperature about 482 degrees Farenheit. The cooling requires five hours. Each two retorts have one fire-place; coal, sawdust saturated with tar, and also the gases resulting from the process, which cannot be condensed, are used for firing. One cord of beech wood weighed 4,092 pounds, and yielded in the average, 966 pounds of good charcoal, or 23.6 per cent. in weight, the small braize not included. And since one bushel of 2,748 cubic inches of coal weighed 20.38 pounds, one cord yielded 47.39 bushels. In the coalings in meilers the average result obtained in the same district, and with the same wood, was 41.3 bushels per cord, or 1,094 pounds, which brings the weight of the bushel to 26.5 pounds, braize included. These comparative results, extending over a number of years, prove that the specific weight of charcoal made in retorts is very much below that made in meilers, whilst the yield in volume is in favor of the retort.

NEW ENGLAND FORESTS AND WEATHER.

The accounts of the Maine logging are accompanied with laments over the drought which the State has suffered for nearly a year, lowering the wells and lakes, and in some cases robbing manufacturers of their water-power. The connection between the destruction of the forests and decrease of rain seems not to occur to the thrifty and usually far-seeing Down-Easter, and if there is any fear that thousands of men in our northern woods are living off their children's children, it is certainly not expressed. The season's cut is over, and there is now being floated down the Penobscot some 150,000,000 feet of logs, while the Kennebec adds 120,000,000, the Aroostook 70,000,000, the Machias basin 30,000,000, the other sources of log crop supply of the state swelling the amount to about 580,000,000 feet, to say nothing of the ship-timber harvest. Some 10,000 men and 2,800 horses and oxen are required to do the cutting and transporting. If these logs averaged two feet in diameter, and could be placed end to end, they would reach over 36,000 miles, or about once and a half round the earth. One of the beneficial effects of the ancient "forest courts" of England and the governmental supervision of forest lands in some of the continental countries is that the destruction of trees was made a grievous offence against the laws, and this was of inestimable service to agriculture. In many portions of New England (for nowhere have the forest trees been properly protected), it is no uncommon thing to hear old inhabitants refer to dry gullies where in their youth a goodly stream of water used to flow, and unless this matter is better regulated by the authorities and not left to the feeble efforts of village improvement societies and sentimental people of the woodman-spare-that-tree variety, many of our towns and manufactories will suffer more and more for lack of abundant water, the danger from spring floods will be increased, while the farmers will be visited more frequently than they are now with long succession of rainless days and damaged crops. It has been frequently demonstrated in New England that waste lands appropriately set with trees will yield a profit of from $6 to $10 per year; but, owing to a want of system in tree-setting, such as prevails in portions of the West, our hills are being rapidly disrobed and our resources wasted.—*Springfield Republican.*

A BRIDGE TWENTY-ONE MILES LONG.

On Sunday a party, composed mainly of railroad officials and contractors interested in the building of the New Orleans and Northeastern railroad, took a trip across Lake Pontchartrain for the purpose of examining the great trestle work now in course of construction. The entire length of the trestlework work when completed will be twenty-one and a half miles. This distance comprises thirteen and a half miles from People's avenue canal to the point, five and three-quarter miles across the lake and two and four-tenth miles from the north shore. All the piling along the southern shore, with the exception of about one mile, has been driven and this division will be completed by July 1. Of the piling in the lake two and a quarter miles and one mile of the work is completed.

The trestle on the north shore has been finished some time and the rails are laid nine miles, or to Pearl river. The trestlework is all constructed after the same plan, except that the cross-ties are further apart in the approaches than in the bridge proper, and that the timber used on the latter is all creosoted, the description of the bridge will answer for the other work.

This structure, which probably will be the longest of the kind in the United States, will also be one of the most substantial. Experts in railroad building pronounce the sections already finished the most perfect specimens of trestle construction they have seen. The piles average 60 feet in length and are driven about 40 feet. In each bent there are four piles and the bents are 15 fect apart. The caps of the piles are 12x14 inches, and the stringers are 6x16 inches, and three of them on each side laid on edge. The cross ties are only four inches apart, and on them are bolted stringers, which act as guard rails. The ties form a secure decking to the trestlework, upon which the wheels of a car could run without danger of leaving the bridge on account of the guard rails.

The trestlework, from begining to end, is one of the grandest undertakings connected with railroad building in the south. Some idea of its magnitude may be formed from the statement that the quantity of lumber required, outside of the piles, is over 15,000,000 feet. There will be 8,161 bents, of four piles each, or 32,644 piles.—*New Orleans Picayune.*

SAVE THE HARDWOOD.

A local correspondent at Long Lake, Grand Traverse region, Mich,, states that farmers in his section, though they are clearing land rapidly, do not slash the timber down in windrows and burn it up to get it out of the way. They are pursuing a much wiser course. They are making saw-logs of all that is available for that purpose, and fence rails and wood of the residue. The correspondent alluded to, wisely pleads with his neighbors to continue on in the good way of economy, "for the time is coming in the near future," he says, "when these majestic maples will be as it were gold mines to the owner." This advice is encouraging as showing that the farmers of that part of Michigan are awakening to the value of their timber, and that the slaughtering and destructive method sometimes pursued in clearing land is to be changed to a better one. A wanton waste of timber iu that section of Michigan, so near to Lake Michigan, and the great markets of the treeless prairie states, would be simply the most inexcusable folly.—*Northwestern Lumberman.*

Squatter Sovereignty.

The *American Lumberman* of New Orleans says:—"Squatter sovereignty" is a persisteut enemy to our magnificent pine forests, and its rule is everywhere found in the shape of thousands of trees girdled aud left to decay arouud thriftless and abandoned homes, hundred of which are found throughout the pine lands of the South. The vandals generally remain long euough to destroy what they can of what is valuable, and then move to some other section to repeat their work of devastation, an evil as far-reaching and as pernicious in its effect as the forest fire. Both are evils which should as far as possible be cured by prompt and proper legislatiou.

THE Ottawa *Citizen* says:—The brisk trade doue in shingles just now is not confined to Ottawa. The Galleta shingle mill on the Mississippi, owned by Mr. James Sheen, has been runniug to its fullest capacity since early in April, and is receiving custom orders faster than it can fill them.

SOMETHING ABOUT WOOD BENDING.

From a lecture delivered a few months ago by H. G. Shepard, of New Haven, Conn., on the principles of wood bending, we extract the following: If I wished to bend a stick and have it remain in position and keep its shape the best, I should put the heart on the inside, for the reason that the tendency of the wood is to bend from the heart; but when I have a difficult piece of bending to do, like a corner piece, that requires a great deal of upsetting, I invariably put the heart on the inside, for the reason that the heart of the stick will admit of more upsetting and end pressure without giving way, wrinkling or anything of the kind. That is the way I use the heart of a stick. When I wish a piece to remain in a certain shape, then I put the heart on the outside, because the tendency of the stick will be in the direction in which it is bent.

As to the peculiarities of bending, after a piece of wood is bent its character is almost entirely changed. It is wonderful how it is changed, and by that change it is better fitted for any use, I claim, than it was before. Bending makes the wood heavier; it is pressed together, and the same bulk of wood weighs more than it did before. Another peculiarity is that when it is thoroughly dry, it is stiffer than the same sized piece of wood, that is alike every other way in regard to grain. It will admit of more strain, and move less out of its position than if unbent. On this account, it is better fitted for carriage making than sawed pieces. I have taken two circles, one sawed out and the other bent, both of the same character of wood and as nearly alike as I could get them; I placed the concave sides together and put pressure on the ends to bring them in contact. They are subjected to equal strain. I found that the bent piece had perceptibly more influence over the sawed one, than the sawed piece over the bent one.

A piece of timber that has been steamed, whether it is bent or not, has its stiffness increased. It is more brittle than it was before, and, for some uses, it will not do as well; and yet there is a quality of timber that the steaming process and the kiln-drying process affect very much the same; they both cook the gum in the timber and make it brittle and stiff. There is a grade or class of hickory that is benefitted by being steamed or kiln-dried for use as spokes or whiffletrees. There is a kind of hickory that never becomes stiff by a natural process of drying, and one of the desirable qualities of a spoke, rim, or whiffletree is stiffness as well as strength; you take that hickory, and it is the very best we have, and steam it, and it is better fitted for these purposes than it was before. It is difficult to tear apart a piece of bent wood; the fibres are interwoven, one with the other. We do not perceive the change on the outside, but when we come to split the stick open, we find that its character is entirely changed.

WOOD ON EXHIBITION.

A New York daily paper gives an interesting account of the valuable collection of woods belonging to the Museum of Natural History of that city. This collection has occupied several years in making and was presented to the museum by Morris K. Jesup.

At present the Jesup collection and the specimens already in possession of the museum represent about six hundred logs, most of them woods from the forests of North America, and those that are particularly valuable to the worker. The specimens are all representative trees of their family, and show a section six feet long, carefully selected and handled, so that even the bark and the tender fungi which affect it are preserved. The woods represent every State in the Union; and with them are samples of seeds, foliage, fruit and flowers, while near at hand, and in most of them, are the insects, injurious to their growth. The preparation of such a collection is not merely a matter of sawing wood and piling, as many would suppose, but requires no little scientific knowledge. The wood is, of course, received green, and when kept in a warm room, cracks, and the specimen is spoiled. To prevent this, much ingenuity has been displayed by those interested. By boring a hole in the heart of the tree from the exposed section, room was allowed for the pressure following the process of seasoning. This was found satisfactory, but previous to this a number of fine specimens were cracked. As it is essential to builders and others interested to know the shrinkage, etc., of various woods, measurements were made of all specimens before seasoning, so that by referring to the diagram accompanying each log the shrinkage is seen, with other interesting information as to the growth of the tree in every year. This is determined by the growth-rings. In a section from a tree called the Pirde of India, the growth-line is shown in a remarkably manner, being one and seven-eighth inches wide, for the growth of a single year.

The seasoning process completed, the specimens are ready to prepare for exhibition. The idea is to have every log represent every possible treatment that wood is susceptible of, and, undoubtedly, the experiment made will place within the reach of the builder many woods hitherto considered unavailable. Each log is sawed down through the centre about half way and then cut off, and half of it is polished. Thus the bark of the tree is seen, the grain, polished and unpolished, in vertical and horizontal sections. Accompanying the logs are watercolor paintings of the foliage, flower, fruit, etc., in size and coloring, and with them a collection showing the economic value other than for building purposes, namely: the various gums, resins, tar, pitch, turpentine, bark for tanning, the cork, the medicinal properties, etc. Some of the logs are of great size and beauty. The largest is a white ash, nearly 46 feet in diameter, and about 170 years old. The museum also possesses a specimen of one of the giant trees of California, which, however, cannot be placed on exhibition on account of the lack of room. An interesting specimen is seen in the honey locust of Minnesota, in which the bark is a mass of sharp thorns nearly five inches in length. The yucca is a tree lily, with a trunk two feet in diameter, and composed of a spongy, string-like mass of fibres, so that even cutting with any regularity is impossible. The tree is extremely tough, and, since it has been received has at various times thrown out sprouts, a process which, if continued in the cases, will more than meet the wishes of the custodians, and take the place of the colored drawings. In a fine specimen of the spruce from the Rocky Mountain country are seen innumerable perforations, each one containing an acorn, the work of a wood-pecker, which thus lays up its winter supply, encouraging the growth of grubs, which are called for later on. Many of the acorns are so firmly driven in that it is almost impossible to get them out.

One of the most ancient specimens in the lot is a spruce from the same locality. It is about twenty-five inches in cross section, the concentric circles telling the story of over 400 years. This wood is one of the most valuable. The nut pine, whose nuts are eaten by some of the Indian tribes, is a little over half the number of inches in diameter, but nearly as old. A buttonwood, 170 years old, California redwood, and a number of others are equally interesting and valuable. Take it in all in all, this collection is perhaps unsurpassed by any of its kind in the world, and is of great value alike to the student and the practical wood-worker.—*The Lumber World.*

PACIFIC COAST LUMBER INTEREST.

Californians, not content with forcing their way to the front rank as wheat shippers, are beginning to turn their attention to lumber, and are seeking markets where their different varieties of native and Pacific coast woods are likely to be appreciated, Redwood, fir, black walnut, cedar and white pine are available in unlimited quantities, having stood for ages unaccustomed to the assaults of the hardy and persistent woodsman; and it is with a view of introducing those and many other varieties of finishing woods, that capitalists intend entering the field as competitors in eastern and foreign markets. Redwood has been in use here for some time, but builders generally are not fully acquainted with all its merits. It is used for many purposes, rough as well as fancy work. It is lasting, worked up either into shingles or for paneling purposes with a high polish. Recently a shipment was made from San Francisco to Glasgow of Washington Territory red fir, cedar and black walnut, and an assorted cargo of woods followed to London.

The scarcity of the lumber supply in many portions of Europe offers an excellent opportunity for Pacific coast shippers, and with their known energy it would not be surprising to see, at the expiration of a few years, shipments of lumber making from San Francisco and North Pacific ports to Europe as frequently as wheat goes now. At the present time shippers are not fully posted as to the requirements of European consumption, the cargoes forwarded thus far being of an experimental character, simply with a view of ascertaining the tastes. The ventures made in the way of shipments to Panama and other South Pacific ports, have met with such encouragement that the trade of Montevideo and Buenos Ayres in white pine is now viewed with some jealousy. Australia is buying largely in the San Francisco market for building purposes, and the demand is rapidly increasing. Canada and the West, keep a good lookout for your trade, or some fine day you may wake to the fact that instead of a prospective famine in lumber, it may turn out a feast with a surplus to spare.—*Lumber Trade Review.*

LUMBER IN WINNIPEG.

The Winnipeg *Times* of June 5th, reports the following discussion in the City Council:

ALD. G. M. WILSON,—What amount of lumber has been purchased since the commencement of the year altogether?

ALD. OVENS—I bought about five hundred thousand feet myself. I understood Parr bought 150,000 feet, I don't know on whose authority. If he did it on his own responsibility I think he should be made to pay for it. I find that we have purchased already nearly three million feet of lumber—2,700,000 feet, I think. This is going it pretty fast. The cost of the lumber will be some-thing like $67,000. It is impossible for the finance committee to raise ways and means for an expenditure going on at this rate. The cheques issued the other night for lumber amounted to $16,000, and there are $49,000 yet to be paid. The chairman of the board of works informs us that they have discharged a large number of men, but I find the pay sheet last month amounted to $12,000.

The MAYOR stated that the exact amount paid for lumber would be $82,697.

ALD. BURRIDGE asked the chairman of the board of works who had bought this lumber, outside of the one million five hundred thousand feet purchased from Macdonald.

ALD. OVENS—Part was purchased by contract—part by Parr. The board of works authorized me to buy lumber.

ALD. G. M. WILSON said the Council had no idea how much lumber was being bought.

As a result of this discussion a motion, by Ald. Fortune and Brydon was carried, rescinding the resolution authorizing the board of Works to purchase what lumber it required.

TIME TO PLANT.

Two provinces—Ontario and Quebec—have, at the same time, passed laws for the encouragement of tree planting. These laws are chiefly directed to planting on road sides. This limited scope of their direct action must not discourage us; for there is reason to hope that the effect of the example may extend much further. The planting of the road sides with well selected shade trees will of itself change the whole aspect of the country; and what is done there, farmers may soon learn to do along the fence rows. Not only would the scenic effect be pleasing; the ultimate pecuniary results may be made very acceptable.

Some of the best trees and the most valuable, including some nut varieties, are not suitable for road sides. Robbing them of their wealth injure the trees and cause a new form of the small boy—and big boy, too, it is to be feared—nusiance. Government bounty to tree-planting is a justifiable thing, where the only advantage to be got is a public one, where no one will be authorized to cut down and appropriate the trees to his own use. For the same reason, the bounty must stop short of the encouragement of private planting. Here the motive to plant must be found in some form of individual compensation; increased beauty of surroundings or the hope of ultimate profit.

The list of trees to which the public bounty is, by the Ontario law, extended, is altogether too limited. Other than our own forest trees deserve encouragement, in this particular. The want of variety in shade trees, even in cities, is a standing reproach. The easily grown horse chestnut and the maple form the chief stock of these trees. The plane tree and the linden tree of continental Europe are specially deserving of encouragement, and there are other varieties now neglected, well worthy of a trial. Our Canadian forests are rich in the variety of their trees; and where nature has pointed out the way, it is safest to go. But even here, the limitations of natural growth may be greatly extended by cultivation; and varieties not native to the soil may be added with advantage.

In Quebec, "arbor day" got a good send off. There was an official ceremonial, which deserved to fix the event in the public mind. The birth of the Ontario law was not emphasised in a similar way, or in any way; and its existence is scarcely felt or generally known. The new law will, when its provisions are fully known, give an impetus to planting on the road sides. And the example will become contagious. That there will be much planting *en bloc* is doubtful. Few persons are likely to be moved to plant even the most valuable trees, say the black walnut, that a future generation may hope to reap, thirty-five years hence, a harvest of $15,000 or $20,000 an acre, or even twice as much. The fashion may change; it must change for want of material to work upon, and when walnut cannot be got for furniture some other wood must be substituted. Walnut may become the more valuable, from its rarity; but in thirty-five years, it will be almost in danger of being forgotten. Though the growth of this tree, in separate plantations, of large extent, is not likely to be undertaken, their are many spots in which it may be dotted over a farm, without any risk of loss and a very good chance of exceptionally large profit. It is a beautiful tree, and after a few years will pay its way with its crop of nuts.

The first thing to be done is to awaken public attention to the desirability of planting; and this done, the folly of selecting poor trees will soon be understood. In Ontario, we have been cutting down trees for a century: in Quebec more than twice as long—though it must be confessed very slowly at first—and now the time to plant has come. Let us recognize the necessity and act accordingly.—*Monetary Times.*

FOREST FIRES.

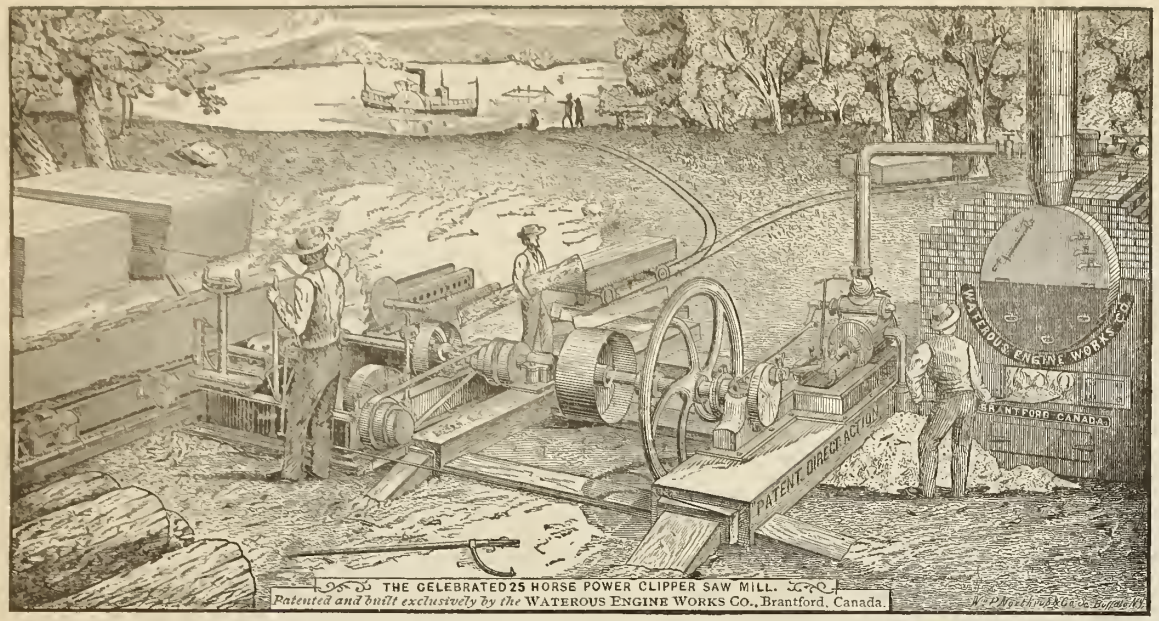
Threatening forest fires are reported in Wisconsin, and the Great Western mine on the upper Menominee was endangered a short time since. A fire near Crystal Falls mine also threatened the Stevenson and Curry mine locations and burned numerous wood piles. Michigan has thus far escaped any destruction from this source this year, but as the dry season approaches, when everything in the woods, especially where lumber operations have been conducted, becomes as inflammable as possible, and is in a favorable condition to feed any flame which may be started carelessly or otherwise, it behooves the utmost caution on the part of settlers, land lookers, hunters, and others, in order to avoid any disastrous results such as were visited on some portions of the state in 1880. The memorable lessons on those dark days in the history of the state, it is to be hoped will serve as a sufficient warning against any carelessness in the future. An ounce of prevention is worth a pound of cure, and all persons engaged in the woods, or who "camp out" over night should see to it that camp or other fires are fully extinguished and not left to be fanned into a blaze by the passing breeze, and perhaps spread devastation, ruin and death to an unlimextent.—*Lumberman's Gazette.*

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

Semi-Portable and Portable Direct Action and Belted Saw Mills!

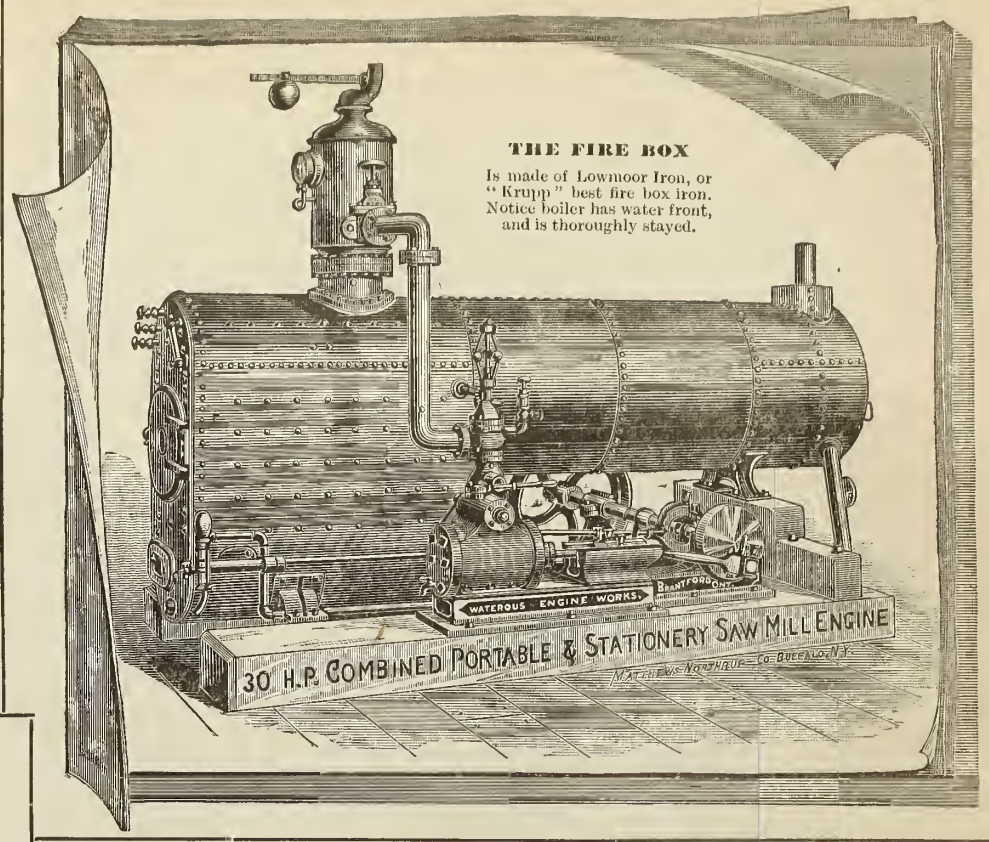
TEN DIFFERENT SIZES.



THE GELEBRATED 25 HORSE POWER CLIPPER SAW MILL.
Patented and built exclusively by the WATEROUS ENGINE WORKS CO., Brantford, Canada.

Above cut represents **Our 25 H. P. Patent Direct Action Mill** which we guarantee to cut 8,000 to 12,000 feet of lumber per day of ten hours, and to be the most efficient, economical and durable mill built in America, and will saw lumber cheaper per thousand than heavy large size belted or gang mills. For over a quarter of a century the leading pioneer mill of Canadian settlers. ☞Specially constructed for hard work.

☞This Cut represents the Engine furnished with Nos. 8, 12, 16 and 18 Saw Mills.

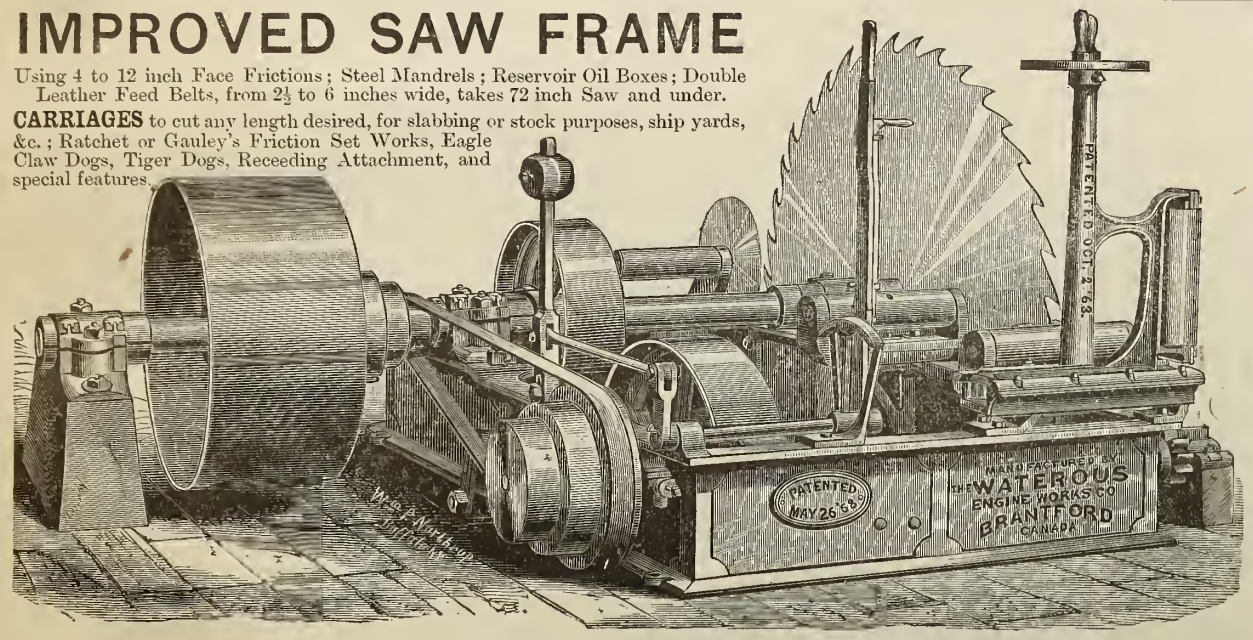


A. & P. White, Pembroke, have one of these 30 H. P. mills at Deux Rivieres, C. P. R. R.
G. C. V. Hall, Quebec, has one of these 30 H. P. mills at St. Agnes, Quebec.
Also, W. & R. Wallace, Gardner's Creek, N.B., with 60 foot Ship Yard Carriage.

IMPROVED SAW FRAME

Using 4 to 12 inch Face Frictions; Steel Mandrels; Reservoir Oil Boxes; Double Leather Feed Belts, from 2½ to 6 inches wide, takes 72 inch Saw and under.

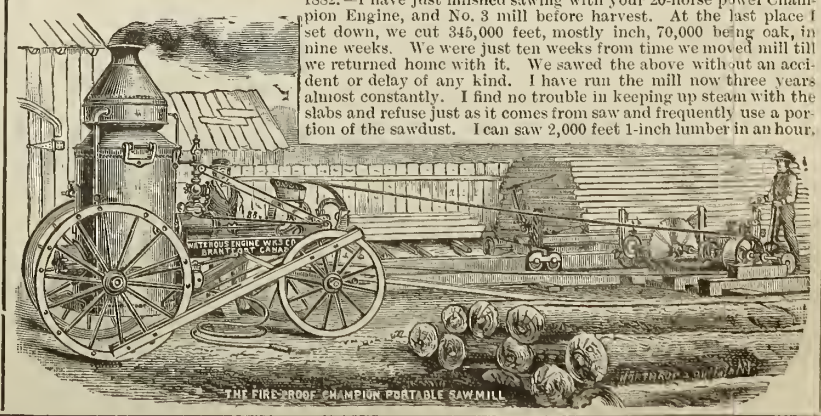
CARRIAGES to cut any length desired, for slabbing or stock purposes, ship yards, &c.; Ratchet or Gauley's Friction Set Works, Eagle Claw Dogs, Tiger Dogs, Receeding Attachment, and special features.



Champion Portable Saw Mills

12, 16, and 20 H. P.

GEORGE BOOK writes as follows:—"ST. ANNS, ONT., July 27th, 1882.—I have just finished sawing with your 20-horse power Champion Engine, and No. 3 mill before harvest. At the last place I set down, we cut 345,000 feet, mostly inch, 70,000 being oak, in nine weeks. We were just ten weeks from time we moved mill till we returned home with it. We sawed the above without an accident or delay of any kind. I find no trouble in keeping up steam with the slabs and refuse just as it comes from saw and frequently use a portion of the sawdust. I can saw 2,000 feet 1-inch lumber in an hour.



THE FIRE-PROOF CHAMPION PORTABLE SAW MILL

The following are a few who have bought these mills:—

Canada Pacific R. R. Co.
G. B. Hall & Co., Que. (2)
Dominion Land & C. Co. Sherbrooke, Que. (2)
Sorel R. R. Co., Que. (2)
Cochrane Ranche Co. Bow River, N.W.T.
Nor.-West Milling and Mining Co., Bow River, N.W.T.
Toronto and Nor.-West Colonization Co., Near Brandon.
Morton Dairy & Farming Co., Turtle Mountain.
Allan Grant, Ottawa.
Geo. Perley, Ottawa.
Michipicoten Native Copper Co.,
W. W. Stewart, Montreal

Double Edgers, 2, 3 and 4 saws; Automatic Lumber Trimmers, 5 to 9 saws each; Log Turners, Slash Tables, Log Jacks or Haul-up of all Capacities, Endless and Single Chain; Automatic Log Rollers, Transfers, Live Rolls, Shingle Machines, Drag Saws, Knee Bolters or Block Splitters, Shingle Packers, Gang Lath Mills, Stave Machines, Automatic Sawdust Feeders for Gangs of Boilers, Sawdust, Slab and Refuse Conveyors, Elevators, Pickering Governors, Worthington and Blake Steam Pumps, American Planing and Matching Machines, American Saws, Solid and Inserted Tooth, Extra Thin Circular Board Saws a specialty, Swages, Gummers, Emery Wheels, and all kinds of Saw Mill Furnishings kept in stock.

WATEROUS ENGINE WORKS CO., Brantford, Canada.

Send for New Price List and Illustrated Circular, of special interest to saw-mill men. ☞Mention this Paper.

LUMBER IN AGRICULTURAL IMPLEMENTS.

The total annual consumption of lumber in the manufacture of agricultural implements in Chicago, amounts to about 20,000,000 feet. Of this about 7,000,000 feet are pine. Three-quarters of the remainder is ash, the great staple. Oak is the factor of next importance, but it is not used to the same extent that it is in the wagon making industry, where it commands a higher place. Hickory, maple, elm, whitewood and basswood, and Norway and white pine are the other kinds of lumber employed.

There are several reasons why ash is preferred, universally, in this line of work. It combines numerous features of general adaptability, hardly found together in any other wood. Its stiffness, durability, freedom from knots, ease in working, and some other facts worthy of consideration are urged in its favor. While white oak is a tough and strong wood, it is more expensive and not so readily obtained in large quantities, and at the same time it is considerably heavier than ash; and lightness, in connection with strength is a combination sought for. There seems to be hardly a purpose, where substantialness is a requisite, outside of building, for which ash is not peculiarly adapted, and preferred. It fills the bill perfectly in a great many particulars of manufacture, and the industrial world is watching a diminution of supply with much concern and regret. Ash is the chief element, in the lumber direction, of all agricultural implements, with a possible exception or two. It is generally admitted that the stumpage supplies of ash are getting sadly reduced, and that Ohio and Indiana are pretty well denuded in some sections. While a preference may be had for that growing in these states or in Michigan, there seems to be but a small choice in the matter, for good ash grows in several states. Illinois produces some, and a good article is obtainable from Arkansas, and elsewhere. While some woods vary materially in different states, to a large extent ash is ash, and requires no pedigree to recommend it. White ash is the only variety that suits the maker of agricultural implements. He will use neither black nor grey ash, if he knows or can avoid it. Black ash, while disliked, is at the same time, where a good article is obtained, a very serviceable wood, and would answer the purpose very well, though inferior to white ash. It is asserted that sometimes black ash is mixed in with other ash, and the manufacturer does not always discover the difference. Yet there is a common prejudice against it.

The office of hickory is sufficiently well known, and in the making of agricultural implements it is used where its peculiar characteristics make it especially desirable. Maple is employed chiefly where a smooth surface is required, and, though sometimes used for the frame work and strong parts, in place of ash, it is not nearly so good. Its durability is less, atmospheric contact affecting it more seriously. Its proper place is regarded to be under cover. On the other hand, ash, oak and hickory, are of noted excellence in withstanding exposure. Rock elm is used for neck-yokes, whiffletrees, etc. It has an inclination to get out of shape, under the influence of the weather, which makes it less desirable than some other woods. Whitewood and some basswood is used for such purposes as rollers, and where inch lumber is required, and principally in the making of harvesters, reapers and mowers. In the latter machines, considerable Norway pine is used in the platforms and bottoms. An immense amount of white pine is also consumed in constructing boxes in which to pack the machines, which, because of their large size and the necessity for thorough protection during transportation, sometimes of long distances, must have an unstinted supply of lumber.

One reason why more oak is not used in the industry is that a good article is in such demand for wagon making, and so readily taken, that it commands a price that makes it decidedly less economical in the manufacture of implements than ash, which is nearly as durable and fully as good in other respects.

The force of circumstances all the time has a tendency to reduce the amount of lumber required in the making of agricultural implements. The fact that the desired lumber is continuing to become scarce, and that in implements great strength and durability are required, is leading to a policy and an effort toward using as little lumber as possible. That is, iron and steel are put in wherever it is possible, the great study being to secure the same amount of strength with the minimum weight. Iron plow-beams are now largely made instead of wood, an item in itself. A firm in this city is now trying to make a steel wheel adaptable, where formerly it was part wood. There are other details in which the same result is sought.

A large amount of thick lumber, and considerable inch stuff are used in the agricultural implement industry, and generally the best lumber is required. There are in Chicago three large concerns, two making harvesters, reapers, mowers and binders, and one making plows and cultivators, who consume all the lumber so employed in this city, with the exception of scattered thousands that go to small repairing establishments. Jobbing depots for the distribution of such goods are, however, numerous, and some of them do an immense business. Implements are handled from the manufactories scattered over the country, east and west. The home manufacturers mentioned have large establishments, one of them consuming alone 10,000,000 feet of lumber annually.

Retrenchment is an important thing in manufacture, and these consumers apply the theory rigidly to their lumber purchases. They aim to buy just what is wanted, as any sagacious business man might be expected to, as advantageously as possible. Their bulk supplies come mainly direct from where produced, and are generally cut to order. Yes, so large is the consumption, and the requirement in case of shortage so urgent, that the city yards secure considerable trade from that source, because they are apt to have very desirable dry lumber that cannot be drummed up in the country in a hurry. The buildings of the two harvester firms cover acres of ground, and either of them employs in busy seasons from 1,000 to 1,500 men.

Kiln-drying is regarded as detrimental to the virtue of the lumber, which must necessarily be submitted to considerable grief after it is put into a machine, and large stocks are kept in pile at the yards of the manufacturers. About a year's supply of dry lumber is kept ahead, and from 4,000,000 to 7,000,000 feet are usually in stock. Both the concerns mentioned have large piling grounds, extensive docks, good railroad facilities, and own or lease saw mills, hence enjoying all the advantages securable by the shrewdest lumber dealer. They each consume from 30,000 to 50,000 feet of lumber daily during a season of brisk operations. One of these establishments made about 30,000 implements last year, and the other went ahead of that record. About 100 feet of lumber go into a mower, 350 feet into a reaper, and 500 feet into a harvester, including waste. The plow and cultivator works mentioned, though a large concern, uses only about 1,500,000 feet of lumber annually.

Felloes are generally secured already shaped from bending factories, but one concern in the line mentioned, in this city, has facilities for this work. An apparatus has been rigged up in a shed that answers every purpose, and yet, might be considered a somewhat awkward contrivance. It was originally an old sorghum mill, but it never caused the saccharine liquid to meander from the succulent sugar cane with any more expedition and facility than it wraps the ash around into the required form. Steaming the wood makes it thoroughly pliable, and all that is required is sufficient force expended in the right direction, to get a piece of timber in the proper form. The device in question has a strong wooden block affixed to a large iron wheel, the former having a notch at one point of the circumference so as to permit a piece of stuff to wind around it without lapping. A piece of ash 1¼x8 inches and 10 feet long is placed between the block and a band of strong sheet iron, and as the machine is started both the timber and the band wind firmly around the circular block. The band holds the lumber in place, and keeps the outer surface from breaking. About a six horse-power engine is applied to the contrivance, and a single revolution is made for each felloe. To save time and effort, the felloe is immediately placed inside an iron rim in shape to go on a machine. Very few felloes are spoiled, and only in the case of bad lumber. A piece of bent wood will dry in a few hours, in the open air, and it is then fast in position, barring a tendency to yield a little. A smaller felloe is bent by being screwed to a form. In the process of bending the wood simply stretches outwardly, and is compressed inwardly, with reference to the surface, doing the former more readily than the latter. Most articles are bent on forms. Several kinds of wood can be bent, but maple is one of the woods little adaptable in that way. Where the timber is heavy, a very thorough steaming and adequate power must be secured. In heavy work where it was once the plan to saw the materal into shape, mechanism has been devised by which the stuff can be forced into any required form, even to the heavy timbers used in ship-building.—*Northwestern Lumberman.*

DYING SPRUCE.

BANGOR, Me., May 19.—I have seen nothing of the assumed rapid destruction of spruce by borers, about which so much has been said, but I have heard of the timber dying in large districts on the Miramichi, in New Brunswick, and on some branches of the St. John, the Aroostook, Fish River, and Allaguash, in northern Maine. But, from all I have heard, the borer does not attack young or thrifty trees; so, whether the dying of the timber is the effect of borers, or the borers an effect of the dying timber, I cannot say. No doubt the death of an old tree in decrepitude may be hastened by borers, severe drought, or other causes. Generally, where the spruce is old and about all of an age, and about ready to die of old age, the borers are said to kill as much as three-fourths of it in spots, in some localities. We have seen nothing of this yet on the Penobscot, or any of the Maine rivers except the Upper St. John. On all these rivers the aged spruce has generally been culled out, and the forest now consists almost entirely of comparatively young and thrifty, growing trees. I have heard of no borers in those localities, and do not believe that it will pay any class of insects or their larva to attack any such thrifty forest. Our Maine forest will be forest a thousand years from now, because the land is worth more to raise wood on than for any other crop. The Pilgrim Fathers and their descendants cleared, plowed and cultivated a million of acres in New England that *is now forest.* So we have to take good care of our forests and manage them properly, and it is our policy to cut and market all the decaying, decrepit trees—pine, spruce, hemlock, etc.—to save them from death by worms, rot, heavy winds, droughts, and the natural death from old age. We do not generally have any trees cut smaller than 14 inches at the stump; nor do we generally cut in any one year more than one-tenth of the wood growing on an acre of land. These reports of the general dying of timber are no doubt much exaggerated. On townships that I am familiar with on the St. John where much of the timber is reported dead, the soil was poor, the growth thin, and the trees rather small and short-bodied; and generally what spruce trees there were scattered here and there in the forest of pine, cedar, birch, beech, maple, fir, juniper, etc., were past their prime, not growing at all now, and always had been of very slow growth. Much of the forest is worthless—small, though ancient, fir—like what we find on the foothills of our mountains, while there are very few young spruce under 12 inches at stump. From all I can learn, most of the reports of damage by the borers come from such lands as these.

Henry M. Prentiss.

THE MATERIAL AND MANUFACTURE OF CANES.

The manufacture of walking stick and umbrella handles is an industry in which a great deal of capital is invested, The material is as various as can well nigh be conceived of. The Chicago *Times* recently had an article on the subject, from which we extract:

Many are of imported woods, some from the tropics, China, and the East Indies. The celebrated Whongee canes are from China, where they are well known and celebrated for the regularity of their joints, which are the points from which the leaves are given off, and the stems of a species of phyllosiachys, a gigantic grass, closely allied to the bamboo. The orange and lemon are highly prized, and are imported chiefly from the West Indies, and perfect specimens command enormous prices. The orange stick is known by its beautiful green bark, with fine white longitudinal markings, and the lemon by the symmetry of its proportions and both prominence and regularity of its knots.

Myrtle sticks possess also a value, since their appearance is so peculiar that their owner would seldom fail to recognize them. They are imported from Algeria. The rajah stick is an importation. It is the stem of a palm, and a species of calamus. It is grown in Borneo, and takes its name from the fact that the rajah will not allow any one to go out of the country unless a heavy duty is paid. These canes, known as palm canes, are distinguished by an angular and more or less flat appearance. Their color is brownish, spotted, and they are quite straight with neither knob nor curl. They are the petioles of leaf stocks of the date palm. Perhaps the most celebrated of the foreign canes are the Malacca, being the stems of the Calamus sceptonum, a slender climbing palm, and not growing about Malacca, as the name would seem to indicate, but imported from Stak, on the opposite coast of Sumatra. Other foreign canes are of ebony, rosewood, partridge or hairwood, and cactus, which, when the pitch is cut out, presents a most novel appearance, hollow and full of holes.

The manufacture of canes is by no means the simple process of cutting the sticks in the woods, peeling of the bark, whittling down the knots, sandpapering the rough surface, and adding a touch of varnish, a curiously carved handle or head, and tipping the end with a ferrule. In the sandflats of New Jersey whole families support themselves by gathering nanne berry sticks, which they gather in the swamps, straighten with an old vice, steam over an old kettle, and perhaps scrape down or whittle into size. These are packed in large bundles to New York city and sold to the cane factories. Many imported sticks, however, have to go through a process of straightening by mechanical means, which are a mystery to the uninitiated. They are buried in hot sand until they become pliable. In front of the heap of hot sand in which the sticks are plunged is a stout board from five to six feet long, fixed at an angle inclined to the workman, and having two or more notches cut in the edge. When the stick has become perfectly pliable, the workman places it on one of the notches, and, bending it in the opposite direction to which it is naturally bent, straightens it.

Thus sticks apparently crooked, bent, warped and worthless are by this simple process straightened; but the most curious part of the work is observed in the formation of the crook or curl for the handles which are not naturally supplied with a hook or a knob. The workman places one end of the cane firmly in a vise, and pours a continuous stream of fire from a gas pipe on the part which is to be bent. When sufficient heat has been applied, the cane is pulled slowly and gradually around until the hook is completely formed, and then secured with a string. An additional application of heat serves to bake and permanently fix the curl. The under part of the handle is frequently charred by the action of the gas, and this is rubbed down with sandpaper until the requisite degree of smoothness is attained.—*Scientific American.*

A TREE MADE FAMOUS.

A correspondent of a New York paper says: "An incident of early days on the Delaware is always recounted with pleasure by the old inhabitants, and as they vouch for its authenticity it must be true. In 1786 Simeon and Franklin Westfall, of New Jersey, took the contract to furnish the government with a white pine tree, which was to be of extraordinary size, as it was wanted for the main mast of a war frigate about to be built. They were to receive $100 for the stick. They hunted the Delaware valley from the Neversink to its head waters, but were unable to find the tree which

would answer the specifications of the contract. At last, when they were about to give up the search, they came upon a pine which they believed would suit. It was on an eminence in Pike County, near the present village of Mast Hope, and three miles from the river at Big Eddy. Upon measuring the tree they found that it was too short by 10 feet. Upon digging at its root, however, they discovered that the tree ran straight down in the earth, and they succeeded in excavating the lacking 10 feet. The tree was felled, hauled to the river, and floated to Philadelphia, and became the mainmast of the frigate Constitution, "Old Ironsides," and carried the American colors in all the glorious victories won by that vessel in the war of 1812."

MANITOBA LUMBERING.

It is stated in a recent issue of the Winnipeg *Sun*, that no less than seventy-eight million feet of lumber has been cut during last winter by the various firms operating in that article in Winnipeg. This quantity has not been all cut in Canadian territory, one firm cut about 7,000,000 feet of lumber in the vicinity of Ottertail Lake and River in Minnesota during the winter. This will be floated down in the course of a couple of weeks to the mill at St. Boniface. Another company cut 10,000,000 feet in Minnesota in the Clearwater River district. This lumber will be floated down the Red River, and sawed at Winnepeg. The total mentioned is arrived at thus :—

	Feet.
Rainy Lake Lumber Co. cut	14,000,000
Rainy Lake Lumber Co. had on hand	7,000,000
J. R. Sutherland & Co. cut	7,000,000
Dick & Banning, L. Winnipeg	3,000,000
Dick & Banning, Lake of Woods	10,000,000
Mr. Ross, at Whitemouth, cut	3,000,000
Schneider & Schneider cut	3,500,000
Keewatin Lumber Co. cut	12,000,000
Winnipeg Lumber Co. cut	15,000,000

These figures give a total of 73,500,000 feet. The *Sun's* total at 78,5000,000 is arrived at by adding 5,000,000 feet which Dick & Banning have arranged to purchase in Minnesota. The conclusion is reached by that journal that "the supply this year will exceed the demand, which is reported to be not so large as it was last year. The price of lumber, too, is reduced this spring, only $25 per thousand feet being asked for lumber which last spring brought $32. The class of lumber cut this year has been very superior, as there were many complaints last year of the lumber not been very good. Nearly all the mills have already been set in operation, and in a few weeks newly sawn lumber will be shipped into Winnipeg in large quantities.

THE OLD STORY.

A great fire at Groton Pond, 23 miles from Montpelier, Vt., on May 10, originated by burning brush in the woods. Besides spreading through the timber, it burned the depot of the Montpelier & Wells River railroad, the waterhouse, 400 cords of woods, a large steam mill, several tenement houses and stores, 200,000 feet of dressed lumber, 400 cords of bark, a lot of barrels, 58 ox sleds, 3 car loads of hay, 23 freight cars, burned out several families with their live stock, the people taking refuge on the pond in boats and on rafts. The mill property was owned by Alvah T. Baldwin, of Wells River. His loss is $100,000, with little insurance. After destroying the mill property, the fire ran along the railroad and burned Peabody station. The territory along the track for six miles is laid waste, the timber, buildings, fences and all improvements being swept away. The loss to the railroad is estimated at $25,000. John Morse was seriously burned. Mr. Baldwin, proprietor of the mill, was forced to take refuge in a brook that ran under the railroad.—*Northwestern Lumberman.*

MONTREAL NOTES.

The *Gazette* of June 1st says :—The local trade in both hard and soft woods has been considerably checked by the constant wet weather, but no material modifications have occurred in prices except for laths, which have declined since our last report 50c. per 1,000 to $1.50. This figure allows a shrinkage of $1.50 per 1,000 since the new make came in. Last year they fell to $1.35. There is some export demand for ash. The old stock of hardwood is well cleaned out, but the new wood is too green to handle. Last season's high prices occasioned a large cut, and an over supply this year is anticipated. Regarding the export trade, we noticed liberal shipments of deals to British ports, steamer freights being quoted at 65s. to 67s. 6d. for Liverpool and Glasgow and 67s. 6d. for London. The South American lumber trade has up to tha present exhibited no life, and we hear of only one charter to the River Platte this season, and that was made some time ago, at $13.

WINNIPEG NOTES.

The Winnipeg *Commercial* says :—Although building operations are increasing a little in the city, the amount of work going on is by no means commensurate with the immense piles of lumber in many of the yards. The supply is far in excess of the demand in the city, and country requirements are scarcely up to expectation. Dealers will undoubtedly find a market for all their stocks, but to judge from present appearances they may have some time to wait. There has as yet been as little cutting in prices as possible on the one hand, and on the other builders are having their wants supplied from the cheapest source. Holders of large stocks will probably suffer in some degree on account of the reduction in freight rates, by which dealers are now able to reduce prices of lumber from $2 to $3 per thousand feet.

VALUABLE WATER-POWER.

It is contended, in the Winnipeg *Free Press*, that the water power at Rat Portage is equal to 300,000 horse power, and superior to that of Minneapolis of which we have heard so much. That journal gives a list of the lumber mills at and around Rat Portage, with the cutting capacity of each :

		Feet per Day.
Rainy Lake Lumber Co. (H. Sutherland & Co.		
Mill at Fort Frances	do	50,000
Mill at Rat Portage	do	100,000
Winnipeg Lumber Co., (Jarvis & Berridge)		75,000
Bulmer, Bailey & Co		80,000
Keewatin Mills, (D. L. Mather)		75,000
Dick & Banning		50,000
Hunter & Co		100,000
Contractor's mill, (Vermillion Bay)		15,000
The American Co.'s new mill will cut		100,000
Total, nine mills		645,000

The paper making interest will be represented by two mills under construction and to be in operation during the coming summer. The country affords an immense quantity of material for the manufacture of pulp. Locations for grist mills have been surveyed with a view to building whenever the through route to the East has been opened for traffic. One of these locations is owned by Hespeler & Co., of Winnipeg, another by D. H. McMillan, and one by Minneapolis firm. The Hudson's Bay Company own the finest location of all, and intend some day erecting a mammoth grist mill on their property.—*Monetary Times.*

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

DIPHTHERIA—that terrible scourage of the present day—attacks chiefly those whose vitality is low and the blood impure. The timely use of Burdock Blood Bitters forstalls the evils of impure blood, and saves doctor's bills. Sample bottles 10 cents.

THE editor of the Grand Rapids *Sachem* says :—"We are usually sparing in our enconium towards patent medicines, but observation and enquiry has satisfied us that the preparation of Messrs. T. Milburn & Co., styled 'Burdock Blood Bitters,' as a blood purifying tonic is worthy of the high reputation it has established among the people."

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.
"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*
Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus :
JAMES EPPS & Co., Homœopathic Chemists,
18Ly London, England.

CONSUMPTION
POSITIVELY CURED.
All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humbug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**
We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.
Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address
ASH & ROBBINS,
20L24 360 Fulton Street, Brooklyn, N. Y.

Special rates will be made for page, half page and column advertisements.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont. JUNE 15, 1883.

CONSIDERABLE timber planting is being done in Umatilla county, W. T. Walnuut, ash, box-elder, maple, white oak, and other trees flourish in that region.

THE Ashland Lumber Company, of Ashland, Wis., recently sold two cargoes of white pine deals to be shipped to Liverpool, England, by the Welland canal.

THE total lumber cut of Wisconsin and Minnesota last year exceeds four billion feet, representing the growth of 1,250 square miles. This is the largest cut in the history of the North-West.

THE men engaged in driving the Swift river, in Maine, were discharged, and 5,000,000 feet of logs were hung up—probably for the season, it was thought, but recent rains have started the drive in good shape.

THE American Lumber Company, with mills at Dollarville, intends to ship 20,000,000 feet from St. Ignace, Michigan, this season. The company's mill at present cuts 80,000 feet a day, and its capacity will be increased to 100,000.

IT is whispered in New York that a "corner," prominent in which are English capitalists, have bought the largest remaining tracts of black walnut lumber and expect to drive the rates high. In other woods the prices are very low.

THE Brandon correspondent of the Winnipeg *Commercial* says:—Mr. Grigg, of London, is about to build a large saw mill near the Brandon flour mills, he is the owner of large timber limits in the Riding Mountains, and he intends to do a large lumber business here.

AN Ottawa despatch says:—Large quantities of square timber are being shipped by rail to Quebec. It seems probable that before many years the bulk of the upper Ottawa cut will be marketed in this way. At present the freight rates are somewhat in excess of the cost of driving, but as soon as a sufficient number of properly constructed cars are placed on the line better rates will probably prevail,

THE Belleville *Intelligencer* says that about 360,000 feet of timber will be brought here this summer from Lakefield and Midland, over the Midland Railway, provided the streams which float the timber do not become so low that the drives cannot reach those places.

A KINGSTON despatch of June 5th, says:—During the last week there were discharged at Garden Island 186,000 feet of square timber, 100,084 pine staves, and 54,090 West India staves, which at the present market value would be worth the snug little sum of $247,000.

IN buying wood-working machinery, the very best rule for guidance is that good old one, "the best is the cheapest." It don't pay to buy cheap materials or cheap workmanship, and cheap machines generally mean both of these. Cheapness is apt to prove an expensive investment in the long run.

A Montreal despatch says:—The deepening and widening of the Grenville and Carillon canals has been the means of stimulating a great increase in the traffic this season. Formerly barges carrying only 130,000 feet of lumber could pass through, whilst now vessels with a capacity of 400,000 feet can easily pass through.

A CURIOUS instance of the durability of oak recently came under our notice in an advertisement which announced a sale of old timber, taken from the bell-loft of St. Micheal's Church, Heighington, Durham, the wood being about 450 years old. It is curious, after being in use during so long a period, that this oak should again come under the hammer for public sale.

WOODEN tooth-picks are now considered to be one of the necessary adjuncts of the hotel dinner table, and many of those persons who have occasion to use them have doubtless, more than once, wondered where they all come from. In the small town of Sebec, Piscataguis county Maine, U. S., there is factory which employs from 12 to 15 girls, and eight or ten men, and turns out daily a two-horse load of this little wooden implement. A thousand cords of poplar and birch wood are annually consumed at the factory.

AN Ottawa despatch says that large quantities of square timber are being shipped by rail to Quebec *via* the Canadian Pacific Railway. It seems probable that before many years the bulk of the Upper Ottawa cut will be marketed in this way. At present the freight rates are somewhat in excess of the cost of driving, but as soon as a sufficient number of properly constructed cars are placed on the line better rates will doubtless prevail. The first raft of the season has passed through the Chaudiere slides. It contained 94 cribs and is owned by Messrs. A. and P. White, of Pembroke.

MESSRS. Grigg & Macgregor are building a saw mill at Brandon. It will have a capacity of 10,000 feet a day to start with, afterwards to be increased, as the necessities of the business demand. The limit on Swan river comprises 32,000 acres, two-thirds of which are reported as heavily timbered. Unfortunately there is a portage of ten miles in order to reach the Assiniboine, the Swan flowing into the Winnipegosis; but once the business gets thoroughly established it is intended to construct a tramway to facilitate the transportation, It is estimated that the portaging with teams will cost about three dollars per thousand feet.

THE trees most valuable for the manufacture of wagon wheels are given as follows:—Black locust, rock elm, white oak, white birch, white elm, white gum. Black locust is placed first in the list, because of its great durability, and its having a solid compact fibre. It shrinks very slightly, only one-third as much as white oak, and less than any other in the list. It is susceptible of a high polish. The only objections to it are its extreme hardness, and the fact that glue does not readily adhere to it. In localities where wagons are constructed to carry all weights from one to fifteen tons it has stood the test when all others failed,

THE Oshkosh *Northwestern* says:—The Webster Manufacturing Company recently purchased an immense tract of hardwood land, containing 43,000 acres, about 50 miles from St. Paul, for which they paid in the neighborhood of $300,000. The St. Paul company are going to run a branch of their road through it. The Webster company will at once build two large mills, a hub and spoke factory, and a barrel factory on the tract. It is is expected that the timber will more than pay for the land, and the land itself, when cleared will be of immense value, it being of good quality and well located. No doubt they will make a mint of money out of this mammoth deal.

TO give ordinary wood the appearance of the most beautiful specimens of walnut, adapted to the very finest cabinet work, the wood must first be thoroughly dried and warmed, then coated once or twice with a liquid composed of one part by weight of walnut peel, dissolved in six parts of soft water by heating it to boiling point, and stirring. The wood thus treated is, when half dry, brushed with a solution of one part by weight of bichromate of potash in five parts of boiling water, and, after drying, is rubbed and polished. The color is thus said to be fixed in the wood to the depth of one or two lines, and in the case of red beech or alder, for instance, the walnut appears the most perfect.

ENGLISH PROSPECTS.

The *Timber Trades Journal* says:—Up to the end of April our table gives the following results as to the following places enumerated:—

London has imported less than last year up to April 30th by ..... 26,130 loads

Liverpool	7,427	"
Hull	14,639	"
Grimsby	11,454	"
Hartlepool	8,614	"
Newcastle	12,110	"
Gloucester	1,520	"
Lynn & Wisbech	4,717	"
Total	86,611	

short imported compared with the first four months of last year by only nine ports, some of them not by any means first-rate, and many others might be added, but the difference is not sufficiently significant to be worthy of notice individually. On the other hand, some ports have essentially exceeded their last year's business up to the same date; but these are chiefly great depots for pit-props and mining timber, such as:—

Cardiff, which is in excess	11,294	loads
Newport, still more so, with	14,302	"
Swansea	2,145	"
Portsmouth, which imported very short last year	1,422	"
South Shields	6,695	"
Total in excess	35,858	"

of last year; but as we stated in our remarks on the Board of Trade returns, May 12th, the whole shortage at the end of April, was about 127,000 loads behind last year. Nor do our reports since then indicate any increase in the rate of importation likely to have any considerable effect in reducing the figures ascertained as the quota of arrears up to that date. On the contrary a deficiency may be counted on also in May, in comparison of May 1882, unless the last week of it should be on a more plentiful scale of import than those that are already behind us. Nor can any established fact be more calculated to reassure the home trade than this of very moderate importation up to date, and if in June it be found that the supplies do not increase by comparison with last year, the trade will probably be considered in a very healthy condition, which is only a short step from prosperity. The only thing it has to fear is the pressure in the money market, which is liable to cause the country banks to restrict their business, and turn away paper they were accustomed to discount, and this is apt to cripple the trade of their respective neighborhoods, and cause prices to decline, as sellers desirous to realize are in such cases more plentiful than buyers anxious to lay in stock,

This is the cloud no bigger than a man's hand, that may by and by assume portentous dimensions, or it may blow over and leave trade to flourish without interruption.

Money regaining its usual equilibrium in this country and America—nor is it yet seriously disturbed—a good fall trade may be safely predicted for those importers of timber goods who choose to limit their transactions to the customary requirements of the connection they have established around them, and fortunately at this time there is not much disposition manifested to enter into unadvised speculations, on the chances of what may turn up.

HOW TO SEASON LUMBER.

The *Journal of Commerce* says:—This is a subject of more than ordinary interest to all lumbermen and manufacturers just now on account of the constantly increasing demand for lumber. With but few exceptions either in Canada or the United States lumbermen have all exceeded their previous cut, and still the demand keeps pace with the production. This demand is kept up by the rapid development of the country, with which it is found difficult to keep pace. These rapid changes induce entirely new methods of business, and lumbermen realize that the old system of piling their lumber in their yards from one to two years, waiting for the wind, sun and rain to make the product marketable, is unprofitable and behind the times. They are consequently introducing the modern dry kiln and planing machines. Long shipments by rail are impossible unless the product is shorn of all superfluous weight. Shavings, edgings and trimmings can be more profitably used as fuel at the saw mill than by adding their weight to a consignment of lumber destined to a distant dealer, who will not pay as much for the rough as he would for the dressed. The same is equally true of the moisture contained in green or half dry lumber. No lumbermen can make it profitable to pay freight on water, and every thousand feet of green pine contains over 1,000 pounds of moisture that can easily be expelled by a few days' treatment in a modern dry kiln, which will leave the lumber in better condition than if seasoned in the open air, and much more acceptable to the customer, for the new process seasons the lumber thoroughly and without injury, which is not always the case with weather seasoning. Lumbermen and manufacturers unacquainted with the new dryer will probably doubt the practicability of drying lumber on a large scale for shipping purposes. It is a fact, however, and there are at least two hundred lumbermen in the United States that are taking their lumber green from the saw and drying with great profit for shipping and manufacturing purposes, and the system is being rapidly adopted by prominent companies in the Dominion. The kilns are usually placed in such a position that the lumber can be loaded on the cars of the kiln at the saws, and pass from them through the dry kiln and on to the dressing mill without further handling. Steam saw mills can use their exhaust steam as a heating medium, and mills driven by water power can have a boiler put in at small expense. The results attained through the medium of these dry kilns is astonishing. Elsewhere will be found the amount saved in freight, which is a large item on long shipments. Add to this the increased value of the lumber, as well as interest and insurance saved, and it will be found a first-class investment On another page of this Journal will be found a cut illustrating these modern dryers, of which Mr. A. F. Barron of Montreal is patentee and builder for the Dominion.

THE WESTERN LOG CUT.

A dispatch from Brainerd, Minn., May 29th, says: By the returns of interested parties from a tour of inspection of the timber wilderness on the Upper Mississippi to-day the first authoritative reports are received of the cut of the winter and the progress of the drive. These make the following summary; The logs of eight out twelve large operators, are hung up under various circumstances, and cannot get out without great rains: some not even then, as it is so remote, and the men have given up and gone home. The winter's cut of Blake Bros., of Minneapolis, 27,000,000, is among these, being hung up in Balsom Brook, and in Prairie River. The aggregate of logs thus hung up is 25,000,000 feet, which is one-fourth of the average crop which comes past Brainerd in the Mississippi annually, The rafts hung up or in jams in the tributaries are estimated at 80 miles,

which includes, however, the Canadian logs in Big Fork River, which flows northward. In one Mississippi tributary, Swan River, there is a jam of 35 miles with 40,000,000 logs in it, which cannot get through without rain. It is also found, after all, that the cut was larger last winter than has been generally believed, but less is likely to get to market, so there is really a shortage. The whole region is found to be full of cruisers spotting fat lands for the next land sale at St Cloud in August.—*Lumberman's Gazette.*

THE CALIFORNIAN SUPPLY.

The State Mineralogist of the state of California estimates the quantity of lumber cut each year in California and shipped eastward at 70,000,000 feet, Cord wood is sent in about an equal quantity. The heaviest drafts on the mountain timber have been for Nevada use. The Comstock lode alone required 1,000,000,000 feet. Notwithstanding this cutting, the replenishing goes on, and no fears are felt for a lack. The Truckee river and the region around Lake Tahoe have been resorted to most for timber of any regions of the state, but they represent, it is stated, but a small fraction of the timber bearing surface of the mountains—say 20,000 acres, out of a total of several million acres of the main summit of the Sierra Nevada range. Estimates claim that there is timber enough on the eastern slope of the mountains, between Hope Valley and Beckwith Pass, to supply Utah and Nevada for half a century, without taking into account the reproduction that is in progress.—*Lumberman's Gazette.*

Forest Fires.

The *Lumberman's Gazette* of Bay City, Michigan, in its issue of June 6th, says :—In our last issue we alluded to the great danger from forest fires, because of the inflammable material left in the woods where lumber operations had been conducted, and urged extra caution and vigilance on the part of the land lookers, hunters and settlers alike in order to avoid a repetition of the terrible disaster of 1880. Since then we have heard of fires raging in the woods quite extensively in Iosco, Roscommon and other counties, and a considerable amount of destruction of property resulting. The soaking rain of Sunday, however, if it reach that far north, has probably settled for the present all danger in that direction. But the necessity for extra precaution will be quite as urgent again in a very short time, and the vigilance should not be in the least relaxed. Another week of hot weather and a cloudless sky will again make the danger as apparent as ever. Let the suffering and devastation of 1880 be a warning to every person who has occasion to use a fire in the woods during the summer months, in order to avoid a like casualty.

Montreal Notes.

The Montreal *Gazette* of June 8th, says :—The local trade in lumber has shown an improvement upon that of the week previous, and prices at the yards remain about the same. A fair number of orders have been filled ex-barge, arrivals are assuming larger proportions, and the season's supply of both hard and soft woods will no doubt be in excess of that of last year. As regards the export trade, there is very little doing yet on River Plate account. Deals, on the other hand, have been shipped liberally to U. K. ports, nearly every steamer taking out her complement. Further engagements have been made for deals at 67s. 6d. to Bristol Channel, some owners asking 70s., but we understand that 67s. 6d. is the fixed rate at present.

Southern Lumber.

The shipments of lumber by rail from southern points to the west and east is assuming large proportions. Railroads which penetrate the pine regions of Georgia have learned that the transportation of lumber brings solid and substantial returns, and what was at first looked upon as a secondary business, to supplement the gross returns on more valuable traffic, is now considered too valuable to be hampered with excessive freight charges. In fact, the solid roads in the state are those which handle the bulk of the timber and lumber. Following in the wake of the roads of the Northwest they offer every inducement and facility to the manufacturer to to get his patronage. This is the only course that our roads can constantly pursue, as the lumber trade cannot expand unless the markets are placed within easy reach. To encumber it at the outset is a pernicious policy. This is a lesson which some of the roads in the south may learn in time ; but the sooner they learn it the better.—*New Orleans American Lumberman.*

A FURIOUS GALE.

ST. JOHN'S, Que., June 6.—This section of the country was this evening visited by one of the fiercest storms seen in years. About 3.45 a terrible rain from the south-west set in, the wind blowing a gale. Shortly after, hailstones as large as marbles began to fall, and continued for several minutes. In an incredibly short time the torrent flooded the streets, the drains being insufficient to carry off the extraordinary amount of water. Several cellers under the principal stores on Richelieu street were flooded, causing much damage. The streets in several places were completely blocked by trees which had stood the storms of thirty and forty years, but to-day succumbed. Piles of lumber were blown from the wharves into the river, and the lumber yards lost heavily, the lumber being blown hundreds of feet and broken to atoms. Fences were blown over in all directions. The gable end of the brick brewery and the iron roof of Mrs. Dewar's store and dwelling were blown off. The rain poured through the wooden covering of the latter in torrents.

The Kennebec Output.

SKOWHEGAN, Me., May 29.—The figures now in show the total cut of logs on the Kennebec river the past winter to be 120,000,000 feet; there being on Moose river 43,000,000 feet ; on the Dead river, 40,000,000 ; and on the Moosehead lake region 37,000,000. To the above must be added at least 5,500,000 feet of old logs left over on the Moose river. The main river from Moosehead lake is driven by Milliken & Sturger at 34 cents per thousand ; last year, driven by the corporation, it cost about 49 cents. The driving on Moose river within corporation limits, has also been let by the thousand, the price from the bridge to Moose Lake being thirty-five cents per thousand. Heavy rains recently entirely changed the out look for the stream drives, and, with one or two exceptions, they will all get out. On the upper waters of Moose river they have had the best of success, making the cleanest drive that has been known for a number of years.—*Northwestern Lumberman.*

Important to Lumber Shippers.

A joint circular signed by the general freight agents of the Ontario roads has been issued, giving special direction about the shipment of lumber. All cars may be loaded to their full capacity at carload rates, any excess over that up to 2,000 pounds will be charged pro rata, but if the excess be over 2,000 pounds the whole of the overload will be charged for at fourth-class freight rates, and the companies reserve the right to remove the overweight at the expense of the owner. Forty-eight hours will be allowed in which to unload cars after their arrival in yards, after which time consignees will be required to pay demurrage charges. When cars are ordered to the Toronto esplanade twenty-four hours will be allowed from the time the car is placed on the switch, and as there is no room on the esplanade the consignees will be required to unload from yard sidings within forty-eight hours after arrival.

Causes of Fires.

The census investigation showed that in Massachusetts, during the year 1880, 52 forest fires were set by sparks from locomotives ; that 40 spread from carelessly burned brush heaps ; that hunters caused 37 ; that 19 careless smokers dropped their lighted cigars or burning ashes from their pipes, and so caused disastrous conflagrations. In three instances the origin of forest fires is ascribed to the burning of charcoal, and in only eight cases to malice. It appears, then, that the railroads are responsible for the greatest number of these fires, and that the remainder may be generally traced to sheer carelessness. As a first step toward checking this evil, railroad corporations should be compelled to provide their locomotives with spark consumers. Another act is needed to compel the collection and burning during the winter in which the trees are cut of every part of them not carried away.—*N. Y. Lumber Trade Review.*

Scarcity of Water.

The *Northwestern Lumberman* says :—The news from Maine is not of an encouraging kind. The scarcity of water in the streams used for logging is very low, and it is feared that many logs will be hung up. A gentleman from that state, who is well posted in the products, estimates that the log crop of the Penobscot would reach about 150,000,000, the Kennebec 120,000,000, Aroostook county 70,000,000, the Machias Basin about 30,000,000, and the cut of the entire state nearly 600,000,000 feet. There is now a fear among the logging men that the drives will not allow of bringing the output to the mills and coast. The lumbermen of Maine would welcome heavy showers even if they have to come with heavy thunder and a sprinkling of cyclones. The work of banking the logs during the past winter has employed something like 10,000 men and 3,000 horses and oxen.

THE *Mail* of June 12th, says :—Rates are reported as being firmer at this port, with a slight upward tendency. The lumber figure of $1 to Lake Ontario ports was so very low that vessels hardly cared to take in such cargo, but as there is a slightly increased demand for vessels to carry this class of freight, it may be that in a day or so a raise in the figures towards the opening price of $1.25 will be reached.

DODGE & CO.

Pine & Hardwood Lumber

Office :—Cor. East Falls Avenue and Stiles Street,

BALTIMORE, MD., U.S.A.

Correspondence Invited. 1yL12

ABOUT

1,000 Feet FLAT IRON

FOR TRACK.

1½ x ¾—Punched, ready for use. For sale cheap.

JOHN J. GARTSHORE, TORONTO
1L12

WATER POWER

TO LEASE.

THE UNDERSIGNED having largely extended their raceway at Lakefield, are desirous of corresponding with parties who wish to go into manufacturing, and they are prepared to sell or lease water power on the most favorable terms, or would erect buildings of any size suitable for factories.

SAWYERS

—FOR—

FOREIGN COUNTRIES.

Young, Single or Married, Energetic, Sober, Self-reliant Men, thoroughly accustomed to manage and run on Direct Action Saw Mills. Two wanted immediately ; three years engagement ; good wages, expenses and board. Write stating what mills have run, references and wages wanted.

WATEROUS ENGINE WORKS Co.

BRANTFORD. 1L12

ROCK ELM WANTED.

A Few Car Loads of good ROCK ELM, cut into 1¼, 2, 2½ and 3 inches thick, 12ft. length prefered.

DUFRESNE & JODOIN,
Lumber Dealers,
6L12 496, St. Joseph Street, Montreal.

A RARE CHANCE!

Valuable Steam Saw-Mill

FOR SALE.

The Waba Creek Steam Saw Mills, situated on the Madawaska River, one mile from Arnprior. Capacity of Mill, Fifty Thousand Feet of Lumber per Eleven hours. Capacity of Booming Pond, Thirty Thousand Logs. Has Sidings through piling Grounds connected with main line of Canada Pacific Railway. The Mill is in good repair, having only run a short time, and is well found in all appliances required to run it to the above capacity. There is also a good water power connected with it from the Waba Creek, and good stabling, Barn, Boarding House, and other buildings. For information, price and terms, apply to John Robertson, 581, Seigneurs Street, Montreal, or to James McCuan, Arnprior, who will show intending purchasers the whole property, or to

ALEX. FLECK,
6L11 Ottawa.

SAW MILLS

AND

TIMBER LIMITS

WITH

Logs, Lumber, Store Goods, &c

FOR SALE

In the District of Algoma, Ont.

Eighty-Five Square Miles (54,400 Acres) of Limits, Good Pine, First-Class Water Power, Large New Water Mill, Steam Mill, Store and Dwellings.

Canada Pacific Railway now running through part of the property.

THE PLAYED OUT DELAWARE.

A correspondent writing from Deposit N.Y., to the New York *Times* says :—"The lumber business has been the mainstay of the Delaware and its tributary valleys for 120 years, but the onslaughts of the woodmen have been so persistent and fierce, especially during the past quarter of a century, that it is believed the present season will see the almost total exhaustion of the lumber supply. The Delaware lumber region embraces a large portion of Sullivan and Delaware counties, N.Y., and Pike and Wayne counties, Penn. Ten years ago the average quantity of lumber sent to market by rafts on the Delaware alone amounted to 100,000,000 feet, nine-tenths of which was hemlock. In 1870 Wayne County's supply of lumber was over that amount, 30,000,000 feet of which was shipped by rail, and the remainder by water. The spring freshet of the present year has been an unusually favourable one for the running of lumber, but the quantity rafted and run from all the regions has not exceeded 20.000,000 feet. Of this amount about one-third has been forwarded by one operator, William Holbert, of Equinunk, Wayne county. The rest was cut principally in Sullivan and Delawaro counties. The rail shipments will amount to about one-half the above amount, and are made over the Erie, Delaware and Lackawana, and New York & Oswego Midland railroads. To secure even this comparatively small supply the country has been scoured from far and near. Pine, which was once the staple product of the Delaware region, was exhausted many years ago. When the first settlers came into the valley the whole region was a dense pine wilderness, and for 70 years the hemlock was left untouched, not being considered of any value. Lumbermen still in the business hereabout remember when the very best quality of pine was manufactured and rafted to the Philadelphia markets and disposed of at $9 per thousand, while now it must be imported for home consumption and six times that price paid for it. In those days there were no circular saw-mills, but only primitive upright mills here and there in the forest. The first circular mill was erected in the Delaware valley, about 35 years ago, and others were quickly introduced until there were scores of them at work, some of them capable of manufacturing 50,000 feet of lumber a day each. The result has been the rapid exhaustion of the forests, until there is but a small area of the original timber standing, and that is in the hands of a very few individual operators.

"The work of cutting away the timber on the headwaters of the Delaware, on the West Brauch, was prosecuted with such vigor that it has been many years since rafts have been run from above Walton, and the number run from that point has been very small. The East Branch drains what was ten years ago the almost primitive wilderness of Sullivan and Delaware counties, but which is now a field of stumps, or tracts of second rate timber. The work of exhaustion has not been allowed a day's cessatiou, although during the past 10 years, with the exception of 1881-2, the price obtained for hemlock was barely sufficient to cover the cost of production. This seemingly suicidal policy on the part of operators, they claim, was to no small extent forced upon them by the fact that the bark on immense tracts of timber land was purchased by tanners, who had the privilege of felling the trees and peeling the bark, which they did as they needed it. The timber onee felled and peeled, it was necessary for the lumbermen to utilize it, as a year's lying in the woods would decrease its value. The destruction of the hemlock forests has also affeeted the tannery interest, so that many of the largest establishments of the kind in this region have been abandoned for want of bark. A few year's ago Wayne county was the second largest leather produeing county in the Union, and had the largest tannery then in the world.

"When the lumber business was at its height in the Delaware region not less than 10,000 persons were employed as choppers, sawyers, teamsters and raftsmen, and most of the towns and villages owed their support, if not their existence, to the industry. None even one-third of that number are now required to carry on the business, aud many settlements are almost deserted. Fortunately, the land once occupied by the forest is capable of being turned into the finest of grazing farms, and it is being utilized by those who can no longer depend on the lumber for support."

SAW MILLS OF CANADA.

The census enumerators have returned 5,390 saw mills in operation in 1881, the location by Provinces being as follows :—Ontario 1,761, Quebec, 1,729, Nova Scotia 1,190, New Brunswick 478, P. E. Island 165, Manitoba 37, British Columbia, 27, the Territories 3.

The hands employed were as follows :—In Ontario 16,846, of whom 69 were women and 8 girls under ten years. In Quebec 12,461 hands, of whom 37 were women, and eight girls. In New Brunswick 7,175, of whom 20 were women and eight girls. In Nova Scotia, 4,160 hands, of whom 34 were women. In P. E. Island 419, British Columbia 404, and the Territories 44.

The following is the statement of the annual wages, value of raw material and value of the products of these saw mills, by Provinces :

	Yearly wages.	*Raw material.*	*Products.*
Ontario	$3,581,225	8,985,797	16,629,075
Quebec	2,287,191	5,101,884	10,542,649
N. Brunswick.	1,243,628	4,355,735	6 532,826
Nova Scotia..	549,480	1,446,858	3,094,137
Manitoba	208,190	513,158	885,173
B. Columbia..	202,420	223,961	550,321
P. E. Island..	58,262	127,194	240,153
Territories ...	16,600	43,802	95,318
Grand total.	$8,146,996	20,798,389	38,569,652

Shingle making is not included in this table —the Provinces standing as follows in the product of the shingle mills :—Ontario $454,803, New Brunswick $128.714, Quebec $98,130, Nova Scotia $69,344, P. E. Island 10,406, British Columbia $5,597. The art of shingle making was either not understood or remained uncultivated in Manitoba and the Northwest up to 1881. Doubtless in the manufacture of lumber of all descriptions great strides have since been taken in that quarter.—*Montreal Herald.*

PROTECTING THE TIMBER.

Nothing could be more gratifying to those gentlemen who have labored so assiduously for years for forest protection and culture, than the efforts which are being made in the different states in behalf of their favorite theory, the practicability of which is doubtless to be attested within the next decade. The drift of public sentiment is getting to be decidedly in favor of the protection of the timber of the country, and also in favor of forest culture, in order to replace as much as possible that of which the country is being denuded to such a serious extent, and in many cases by such lamentable methods. Our national and state legislators also are becoming interested in the subject to an appreciable degree. But the subject is one of such vastness and magnitude, the returns to be derived pecuniarily, appearing so far in the dim vista of the future, the task of such herculean dimensions, the sentiment of such slow growth, because of seeming impracticability and almost insuperable obstacles, that nothing short of unbounded faith, indomitable will, unmeasured perserverance, courage, determination and zeal, would have continued the work in the face of such opposition as has been encountered by the advocates of this measure, both in the United States and the Dominion of Canada. Indications, however, point unmistakeably to the fact that their zealous and unselfish efforts are in the not very distant future to be rewarded by the highest and most gratifying of all remuneration,—success. The Canadian government, as well as the legislatures of several states, have already by favorable legislation inaugurated practical measures in behalf of both forest protection and culture, which are already prolific with such grand results, as must be in the highest degree satisfactory to those gentlemen who, through the press and forestry congresses, have been instrumeutal in inducing the legislation referred to. The Minnesota legislature has taken an advance position on this question and passed two bills, the result of which will be watched with exceeding interest, as they embrace the protection of the present standing timber, and forest culture as well. A synopsis of these two measures recently appeared in the *Lumber World*. One provides that every person who shall plant prairie land with any kind of forest trees, except black locust, and keep them in a thrifty, growing condition for the period of six years, shall receive three dollars per year for each acre of grove so planted. Persons planting forest trees along the public highway will be paid two dollars annually for each half mile so planted. Not less than 2,700 trees to the acre must be planted, of which at least 1,800 must be maintained in a healthy, growing condition, during the first two years after planting, and at least nine hundred must survive the whole period of six years. Trees along the highway must be planted not more than eight feet apart, and maintained in a healthy, growing condition for four years. The second act appropriates five thousand dollars to be paid to the Minnesota State Forestry Association to be by them expended in the promotion and encouragement of tree planting in Minnesota, by means of distributing a manual of directions for planting and cultivating forests, procuring lectures and addresses on the subject by persons skilled in that science, and disseminating the same through the public press ; collecting information on the best methods of forest culture from persons in the state who have been successful in the same ; by experimental cultivation of varieties of forest trees which are supposed to be adapted to this climate, or by procuring and distributing seeds and cuttings for the same, and generally to aid and encourage tree planting by any other means which they may think advisable. A portion of the money may be expended in measures for the protection of the forests already growing in the state, by publishing information as to the best mannor of preventing forest fires, and otherwise protecting them, with directions for the proper thinning, replanting, etc., so as to produce systematic care of the woodlands of the state and their profitable use.—*Lumberman's Gazette.*

IMPORTANT SALE OF LUMBER.

The Montreal *Gazette* of May 26, says :—The auction sale of lumber held yesterday morning for account of Messrs. Henderson Bros., who have to remove from their yard on William street in consequence of the Dominion Government having decided to build new basins on the Lachine Canal—and are now calling for tenders for the same,—drew a large audience, most of the buyers being outsiders. The sale was conducted by Mr. William H. Arnton in a remarkably ablo manner, not a single dispute having occurred during the whole sale, which lasted from ten o'clock (10 a. m.) until half-past six o'clock in the evening (6.30 p. m.), when it was adjourned until next week, due notice of which will appear in the papers, The following are the prices obtained, a large number of lots of each having been sold ; the prices, though not high, are considered fair. Every lot put up was sold without any reserve. The total amount of the sale will foot up about $40,000.

PINE.—3 inch pine, 14 to 15 feet, at $9 per M board measure ; 1½ iuch piue, 14 to 16 ft, at $17 per M board measure ; 3x4 inch pine, at $12.50 per M board measure ; 2 inch pino, plank, at $16 per M board measure ; 1 inch pine, plank, at $15 per M board measure ; 2 inch pine, battens, at $9 per M board measure ; 3 inch pine, sidings, at $9.50 per M board measure ; 1½ inch pine, extra, at $24 per M board measure ; 1¼ in. pine, extra, at $18 per M board measure ; 3 in. pine, wide, at $16.50 per M board measure ; 3x4 inch pine, scantling, at 12c. each ; 2 inch pine, prepared, at $14 per M board measure ; 1 inch pine, prepared, at $24.50 per M board measure ; 3x4 inch pine, at $20 per M board measure ; 3x3 inch pine, at $15 per M board measure ; 1 inch pine, prepared, at $18 per M board measure ; 2 inch pine, extra, at $23 per M board measure ; 1½ inch pine, extra, at $31 per M board measure.

SPRUCE.—2 inch spruce, prepared, at $20 per M board measure ; 1¼ inch spruce, at $9 per M board measure ; 1¼ inch spruce, prepared, at $13 per M board measure ; 1 inch spruce, at $11 ; 1 inch spruce, prepared, at $5.75 per 100 pieces ; 2 inch spruee, plank, at $11.50 per M board measure ; 3 inch spruce (11 inch wide) at $9 do.

Hemlock, tamarac, basswood, cottonwood and red pine—2 inch hemlock, $8 per M feet, board measure ; 1 inch hemlock, $7 per M feet, board measure ; 3 inch tamarac, $15.25 per M feet, board measure ; 1 inch basswood, $15 per M feet, board measure ; 3 inch cottonwood, $7 per M feet board measure ; 6 inch basswood, $8.75 per M feet, board measure ; 1¼ inch red pine, $13.75 per M feet, board measure ; 2 inch red pine, $14.25 per M feet, board measure ; 1 inch red pine, $14 per M feet, board measure.

Hard Woods—Black walnut, 1 inch, $45 per M feet, board measure ; hard maple. 2 inch, $24 per M feet, board measure ; birch. 2 inch, $16 per M feet board measure ; maple. 3 inch $23 per M feet, board measure ; maple. 3x1 in. $23 per M feet, board measure ; hardwood, 3x4 inch, $20.50 per M feet board measure ; hardwood, 2 inch, $15 per M feet, board measure ; hardwood, scantling, $20.50 per M feet, board measure ; ash, 1 inch, $12.50 per M feet, board measure ; oak, 6 inch, $16 per M feet, board measure ; oak, assorted, $20 per M feet, board measure ; ash, 2 inch, $13 per M feet. board measure ; oak and ash, 1 inch, $15 per M feet. board measure ; butternut, 1 inch, $18 per M feet, board measure ; cherry, 1 inch, $19 per M feet, board measure ; oak, 2 inch, $28 per M feet, board measure ; oak, 2½ inch, $28.50 per M feet board measure.

THE Lindsay *Warder* of June 1, says :—The Gilmour drive is already in Pigeon Lake. It contains 18,000 logs and 600 pieces of square timber, out on the Galway limits and brought down Negey's creek. These limits have been worked for a number of years, and appear to be inexhaustible.

THE Ottawa *Free Press* says that Mr. E. B. Eddy seems determined to keep in advance of all competitors. To make room for the large product of his new mills he has added the extensive grounds surrounding Currier & Batson's old mill to his piling ground, and has a tramway running direct from the mills to the wharves on the east side. This is the finest piling ground around Ottawa.

LIVRPOOL STOCKS.

We take from the *Timber Trades Journal* the following Comparative Table showing Stock of Timber and Deals in Liverpool on April 30th, 1882 aud 1883, and also the Consumption for the month of April, 1882 and 1883 :—

	Stock, April 30th. 1883.	*Stock, April 30th. 1882.*	*Consumption for the month of April 1883.*	*Consumption for the month of April 1882.*

Chips.

THE *Monetary Times* has a special supplement devoted to "The paper trade of Canada." Among its valuable information are details showing the great importance and the rapid growth of the manufacture of wood pulp.

A DESPATCH from Duluth of May 26, says :—The schooner Dot has arrived from Midland, Ontario, with 800,000 feet of lumber for Winnipeg. She reports lots of ice near Sault Ste. Marie. She was fourteen days coming.

THE Belleville *Intelligencer* says a quantity of timber in Sidney has been purchased by Thomas Buck and is being brought here by wagons, each one of which used carries 126 feet. The timber will be rafted here and will make about three drams.

THE *Northwestern Lumberman* says :—Some very heavy square timber, for the Canadian market, that was hung up on the St. Regis river, in northern New York, for an entire year, were latterly floated down to the St. Lawrence on the spring rise.

IT is proposed to have an International Forestry Exhibition in Edinburgh next year. The Highland and Agricultural Society are to co-operate, and have subscribed £100 to the guarantee fund. Canada should be well represented at the Exhibition.

THE largest specimen of wood that has thus far been received by the Central Park Museum, New York, is a section of white ash, which is 46 inches in diameter, and 82 years old. A section of sycamore, or buttonwood, is 42 inches in diameter, and 71 years old.

THE Oakland Manufacturing Company, Gardiner, Me., consumes annually 1,500,000 feet of hardwood, and 2,000,000 feet of spruce and pine in the manufacture of gutters, moldings, broom handles, spring bed stock, slats, etc. During a busy time 40 hands are employed.

A TRIAL was recently made at Williamsport, Pa., of gas made from wood. It gives a soft light, and is about 30 per cent. cheaper than ordinary gas. Any kind of wood except oak, can be used in making the gas, which is manufactured by a portable and easily managed apparatus.

THE Plevna correspondent of the Napanee *Beaver* says :—Mr. George Hick's circular saw mill, a few miles up the creek, is now in operation. The erection of the mill and machinery is entirely the work of Mr. Hicks and his sons, and the building reflects great credit on their workmanship.

A KINGSTON correspondent under date June 1st, says :—Wm. McRossie has received an order to ship 1,500,000 feet of pine timber to Syracuse and Albany. The lumber will be brought in by the Kingston & Pembroke Railway and shipped *via* Oswego. The rate across the lake is 85c.

AN Ottawa despatch of June 1, says :—Lumber shipping continues brisk. All the American boats are now loading at the advanced rates. It is thought that there will be an unusually large cut of deals for the English market this season. Several English buyers are at present in the city. Prices remain unchanged.

THE Winnipeg *Commercial* of May 22, says : The demand for lumber during the week has been a little more lively, but otherwise the trade remains in the same condition as last week. Prices as formerly continue to be fixed pretty much according to arrangement between the contracting parties. Money is reported to be very close.

DESTRUCTION is threatening the fine pineries of Lincoln county, Arkansas, in the shape of a peculiar caterpillar, which feeds on the foliage, and are in such huge numbers as to strip the trees entirely of their needles, giving them the appearance of being dead. This being the first instance known of any kind of worm that would feed on the foliage of the pines, speculation is rife as to the result, some maintaining that it will kill the trees, while others think they will not be materially injured. Those owning fine pineries are quite interested on the subject, and fear the destruction of their trees. The worm drops to the ground after having stripped the trees, and dies where it falls, and neither hog nor fowl will eat them.

AN Indiana lumberman asks, what will prevent heavy ash and oak from checking? The ends of hardwood logs for export are covered with a coat of paint to prevent them from checking, and the same treatment would be applicable to logs or timber not for export. To prevent the sides of plank from checking they should be properly piled and protected from the rays of the sun.

A DESPATCH from Eau Claire, Wis., dated May 27th, says :—Up to date the large amount of 120,000,000 feet of logs have been rated at the Beef Slough works, near the mouth of the Chippewa, and towed by raft boats to Dubuque, Iowa, Burlington, Iowa, Clinton, St. Louis, and other prominent places on the Mississippi. There remains in the works 60,000,000 feet of unrafted logs, and a force of 500 men are engaged in rafting and brailing at present.

A LARGE elm tree growing at Norwich, Conn., is over 70 years old, and the limbs are 30 feet from the ground. It stands alongside a house, the chimney of which has been swept away by the overhanging branches, while the tree has raised and moved the house one foot by the force of its growth. A similar instance has occurred at Nassau, New Providence, one of the Bahama islands. A cotton silk tree growing there has obtained such mammoth proportions that it has actually lifted a large government building.

THE *Monetary Times* says :—The quantity of timber imported into Great Britain for the first four months of this year compares as under with that of the same period last year :

4 Months.	*Hewn Timber.*	*Sawn Lumber.*
1883.....	408,733 loads.	376,466 loads.
1882.....	460,566 "	452,210 "

There is thus a decrease of between fourteen and fifteen per cent. in the quantity imported this year. The decline was most marked in April, being over twenty-five per cent.

To remove the unpleasant taste which is frequently observable from new wooden vessels is a thing difficult of accomplishment. The *Brewing World* says that the simplest plan, and one that will succeed in most cases, is to scald them thoroughly several times in boiling water, then dissolve some pearl-ash or soda in lukewarm water, adding a little lime to it, and wash the inside of the vessels well in the solution. Afterward scald them several times thoroughly as before.

IF the block pavement is carefully swept every day, it does not need much watering, yet it is the practice of some of the drivers to put as much water on the clean block surface as used to be found necessary before the blocks were laid. It should be needless to remark that when the dust is gathered by the new patent process, it is with the intention that the dusting service shall nearly suffice. To deluge the wooden blocks with water in addition, is not only unnecessary, but injurious.

THE *Timber Trades Journal* of May 19, under the head of Glasgow, says :—As regards Quebec goods the trade apparently are waiting for fresh importations, when it is to be expected that larger companies will be attracted and give prices a decided start upwards. Meantime the market is not buoyant. Recent deliveries of deals from Yorkhill yards here show little difference in quantity compared with same time last year. The number of deals delivered last month was 68,826 pcs., and in April, 1882, 64,353 pcs. Since the beginning of the present month deliveries have been lighter than usual.

THE *Timber Trades Journal* of May 19, says : More birchwood is being imported here this season than we have noticed in previous years. Messrs. Forslind & Co., a firm who have contributed much to the extension of this trade, are not only importers, but in many instances the shippers as well, cutting down the wood on the other side, preparing, shipping, and finding a sale for it here upon it arrival ; most of it is being sent into Lancashire and Derbyshire, where it is put to suitable use by the cloggers, brushmakers, and bobbin manufacturers of these counties. The arrivals of the past week have been much fewer than usual, and their absence has caused the quietness occasioned by the holidays to be all the more apparent ; the only imports consist of two or three cargoes of props and a steamer from Pillau with sleepers.

THE Morris correspondent of the Winnipeg *Commercial* says :—The saw mill at Morris has been overhauled and is now in readiness to commence the season's operations. Large quantities of lumber are being imported into Morris this spring, from which it appears that building operations are to be carried on briskly during the summer.

THE Chicago *Tribune* says :—Lumber vessels are experiencing considerable trouble in entering and leaving east-shore ports, occasioned by the shallow condition of the harbors. At White Lake the water is only nine feet in depth, and the captain of a steam barge arriving here yesterday, reports having grounded several times when leaving Montague. The captain of the propeller Lawrence also states that he has encountered difficulty at Charlevoix and Frankfort on account of the bottom being too near the surface.

IT is mentioned, in advocating the white willow as a profitable tree for planting, that one is growing at Stockbridge, Mass., which measures 22 feet in circumference four feet from the ground, while its branches extend 50 feet. In England the willow often grows to a height of 50 to 60 feet in 20 years. There it is much esteemed, because the wood is light, very tough, takes a good finish, and will bear more hard knocks than any other wood. It is used for floats to steamer paddle-wheels, brake blocks on cars, cricket bats, turning purposes, planking, vessel furniture, ox yokes, wooden legs and shoe lasts.

THE *Northwestern Lumberman* says :—Prospects for clean drives are growing brighter every day. Copious rains have followed the dry weather in some sections, and many of the hung up logs have started down stream. In eastern Michigan the improvement is very marked. On a few of the Wisconsin and Minnesota streams they do not expect to make much headway until the June rains come, but it is possible that the rain of yesterday (Wednesday), that had the appearance of being general, reached them. There is not, at present, any indications that the drives, on the whole, will not be very successful.

THE Wyevale correspondent of the Barrie *Northern Advance* says :—Times are busy about our little village. The mills are all running full blast. Mr. Belding's mill has run for three years, winter and summer without cessation. During last winter Mr. Belding supplied the Canada Southern Railway with about 500,000 feet of bill timber, most of it 45 feet long. He has also shipped a quantity of lumber from Penetanguishene to Prince Arthur's Landing, and as soon as the vessel returns will ship another cargo. It is his intention to run steady while the limits last. Mr. Dyment's new mill is now running under the management of Hogan Bros.

THE East Templeton correspondent of the Ottawa *Free Press* says :—The hemlock bark concern is in full blast now, having over 100 men busy in the woods, and anticipate getting out 1,000 cords at least, and the season for stripping it appears only lasts about six weeks, hence they will have to look lively. The men are all camped out and are a fine lot of quiet fellows, happy at their avocation. The last drive this season is Messrs. Edwards', of Rockland. They are still in the lakes, but are pushing along rapidly. The quantity of lumber brought down the Blanche is larger this year than usual. The quality of the logs is very good but small in the average.

THE London *Timber Trades Journal* says :—Twenty five vessels of all sorts, carrying timber goods, must be counted as a very moderate week's arrival for the month of May. Seventeen were steamers, and several of these brought only small instalments of fancy woods, adding but a trifle to the stocks in hand, a cargo or two of flooring, with a sufficiency of sleepers, staves, and lathwood, and the customary supply of doors and other joinery, by the regular liners from New York and Gothenburg. Teak, mahogany, and pitch pine also, each contributed a cargo or two, and the rest were mostly vessels laden with building wood, including one cargo from St. John, N. B., apparently on Liverpool account. But at all events the London supply for the week cannot be in any manner considered excessive.

SHORTAGE OF LOGS.

Every few days the announcement is made that some of the mills on the rivers are compelled to cease operations for the want of logs. This is the fulfillment of our predictions made several weeks ago, and which was as inevitable at that time as at the present. As the season progresses the announcement of stoppages will be even more familiar than at present, and the inevitable result must be a material reduction in production because of the shortage of logs. The 300,000,000 shortage in the Tittabawassee boom at the close of last season, with the large number of logs which are being held back by low water in the tributary streams, cannot but have their effect on the result of the season's cut, and those valley papers which have been to the trouble of figuring up a cut on the Saginaw river greater than that of last year, without any shadow of foundation for such an estimate, and which have not the honesty even now to retract the statement, and in a measure repair the injury, which their falsehoods or ignorance is producing, are deserving of only the utmost contempt, and of course, while they maintain silence, it cannot be expected that their aping copyrighted reprint at Chicago will do any better than they do themselves.—*Lumberman's Gazette.*

Suggested by a Wasp Nest.

A man named Keller is alleged to have been the first discoverer of the process of wood grinding for pulp. The peculiarity of the structure of the wasp's nest suggested the idea that possibly wood could be substituted for rags in making paper. He experimented with saw-dust to no purpose. Wet grinding next suggested itself. This idea was brought into service by means of an old grindstone, and wood pulp was the result. He made a sheet of paper in four hours by straining the pulp through a cloth and leaving it pressed between the leaves of a book till dry. Keller built a rude grinding apparatus, taking no one into his confidence but his wife, and after encountering the vicissitudes which usually beset the path of an inventor, was finally possessed of a mill, which was sold for debt.

Convincing Proof.

Having suffered from rheumatism for a long time I was induced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to buisness, thanks to your wonderful medicine.

I am yours truly,
W. H. DICKISON,
218 St. Constant St., Montreal.

To Henry, Johnsons & Lord, Montreal.

Arnica and Oil Liniment is sold by all Druggists.

NEVER ALLOW IT.—Never allow the bowels to remain in a torpid condition, as it leads to serious results, and ill health is sure to follow. Burdock Blood Bitters is the most perfect regulator of the bowels, and the best blood purifier known.

A WONDERFUL CHANGE.—Rev. W. E. Gifford, while pastor of M. E. Church, Bothwell, suffered from chronic dyspepsia so badly as to render his life almost a burden. Three bottles of Burdock Blood Bitters cured him.

THE KEY TO HEALTH.

BURDOCK BLOOD BITTERS

Unlocks all the clogged avenues of the **Bowels, Kidneys and Liver.** carrying off gradually without weakening the system, all the impurities and foul humors of the secretions ; at the same time **Correcting Acidity of the Stomach,** curing **Biliousness, Dyspepsia, Headaches, Dizziness, Heartburn, Constipation, Dryness of the Skin, Dropsy, Dimness of Vision, Jaundice. Salt Rheum, Erysipelas, Scrofula, Fluttering of the Heart, Nervousness and General Debility ;** all these and many other similar Complaints yield to the happy influence of **BURDOCK BLOOD BITTERS.**

Sample Bottles 10c ; Regular size $1.

For sale by all dealers.

Market Reports.

TORONTO.

From Our Own Correspondent.

JUNE 9.—Considerable lumber is still passing over our docks here, the same fleet of vessels being kept going, some of which bring return cargoes of coal, but there is no disguising the fact that the quantity of lumber to be moved over the N. & N. W. R. R. this season will not be as large as in former years, owing largely to the fact that in consequence of the late starting up of the mills this spring, a considerable portion of the total cut will not be fit to move before the close of navigation. This will be the case with regard to shipments from Port Hope and other points, as well as from this port.

The car load trade is somewhat disturbed by the combined action of the various roads in regard to excess weights, and other matters affecting the wholesale trade. Heretofore considerable lumber passing over the Midland system has found its way to the adjoining municipality of Parkdale, passing over a portion of G. T. R. R., and into the yard owned by the C. V. R. R. Co., for which service dealers have hitherto paid the sum of $2.50 per car, and for which service, although it may be said to be within the city limits *proper*, the extortionate sum of $5.00 is now demanded, and in some cases the time occupied in sending a car of lumber the three miles alluded to would be amply sufficient to take it to Liverpool, England. This state of things tends to hamper the trade, and can only results in loss to the Midland Railway Co., as in future the lumber needed for consumption in Parkdale will come over the N. & N. W. R. R., whose track passes directly through Parkdale. The gist of the whole matter is, that huge monopoly the Grand Trunk Railway Co. wishes to control or absorb all the smaller railway systems, and where they fail in this respect they place every obstruction possible in the way, but like all such attempts it must sooner or later end in mortification and failure to themselves.

Trade from the retail yards is fairly active and prices of bill lumber quite firm, in fact retailers are compelled to stand stiff on prices, being forced into that position by mill men who invariably decline to cut bill stuff unless dealers come up to their figures, and in ordor to give retailers a living profit on dimension lumber it should rule fully $1.00 per M higher from the yards. Lath continues exceedingly scarce, and former figures firmly maintained. Cull lumber is only in moderate demand owing to speculative building having nearly come to an end, which will ultimately prove a blessing to the city, even if it is a blessing in disguise.

MONTREAL.

From Our Own Correspondent

JUNE 9.—The amount of business done so far this season is not quite so large as it was last year, and a much smaller quantity of lumber is arriving. This latter circumstance is considored a very satisfactory feature in the trade, as last season there was really a larger quautity of coarse pine, spruce and hemlock than was required; but now stocks are expected to be well worked off this summer as there is a considerable quantity of building to be done, There is a fair retail trade being done in hard woods, choice lots being still inquired for on American account. Laths are now reduced to $1.50 with considerable stock on hand; with this exception we have no changes to report. We quote prices ex yard as follows:—

Pine, 1st quality, ℔ M	$35 00@40 00
Pine, 2nd " ℔ M	22 00@24 00
Pine, shipping culls, ℔ M	14 00@16 00

FREIGHTS AND SHIPMENTS.

As yet there is nothing doing on South American account, but, as will be seen from the following statement, deals has been shipping in large quantities to London and Liverpool; 67s. 6d. is about the current rate of freight, although some owners are inclined to ask an advance. Shipments to London since the date of our last report have been, per SS Carmona, 10,868 pcs deals; per SS Barcelona, 10,389 pcs deals; per SS Viking, 1,539 pcs deals. To Liverpool, per SS Nepigeon, 67 std deals; per SS Oregon, 13,660 pcs deals; per SS Polynesian, 9,158 pcs deals; per SS Lake Winnipeg, 39 std deals; per SS Montreal, 8,340 pcs deals, 3,258 boards, 6,257 strips; per SS Manitoba, 46 std deals; per SS Toronto, 9,353 pcs deals and 775 boards; per SS Mississippi 4,689 pcs deals. To Hull, per Barque Polynesion, 8,043 pcs deals and 460 pcs deal ends.

CORDWOOD.

There is very little coming in either by boat or rail, and at present there are no boats at the wharf. Tamarac is scarce and what is in stock is generally short and of poor quality. The demand, however, just now is very slack. The Government are calling for tenders for the supply of wood required for the Court House to be in by the 16th inst. The market is firm and tends upwards. We quote at wharf ex cartage:

Long Maple	$ 7 00
Short "	6 50
Long Birch	6 00
Short "	5 50
Long Beech	6 00
Short "	5 00
Long Tamarack	5 25

WINNIPEG.

The *Commercial* of June 5th, says:—There has been no material improvoment in the state of this trade during the past week, and dealers are gradually settling down to the conclusion, that they have over estimated the demands of this season. Building operations are not going to be so extensive as was anticipated, and the lumber demand will be correspondingly lighter.

In its manufacturing notes the *Commercial* says:—There is no probability of the lumber mills being rushed this season as they were last summer, and the day and night run will be avoided at least for a great portion of the season. The facilities for shipping in lumber will give a good show to importers, who have already a large stock on hand, aud local manufactures like other industrial interests are liable to find out that they have slightly overestimated the trade of the season. Furniture factories are still keeping busy, but are not forced to undertake night work. Later iu the season their rush will probably be much greater, as with the location of the settlers who are now rushing into the country, there must be in a few weeks a heavy demand for furniture. Manufacturers are not disappointed with present affairs, and state that the present even flow of orders is almost as profitable as the rush of last season.

ALBANY.

The *Argus* says:—The trade during the week ending June 6th has been only fair, and does not embrace any transactions of importance. There have been no large buyers of pine in the market, and the shipments have been mostly of previous sales. A good assortment and stock of seasoned lumber is still on the yards, aud the receipts have been mostly in good order. The differenco between buyers and sellers at the mills as to the prices of this year's cut still continues, and thus far but few purchases have been made in Canada and Michigan. This is shown by the falling-off in the shipments by canal for the last ten days in May, which have been some twenty millions of feet less than those of last year. There has been a steady demand for the better kinds and qualities of hard woods, though the trade has not been large. Receipts by canal and rail keep up a full assortment of seasoned lumber on the yards. Spruce and hemlock are coming in lively, and the demand equals the supply, particularly of good boards and plank, while culls are accumulating to some extent on the yards.

Quotations at the yards are as follows:—

BOSTON.

Cotton, Wool and Iron of June 9, says:—The demand while not very active is of very fair, steady proportions. Good desirable lumber keeps along at quite steady prices. Pine is moving moderately at the prices that have ruled for quite a time. Spruce is firm, with liberal orders. Hemlock boards are rather scarce and values are quite strongly held. Laths are iu brisk request. Southern pine moves slowly and the market is easy. Hardwoods are keeping along quite evenly. Desirable grades of walnut are firm. Ash, oak, cherry, and whitewood move fairly at about previous prices.

CHICAGO.

The *Northwestern Lumberman* of June 9th, says:—The daily arrivals of cargoes at this port during the past week have averaged a larger number than in any previous week since the openiug of navigation. Over 250 are reported in the port list, the usual proportion stopping at the market. The greatest number reported was on last week Thursday, when 58 put in an appearance. On Wednesday of this week there were 46, and over 30 came in on each of four days, the least number, 19, arriving last week Friday.

The offerings have represented a fair proportion of dimension, boards, strips and shingles. There is but little really dry lumber coming at present, and it is claimed that there is not much in pile over the lake that has not been disposed of.

Piece stuff has ruled firm in spite of the larger offerings. The lower figure on short lengths has been lifted from $9.50 to $9.75, as indicating a settling and hardening of prices. Very little is selling now below $10, if it is fairly desirable. The frequent sales a week or two ago noticed at $9.50 are now so scarce that that figure may be declared off. It is claimed by some that the numerous offerings during the past three or four days have caused piece stuff to drag a little, while others assert that cargoes have been disposed of with reasonable celerity. It is certain that all the arrivals have moved away from the docks after a short tarry, and there has been no appreciable glut in the market.

Boards and strips are firm and steady at quoted prices. Shipments directly from the mills have been liberal, and the commission men claim that but little cross-piling has been done within a few days past, and that the cut will come forward freely as long as the demand is as good as at present. It is also alleged that as heavy a volume of lumber of all sorts is coming forward as at this season last year.

It is understood that the east shore mills are this year cutting a larger proportion of boards and strips than of dimension, for the purpose of equalizing the prices between the two classes of stock. The decline in the price of dimension from last year's prices is assumed by the manufacturers as having arisen from a disproportionate cut of this kind of lumber, which rather overdid the demand. The change in relative proportions of output may be now carried too far, so that at the close of the season there may be too much inch lumber. The question has been asked: If the mills are sawing mostly boards and strips out of dimension logs, will the quality of inch lumber run lower this year than usual; or, rather, will there be an over-abundance of coarse common?

Quotation are as follows:

Short dimension, green	$ 9 75@10 00
Long dimension, green	10 50@12 00
Boards and strips—No. 2	11 50@13 00
Boards and strips—Medium	14 00@16 50

NEW YORK.

The *New York Lumber Trade Review* of June 9th, says:—The condition of trade during the week shows but little change siuce last report. The demand has made no progress, the limited quantities passing into distributers' hands being taken without spirit or confidence, and only against wants in sight. Among the yards the opinion prevails that lower prices are likely to rule soon on both yellow and white pine, while the continual free offerings from the mills strengthens this belief, and causes the adoption of caution when stocks require additions. The predictions freely indulged in earlier in the year have failed of realization, and disappointed with the contrary condition of affairs, dealers no longer express themselves as being on the "bull" side of the market, but all, seemingly, have turned "bears" and settled down to await the pleasure of buyers. The active competition to secure the few orders that come upon the market show to what length manufacturers and holders generally are prepared to go, so eager are all to meet those who are willing to assist them in the uuloading process. The prospects are indeed unfavorable. Consumption does not increase with the advauce of the season, but the stock is gradually becoming greater, and this fact makes holders anxious.

Spruce appears to hold its own very steadily. There are fewer orders offering, but the random cargoes as they come to hand are taken at about the rates current last week. For some few undesirable lots in since our last $13.50 has been accepted, but this price does not really represent the market, as any fair cargo can be placed at $14 and up to $16 for a really good schedule.

For orders the current range stands $15.50 @ $17.50, within which a few bills havo been taken, but the orders offering are mostly small, intended to cover early requirements only. Work at the mill is steadily progressing. There is no longer any scarcity of water, though the streams are said to be falling quite rapidly. The new logs, however, are under good headway, and manufacturers count on a full supply.

Orders for hemlock continue to offer quite freely and mill representatives have their capacity well under engagement. Prices are firm, and no change in the value soon is anticipated.

OSWEGO, N. Y.

From Our Own Correspondent.

Since my last there have been some sales reported below opening prices. The market is dull and receipts light for this season of the year. Lake and canal rates are very low; receipts to date as follows: 1883, 45,000,000 ft.; 1882, 67,500,000 ft.

Three uppers	$46 00@48 00
Pickings	36 00@38 00
Fine, common	20 00@25 00
Common	14 00@17 00

Culls	12 00@14 00

GLASGOW.

The *Timber Trades Journal* of May 26, says: The past week may be counted as the opening of the early summer market. There have been numerous arrivals to Clyde, as will be observed from the import list; and on the 23rd inst., as noted below, a public sale was held in Yorkhill yard, here, the goods offered consisting of a large fresh cargo of birch and maple logs, also St. John, N. B., and Halifax, N. S., spruce deals.

The stock of last year's birch has been exhausted for a long time past, and this fresh cargo was expected to prove an attraction at the opening of the season; yet, although a good company was present, there was little spirited bidding for the birch or for deals. As noted below, the birch was not of large squares, so that the rates realized appear to be an improvement on last year's prices. A bid of 16d. for maple was given, but as the brokers were unable to obtain an advance on this figure, the wood was withdrawn.

Apparently, from the present weak demand for spruce deals, the supply meantime may be considered ample. Besides the sales of birch appended there were some made privately.

AUCTION SALES.

On 23rd inst., at Glasgow, Messrs. Singleton, Dunn, & Co., brokers:—

Halifax birch (squares, string measure, ranging from 13 to 21 in. and avg. 15 to 16 in.)

400 logs	18½d & 19d	per c. ft.
140 "	19½d & 19½d	"
40 "	20½d & 21d	"

Halifax spruce deals—

9 to 21 ft.	13/14×3	10½d	per c. ft.
9 " 21 "	12×3	11d	"
9 " 21 "	11×3	11½d	"

Do. ends—

3 to 8 ft	7/14×3	8½d	"

LIVERPOOL.

THE *Timber Trades Journal* of May 26, says: The dull condition of our trade during the present week would, so far as it has gone, appear to point out that the consumers have hardly yet settled down to business after the Whitsuntide holidays, as there appear to be comparatively few orders in hand, or if they have resumed business, that the demand in in general is far from strong. The latter supposition is far more likely to be the case than the former, and though it is by no means strange to hear reports from the country that orders are few in number, or trifling in amount, yet a survey of what is being done in the way of deliveries from the yards shows that the consumption of timber, &c., is not what it ought to be to meet the views of merchants. The low range of prices for all kinds of whitewoods ought to stimulate consumption to some extent, as it is difficult to see how they can go lower than they are now, but apparently this has little effect.

Spruce deals continue to be sold from the yard at declining prices, and at Messrs. Farnworth & Jardine's sale of Friday last, the 18th inst., when they offered 40,000 pieces, part of cargo landed ex steamer last season, only about 8,700 pieces changed hands. The lots sold were:—

St. John, N. B., spruce deals—

		£	s.	d.
12 to 15 ft	3×9	7	5	0
16 " 20 " and up	3×7	6	17	6
12 " 15 " "	3×7	6	17	6

all the other dimensions, as well as the broad deals and 4th quality being withdrawn.

The imports continue light, and this should help to reduce stocks, though, with few exceptions, they are moderate and would not stand any great demand upon them without affecting prices, were it not that we are now approaching the general import season; hence there is little prospect of enhanced prices being obtained unless something unforeseen should happen which might give an impetus to the trade. The reports of the condition of the building trades in the various districts supplied from this port are, are, however, so uniformly discouraging that little relief can be looked for in this direction, and we must only trust that the imports will be restricted as much as possible.

LONDON.

The *Timber Trades Journal* of May 26, says: Business at the docks continues quiet, although vessels are dropping in from the timber ports; still numbers are confined to very small proportions, and the cargoes they contribute are absorbed apparently without adding materially to the constantly diminishing piles. At a recent visit to Rotherhithe it struck us the freshly piled cargoes could be counted on the fingers, and we hardly remember to have seen the dock stocks at the end of May so reduced as they are at the present time.

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* writing on May 19, says:—The weather being now warm and spring-like, the ports of the upper Bothnian Gulf are opening out rapidly, and before this meets the eye of your readers navigation will have commenced along the whole seaboard up to Haparanda. In the lower ports, the bulk of the first open-water fleet has already arrived, and loading operations commenced. With the exception of the Sundswall district possibly, the tonnage of the vessels arrived is considerahly less than last season. Comparatively few steamers are expected for London and other large importing English centres, while there is, on the other hand, a large number of small sailing craft chartered to convey sawn wood to a diversity of outports, both in Great Britain and on the Continent. The special feature of the present season's business, so far, appears to be that a great number of small transactions have been entered into, whereas large speculative purchases are conspicuous by their absence.

The same inanity and want of life which has characterized the f. o. b. trade the whole of this year still continues. An occasional transaction of a retail character is reported, but, with the exception of the purchase of about 1,000 standards of Sundswall goods at low prices, nothing of note has come under my ken this month. The Sundswall purchases in question are reported to have been affected at a trifle under a £10 basis for mixed 3x9 and 11 redwood; but I consider it right to mention that the transactions referred to are scarcely a criterion of the state of trade, terms of payment being exceptionably favorable for the seller. Considerable quantities of 2½x6½ and 7 whitewood battens, as well as 3x11 white deals, are being inquired for from Scotland and elswhere, but the prices offered—viz., about £4 7s. 6d. and £5 5s. respectively for unassorted f.o.b. lower Gulf—are so low that business seldom results.

The larger holders of good redwood marks between Gefle and Sundswall are still disinclined to make large concessions on their list prices to induce business. Their argument is something in this wise: "What is the use of our reducing prices for one-third of our season's production, when we have obtained our quotations for most of the remaining two-thirds, and when we know that stocks are not large abroad, and that a fair consumption is going on, which will compel London and other large English ports to pay our rates before long? We prefer holding our unsold balance in the meantime, and reducing our production by working shorter hours." Such is the reasoning of more than one large exporter, and I leave it to my readers to form their own estimate of the value of the arguments.

I remarked, a short while ago, that the Spaniards have bought pretty freely of Swedish goods this season. According to no less an authority than Mr. H. R. Astrup, of this city, we are informed that one Swedish mill has already this season sold to Spain wood goods to the value of about £60,000. This is probably the largest quantity that has hitherto been placed in that country by one concern during the course of a season, and gives additional probability to the opinion of those that hold that, with the possible exception of the Australian Colonies, there is no market which gives such promise of increase in the consumption of Swedish sawn and planed wood within the next decade as Spain, supposing the import duties there to be satisfactorily and permanently regulated, Mr. Astrup thinks the export on such conditions likely to reach nearer 100,000 standards annually than the present 25,000 standards, within ten years.

According to intelligence from Berlin, the German Reichstag has cast out the Government Bill to increase the import duties on wood goods for that country. This is causing an increased demand for rough red boards and whitewood battens for Germany, and several transactions are reported from the Sundswall and Henosand districts.

NORMAN'S ELECTRO CURATIVE APPLIANCES

RELEIVE AND CURE

Spinal Complaints, General and Nervous Debility, Nervousness, Rheumatism, Gout, Liver, Kidney, Lung, Throat and Chest Complaints, Neuralgia, Bronchitis, Incipient Paralysis, Asthma, Sciatica, Sprains, Consumption, Sleeplessness, Colds and Indigestion.

Ask for NORMAN'S ELECTRIC BELTS and you will be safe against imposition, for they will do their work well and are cheap at any price.

A. NORMAN, ESQ.—Dear Sir,—Please send me a waist belt. Enclosed find price. Head band I got for my wife has almost cured her of neuralgia. Yours truly,
C. L. TILLEY, WATERVILLE, N.B.

Numerous of such testimonials can he seen at my office, proving that they are doing a good work and worthy the attention of all sufferers. Circulars free. No charge for consultation.

A. NORMAN, 4 Queen Street East, Toronto.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1YL7

Health is Wealth.

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, a guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain, resulting in Insanity and leading to misery decay and death, Premature Old Age, and Spermatorrhœa, caused by over-exertion of the brain, self-abuses or over-indulgence. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by use for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by ORMOND & WALSH, sole authorized Agents for Peterborough, Ont. JOHN C. WEST & CO., Sole Proprietors, Toronto

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

THE RAFTSMAN'S LIFE.

Since the opening of navigation several gangs of raftsmen have been employed at the Northern Railway docks in constructing the timber which arrived there over the different railways, into rafts to be towed to Quebec and then shipped to Europe. Within the last decade the quantity of timber received at this port has materially decreased, and as each succeeding year greater inroads are made upon the primeval forest of Ontario, the total extinction of the trade is but a question of time. As yet, however, it retains respectable proportions, and this spring nearly half a million dollars worth of timber will be constructed into rafts at the Northern Railway docks, and forwarded to Quebec. The bulk of this timber is rock elm from Muskoka, but a considerable quantity of walnut and other fine woods have a place in the collections. The firm who build the rafts have men at work in the woods all winter cutting lumber, which is dragged over the snow to the nearest railway where, as soon as spring opens, it is shipped to Toronto. When the lumber train arrives here it is shunted on a siding close to the margin of the dock, and then commences the work of raft building. A gang of men roll the logs from the car into the water, where a wire rope is hitched around them. By the aid of a horse power which revolves on a strongly built raft, the logs are hauled to any spot desired with rapidity and ease. The timber is first formed into a small raft, which is called a dram. A dram is generally about 50 feet wide, by 300 feet long, and contains from 25,000 to 40,000 square feet of timber. The logs are bound together in a solid mass by maple saplings, which are so twisted by machinery as to be extremely pliant. After a number of drams have been completed a steam tug tows five or six of them to Prescott, where they are formed into one great raft, which generally comprises about seven drams. This immense mass of timber is then towed down the St. Lawrence until the rapids are reached, when the raft is broken into single drams and in this way passes the many rapids of that mighty stream. The crew who man the rafts are thoroughly conversant with the intricacies of the channels, and it is very seldom that a raft comes to grief among the rushing waters. About two weeks is the time generally consumed in making the voyage from Toronto to Quebec, but of course if the weather is unfavorable a much longer time is occupied in the trip. When the timber reaches Quebec it is cut up into lengths suitable for shipment, and is then forwarded to England by sailing vessels.

A few seasons ago it was not an uncommon thing to ship 40 drams of timber from Toronto by raft, but this season only 20 drams will be made up. The value of these is about $20,000 per dram, so that the total value of the timber made up at the Northern Railway docks will not fall far short of half a million dollars. The number of men employed at the work is about 120, principally French Canadians. For some reason or other the light and volatile French Canadian seems better fitted to endure the alternate hardship and ease of a raftsman's life than his Ontario fellow-countryman. At all events, but very few Ontarians follow the raftsmen's hazardous calling. The party who have been working at the rafts at the Northern docks here are what the late Artemus Ward, of facetious memory, would term a "gallus lot." Accustomed to the easy romantic life of the lumbering camp, their free spirit revolts at the idea of submitting to the restraints imposed by civilized life. They cherish a deep-rooted antipathy to living in a dwelling-house, and to humor this fancy, their employer has given them quarters in several old shanties in the lumber yard, adjoining the docks. In their humble quarters here they seem to be supremely happy, and seemingly enjoy their free and easy style of living quite as much as the pampered child of luxury enjoys his style. In the evening, when the labors of the day are over, the men assemble in the yard and adopt various devices for killing time. The musicians of the party will bring out their instruments and furnish the music to which some giddy youth will trip the light fantastic. The yards resound with the music of the deep voices of the lumbermen as they gaily trill short snatches of some old French song. Some amuse themselves by playing euchre and other sinful games, with packs of cards that look as if they had seen the service of many winters. The curiously inclined gather around the "oldest inhabitant," who, with that veracity characteristic of ancient residents, tells his open-mouthed audience of the hair-breath escapes which he had from death while running a raft down the mighty St. Lawrence. In these and sundry other ways they manage to pass the time, and each evening their quarters are visited by large crowds of citizens who are anxious to view a realistic representation of life in a lumbering camp.

In the winter months the raftsmen busy themselves in cutting timber in the woods, and when the return of spring loosens the ice king's grasp on the mountain's torrent, the raftsman has often to guide logs down to a spot where it is convenient to ship them from. This is a situation that requires great steadiness of nerve and courage, and it is no infrequent thing to hear of adventurous lumbermen getting drowned while taking a drive of logs down stream.

After the raft building operations are concluded each year the men receive their well-earned wages, and so often go on a prolonged spree which lasts until their money is exhausted. In the fall they are generally as badly broke as the ten commandments, and anxious to go into the woods for another winter. This routine continues while their health can stand the strain, and when asking the lumberman what becomes of the men who were too feeble to go back to the woods he answered simply "God knows."

The men who are working on the rafts this spring are a very quiet and well behaved lot. Since their arrival here the police have not once been called on to suppress any disturbance. In a few days the men will take their departure, and instead of the merry shouts of the raftsmen, the shrill whistle of the propeller, and the gruff voice of the schooner captain, as with many unscriptural quotations he urges his crew to increased diligence, will be the sounds that will break the nightly stillness of the lakes.

VICE-ROYALTY ON A CRIB.

OTTAWA, May 29.—The first crib of the season began to come down the slides yesterday, and his excellency the Governor-General and Her Royal Highness the Princess Louise, having expressed a desire to "run the slides," special arrangements were made for their reception. About five o'clock in the afternoon His Excellency and Her Royal Highness, attended by a numerous suite, drove to the head of the slides at the Chaudiere. Here a raft constructed with unusual care of timber belonging to the Messrs. White, and fitted with rough but secure seats for the accommodation of Her Royal Highness and the Ladies in Waiting, was lying in readiness. Having boarded the frail-looking craft, Mr. W. A. Humphrey, who acted as pilot, took charge of the raft. Some half dozen raftsmen, carefully selected for their experience and trutworthiness, formed the crew, and under the watchful eye of Mr. Humphrey the rafts with its distinguished passengers passed through the danger of the slides without accident and mishap of any description. About six o'clock it shot out into the broad expanse of the river opposite the Parliamentary grounds where the steamer which plies between Hull and the Outario shore ran out to meet it, and took the Vice-Regal party ashore. His Excellency and Her Royal Highness expressed themselves as being delighted with the success of the trip, and paid many well-merited compliments to the raftsmen. Amongst the Vice-Regal party was Mr. Samuel L. Clemmens' "Mark Twain" who will now have another chapter to add to his rafting experience.

PROPOSED FORESTRY CONGRESS.

A new item has been going the rounds of the Southern press to the effect that a proposal has been made to hold a Forestry Congress at Lake de Funiak, in Florida, during the month of March, 1884. It does not appear under whose auspices the proposed Congress is to be held, nor has anything transpired showing who are to be invited to attend its deliberations or take part in its discussions; but the forestry interests of the South are among the most important of its industries, and it is an encouraging sign to find that someone has become aroused to the necessity of conserving the vast reserves of growing timber that abound in that section. Lake de Funiak, which is on the line of the Pensacola & Alabama R. R., is a new town, but it is in the midst of forests, and is in an appropriate place for such deliberations to take place. If taken in hand by well informed men of practical knowledge and intelligence, such a meeting ought to result in benefitting the important lumber, as well as agricultural interests of the Southern States; but preserve us from a gathering of *doctrinaires*, whose chief object in attending such a convocation would be for the purpose of ventilating well-worn theories that are as impracticable as they are useless. The importance of tree planting in this country can not be over-estimated, and anything that will stimulate the interest that ought to be felt upon this question, should receive the support and co-operation of lumbermen.—*N. Y. Lumber Trade Review.*

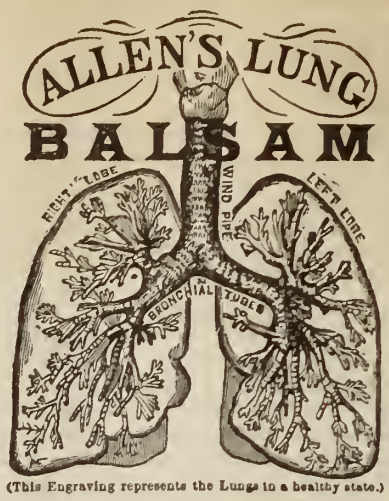
Logs "Banked."

The *Lumberman's Gazette* of Bay City, Michigan, says:—The storms of the past week were exceedingly destructive for the lumbermen on the rivers in the loss of logs, quite a number of rafts being broken up and the logs scattered along the shore in almost inextricable confusion from the mouth of the Saginaw river to the mouth of the Au Gres. Messrs. Chapman & Co., I. H. Hill & Son, and some others are among the losers by the heavy northwest gales, which thus scattered their logs, and sent the tugs flying to the river for shelter. The Bay City Lumber Company had their rafts containing nearly one and a half million feet of 20 per cent. logs banked between the mouth of the Kawkawlin and Saginaw rivers, and some of them so effectually banked that it will cost as much as the worth of the logs to secure them again.

A New Canal.

The Florida ship canal scheme is likely to result in the actual opening of a water-way from a point near Jacksonville, on the St. John river, to a connection with the Suwanee, near the Gulf of Mexico. The purpose is to construct a canal capable of the passage of the largest ocean steamer. The company has been formed and is ready for business. This work will shorten the distance between gulf ports and the Atlantic 800 miles. It will be important to the yellow pine trade of Pensacola, Mobile, and other producing and shipping points on the gulf coast, as it will shorten the route to New York and Boston by nearly a thousand miles, and obviate the dangers of navigation among the reefs around the southern end of Florida.—*Northwestern Lumberman.*

MENTAL depression, headache, and nervous debility, are speedily remedied by that excellent blood-purifying tonic, Burdock Blood Bitters. The Editor of the Mitchell *Recorder* states that he was cured of biliousness, liver derangement, and sick headache, by the use of this medicine.



(This Engraving represents the Lungs in a healthy state.)

THE REMEDY FOR CURING
CONSUMPTION, COUGHS,
COLDS, ASTHMA, CROUP,
All Diseases of the Throat, Lungs and Pulmonary Organs.
BY ITS FAITHFUL USE
CONSUMPTION HAS BEEN CURED
When other Remedies and Physicians have failed to effect a cure.
Recommended by PHYSICIANS, MINISTERS AND NURSES. In fact by everybody who has given it a good trial. *It never fails to bring relief.*
As an EXPECTORANT it has no Equal.
It is harmless to the Most Delicate Child.
It contains no OPIUM in any Form.
Directions accompany each bottle.
For sale by all Druggists.

PERRY DAVIS'
VEGETABLE
PAIN KILLER.

This celebrated Medicine is recommended by Physicians, Ministers, Missionaries, Managers of Factories, Workshops, Plantations, Nurses in Hospitals,—in short, everybody, everywhere who has ever given it a trial.

TAKEN INTERNALLY, it cures Dysentery, Cholera, Diarrhœa, Cramp and Pain in the Stomach, Bowel Complaint, Painter's Colic, Liver Complaint, Dyspepsia or Indigestion, Sudden Colds, Sore Throat, Coughs, &c. Used externally, it cures Boils, Felons, Bruises, Cuts, Burns, Scalds, Old Sores and Sprains, Swellings of the Joints, Toothache, Pain in the Face, Neuralgia and Rheumatism, Chapped Hands, Frost-bitten Feet, &c

The PAIN-KILLER is sold by medicine dealers throughout the world, Price 20c., 25c., and 50c. per bottle.

FROM THE JAWS OF DEATH.

On Tuesday morning a young French Canadian mill hand named Narcisse Meunier, in Eddy's new mill, at Hull, Que., had one of the most marvelous escapes from death on record. It seems that while attending to his duties in the lower part of the mill he slipped and fell into the water beneath. At this point the stream resembles a gigantic seething cauldron, but notwithstanding the warning of the rushing waters Narcisse, who is a powerful swimmer, struck out boldly for the shore. In spite of his efforts he was hurled down the waterway towards the Devil's Hole, where the stream enters the underground passage. Nothing daunted by the tremendous strength of the current, against which he was battling, Narcisse continued to fight for his life. At length he succeeded in getting near enough to the shore to clutch a projecting piece of rock, to which he held until rescued by some parties who had witnessed the accident. When the news spread about the mill that this had occurred few could credit it, as it was considered utterly impossible that any man could have fallen into the maelstrom beneath the mill and escape with his life. When he fell into the water he shouted as loud he could, but the noise of the mill prevented his cries being heard, consequently his fellow workmen did not know of the occurrence until it was over. Fortunately for him some outsiders happened to see him clinging to the rock on the shore with the energy of dispair, while the force of the current was almost tearing his arms out of their sockets, and came to his rescue. Had it not been for this he would inevitably have been sucked down into the Devil's Hole and probably never heard of again. No description can give the faintest idea of the dangers of this spot, but after one glance at it it seems incomprehensible that a human being should have been there and survived. A reporter called at the mill to get the particulars of the affair from Meunier. Notwithstanding the fearful peril from which he had been rescued a few hours before, he was coolly engaged at his usual work as though nothing out of the way had happened. He is a stoutly built young fellow of about nineteen summers, and although he looked rather pale after his battle with death, he made light of the affair. In answer to an enquiry by the reporter he shrugged his shoulders and said he didn't feel very bad at the time, but he wouldn't like to be there again.—*Ottawa Citizen.*

Two-Horse Load of Tooth-Picks Daily.

Where do the tooth-picks come from? A Maine newspaper states that the little town of Sebec, at the outlet of Sebec Lake, Piscataquis County, in the interior, has one of the best waterpowers in the state, but has never been fully developed. A tooth-pick factory there is doing a large business, using over a thousand cords of poplar and birch wood annually, turning out a two-horse load of tooth-picks daily, and employing from 12 to 15 girls and 8 or 10 men. A private letter from the place states what the newspaper omitted, that "the tooth-pick mill gives employment to as many girls as can afford to pack a hundred boxes for twenty-five cents, and feed themselves." This seems very small wages for women, but board is cheaper there than in the city, and probably many of them board at home, and would be unable to earn as much otherwise.

A Good Wager.

The "Greendale oak" in Welbeck Park is called "the Methuselah of trees," and writing of it in 1790, in his "Descriptions and Sketches of Remarkable Oaks at Welbeck," Major Rooke said the tree was then thought to be 700 years old. In 1724 an opening was made in this oak large enough to allow a carriage, or three horsemen abreast, to pass through it. At that time the girth of the ancient tree above the arch was nearly 36 feet, the height of the arch was 11 feet, and the topmost branches were 54 feet from the ground. On the estate the story is told that a former Duke of Portland, in an after-dinner frolic, made a bet of 1,000 guineas that he could drive a coach and six through the body of the tree without touching the bark, and that he accomplished the feat and won the guineas.

CLARKE'S ETIQUETTE.

An Oshkosh, Wis., paper relates the following incident in the history of the Hon. J. C. Clarke, familiarly known as Jack Clarke:—"About one quarter of a mile below the dam at Merrill, the Lincoln Lumber Company own about 30 acres of land, on which they have erected a saw and planing mill. They have a double gang and a circular saw, having a capacity, for manufacturing 130,000 feet of lumber per day. Last fall John C. Clarke, of Wausau, took and interest in the property and was elected general manager, and under his supervision the mill has received a general overhauling, so that now it is about as perfect as a mill can be. A story is told of Mr. Clarke that is worthy of repeating. When he took charge of the business, he found in the office several young gentlemen who were somewhat on the dude order. The new superintendent is a plain man, and he does not believe much in standup collars, tight breeches and eye-glasses. When dinner was announced, all parties took their seats at the table. By the side of each young gentleman's plate laid an elaboratley carved ring and napkin. One glance was sufficient, and the new superintendent broke out with "Well, young gentlemen, what do you do with those things?" Receiving a reply, 'We wipe our mouths with them.' 'You do? Well, you can pack up your traps and seek other sights and scenes, for I never employ men that do not wipe their mouths on their shirt sleeves when they eat.'"—*Northwestern Lumberman.*

THE EXTINCTION OF FIRE BY STEAM.

The frequently proposed application of steam for the extinction of fire has recently met with a practical application in a steel-pen manufactory in Berlin. The owner of the factory, in consequence of frequent conflagrations in the drying rooms for wooden penholders, had three small steam pipes, in connection with the steam boiler of the establishment, fixed in three such rooms. The ends of the pipes were closed by a short piece of pipe, made of an alloy of lead and tin, which would quickly melt should fire break out, when steam would at once rush out. To prevent the steam inside the pipes from hindering the melting of the ends, the latter were filled with resin. Quite recently the stoker was warned by a hissing noise that fire had again broken out in one of the drying rooms, and when it was entered it was found that such was the case, but that only a small portion of the contents had been destroyed. The other combustible materials in the room, frames, walls, and floors, were found to be only saturated with the condensed steam, a portion of the penholders still smouldering. The heat caused by the breaking out of the fire had melted the ends of the pipes, and thus caused the heat to escape, which had extinguished the conflagration at its commencement without the intervention of the hand of man. It is probable that this ingenious and valuable contrivance, which is especially suited for large factories or stores, will find a wide application in the near future.

Matters in Maine.

A correspondent of the *Lumber World* says: It has been very unfavorable weather in this vicinity this spring for stream driving, as we have had very little rain. We had little or no thaw during the winter, leaving the snow light and but little water in it. It went off by the sun so slowly that the small streams did not get water enough to bring out the logs. The first rain of any account was on the 22nd, and that not very great, but it raised the streams considerably for a few days. The prospect is now that there will be a large amount of logs kept back that cannot be got out this spring. The prospect for sales of lumber is good, so far as for heading for West India trade, and home consumption for box-boards, which constitutes nine-tenths of all the Saco river long lumber. All the mills that saw oak for shooks are overstocked, which makes shooks low, as they have fallen from $1.25 to 80 cents and must be low for a year to come.

Of the five hundred men at present at work on the Moira timber drive, 200 are in the employ of Messrs. Rathbun & Son, Deseronto.

RAFTS ARRIVED AT QUEBEC.

The *Chronicle* gives the following list of rafts, &c., arrived at Quebec:—

MAY 25.—Jean Voyer, deals, Connolly's Mills.

Ross Ritchie & Co., deals, Three Rivers and St. Maurice.

Calvin & Son, staves, Bowen's Cove (Sillery).

Ross & Co., oak, &c., Cape Rouge.

MAY 30.—Sundry persons, oak, &c., Cap Rouge.

J. McRae & Co., oak, &c., Cap Rouge.

JUNE 1.—Collins Bay Co., oak, St. Michael's cove.

Collins Bay Co., oak, sundry coves.

Burton Bros., sundry woods, Sillery cove.

JUNE 7.—J. McLaren, white pine, St. Lawrence Docks.

E. L. Kelsey, staves, Union cove.

" " New Liverpool.

Simon Wigle, " Woodfield.

Monster Conveyance of Real Estate.

Probably the largest conveyance of real estate ever made in the Dominion to a private individual was made in Quebec on Thursday, June 7, the vendors being the executors of the estate of the late G. B. Hall, of Quebec, the well-known timber limit and saw-mill owner. The purchaser was L. A. Senecal, and the property transferred comprising, among other features, the famous saw-mills at Montmorenci Falls, the Radnor forges, near Three Rivers, and over 2,662 square miles of timber limits in this Province alone, besides various other lands in the Eastern Townships and elsewhere. The deed, which covered 260 pages, was signed on his own behalf by Mr. Senecal, who paid down $250,000 cash on account of the purchase price of $1,600,000. Hon. Geo. Irvine, who leaves shortly for Europe on professional business, acted as legal adviser of the Hall estate.

Salt Preserving Timber.

It is a curious fact, says the *Carpenter*, that in the salt mines of Poland and Hungary the galleries are supported by wooden pillars, which are found to last unimpaired for ages, in consequence of being impregnated with the salt, while pillars of brick and stone used for the same purpose, crumble away in a short time by the decay of their mortar. It is also found that wooden piles driven into the mud of salt flats and marshes last for an unlimited time, and are used for the foundation of brick and stone edifices; and the practice of docking timber after it has been seasoned, by immersing it for some time in sea water, is generally admitted to be promotive of its durability.

MELLY'S saw mills, at Somerset, Que., were burned on Sunday, June 10th. The loss is estimated at $10,000.

THE St. Paul *Pioneer-Press* gives a statistical review of the season's lumbering operations in the Minnesota and Wisconsin woods. The aggregates reveal the stupendous magnitude of the business. The total cut of the two states exceeds 4,000,000,000 feet. This represents the trees growing on 1,250 square miles. The Chippewa valley region of Wisconsin contributes nearly 1,000,000,000 feet, the Mississippi above Minneapolis nearly 600,000,000 feet, the Wisconsin river 441,000,000, the Duluth district 297,000,000, and the Black river 228,000,000. The streams on the west shore of Lake Michigan, grouped together for convenience, show a cut of 785,000,000. On the different railroads in Wisconsin and Minnesota about 600,000,000 feet were cut. The cut is by far the greatest in the history of the Northwest.

THE *Central Canadian* says:—The activity one beholds about Mr. Peter McLaren's mills and yards is truly wonderful. Night or day there is unbounded bustle. The great head himself is nearly always present somewhere. Occasionally he goes into the yards where there appear to be dozens of men both piling up and pulling down; and when he speaks to them it is in a friendly sort of way—the kind of tone and the kind of words that make men say: "A first rate man, that." The wages are very high this year—higher, we believe than ever before—and this puts fire into the men, who keep a cheerful sunlight in their faces all the day. We hear no real cases of discontent. Though the work is heavy, it is not constant; and there are many chances to rest. The machinery gives entire satisfaction, and everything runs with the regularity and harmony of clockwork.

THE *Timber Trades Journal* says:—We learn that a couple of cargoes of deals, &c., despatched from the Surrey Commercial Docks to the Island of Cypress about the time of the termination of the Egyptian campaign last year, in the expectation of considerable building operations being carried on there, are still unused. In fact, it is reported that they lie just as they were discarged from the vessel, with very little prospect of their being called into requisition, and the off chance of never being used at all in that region. It would be interesting to know how the deals have stood the long exposure out there, and what they would be worth for transhipment elsewhere. We believe the stuff was sent to Cyprus for the purpose of constructing barracks for the soldiers and other buildings in connection therewith, but the troops have been withdrawn, so the deals are apparently useless.

THE Buffalo *Lumber World* says:—A great variety of wood will be used in the manufacture of furniture this season. Walnut still remains in favor, and is quite expensive. Mahogany is also much used, the variety known as San Domingo mahogany being very desirable. It has an excellent yellow tone, growing richer and darker with age. Amaranth is among the rare varieties, its beautiful purple surface taking a high polish and carving finely. Leopard-wood shows a yellowish ground, with darker spots, and is rich and effective for screen frames or panels. Butternut resembles oak, and takes a carved decoration well. Satin wood is much used, and cherry is quite a satisfactory substitute for mahogany. Unstained cherry is a yellowish brown color, and can be used with good effect. Ebony is somewhat out of favor, the genuine wood being very expensive, while the imitations are always unserviceable and disappointing.

ONE OF MANY.—Mr. R. W. Carmichael, Chemist and Druggist, of Belleville, writes as follows:—"Your Burdock Blood Bitters have a steady sale, are patronized by the best families here and surrounding country, and all attest to its virtues with unqualified satisfaction."

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

$500 Reward!

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. ORMOND & WALSH, sole authorized Agents for Peterborough Ont. w46d1121.29

FITS EPILEPSY

OR

FALLING SICKNESS

Permanently Cured—No Humbug—by one Month's usage of Dr. Goulard's Celebrated Infallible Fit Powder. To convince sufferers that these powders will do all we claim for them we will send them by mail, **post paid, a free Trial Box.** As Dr. Goulard is the only physician that has ever made this disease a special study, and as to our knowledge thousands have been **permanently** cured by the use of these **Powders. We will guarantee a permanent** cure in every case **or refund you all money expended.** All sufferers should give these powders an early trial, and be convinced of their curative powers.

Price for large box $3.00, or 4 boxes for $10.00, sent by mail to any part of the United States or Canada on receipt of price, or by express, C. O. D. Address

ASH & ROBBINS,

FOR THE

Canada Lumberman

FOR THE FOLLOWING REASONS:

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☛ TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

——CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM——

for placing your goods or wares before the saw mill men and lumber and timber dealers of the Dominion.

EMERY WHEELS FOR SAW GUMMING.

In order to remove the difficulties connected with the importation of TANITE GOODS in small quantities, and to bring such goods within easier reach of

CONSUMERS IN CANADA,

we have arranged with the well-known firm of

FROTHINGHAM & WORKMAN

MONTREAL,

To take our sole Agency for the Provinces of ONTARIO and QUEBEC. By this means consumers who want only single wheels, or goods in small quantity, can supply themselves easily and avoid the trouble of special importations, while dealers can secure the most liberal terms, fully equal to those they could obtain by buying of us direct.

Messrs. Frothingham & Workman will carry a full stock of TANITE EMERY WHEELS, and a sample line of Machines, and can fill all orders promptly.

The Tanite Company, Stroudsburg, Monroe Co. Pa.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

SUBSCRIPTION $2.00 PER ANNUM.

VOL. 3. PETERBOROUGH, ONT., JULY 2, 1883. NO. 13.

A HEMLOCK-BARK conceru at East Templeton, Ottawa river region, has 100 men stripping bark, and intends to get out 1,000 cords.

MR. E. B. EDDY, of Hull, will, it is stated, shortly establish a paper pulp factory in that city on the site recently occupied by Batson & Currier. He expects to utilize in this way all the sawdust and refuse of his saw mill.

IN one day Thomas Hall, with eighty hands, 75 Indians and five whites, put over the Chats slides and rapids a raft containing 170 cribs of white pine and other cribs, amounting in all to 206 cribs, which were rafted and got off the same night. This is probably the biggest day's work of the kind on record.

THE *Timber Trades Journal* has the following paragraph on "Yellow Pine," being our "white pine :'—This question of dryness is an important consideration in regard to yellow pine, fully seasoned wood being intrinsically of much more value than stuff freshly manufactured. In Baltic goods, on the contrary, the fresher they are from the mills the more the trade here like them. Of course we do not mean to infer that green wood is as marketable as seasoned, but all deals are supposed to have undergone a process of drying before shipment.

The *American Lumberman* of New Orleans says :—"Squatter sovereignty" is a persistent enemy to our magnificient pine forests, and its rule is everywhere found in the shape of thousands of trees girdled and left to decay around thriftless and abandoned homes, hundreds of which are found throughout the pine lands of the South. The vandals generally remain long enough to destroy what they can of what is valuable, and then move to some other section to repeat their work of devastation, an evil as far reaching and as pernicious in its effects as the forest fire. Both are evils which should as far a possible be cured by prompt and proper legislation.

THE London *Timber Trades Journal* of June 2nd, says :—It is satisfactory to record, that if the deliveries are on a moderate scale, so are the supplies that have to replace them. Twenty-seven vessels only have to be recorded with timber goods in the port of London for the seven days ending with the 29th, or about 15 short of the number that put in appearance the last week of May, 1882. The next Board of Trade returns will be awaited with some curiosity by the leading importers at the chief centres of trade, and if they show that the same limited scale of supply has prevailed generally in the United Kingdom through the month of May as we had to chronicle in April, a better feeling may be expected to assert itself for the rest of the season among buyers.

PROSPECTS IN ENGLAND.

The *Timber Trades Journal* says :—It has been shown in our columns, and corroborated by the Board of Trade returns, that there has been a great falling off in the importation of foreign timber into this country up to the beginning of the month of May, nor has there been any excess of importation since, and it is the opinion of many that, however delayed, this backwardation will have to be made up before the season comes to an end. If this theory be admitted—and it is certianly very plausible—nothing is more likely than that the state of markets will ere long begin again to favor the shippers abroad, and that a brisk fall trade at remunerating prices may compensate them for the absence of the usual demand on their stocks in the earlier months of the year.

By the tone of our correspondent in Sweden, we may reasonably assume that there will be some curtailment in the production at the sawmills over there, though whether this will be on a sufficiently large scale to appreciably affect f. o. b. values during the present season it is impossible to say without more data to go upon. With any improvement in the demand we fear the resolve to work short time, to which the Swedish shippers have seemingly agreed, would soon disappear, and stuff might be cut to more than meet the revived requirements. But in any case a greater business is likely to be done shortly, if at no better prices, though with the consumption accelerated it is difficult to see how these can be kept from advancing.

We shall not expect to see much improvement, however, till we hear of ships for charter being in more request, because the action of producers in limiting their manufacture will not stimulate the consumption unless a real revival of business takes place over the country in every direction. That the prospects of fall business are more encouraging may be traced to the fact of the present greatly reduced stocks here rather than to what they represent upon the other side. When once buyers begin to find they may be late in getting what they require, a tone will be given to the market which can hardly fail to render values firmer.

In the meantime the cutting trade that is now done keeps quoted prices very low, though for the leading stocks little alteration has been made on last week's prices. If anything, they are already hardening, but taken one with another we consider there is nothing to denote any upward inclination.

Common deals are sufficiently cheap to induce sales, but stocks of this description are plentiful enough to make buyers indifferent as to fresh purchases except at a still futher reduction.

As to best goods, these, though wanted, are not in such demand as to make dealers anxious to supply themselves, and they continue to decline transactions except for immediate wants, at shipper's present holding values. So the market stands, the buyer having rather the best of it; the immense facilities for supplying himself which the public sales here afford, if only on a limited scale, induce him to import only sparingly and to keep on the outskirts of the market until he sees some outward and visible sign that the trade is again moving ahead.

The one favorable fact of a diminished supply is all that we can at present adduce in favor of an approaching upward movement in the trade; but is an important fact, and is more to be relied on than a dozen rumours of short supplies abroad, rivers running dry, or great orders going out from other countries to clear away the stocks that were intended for us.

SUGAR OR ROCK MAPLE.

The following paper on the Acer Saccharinum, is by Jacob W. Manning, Reading, Massachuesetts :—

This is in a broad sense an American tree, for it extends from the extreme eastern part of North America to the Eastern Rocky Mountains, and from the highlands of the Gulf States to the watershed between the waters of the St. Lawrence and Hudson Bay. In all this territory it is found at frequent intervals on elevated land and along rivers, and is at home in all rocky formations.

This tree is often from three to five feet in diameter, and seventy to eighty feet high, large and straight enough to make ship-keels, growing naturally without any aid from man.

I measured a tree in Northampton, Mass., that had been planted sixty years that was eleven feet six inches in circumference, three feet from the ground; even this is small compared with some natural trees seen in old pastures.

The wood is close grained and solid, and one of the handsomest of all light colored woods for furniture and house finish. The bird's-eye, curly and branched maple veneers that make such a rich and varied finish are made from it. It is almost the only wood used in the manufacture of boot and shoe lasts, for which a surprisingly large amount is used, and in many other industries where a solid and close-grained, but light wood, is necessary. As fuel it is but little excelled by any other wood.

No other native plant growth produces such delicious syrup as the rock maple. A sugar orchard is a valuable addition to a farm; even our street and lawn trees can be tapped without injury; they appear to grow as finely and live as long as those not robbed of their sap, which one would suppose was their vital fluid.

As a street lawn or park tree it is justly valued as one of the best American trees. It is thrifty, comparatively free from insects, and is sure to grow into a well balanced tree in nearly every locality. The shade is very dense, and yet grass will grow quite freely under single specimens where the wind blows off the leaves.

In planting, to prevent monotony, it is well to intersperse other trees of different outline. The gorgeous autumn hues of our forests are largely due to this maple. I witnessed at Newburg, N. Y., on a cloudy fall day in suburban home grounds, laid out by the lamented A. J. Downing, the very best effects in the varied hues taken on by this tree; interspersed among other kinds, each with its own peculiar autumn color, and some still green, but the rock maple outshone them all.—*Boston Traveller.*

SHIPPING FOR TIMBER.

The New Orleans *Times-Democrat* complains of the scarcity of tonnage combining large carrying capacity with light draft. It says :—"Our commerce with Mexico, Texas, British Honduras and South America is increasing yearly. More especially is this felt in lumber, but restricted to a class of vessels which are compelled to charge a rate of freight which exceeds in many cases more than one-third the cost of the lumber itself, delivered alongside; the mills can ship nothing but the choicest article, leaving on their hands the cheaper grades and offal. This necessarily entails a higher price being charged for the lumber, and, in consequence, the purchaser is deterred from ordering more than he barely needs. But once let the rate of freight, by employment of the right class of vessels, be reduced; let the mills once be able to lay down the whole cut of the log at the point of delivery, then they in turn can afford to cut cheaper and thus attract orders. The volume of business, it is safe to predict, would be more than double what it is now. Mill owners in the Sonth are, as a rule, hampered for capital, and need all of their means for the development of their bnsiness, and cannot afford to embark in a business which is separate and distinct from their own. Yet so severely is the want of this class of tonnage felt that some of our largest mill owners along the Gulf coast are building vessels of their own, with a view of making themselves independent of chance and the exactions of ship brokers. Another feature in connection with this business is the fact, that, could the different ports to the south of us, which have but 7 or 8 feet of water on their bars, rely upou a sufficiency of cheap and light draft tonnage, trade would be stimulated to an exteut never kuown before. In return for our yellow piue and other products, regious of the valuable woods of the topics, mahogany, cedar, fustic, etc. would be opeued up, and vessels which now in a majority of cases return empty, would be guaranteed good freights back. The field is a promisiug one, aud while, for lack of space, we must bring our article to a close, we canuot refrain from inviting our moneyed men to give this subject the earnest attention it deserves, promising ourselves at some future time to treat it more exhaustively and fully.'

LUMBER FIELDS.

The aggregate results of the logging operations in the Minnesota and Wisconsin woods reveal the stupendous magnitude of the northwestern lumber interests in a light which will probably astonish persons most familiar with the subject. The total cut of the two states exceeds 4,000,000,000 feet. The mind will be better able to grasp this unwieldy number when it is understood that it represents the trees growing on 1,250 square miles, or about 35 townships of land. In the classification of districts, the great Chippewa valley region of Wisconsin is easily first, with 1,000,000,000 feet on the Chippewa, Eau Claire, and their tributaries. The Mississippi above Minneapolis comes next with 600,000,000 feet. The Wiscensin river returns 441,000,000, the Duluth district 297,000,000, and the Black river 228,000,000. The streams on the west shore of Lake Michigan, grouped together for convenience, show a cut of 785,000,000 feet. On the different railroads in Wisconsin and Minnesota, between 500,000,000 and 600,000,000 feet were cut. The cut is by far the greatest in the history of the northwest.

There is a great truth to which this enormous growth in the logging interest in the northwest points. The swift and surprising development of the country west of the Mississippi river has created a greater revolution in the lumber business than in any other interest that supplies its various demands. Within the last few years the onormous demand from the west has revolutionized the lumber trade in its sources, its methods, its channels and its markets. This year's investigation reveals clearly the fact, more vaguely understood before, that the destination of nearly all the lumber cut in Wisconsin and Minnesota is the treeless prairies and magically-up-springing new cities of Dakota, Montana, Nebraska, Iowa, and even the more southern states. Chicago, once the lumber market of the whole west, gets now only a fraction of the enormous product of Wisconsin and Minnesota, and the magnet of the western demand attracts the lumber from the cheap water routes of the lakes to the westward railroad lines. Nearly all the lumber cut on the shores of Lake Superior goes west by the Northern Pacific. The Wisconsin Central carries a little to Milwaukee, though much of the traffic by that line is diverted by the westward lines it crosses. The great lumber centres of the Chippewa, Black and Wisconsin valleys are drained by the Omaha and Milwaukee and St Paul to the west and southwest. Even the lumber on the west shore of Lake Michigan, within easy reach of cheap water transit to Chicago, chooses instead a circuitous route by the Chicago & Northwestern road across Wisconsin, Minnesota and Iowa to the omnivorous western prairies. The once all-absorbing lumber trade of Chicago is reduced to the handling of so much of the Michigan product as is required for western consumption.

The stimulus of the western demand has changed the methods of lumber production and transit, as well as the direction of the market. The present or prospective exhaustion of the richest and most convenient tracts on the margins of navigable streams, while the demand is annually increasing, compels a resort to new sources and a more careful gleaning of old. During last winter many tracts were cut for the second or third time. Higher prices and an eager market made it profitable to return to second class timber, windfalls and smaller growth, neglected in former years. So far as this tendency leads to a cloaner and more economical reaping of the pine harvest, it is to be commended. It may work harm, however, by causing the destruction of half-grown trees, which contain the promise and potency of the future timber supply. A still more important change in the methods and sources of lumber production is the adoption of means of reaching rich tracts remote from the channels of navigable streams. To an extent not generally understood, the railroads are taking the place of rivers as a means of transit of the product, even from its first source. Hundreds of millions of feet of logs are taken to market every year that never float for a mile on the waters of rivers. Railroads are penetrating the lumber districts in every direction, the North Wisconsin, the Chippewa Valley, the Wisconsin Central, the Northwestern on the Michigan shore, whose sole or main business is the transportation of lumber cut on their lines, hauled to mills at their stations, sawed into boards and loaded into cars without ever seeing a raft or a boom. In many places narrow guage roads are built from the main lines into remote tracts, to enlarge the field from which supplies may be drawn. This change of method adds a large percentage to the available supply, and hastens by as much the rate of exhaustion of the forests.

The question of the prospective exhaustion of the pine timber of the northwest will suggest itself to every thoughtful person. There is no question that the time is swiftly approaching when the forests of Minnesota and Wisconsin will no longer answer to the annual demands made upon them, nor that the day is hastened by the extravagant and destructive methods of production, happily less common now than a few years ago. A pine forest is a thing of slow growth, and those of Wisconsin and Minnesota are definitely limited, though still of vast extent. They cannot indefinitely endure the stripping of the available timber from 1,250 square miles per year. The period of exhaustion of the northwestern forests has been the subject of speculation. It is vaguely put at ten years, but there are no data to justify such exact computation. The demand is variable, and there is no means of estimating what the supply may become under changed conditions. Poorer and less accessible timber will be made available by improved methods, and the pine lands remaining will probably be made to go much farther than the same quantity in former years. But the certain fact that the forests are destroyed much more rapidly than they are replaced with new growth, makes their exhaustion only a question of time. There are few virgin tracts left now. The loggers are already invading the Red Lake and Vermillion districts in Minnesota, and the railroads have penetrated to the hitherto intact forests above and between the heads of navigable streams in Wisconsin. Whether ten or twenty years hence, the exhaustion of the northwestern lumber supply is near enough to suggest the most careful husbanding of the resources that remain, and to emphasize the blind and mad folly of a lumber tariff that preserves the forests of our neighbors and puts a premium upon the destruction of our own.—*St. Paul Pioneer Press.*

TREES AGAIN.

One of the vagaries of the free-traders is the publication of a pamphlet intended to show that the only way to check the destruction of forest trees in the United States is to abolish the duty on foreign lumber; and a scientific periodical, which ought to know better, remarks in commending the argument that the timber duty offers "a direct encouragement to a continued course of ruin." The forests are recklessly destroyed because the people have no adequate sense of their value; and the way to check the destruction, say these economists, is to reduce their value by introducing Canadian timber at a low price. To state their position is to show its absurdity.

If we are not to check the destruction of forests until we have pursuaded people to cease cutting our trees into planks and shingles, and to buy their building material abroad, we may as well abandon the expectation of a change. The abuses to which we ought to direct our attention are reckless waste in wood-cutting, wanton or careless devastation by fire, and the wholesale destruction of forests not for the use of the timber but merely to get rid of it. All these evils, except possible the second, would be aggravated by the repeal of the lumber duty. It is a common practice all over the country to waste the woods in such a manner as to wreak the greatest possible ruin for the least possible result. The axemen who are cutting fuel leave all the fallen trees and broken boughs, and bring down the fresh ones, of which, moreover, they take only the best parts; or they sweep away the young and old growths together, destroying all chance of a renewal of the forest. Perhaps only a few miles away another gang are stripping hemlock bark for the tanneries, and the naked trunks, instead of being turned to use, are left to rot on the ground. As the woodman will only chop in the easiest way, without regard to economy, so the householder will burn nothing but the best firewood, without reflecting upon the cost which he will ultimately have to pay for his extravagance.

Forest fires, which are more frequently the result of criminal recklessness than of accident, ought to be the subject of penal legislation. But closely connected with the frequency of these disasters is the widespread sentiment that woods are like weeds, the natural enemies of the settler which must be exterminated to make way for civilization. There are regions of the United States where the owners of timber offer it gratis to anybody who will cut it and haul it away. Under this system the best parts of the best trees are taken for fuel and the rest is burned on the spot, the fires of course often spreading over miles of valuable standing timber. Thus, in order to hasten the clearing of a few acres for the plough, the landholder destroys one of the most important elements in the productiveness not only of his own farm but of the whole country around. His case is like that of the thriftless cultivator who exhausts his fields by excessive and improper cropping, ruining his future for the sake of a few hundreds of bushels in the present. And the man who wantonly lays waste a forest is worse than the man who exhausts a farm, because the injury is not confined to himself and his heirs but is spread far and wide.

The State will sooner or later find itself forced to consider how it can prevent people from cutting down their own trees. But before any such radical reform as this is attempted we must cultivate the "sentiment of trees," in which a large part of our population seem to be strangely deficient. No important public measure can be carried out until public opinion demands it; and although this question of the preservation of forests is attracting more and more attention every year, there is a huge mass of indifference and ignorance which will long resist any change. To this formidable inert opposition, journalists and economists must patiently address themselves.—*N. Y. Tribune.*

LUMBER RAFTS.

The lumber merchants of Hannibal, Me., employ a novel method of removing lumber from rafts in the Mississippi to their yards. This is usually done by towing the "strings" of which the rafts are composed alongside the shore. The lumber is then washed off by the use of buckets and brooms, and loaded by hand upon wagons which convey it to its proper place for piling in the yards. This method, it will be noticed, necessitates a large amount of manual labor and the occupation of considerable river front in order to handle a large amount of lumber in the season.

The new method calls in the use of the railroad and is operated as follows:—A track is laid along the edge of the water, extending even beyond the low water line. This is heavily ballasted with rock, so that water running over it will have no effect in moving it out of place or floating the ties. At ordinary stages of water, therefore, there is a depth of several feet over the river end of this track. The lumber-raft which it is desired to land is then broken into its "strings," one of which is floated over the line of submerged track and kept in place by a line of guide piles driven for that purpose. This string is again divided into the various cribs composing it, which vary somewhat according to the size of lumber. A train of low, strong flat-cars, built for the purpose, is then run down from the shore, so that one or more of them are under the cribs of the lumber-raft. These cars are of such size that each will take in the length of the crib.

By the proper connections of ropes and stakes a crib is moored over a car, and the movement of the train away from the water by an engine floats the crib also ashore. When in such shallow water that it touches the car, the latter receives its weight, and instead of being floated it is carried shoreward and out of the water. The cribs thus loaded, each on its car, are switched to the yards, which are now some distance from the river, as by using this method they can be. At the yards the lumber is quickly washed off with a hose while being unloaded.

The advantages claimed by this manner of handling lumber are many. There is less obstruction of valuable river front by lumber-rafts; cheaper ground can be used for the lumber yards, as they can be away from the river; the saving in manual labor and teaming is very large, and, lastly, the saving in time is an important item. It is claimed in Hannibal that last year was the first that saw the whole supply of lumber out of the water before winter set in, and this was only possible through use of the method we have described.—*Railway Review.*

EXHAUSTED FORESTS.

The following letter has appeared in the Montreal *Gazette*:—

SIR,—I observe, in the *Gazette*, an article referring to the drive of logs on the Connecticut river, containing 90,000,000 feet, as an evidence that the forests of the east are not completely exhausted, and inferring that years after the time at present allotted by statisticians extracts of similar import may be expected from Michigan papers, and that in the estimates of standing pine no calculation is made for the natural growth of trees, etc.

That the forests of the east are completely exhausted has hardly been claimed, but no better evidence of their scant condition as regards pine could be furnished than on this enormous river, draining such a vast extent of country, which not many years ago was covered by magnificent pine forests, hardly a stick of pine is to be found in the whole 90,000,000, and to obtain this amount of spruce, most of which is to supply mills in Massachusetts and Connecticut, the lumbermen were compelled to go to the headwaters of this river in New Hampshire, within gunshot of the Canadian line, even getting some of it from Canada; in fact, four-fifths of it from the region of the Connecticut lake a section of the country that would not have been in the States at all but for the generosity of Lord Ashburton, who, with that liberality proverbial with those dealing with the property of others, presented it to the United States rather than have any unpleasantness with his friend Webster, for a projection eastward of the northerly line bounding Vermont and Canada would cut off nearly the whole of it.

If this Connecticut river spruce drive of 90,000,000, 40,000,000 of which are old logs, proves anything, it is rather that the eastern states are pretty near the end of their supply, not of pine only, but also of spruce." W. LITTLE.

TIMBER TREATING PROCESSES.

At the National Exposition of Railway Appliances the American Society of Civil Engineers has a large display of specimens of different kinds of wood treated by various processes for divers purposes, in which are included many curiosities, The collection is the result of the labors of a committee appointed to investigate the subject of timber preservation. The conclusions arrived at, after corresponding with 350 persons, examining 104 patents, and collecting a fund of general information, are that out of innumerable methods of preserving timber but few are practical, and only three can be relied upon to prolong the life of wood exposed to the elements, namely: kyanizing, burnettizing, and creosoting. In Europe these methods have passed beyond the domain of experiment, and there produce great economical results. In this country the cheapness of timber has been the principal obstacle to wood preservation, the cost of injecting making the price of cheap woods too high, and consumers have preferred letting the wood rot and renewing it. The committee believe that this condition of affairs is fast being removed by the enhancement in the price of timber, and the proximate exhaustion of the more available forests, the time having probably arrived when the economy and necessity exists in many parts of the country for treating wood against decay in exposed situations. The selection of the proper method to be used depends upon the proposed subsequent exposure of the timber—dry, wet, marine worms, etc.—and the amount of material which the value of the unprepared timber admits of being expended upon it. For bridge and trestle timber, for fences in

dry soil, and generally for wood exposed to the weather, but not to constant moisture, kyanizing—steeping the timber in a solution of corrosive sublimate—may be relied upon. Hemlock was exhibited that was exposed for 40 years at Fort Ontario, Oswego, N. Y., and various kinds of timber that were exposed for 20 years at Lowell, in a sandy soil; while the samples of spruce, from the gate-boxes of the Lowell water works, exposed in various soils for ten years, exhibit the effect of various degrees of moisture, and show that kyanized timber should be kept dry. Kyanizing costs about $6 per thousand feet, board measure. Under favorable circumstances it may be relied on to double or quadruple the life of the more perishable woods. Where and when it will pay to use this method will depend upon the price of the timber and its subsequent exposure.

Burnettizing consists in injecting the timber with a solution of chloride of zinc. It cannot be done successfully unless the wood is first seasoned, either naturally or artificially, to deprive it of moisture, and make room for the solution. This is forced in under pressure in closed cylinders, and is liable to wash out subsequently from the outer layers of the timber, unless retained in some way. For cross-ties, and for timber exposed to weather and moisture, but not in very wet situations, burnettizing is probably, in view of the present price of timber, the most economical method to use. It costs, if well done, about $5 per thousand feet, board measure, or some 20 to 25 cents a tie. It can be done for even less, but the result is not likely to be satisfactory. The hemlock and maple ties exhibited, which have been in use 15 years on the Lehigh & Susquehanna railroad, and the oak tie, 17 years in use on the Erie railway, show the results which may be accomplished. In Germany brunettized fir and beech ties average from 15 to 18 years in the track, and this method has there become the favorite for ties, after extensive trial of all the others. This process should by preference be applied to the cheaper and more open-grained woods. It does not answer so well for bridge ties and timber, as burnettized timber is apt to check and split when dry and exposed to the sun. It will probably not pay to burnettize ties where white oak, or other equally durable woods, can be obtained at 40 or 45 cents a tie, but a recent investigation upon one of the eastern trunk lines, about 1,000 miles long, has established the probability that, with white oak ties at 62 cents each, an annual economy of $250,000 may be expected by burnettizing the hemlock, instead of laying down the oak unprepared.

Creosoting consists in injecting the timber with hot creosote oil under pressure. The mode of application, and necessity for seasoning, are much the same as for burnettizing. For timber in very wet situations, or exposed to marine worms, the best method to use is that of creosoting. It is the most effective, but also the most costly of the various processes. When well done, it costs from $12 to $20 per thousand feet, board measure, or from 50 to 60 cents a tie. It is the favorite method used in England, and is there materially cheaper than here, in consequence of the lesser price of the oil. The English ties exhibited have been from 20 to 22 years in use, and show perfect preservation. Ties and timber creosoted in this country are also shown, but have not had so long an exposure. It is probable they would be thrown out of service, by being cut into by the rail, long before they would decay. Where it will pay to use this process, depends upon a number of local circumstances and prices, which cannot well be enumerated here. It is very good, but costly. There are other substances, such as pyrolignite of iron and sulphate of copper, which have proved fairly effective in preserving timber, but European experience seems to favor most burnettizing and creosoting. The sections of ties exhibited from the Wabash line, and from that of New York, Pennsylvania & Ohio, were prepared by a modification of the sulphate of copper process. The original patents on all the effective processes have long since expired. There are several patented modifications and modes of application, some valuable, and some otherwise, which are still in force. It cannot be too strongly insisted upon, that to be effective the work must be well done. The sap or moisture must be gotten out of the timber, and a sufficient amount of antiseptic put in. If the solution exceeds a certain strength, the wood is rendered brittle and inelastic, so that both skill and honesty are required to accomplish success. —*Northwestern Lumberman.*

CUMBERLAND MOUNTAIN TIMBER.

A correspondent of a southern journal has made a tour over the Cumberland mountains, and tells about the timber he saw. In Monroe county cherry is very abundant, ranging from two to six feet in diameter at the butt, and 60 feet to the first limb. It is difficult to get out and will have to be hauled from one to sixteen miles, and then floated down to a mill site. The benches are not smooth but rocky and rugged. The standing cherry in this county is estimated at from 10,000,000 to 16,000,000 feet. It can be bought very cheap, and the correspondent is of the opinion that a man with money and pluck could make a fortune out of it.

In McMinn, Polk, Bradley, Hamilton, Marion, Franklin and Lincoln counties there is a heavy growth of timber, but little cherry and pine, and these counties have some good logging streams. The poplar is very fine, and most of it is accessible at a reasonable cost. The hickory is straight, long-bodied, free from knots and tough. Franklin county is one of the best of this range, both for choice timber and the ease with which it can be marketed. The mountains in this county are less rocky than in the others, and the benches not so steep, with good points for road-beds. There is hickory enough on a tract of 6,000 acres to pay the state debt, if worked up into awl handles and sold at one cent each. On this tract there are estimated to be 15,000,000 feet of poplar, and it can be bought for $4,000. There is, however, a question as to the title, as there is too much of the land.

One man was cutting butternut and walnut to fence his 10-acre lot, and ash trees, four feet in diameter, were deadened to give his crop sunshine. Small mills, with a capacity of from 2,000 to 4,000 feet per day should be used, as moving often is necessary. The most wonderful mill was found on Robinson creek, in Franklin county. It is very primitive. The mill is made entirely of wood, with the exception of the saws, and was built by George Keller, a 19-year old boy. The mill is driven by three turbine water wheels, all made of wood. The head-blocks are of wood, with wooden ratchets. The sawing is smooth, and the working of the mill would surprise the most credulous.

Mills are being put in operation all along the range of mountains, where a few years ago it was thought out of the question to handle logs In a short time the sombre stillness of this mighty forest, where now only the plaintive call of the lonely owl is heard, will be broken by the busy hum of many saw-mills.—*Northwestern Lumberman.*

Manitoba Shipbuilding.

The following from the Manitoba *Free Press*, of Winnipeg, shows considerable activity in vessel building among the lumbermen of the Canadian Northwest: The Couchiching, a double screw propeller, was launched May 24. She was built by John Short for the Rainy Lake Lumber Company, and is 93 feet in length over all, 18 feet beam, and 7½ feet deep of hold. Mr. Short has two more boats on the stocks, one for Garden & Short, to be 88 feet over all, 16 feet beam, and 6½ feet depth; and the other for W. T. Gibbins, to be 60 feet over all, 12 feet beam, and six feet depth. The Winnipeg Lumber Company has also two boats on the stocks. One is to be 100 feet long, 20 feet beam, and 8 feet depth; the other is for a steam pleasure yacht 50 feet in length.

A MINISTER'S EVIDENCE.—The all prevalent malady of civilized life is Dyspepsia. Rev. W. E. Gifford, of Bothwell, was cured of Dyspepsia and liver complaint that rendered his life almost a burden. The cure was completeed by three bottles of Burdock Blood Bitters.

ONE OF MANY.—Mr. R. W. Carmichael, Chemist and Druggist, of Belleville, writes as follows:—"Your Burdock Blood Bitters have a steady sale, are patronized by the best families here and surrounding country, and all attest to its virtues with unqualified satisfaction."

Established 1874. Established 1874.

NORMAN'S ELECTRO CURATIVE APPLIANCES

RELEIVE AND CURE

Spinal Complaints, General and Nervous Debility, Nervousness, Rheumatism, Gout, Liver, Kidney, Lung, Throat and Chest Complaints, Neuralgia, Bronchitis, Incipient Paralysis, Asthma, Sciatica, Sprains, Consumption, Sleeplessness, Colds and Indigestion.

Ask for NORMAN'S ELECTRIC BELTS and you will be safe against imposition, for they will do their work well and are cheap at any price.

A. NORMAN, ESQ.—Dear Sir,—Please send me a waist belt. Enclosed find price. Head band I got for my wife has almost cured her of neuralgia. Yours truly,
C. L. TILLEY, WATERVILLE, N.B.

Numerous of such testimonials can be seen at my office, proving that they are doing a good work and worthy the attention of all sufferers. Circulars free. No charge for consultation.

A. NORMAN, 4 Queen Street East, Toronto.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1tl7

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

THE PRESERVATION OF FORESTS AND THEIR ECONOMIC RESULTS.

If any Canadian were asked whether it was a desirable thing to preserve old forests and cultivate new ones, he would without a doubt assent. Strange to say, everybody would agree with him, and yet when we come to apply the proposition with some very practical test, as many votes are found objecting to what ever is advanced to conserve of our forests. Last year an attempt was made in Montreal to awaken public interest by holding a Forestry Congress, which was addressed by many able men, including the ex-Prime Minister of Quebec and the American Commissioner of Agriculture. The instruction which the Congress diffused was valuable and was disseminated over a large area of the country. Whether it will accomplish anything more than the planting of a few thousand trees may be doubted. The subject is becoming serious, and mere individual effort will not be sufficient to meet the requirements of the case. Whatever improvements have been introduced, and however much manufacturers may economise their use of wood, the fact remains that the resources of the country's forests are yearly becoming less. Hitherto the doctrine of private property in land and all that pertains to it has been cherished here and in the United States with a vengeance. It does not seem to have occurred to our legislators that there were other claims upon them than mere socialistic or communistic ones, which merited attention. The theory and practice of all European legislation has long been based on the principle that the State is but the trustee for unborn generations of the human race. There are all sorts of limitations restricting the use of land and its products in France, Germany, Russia and England. Among these are the Agricultural, Mining and Forest laws. The object of these laws is to ensure the largest aggregate production, and to reduce waste to the very smallest limits. The cutting of wood is regulated in such a manner that the area and quantity of wood of forests never becomes less, but rather shows a tendency to increase. The teaching of forestry as a subject of education, is practised just as engineering and chemistry are. Not only so, but France, Germany, Russia and Switzerland have separate schools where forestry is the chief subject of study. In all of these countries, there are, of course, State Forests, without which complete instruction would not be practicable. The schools form a part of a department of forestry presided over by a State Commissioner. The teaching is conducted in intimate connection with the forests. As no statistics are at hand it is impossible to form any correct estimate of the value of the work done by these schools, the number of students turned out, or the precise character of the effect which these schools have had on the conservation of European forests.

We, however, are still young, and our future is all before us; forest land is yet abundant in all the provinces of the Dominion. It is not a very serious matter to urge the appropriation of a sufficient number of acres of forest as a state reserve for the teaching of forestry, and the creation of a fund for its support. Now, there is no need of doing anything in the way of money doles, as a vote of about four townships, or a block of woodland of twelve miles square, would meet all the requirements of the case. An establishment might be begun for twenty students, which would steadily expand to one hundred. Taking the capitalized value of the 92,160 acres at as many dollars, the endowment would be nearly equal to one thousand dollars per head on a hundred students. Worked on the plan of a high timber productive forest, an area equal to 600 acres could be cropped annually. As fast as the wood was harvested the bare places would be rosown for a new crop. Several systems might be adopted by which the relative merits of each plan could be practically tested. Although the land would not perhaps need to be kept under crop for a longer period than 150 years, many portions could be cultivated so as to yield a crop in periods varying from 35 to 120 years. In the course of a generation every part of the plantation would exhibit new crops under growth, and a convention held in a tent in such a forest would speak with an authority greater than any institutions of a smaller character thousands of miles away over oceans. Boys at the forest school would see trees in all stages of growth from one to one hundred and fifty years; they would see operations for keeping the land clean, and the upgrowing crop of trees vigorous, analogous in every respect to the weeding of farm crops. Not only so, they would learn to bear their part in the work, and when in after life they found themselves engaged as lumber merchants or farmers, they would know how to crop and plant land, so as to avoid waste, and increase the revenue of their country. What farm of 100 acres is there that would not be better for having upon it at least four per cent. of wood land which might become the preparatory training ground of the future forester? The value of such little scraps of wood on a prairie soil is great, apart from any direct commercial result from sales of wood. In the hot summer suns cattle love shade; and their influence in the storm and the wind is none less valuable. In the older Canadian settlements a very large percentage of the agricultural land is wooded, and all that is necessary is to preserve by replanting and judicious cutting what remains.

What is needed most is a forest law for every province, for regulating the cutting of timber. Every lumberman should be required to hold a license to cut under well defined conditions of cropping and replanting. The law need not be vexatious either in letter or spirit, but just and liberal in all its provisions. There are even now ample woodlands in Canada, but at the present rate of slaughter they could not remain to us long. Five years' experience would develop an immense amount of interest in the new system. The forests of Quebec might be made to yield a revenue large enough to emancipate her from the enormous burden of debt she carries. In India the revenue in 1870 from forests was £357,000, giving a net income of £52,000, or 14⅝ per cent. In 1880 it was £545,000, with a net revenue of £215,000; that is, the revenue had increased 56 per cent., while the charges increased to only eight per cent. India has 9,820,000 acres of state forest reserved, 2,493,000 acres of which are protected from fire, and from cattle and sheep grazing. They are now in a condition to reproduce themselves under the natural system.

Australia is fully alive to the importance of the subject, for ten years ago an act was passed authorizing the payment of £2 per acre to landowners in certain districts of South Australia to form plantations of trees. In 1875 a Forest Board was constituted, and certain districts of the colony were formerly defined as forest reserves. In 1878 a Forest Act was passed, and a Conservator of Forests was appointed. Last year a quarter of a million trees were planted out, and the forest revenue amounted to £6,517—of which £1,380 was for timber sold—against an expenditure of £6,200. A profit of only £317 is not to be sneered at; it is something that a department of State should pay its way. India did not move in the matter till 1867, and it is only ten years ago that legislation was attempted in South Australia, a colony one-eighth the population of Ontario. Not only do the Forest Department in each case pay their way, but manage to make a revenue. Any one visiting Baden-Baden cannot fail to be struck with the great beauty of the valleys of the Oos and the Murg, and the forests in the immediate neighborhood, which furnish a splendid example of the successful working of forest culture as carried out in Germany. As an example of private forests, which are managed in much the same way, those of Prince Furstenburg, near Rippoldsau, may be mentioned.

Our neighbors the American are waking up to the importance of this matter, and in 1881 Dr. Hough visited the forest schools of Europe, with a view to establishing a similar institution on this side of the Atlantic. We are accustomed to flatter ourselves that we are ahead of the Americans in educational matters and also in public spirit. The Americans have never very seriously disputed the claim, but if the forest country of Canada allows them to take the lead in this matter the claim will certainly not be strengthened. Under any judicious system of management the annual yield of Canadian woods can be increased without any actual restriction on the just rights of any. The soil of a country is not for a generation, nor for a century, but for all that are yet unborn. The theory and practice of all systematic management in Europe is that the annual yield of the forest should represent the earning of the year only, and not any portion of the capital.—*Canadian Manufacturer.*

THE MIDLAND AND LUMBER.

The Orillia *Packett* says that at a special meeting of the Town Council, held on Friday evening, June 8th, the Mayor read the following letter he had received from Mr. Cox, manager of the Midland Railway:—"We have been in communication with the Messrs. R. & G. Strickland in reference to the removal of the Bradford Mills to some point on the Midland. We have suggested to them Orillia, and they have pointed out to us difficulty in bringing logs from the Black River to Lake Couchiching over the Portage Company's tramway. If this difficulty were removed Mr. Strickland says all their timber on the Black River, about 150 million feet, could be brought to Orillia, which would be the best point to manufacture at. They suggest that the town of Orillia, and ourselves ought to take steps to connect Lake St. John with Lake Couchiching, by a canal, which would at once open a water highway for all the productions of the forest on those waters, which are reported to be very extensive. It seems to me that the idea is a good one, and it is strange that Orillia has not taken action in the matter before, instead of allowing all the forest produced to go past them, by way of the Severn River to Georgian Bay; and Muskoka River to Gravenhurst. Messrs. Strickland think, to accomplish this end the outlay would not exceed $30,000. My object in writing is that if you think it advisable, I would meet a committee of your Council, and would invite the Messrs. Strickland to attend, who are now the holders of the Dominion Bank limits, Thompson Smith limits and Hilliard limits, which are all tributary to the Black River, and if the mill was moved to Orillia they would pay out annually from fifty to sixty thousand dollars, and give employment to a large number of men.'

His Worship said he had been speaking of the matter to Mr. Scadding, had told him the mills would be larger than those of the Longford Lumber Company; Orillia would also be made the distributing points for the shanties. In reply to Councillor Miller, he said the Council could grant no aid beyond the corporation limits; but the Council had power to remit taxes for ten years, and, with the sanction of the freeholders, of granting a bonus. Councillor Jupp said the Railway was interested in the matter. The Reeve did not care who was interested, so long as it was for the benefit of the town. He would not vote bonus for anything; but favoured appointing a committee to confer with the applicants as to what encouragement might be given them. It would not be for Mr. Tait to remit taxes to a new enterprise and continue to tax him. Councillor Thompson said the new mill would not interfere with the home market of Mr. Tait, except for slabs, and the latter could not meet the demand for them. It would be better to receive their proposal, before discussing what could be given. Councillors Miller and Mainer thought it would be preferable to have them meet the whole Council, but the other members thought the smaller the committee the better. On the motion of Councillor Thompson and the Reeve, the Mayor was requested to name a committee and communicate their action to Mr. Cox. His Worship named the Reeve, Councillors Miller, McKay, Thompson, and himself.

BI-PRODUCTS OF LUMBER MILLS.

The *Canadian Manufacturer* says:—

"To Messrs. H. B. Rathbun & Sons, of Deseronto, belongs the credit of being the first, in Canada at least, of practically solving the problem of how to utilize the waste from saw mills, and turn the refuse into bi-products that have a marketable value. They have established chemical works adjacent to their mills, and we give a condensed account of the visit of a correspondent of the Napanee *Beaver* to the works:—"It is now admitted these experiments are about to be crowned with success, and that the solution of the important problem of the utilization of waste material has at length been reached. It has been demonstrated that from the sawdust of the big mill can be extracted acetic acid, wood alcohol and tar: that the charcoal can be disposed of for the manufacture of gunpowder, and that as a bi-product, sufficient illuminating gas of an excellent quality can be produced to light the village and its factories. The chemical works are now being enlarged for this purpose, an excavation is being made for a gas-holder and mains, and it is expected that the whole will be in operation early in August. This department is under superintendence, and the whole of the experiments have been conducted by George Walker, formerly of New York." The article on "Bi-products," to be found on front page, treats of many more instances in which so-called refuse matter is capable of utilization, and the subject is one well worthy of consideration."

"Lumber mills have many bi-products which run to waste for want of some cheap and ready mode of converting them into useful and saleable articles. Such are sawdust and shavings. It may be confidently predicted that in the near future uses will be found for all the surplus shavings and sawdust now made. It is only a year or so since car wheels were made of paper mache, and why may not sawdust be so changed by mechanical and chemical manipulation as to become equally useful. A few years ago a great cry was raised at Minneapolis on account of the accumulation of sawdust. Notwithstanding that much has been used for packing, stable bedding and other absorbant purposes, there is a large quantity yet to be utilized. Converted into charcoal by the addition of sulphuric acid, it would be a valuable accessory to the farmer's stable manure heap, as tending to convert the free ammonia of the litter in sulphate, and the charcoal itself has a decided value as a fertilizer."

THE MINNESOTA SITUATION.

St. Paul, Minn., June 4.—The logging situation has not materially changed during the last week for the drivers, and prospects have grown worse rather than better, but the lumbermen do not yet despair of getting some of the logs out that are now reported hung up. The logs are pretty sure to come out of the Rum river, except those on the West Branch and Hillman Branch. The West Branch logs have moved down only about six miles, but heavy rains will bring them all right. The logs are reported hung up on the Willow, at Prairie, Platte and Swan rivers. The local mill owners liable to be most incommoded by the prevailing situation being Merriman, Barrows & Co., and Camp & Walker. The logs which have got out into the main river are moving slowly. A big jam fully four miles long is reported at Aitkin, and another quite unusual is reported at Grand Rapids. There are probably 80,000,000 to 100,000,000 of the whole cut of 500,000,000 that stand a chance of not getting out. There is no apprehension, however, that the crop will not be ample for every demand of the mills. The cut was an unusually large one, and for the present some of the lumbermen are willing that the logs shall be hung up. The sawing season commenced fully three weeks later than a year ago, and even with the aid of three new mills, two of the three thoroughly equipped and capacious mills, the season's cut of lumber does not promise to be larger than a year ago. Logs in the drives tributary to Duluth are hung up still. Before the water grew so low a few millions got out, as follows: On the Nemadji, 5,000,000 to 10,000,000; on the south shore streams, 500,000; on the St. Louis below the rapids, 5,000,000; above the rapids, none. About 15,000,000 have been towed to mills from the north and south shore camps, and more will follow. About 17,500,000 feet are hung up. Advices from the Chippewa River, in Wisconsin, say the general outlook for the drives is about the same as in former years, if anything a trifle better. Most of the drives on the tributaries are hung up, except on the Yellow river, where they are doing fair work and have the run down to within sixty miles of the mouth. There is a lack of water on the Deer Tail, Brule, and north and south forks of the Flambeau. Several of the log-drivers of the St. Croix and its tribu-

taries are undoubtedly hung up for the want of water, and unless there is considerable rain they cannot possibly reach the boom. At present there have been about 125,000,000 feet received in the boom from Pokegema, Groundhouse, Lower Kettle river, Sand Creek, Chicoq Brook, Main St. Croix, and the south fork of the Olam. The Namekagon, Moose, Snake and Crotty Brook logs are running in more or less numbers. *Lumberman's Gazette.*

NOTES ON WARPED WOOD.

It is very often found that wood which in the board or plank is perfectly straight, or appears to be so, will twist and wind in every conceivable manner when cut up into long, narrow lengths, or cross-cut into short, broad panels. When wood is "winding," the only remedy, says *Amateur Mechanics*, is to plane off the high corners and make it true by reducing the thickness; but if it be simply cast (one side hollow and the other round), the defect may be easily got over. If the man, by working on some other portion of his job, can let the defective pieces stand for a day or two, then by placing the wood "hollow side" down on a plane surface, or by putting two such boards one on the top of the other, with the hollow sides facing each other, the wood will draw straight without any more trouble. It is always best, when possible, to work wood in its natural state, as even if the tendency to cast be overcome previous to working it, there is always the probability of its returning to its normal condition. Some men when pressed for time, heat the round side on the stove. This does indeed make the wood straight, but there is a great risk of opening and splitting under this toasting treatment, and this liability is very much increased if the wood be at all shaky. If required the wood can at once be straightened without this risk, by damping the hollow side with water, when the expansion of the fibre on that side pulls it straight. It sometimes happens that a piece of wood of some considerable width, such as a carcase end or a wardrobe panel, has to be reduced from ¾ inch to ½ inch thickness. If this superfluous wood be all taken off one side, that side will become hollow, whereas if it be taken off equally on both sides the wood remains as before. In veneering panels, etc., it is always best to veneer on the outside, that is the side opposite the heart side, the reason for this being that veneer is apt to swell with glue being laid on, and must therefore contract after it is fixed. As the heart side has always a decided tendency to curl, the two forces counteract each other, and the wood remains the same. For this reason, it is always best to inlay on the outside.

CULTIVATION OF TIMBER.

We take the following from the *Builder*:—"How fatal are the results which attend careless indifference on this point is singlarly shown by what has followed in Italy on the disforesting of the once well-wooded peninsula. Not alone have the recent terrible inundations in the north of Italy been directly traced to this cause, but the fatal *aria cattiva*, the poisonous breath of the marsh lands, which has within twenty years or so invaded almost every province of the peninsula, now reigns supreme, driving from the once fertile plains thousands of the unhappy inhabitants. Here we see the direct influence of false economy in this one direction. When we consider, in addition, that Italy could undoubtedly, by proper management, grow a large portion of the timber which at present she has to import, we see another direction in which a false economy has impoverished and impoverishes an already poor nation. England, without having reached this sad position, cannot be said to be beyond blame. There exists in our country many a broad stretch of land which, by the action of science, might be rendered productive, and at the same time beautiful. The growth of timber is not of a nature to tempt the speculative demands of modern private initiative; it is for this reason that it behoves the Government, or at least, local authorities, to take up the question. They, at least, standing virtually independent of the consideration of immediate gain, are the only fit instruments by which such work can be done; but the system once set in order, the returns, it is evident, will be no less regular, even more so than from the ordinary sources of profit. A close study of the matter—an enquiry into the admirable methods adopted on the continent, in France, in Belgium, and in Germany—would form an interesting subject of enquiry either for some Government commission or for some privately appointed body. The question is one of something more than passing interest. Whence are we to obtain our supply of timber? Nature unaided will soon cease to be able to satisfy our demands; but we have here another of the many instances where science intelligently directed can solve the difficulty, and thus once again be of the utmost service to the world, not alone practically, but æsthetically."

REMARKABLE VIADUCTS.

What will be the highest viaduct in the New World is the one now being made (and near completion) for the New York, Lake Erie & Western Railroad over the Kinzua Creek, four miles from Alton, in McKean county, at a height of 2,100 feet above the sea level. This work, designed by Messrs. Barnes & Pugsley, will have a total length of 2,051 feet between the abutments, and a height of 301 feet between the level of the rail and the bed of the river. The line is supported on twenty straight piers of wrought iron work, 61 feet apart, The construction requires nearly 4,000,000 pounds of iron, and 7,000 yards of masonry, and the cost is about $300,000. This bridge, exceeding by sixty feet in height the Niagara Suspension Bridge, and by forty-five feet the Portgage railroad bridge, was recently stated by the *Scientific American* to be "the highest in the world." But this title rightly belongs to the railway viaduct of Garabit, in France, now being erected over a river. The locality is in the department of Cantal. This bridge, planned by MM. Banby & Boyer, and constructed by M. Eiffel, has a total length of 565 metress (say 1,880 feet) and near the middle of the great centre arch (which is the most remakable feature) the height from the bed of the river to the rail is 124 metress, or 413 feet. A good idea of the height is given in *La Nature*, where it is shown that Notre Dame with the Vendome colum placed on the top of its towers would clear the arch. The viaduct was begun in 1881, and it is to be completed next year. It is estimated to cost about 3,000,000 francs.

Two Cribs Broken Up.

MONTREAL, June 12.—In the gale yesterday afternoon, two cribs of Messrs. Calvin & Son's rafts were just descending the Lachine Rapids, and it was only with the greatest exertion the rafts were navigated through the dangerous channels of the rapids. On arriving opposite Nun's Island, however, the wind increased in force and most of the cribs comprising the rafts were blown considerably out of their course, several nearly going ashore on St. Helen's Island. Two of the cribs became unmanageable just above the Victoria bridge and swinging with the current were thrown against the piers of the bridge and broken up. The crash each time is said by the raftsmen to have been tremendous, all of the timbers being separated, and the men, of whom there were about a dozen on each crib were thrown into the water and had a hard struggle for their lives before being rescued.

WHAT EVERY PERSON SHOULD KNOW.—The grand outlets of disease from the system are the Skin, the Bowels, and the Kidneys. Burdock Blood Bitters is the most safe, pleasant, and effectual purifier and health-restoring tonic in the world. Trial bottles 10 cents.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle,

CONSUMPTION
POSITIVELY CURED.
All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humhug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**
We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.
Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address
ASH & ROBBINS,
20L24 360 Fulton Street, Brooklyn, N. Y.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

THE KEY TO HEALTH.
BURDOCK BLOOD BITTERS
Unlocks all the clogged avenues of the **Bowels, Kidneys and Liver.** carrying off gradually without weakening the system, all the impurities and foul humors of the secretions; at the same time **Correcting Acidity of the Stomach,** curing **Biliousness, Dyspepsia, Headaches, Dizziness, Heartburn, Constipation, Dryness of the Skin, Dropsy, Dimness of Vision, Jaundice, Salt Rheum, Erysipelas, Scrofula, Fluttering of the Heart, Nervousness and General Debility;** all these and many other similar Complaints yield to the happy influence of **BURDOCK BLOOD BITTERS.**

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.
"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*
Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus:
JAMES EPPS & Co., Homœopathic Chemists,

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont. JULY 2, 1883.

RECENTLY 8,000 cedar logs were seized by the United States officials, at Newport, Arkansas, on the charge of having been cut from government land.

THE Erie Car Works, at Erie, Pa., have one of the largest stocks of seasoned lumber on hand ever collected in this country, and are now very busy turning out cars on orders.

THE automatic fire sprinkler is becoming very popular among furniture manufacturers and other wood-workers in the United States. The Grand Rapids, Mich., furniture factories are reported to bo equipping themselves with the device.

THE Brandon correspondent of the Winnipeg *Commercial* of June 19th says :—Owing to the difficulty in driving logs down the river from the limits, Loacock's saw mill is still idle. For the same reason Mr. Grigg is not pushing his mill forward as rapidly as he would have done.

THE scarcity of timber at Darien is becoming a very serious matter with those manufacturers who have contracts and are obliged to meet the extreme prices demanded for that which offers. There have been sales at prices equivalent to $20 for 1,200 feet average, a figure not before touched in years.

THE accumulation of sawdust in St. John river, New Brunswick, has become so serious a matter that it threatens to obstruct navigation for large vessels passing up to Fredericton, and a local paper calls upon the authorities to enforce the law against allowing dust from the mills to fall into the stream.

THE *Wood-Worker* says :—The band saw mill is evidently the mill of the future where valuable hardwoods are to be cut. Even now the novelty of this style of mill has almost worn off, and they are being set up in nearly every part of the country. That this mill is looked upon as the coming mill is evidenced by the fact that there are not less than half a dozen prominent machinery builders who have recently brought them out, or are preparing to.

A WRITER in an exchange is correct when he says that : "In buying wood-working machinery, the very best rule for guidance is that old one 'the best is the cheapest.' It don't pay to buy cheap materials or cheap workmanship, and cheap machines generally mean both of these. Cheapness is apt to prove an expensive investment in the long run."

THE Bobcaygeon *Independent* of June 22nd, says :—The first drive of the season has passed through, under the command of Mr. Frank Bell. The drive contains 28,000 logs, which were cut in the township of Anson and the neighborhood of Minden. Mr. Bell is noted for his quick runs, and is this year two weeks earlier than usual.

THE *N. Y. Timber Trades Review* says :—At Chapman's shovel handle factory, Oxford, Me., they turn out about 150 dozen handles per day when in full blast ; use all the ash they can get —from 150,000 to 300,000 feet a year. All their handles have gone to the same man for fifteen years, Jones, of Gananoque, Ontario. They saw out about 400,000 shingles this season.

DURING the last few years a number Mobile, Ala, saw mills have gone into the box making business, or rather, have made it a branch of their business. This branch has increased to enormous proportions ; so that now it gives work to several hundred men. The boxes are chiefly for the shipment of early vegetables and fruits.

FURSTENFELD, Germany, boasts of the oldest tree in that country. It is a huge Linden, believed to be 1,000 years old, growing at the back of the village church, in the midst of the tombs of two centuries. Its trunk is fully fifteen feet in diameter, and its twisted branches stretch out far and wide, seemingly covering the entire inclosure. It is still growing, and is one of the sights of that section of Germany.

SOME of the loggers in white cedar timber on South Slouth, Coos county, Oregon, have adopted a new mode of getting the timber to market. The logs are hewn into square pieces from six to twenty feet in length and not less than six by six inches, in the woods, and hauled to the landing where they ship them up the bay on lighters and thence to San Francisco. They receive $20 per thousand feet for these pieces on the wharf at Empire.

A STURGEON Bay, Wis., paper says that Chicago commission men, who buy railroad ties in Door county, are getting very particular as to how ties are made. They will not receive any, even on contract, that are not eight feet long' six inches face and sawed at both ends ; otherwise they are culled. One shipper who had 4,000 ties to deliver on contract was obliged to set men to sawing off the ends at a cost of two cents each stick—something that he did not expect when the contract was made.

THE Winnipeg *Commercial* of June 19, says : The saw mills have not much more than fairly got to work, and as the demand is lighter than was anticipated they are not running so strong as they otherwise would. An immense amount of lumber is reported as on the way to this market, via Port Arthur, which will tend to make business in the lumber line quieter. The furniture factories are kept going pretty well. There cannot be said to be any particlar rush, but still a healthy trade is being done.

THE cases in which plug tobacco is packed are made almost entirely of sycamore. This wood is valuable for this purpose, as it will not impart any smell or taste to the tobacco and as it will not absorb moisture readily. This appears to be about the only use which can be made of sycamore lumber, which has the very serious defect of warping badly. Were it not for this, it would be a valuable wood for many purposes, as the lumber is large and clear of knots, and there are very large amounts of it in Ohio, Indiana and Kentucky. Perhaps, in the future, some sure method of so treating lumber that it will not warp will be devised, but until then then sycamore will be useless for building purposes.

THE *Northwestern Lumberman* says :—The most cheerful notes come from Ohio, Indiana and the new Northwest. In the two older states there is an era of improvement in town and country, and new buildings are requiring a large amount of lumber. There are exceptions to this general rule, to be sure, but generally Ohio and Indiana are very prosperous. The progress of new settlements in western Minnesota, Dakota, western Iowa and Nebraska is calling for a heavy volume of lumber, and the Wisconsin and Minnesota lumbermen are reaping the advantage of it, to a greater extent than the trade here. The railroad mills in Wisconsin are particularly busy supplying the western demand.

THE Halifax *New Era* says :—The market during the week has been quiet and slack in all kinds of lumber. There have been very few arrivals and no exports except a few thousand feet to the West Indies as deck loads. No new orders have been received and there is apparently no demand in any market. Prices are weak at our quotations and unless some change in the demand speedily transpires prices must decline —especially for the lower grades for which this market has become a general rendezvous, owing to the fact that we have no official inspector or surveyor of lumber. In consequence we are the recipients of such lumber and shingles as other markets would reject. We are convinced that it would be to the advantage of the public if some rule were established by which our lumber interests—no unimportant item in our revenue—should be placed under proper management.

IN reference to the statement, in our Toronto correspondence in last issue, that lumber for Parkdale, carried by the Midland Railway, was charged $5.00 per car load, extra, by the G. T. R. R. and C. V. R. R., and that serious delays occurred between Toronto and Parkdale, it is gratfying to learn that as soon as Mr. White, traffic manager of the Midland Railway became aware of the state of affairs he proceeded to Toronto, and made arrangements which will enable dealers in Parkdale to receive lumber, etc., over any portion of the Midland system at the same price per car load as dealers do in Toronto. As far as the excess referred to of loading over the standard weight per car load is concerned, shippers should abide by the acknowledged and contract standard. The management of the Midland Railway has never been considered shabby in this matter, where only a few hundred feet extra were concerned, but when the excess swells over a thousand feet, it becomes too much of a burden to be carried without challenge. Shippers must admit that there should be a limit somewhere. As to the question of the rate from Midland to Toronto those interested should interview the Midland Railway authorities and state their case.

SIMCOE, ONT.

To the Editor of the Canada Lumberman.

SIR,—The lumber trade in this county is booming, and we are sawing five millions, be sides supplying 50,000 white oak railway ties to the Great Western division of the Grand Trunk. London, St. Thomas, Woodstock and Toronto take most of our lumber. Toronto takes hardwood, and we send long pine and oak bill stuff to Buffalo. There are still twenty to twenty-five millions per year made in this county, but a few years will exhaust it. The small second growth, eight to fifteen inches on the stump is being cut now.

Yours, &c.,
A. McCALL.

Simcoe, Ont., June 22, 1883.

MILL REFUSE.

It will be remembered that some months ago the village of Plattsburg, N. Y., brought a suit in the New York state supreme court to enjoin Chauncy and Benton Turner, owners of a large mill at that place, from allowing sawdust to fall into the Sarauac river. It was charged in the complaint that the mouth of the river, which was once a clear stream, was choked with sawdust, which generated a foul gas, arrested the outflow of sewage, and befouled the river within the corporate limits, thus endangering health. The referee has decided that the plaintiff is entitled to a decree, perpetually restraining and enjoining the defendants, their agents, etc., from suffering or permitting to fall into said river at their mill any sawdust or refuse matter, and judgment was accordingly directed in favor of the plaintiff with costs. The Turners will, therefore, hereafter have to provide themselves with a refuse burner, or, what would be better, with a chemical works attachment, like Rathbun & Sons, of Deseronto, Ont., by which the refuse could be converted into articles of commerce at a profit.—*Northwestern Lumberman.*

WERE THE PLAINS ONCE TIMBERED ?

This has been a question of no little speculation and comment, and we now come forward with additional "points" on the subject. Last week we were out with a survey party in town 27—2 east. The land was undulating, composed of gravelly loam with a noticeable admixture of clay. The numerous brooks had clay banks with stony and gravelly bottoms. Timber beech, sugar, maple, and large hemlocks, with an occasional birch, white ash, ironwood, etc. Forty-four years ago the United States survey found the same land "third rate, timbered with poplar, birch, hemlock, etc." Three-fourth of the monuments erected by the United States survey were upon poplars from 6 to 10 inches in diameter. In a straight run of five miles we found but one poplar, and that was a gigantic dry stub nearly thirty inches in diameter. We imply from this that the character of the timber has changed with the past forty years, and now we will prove it. (1) The beeches and maples are young,—averaging not more than 8 or 10 inches in diameter in this particular locality. (2) The hemlocks are of monstrous size,—36 inches and over. (3) All the large hemlocks are either hollow or very shaky, while very many are dead. (4) Brooks 4 links wide and larger were found where none existed 44 years ago. (5) Further to the north and upon the same soil with a decided admixture of clay, we found a plain covered with a dense growth of poplar and birch with some Norway pine and spruce pine, all of not more than five years growth, with some soft maple, cherry and iron wood sprouts. A few young spruce pines yet seemed to hold nominal possession, while the blackened stubs of the once gigantic white and yellow pine give the remainder of the history written by fire. (6) The spruce pine will withstand a considerable amount of fire without injury, as attested everywhere by their blackened and charred trunks and green tops. Fire seems absolutely necessary for the germination of its seeds, which by the hundreds of bushels lie in the soil of the plains until a fire sweeps over it at the proper season of the year, when the trees spring up in abundance. We have seen places so thickly covered with spruce pines not more than three feet high that at a short distance it resembles a field of wheat.

What, then, is the history of the plain which we saw covered with poplar and birch ? Many years ago it was a forest. Within the last 15 years the land has been denuded of timber by frequent fires.

What will be its future ? Should fire not interfere, the poplar and birches will grow in 75 years to forest trees, the maple, ash and ironwood sprouts will grow likewise and become more numerous.

Poplar almost invariably dies at the end of this time, and birch is always crowded out and killed by other timber except in spots peculiarly adopted to its growth. In 50 years more the maple, beech, linden, etc., will have gained the ascendancy, and for the next two hundred years we will see a magnificent forest, where was once a parched and barren plain. It has taken hundreds of years to make this change, but it has nevertheless taken place.

Suppose that at irregular intervals of from two to ten years fire continues to sweep over this place. It licks from the hills the scanty deposit of molud from the falling leaves, and digs deep into the peaty soil of the swamps.

Death and desolation seem to reign supreme, but the spruce raises its head defiantly and thrives amid such scenes. The stumps of the charred oaks send up shrubby sprouts that struggle on until the next fire lays them low. The resin dropped from the trunk and limbs of the pine, and the dried grass feed a future con-

flagration. The potash and other soluble elements left in the form of ashes are washed away by the passing shower, and under the reign of fire the vegetable elements of plant nutrition disappear, and a waste is left covered sparingly with spruce pine, while stunted moss ineffectually endeavors to hide the barren soil, and prepare the way for higher forms of vegetation. Although a greater portion of the so called plains of northern Michigan is covered by a thick sward of hardy grass and herbs, we have seen knolls of hard clay as well as light sand covered with scarcely anything but this moss, showing that the character of the earthy or mineral portion of the soil has nothing to do with this condition. The reclaiming and successful cultivation of a large share of the plains is no longer an experiment but an established fact, but from what we have noted above it follows that every square foot even of the poorest of this once supposed desert will become of service to the agriculturist, and that at no distant day.—*Oscoda County Mail.*

CINCHONA CULTURE IN GUATEMALA.

President Barrios of Guatemala has made arrangements to try the experiment of cultivating the cinchona tree, and Mr. W. J. Forsyth, a planter of Ceylon, who has ridden a thousand miles through Central America, exploring the country to discover the best site for the plantation, is now in this city on his return to East India to select the seed for 5,000,000 trees. Speaking on the subject, Mr. Forsyth said: "The rapid increase in the number of uses to which the bark of the cinchona tree is put, not only for the manufacture of quinine and an ingredient in the substitute for hops, but for various commercial purposes, induced President Barris to try this experiment. Although the cinchona tree is not a native of India, but was introduced there in 1879 by the celebrated botanist Clement Markham, at the instance of the British Government, the culture was so profitable that not only has the original investment of £150,000 been repaid, but the trees have been valued at £1,000,000. There are many varieties of the cinchona. One is the Legeriana calisaya, which is rich in alkaloid. Another variety is the officinalis, the bark of which is known as crown bark. Other varities are condamanca and the succirubra. The last named is rather larger than the others and more robust and of quicker growth, but not so rich in alkaloid, though it yields plenty of bark. These barks are generally known to commerce as Peruvian bark, though not cultivated in Peru nor grown there to any great extent. The trees are planted from three to four feet apart, the mature in about six years.

There are three methods of treatment in cultivation. One is by thinning out, or selecting the largest trees to be retained. Another is by coppicing, which is simply cutttng the tree down to a stump and permitting the shoots to grow. At the harvest the shoots are cut off. The third method is called the Melver system. and consists in taking the bark from a part of the matured tree and mossing over the stripped place until the bark is renewed. If the mossing is carefully done the bark will renew itself continually. The bark is sold at 2s to 13s a pound, and is sold readily, for the supply has never yet been too great.

"The cinchona trec requires a tropical climate and a plentiful rainfall. It would not grow in the United States, but can be cultivated in Mexico. The trees require careful cultivation. President Barris gave me every faculty to explore the country, and he has great hopes of the success of the experiment in utilizing the vast amount of soil in Central America not now under cultivation. They raise coffee there for export, but their methods of cultivation are crude. Fortunately the deseases of the coffee plant which make the culture so precarious in India do not appear in Central America."

NEW USES FOR WOOD.

It does not seem safe nor wise, now, to declare any kind of tree worthless. Even the despised basswood and cottonwood trees have become valuable. It may be, the so called good-for-nothing sage bush, which covers the bad lands of the western states and territories will be found to possess some valuable properties, and then it will be elevated to a place among the now valuable trees. "Late inventions and discoveries have revealed the fact that the finest polish and strongest household furniture can be made out of paper. It can be pressed so hard that no instrument short of a diamond can scratch it—and it can be given the finest shades in imitation of wood, and produced cheaper than walnut, mahogany or ebony. And late discoveries in paper-making established the fact that cottonwood makes the whitest and strongest fibre pulp yet manufactured out of wood. There are vast quantities of pulp imported, and some newspaper men are clamoring for it being done free of duty. Paper mills in Delaware, Pennsylvania, and other northern states are shipping thousands of cords of poplar wood from Chowan river in North Carolina, one mill in Delaware contracting for 30,000 cords. This is costly, and shows conclusively that our rich lands, where cottonwood grows so luxuriantly and of which in many cases the black walnut has been denuded to make furniture in England, may yet become profitable fields to raise and manufacture paper furniture, car wheels, and houses. Something has to take the place of pine, walnut and cherry in house-building and ornamental wood-work, and the probability now is that the cottonwood is the coming tree. It is easier propagated, a more rapid grower, is exempt from enemies and parasites, and is a native almost everywhere. Forestrymen have troubled themselves about the future timber to supply the industrial pursuits. The best of car-wheels are made of paper, which stand the weather and wear longer than iron, and are less liable to accidents from breaking. If they will stand in this most difficult trial, paper can certainly be used in almost any place. And if it can best be made of cottonwood pulp, who doubts that this abused and derided tree is bound to come to the front and yet become one of the most popular timbers for tree cultivation."—*Iowa State Register.*

WOODS LIFE IN MAINE.

Says the *Bangor Whig*:—"An interesting souvenir comes from the lumber woods of the north, in the form of a communication written very lengthy on a fine sheet of birch bark, and incased in an envelope composed of the same material. The letter is dated Mattamiscontis, No. 2, range 7, about 15 miles from any settlement, in a lumber camp where Mr. John McGregor has a crew of men engaged in cutting spool wood for his factory. The writer gives some idea of how men live in a lumber camp: "Our camp is built of rough logs of poplar, laid up on the sides about four feet, and running up to a pitch in the centre of about 10 feet. The roof is covered with cedar splints four feet long and laid the same as shingles, making a very good covering, though not very tight. The floor is made of poles laid on the ground. We have two stoves, one a large heater, three feet long, and the other a cooking stove. For sleeping apartments we have a berth made the length of the camp, which is 19½ feet, and accommodates 14 men. In front of this and on a range with the stove is the 'deacon seat,' of the same length as the camp. Our living consists of pork and beans, bread and cookies, ginger bread and old-fashioned doughnuts, dried apples, beef, codfish, mackerel, tea, and molasses. For breakfast we have pork and beans hot from the oven, with ginger-bread, cookies, and tea. For dinner, which is eaten in the woods, we have beans, doughnuts and bread, with tea, and occasionally beef. For supper we have codfish or mackerel and potatoes, with fried pork. We get any amount of fresh perch and pickerel close by the camp, in Mattamiscontis lake. Fish forms a prominent item in our diet."

THE PAPER CRANK.

The *Northwestern Lumberman* says:—The paper crank seems more energetic with the approach of warm weather. In the direction of paper there is nothing that he is not anxious to do except to tell the truth. He carries his theories to a ridiculous extreme, often failing to temper them with practicability. The paper tie man, who claims so much for his own hobby, is quoted as remarking:—

"Almost anything can now be made of paper. A paper ball can now be made so solid that nothing can indent it but a diamond tool. Car wheels are now made of paper. Its strength is astonishing. You can suspend 339 pounds from a Bank of England note and it will not part. Bath-tubs, pots, plates, knives, forks, cooking stoves, printing-presses, steam engines and chimneys are made of paper nowadays, and there is absolutely no limit to the uses to which it may be put."

A part of this statemcnt any observant reader would be ready to admit, but the rest of it is sheer nonsense. Car wheels are not made of paper, but paper is an element of their construction. It is sandwiched between iron plates, and enclosed with a tire, being also securely bolted in position. It is not a wheel—it is the filling. The mythology about pa per stoves. printing-presses, steam engines, *ad libitum*, may be thrilling literature, but the paper crank cannot produce the originals. The *Lumberman* never expects to be printed on a paste-board press, nor to eat bread baked in a papier mache oven. To construct a non-explosive steam boiler out of paper plate is also a refreshing suggestion. Probably the chemical combination of paper with other materials will result in producing a large number of articles that will have a practical utility, but the range of that utility must be limited to something. It is not at all likely that paper can be made an entire substitute for wood, iron, stone, coal, and other minerals, but this is a claim by no means too aspiring for the paper crank to make.

MONTREAL NOTES.

The *Gazette* of June 22nd says:—As regards the local trade, we have not much to report during the week, the only change of importance being the advance of 50c. per M in laths, sales having been made at $2 on account of the improved demand and scarcity of stocks. A moderate trade only is reported in hard and soft wood. Very little dry wood is now to be had, and the new supplies being green there is scarcely any call for it. As regards the export trade, the shipments of deals from this port have already been about double those of the corresponding period of last year. There is very little doing in lumber on River Plate account. In freights a small vessel has been chartered at 67s. 6d. for East of England coast.

The Great Northwest.

The great increase in travel to the Northwest, has forced the "Famous Albert Lea Route" to put upon its line magnificent dining cars, in which passengers will be served meals second in quality to no first-class hotel, for the small sum of seventy-five cents each.

The Chicago, Rock Island & Pacific Railway, which controls this route, has always maintained a reputation for giving travellers first-class meals on its dining cars, and in putting on this line the same class of cars, it fills a want that the travelling public will appreciate.

"The Albert Lea Route," is carrying a very large share of the Northwestern travel, and, although early in the season, has commenced to sell tourists' tickets to the various pleasure resorts in a volume sufficiently large to guarantee an immense summer traffic.

ROCK ELM WANTED.

A Few Car Loads of good ROCK ELM, cut into 1½, 2, 2½ and 3 inches thick, 12ft. length prefered.

DUFRESNE & JODOIN,
Lumber Dealers,
6l12 496, St. Joseph Street, Montreal.

A RARE CHANCE!

Valuable Steam Saw-Mill

FOR SALE.

The Waba Creek Steam Saw Mills, situated on the Madawaska River, one mile from Arnprior. Capacity of Mill, Fifty Thousand Feet of Lumber per Eleven hours. Capacity of Booming Pond, Thirty Thousand Logs. Has Sidings through piling Grounds connected with main line of Canada Pacific Railway. The Mill is in good repair, having only run a short time, and is well found in all appliances required to run it to the above capacity. There is also a good water power connected with it from the Waba Creek, and good stabling, Barn, Boarding House, and other buildings. For information, price and terms, apply to John Robertson, 581, Seigneurs Street, Montreal, or to James McCuan, Arnprior, who will show intending purchasers the whole property, or to

ALEX. FLECK,
6l11 Ottawa.

SAW MILLS
AND
TIMBER LIMITS
WITH
Logs, Lumber, Store Goods, &c
FOR SALE
In the District of Algoma, Ont.

Eighty-Five Square Miles (54,400 Acres) of Limits, Good Pine, First-Class Water Power, Large New Water Mill, Steam Mill, Store and Dwellings.

Canada Pacific Railway now running through part of the property.

For full particulars address:—

Office, 9, Corn Exchange,

MONTREAL,

Send for descriptive Pamphlet containing list of parties using this Dry Kiln in the United States.

Dryers built and in working order by the following Companies:

James Shearer, Montreal; James Crossen, (car builder), Cobourg, Ont.; Canada Pacific R.R., Perth, Ont.; Kingston Car Works, Kingston, Ont.; Pike & Richardson (Cooperage Co.), Chatham, Ont.; and in course of construction, Grand Trunk R.R., London, Ont.; Steinhoff, Schnoor & Co., Staves and Heading, Wallaceburg, Ont. 12l12

NORWEGIAN BUILDING.

Our contemporary, the *Builder*, recently gave an interestering article on the Norwegian style of building, from which we quote the following extracts :—"Having seen other countries of a more advanced culture than their own," says the writer, Mr. P. Lowzow, "the taste for the beautiful was comparatively early awakened, resulting in a desire to give shape and form to their thoughts and ideas, which was most successfully carried out in the well-known and characteristic art of Norwegian wood-carving. Owing to the imperfect implements and tools of that age, the granite was too hard and difficult a material for building and ornamental purposes, and the large forests had to render the necessary material instead. In the time of the Vikings Norway could scarcely boast of any architecture. Their dwelling were plain, generally consisting of but one large room with an earthen floor, in the middle of which they built a rude fireplace, and made a hole in the roof to allow the smoke to escape. It was their ships that they first attempted to beautify with ornaments, and here their fancy had free scope.

"After the introduction of Christianity, about the year 1,000, a more developed state of society was established. The first church was built in A. D. 996 of timber, on the same spot where now stands the celebrated Trondhjems Cathedral. During the long struggle between Christainity and heathenism, no progress was made in the building of churches, and the second church was not finished until 1,050. This church was, however, built of stone. About this time Norwegian wood-carving made considerable progress, and many of the timber churches were decorated with ornaments of this kind. In these early wooden churches the walls were constructed by the timber being raised on its ends ; the outsides was covered with deals to protect the inmates against the great cold. The nave was supported by wooden pillars, and rose considerably above the side aisles.

"Of these ancient and interesting structures there are still a few preserved, of which the churches in Borgund and Hitterdal are well known to tourists in Norway. At the same time, considerable progress was made in the architecture of dwelling houses, &c. Each building had its separate use. The number of rooms increased, and they were now provided with wooden floors. It is only within the last century or two that two storied houses have come into use, and are now rapidly supplanting the old ones. During the last centuries little or no attention has been paid to the ancient Norwegian architecture in the construction of new houses ; but it is a pleasure to report that during the last thirty or forty years a great revival has taken place. Many Norwegian architects have done great service in re-introducing the old Norwegian style, in which many new buildings have now been built and decorated, and Norway will again respect and appreciate its old timber architecture.

"In considering the later and more modern architecture, we must strictly distinguish between the town and the country. In the town the houses are built on the system of flats, and are usually either three or four stores high. Brick is now by law the material for building in town, and nearly all the houses are plastered with cement as a protection against cold and rain. The last fifty years have also developed a stucco architecture, which gives the broad streets and the houses a bright and clean appearance. But in the country timber architecture is still used for churches and dwelling houses. The plan of the residence is, as a rule, simple. In the middle of the house a lobby or small hall is arranged, which forms the means of communication between the rooms arranged around this. As the price of timber is cheap, and rates of wages low, we find, as a rule, that the houses are built larger than required for actual use. Easy access is obtained between the different rooms through doors leading direct from one room to another to avoid the cold air in the lobby. Thus a suite of rooms is obtained, which is found to be very convenient and comfortable. Carpets are seldom used, but the floors are painted and varnished, wainscoting is arranged in the best rooms, and the walls are covered with deals, which is painted or covered with painted canvas. The ornamentation and decoration of the houses outside are obtained through the projecting head-pieces of beams, the projecting roofs, and the elegant open verandahs.

"The present design of a Norwegian modern timber-house presents a large and more than usually comfortably arranged residence in the country. One now is in course of erection at Osterdalen will form the main building in a large group of houses. The floor will be fitted with English tiles to harmonize with the high wainscoting and the painted ceiling. In one of the broken corners of the large parlour is an open fireplace for use in the mild weather in the spring, and in the other a stove for the severe cold in the winter. Wainscoting of wood is arranged here as in the other rooms, and the ceilings are of ornamental woedwork. In the dining-room the side-board is constructed in the wall, which has a small opening through which the dishes are passed direct from the kitchen.

"The house is entirely built of 7 in. timber, outside and inside, covered by deals to resist the cold, which a well-built timber house fully does. The floor beams of the first floor project, after old Norwegian custom, 12 in. out over the ground floor, and support the upper walls. Through this, variation and ornamentation are produced in the elevation, giving the exterior a striking appearance. The high pointed arches of the verandahs under the projecting roofs assist also in this, and thus depth and a fine variety of light and shade are obtained. As a rule, the Norwegian timber houses are light and elegant, and produce by their warm and bright color an attractive appearance. At the same time, they are strong and cheap. The price of the timber is low, and the rates of wages are low, so it is possible even for people not so well off to inhabit a good and handsome house. For this reason," says Mr. Lowzow, "I recommend these timber houses for use in England, to have the houses built in Norway and sent here by steamer, where they can be easily re-erected. The total cost of a timber-house will favorably compare with the cost of a brick house, besides being a much more healthy and comfortable abode."

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* writing on June 2nd, says :—The weather still continues favourable for the loading of the spring fleet, and the first batch of ships, with a few steamers, have already sailed, and as winds have been favorable for good passages, vessels will be commencing to drop in rapidly on your side by the time this reaches your readers. An average tonnage of ships seemed to have arrived at Skutskar, Sundswall and the Angerman River, but the arrivals to date at Gefle, Soderhamn and Hudikswall districts are considerably under the tonnage of last season. The diminution in large steamer cargoes to London, Hull, &c., accounts for the reduction in tonnage.

I mentioned a month ago that a reduction of 20 per cent. in the number of logs cut last winter in the Sundswall and Hernosand districts, as compared with the output of the two previous seasons, was the generally received opinion of the producers, and from further inquiries made have no reason to alter the figure given, which, in my opinion, is within the mark. I have also had reports from the Gefle district, to the effect that the diminution in the get of logs last winter, as compared to winter 1881-82, is equal to a total of 13,000 standards of sawn wood in the case of the large companies alone, while a reduction of 30 per cent. in the case of the smaller concerns is well under the reality. I hope to give you the result of observations in the Ljusne and Soderhamn districts in a subsequent letter.

Floating operations have been prosecuted with a fair amount of success during the last three weeks, but complaints are now rife of want of water in the smaller streams, and without being a pessimist, it is quite clear that the present season will be a much worse one than the last in a "floating" sense. It is asserted that the reserve of snow on the mountains is much less in proportion than what fell on the coast last winter, and consequently that the so-called "fell flood" will be less in volume and of shorter duration than usual. Be this as it may, there is little doubt but that the certainty of a smaller supply of logs than last year, in conjunction with the late spring, has already exercised a curbing influence on the production, which will, in all probability, be some 70,000 standards under 1882 for the district north of Dal River.

At the late meeting of the Hudikswalls Travaru Aktiebolag, a dividend of 10 per cent. was declared for 1882, and a considerable amount carried to reserve. The position of the concern in question has much improved of late years and it now takes a high rank amongst similar establishments. The profits of most of the other large saw-mill companies in Sweden were last year very satisfactory, and altogether it was one of the best seasons the trade have had. This year the result will be much less favorable, not only for producers, but for the middlemen, both on your side and this. At least one English firm of the latter description *speculated* very heavily last autumn.

A SAWYER ON SAWS.

Having served in the capacity of sawyer for a number of years, says J. G. Kinder, in the *Artisan*, of Cincinnati, I have naturally arrived at certain conclusions, some of them at variance with those generally accepted. First, I have no use for end-play in a saw-mandrel : would like for some one to give a good reason why he considers end-play of any use. I have no use for a slotted saw. No one contends that a slotted saw will make better lumber than a solid saw, if the latter is cool. I have no use for a hot saw. When it gets hot, better put the slot in the filer—that is where the trouble lies. I have no use for inserted toothed saws. Have seen a good many fancy kinds of saws, and from the immense quantity of profanity they have caused to be thrown on an unprotected atmosphere, I get my solution of the cause of the great cyclones in the west in recent years ; and I am pretty certain that it is some new wrinkle that I have not heard of that is causing, in pretty much the same way, high waters, Wiggins' storms, etc.

I have no theories to advance against their use. I only feel that a solid toothed saw is good enough for me ; and there is no tool made on earth, to my eye, that is as pleasant to look at as a circular saw with that keen, whistling cut, wading through big knotty logs, and standing up to the work like a giant. Every sawyer, I presume, has certain little peculiar ways of managing saws. I have only one crotchet of my own that I will make particular mention of, and I will give your readers the benefit of it, provided, by trying it, they will find it a benefit.

It is pretty clear to me that, no matter how true a saw will run when sharp, you can not always keep them just that sharp, and they are inclined to waver to one side or the other, and this tendency must be overcome with the guides. Now, I file my saw with a very slight inclination to the board ; in running, the saw bears slightly but invariably to the inside guide pin. As the saw gets duller, it may incline to cut the board slightly scant. By screwing up the inside guide this tendency will be overcome ; and if the saw becomes very dull it may heat at rim, which is a very good sign to file. Now if the saw, instead of having tendency to the board, was inclined to the log, as it became duller, the outside guide pin must be screwed up to overcome this tendency as in the other case, but with the most serious consequenses : because you are only forcing the edge of saw temporarily out of its true line, and not the collar or middle of the saw, as there is only about one-sixteenth of an inch clearance for log past centre of saw. And if, in order to make the saw stand up to the work, you have guided the edge one-eighth of an inch out of its true place, it brings the log right against the saw. About this time you will see some blue smoke coming out of the cut, be sending a man to the pond after water to cool the saw, and in a short time will find that some artist has painted in fast colors several little patches of sky-blue scenery all around the collar of saw ; after which comes the time for the scientific filer to step in, for I claim it takes very little science to run a true saw. But when you have a kinked saw, from heating at the collar or otherwise, then it does take a scienced hand to control it ; there is no rule I known of to control an untrue saw, only the general one for a filer to put a kink in his filling to suit the kink in his saw. The better plan would be to have both saw and sawyer hammered.

SAWDUST.

Mention was made in these columns recently of cork brick, which are light, strong and sound-proof. The *American Architect* suggests that a similar concrete might be made of sawdust, and if the sawdust could be furnished cheaply (in Boston) it is of opinion that such a concrete would probably find an extensive application, deafening floors and partitions, casing water pipes and furring brick walls. If sawdust costs too much for concrete in Boston, it certainly does not at northwestern lumber producing points ; and the cost of transportation of sawdust brick would not be heavy. It is somewhat remarkable that sawdust has not been put to some general use. Some attempts have been made, but one by one the experiments have dropped out of sight. A year and a half ago, or thereabouts, a gentleman began the construction of a machine in this city for the compression of sawdust into fuel, railway ties, &c. The machine worked satisfactorily, but all at once nothing was heard of the invention or the inventor. Whither they have flown is unknown. Other attempts to make sawdust into fuel have been made, but after a flourish of patent rights on the processes, and a good deal of loud talking the schemes have amounted to nothing, so far as supplying fuel is concerned. It is a pity that so much of the timber that the millions of saws chew up should lie and rot. The mill men are crying that it be removed from their sight. It is generally the biggest white elephant they have on their hands. Senator Ingalls, who professes to believe that there is not enough timber in the country to furnish fuel for its inhabitants to exceed fifteen years, ought to go right to work and invent a way to burn sawdust. If he is particularly interested in the protection of our forests such an achievement would amount to a great deal more than swashy talk. If he would do this he would at least get a reputation of being practical, something that his talk about the exhaustion of our forests would never lead one to suspect. The timber yearly converted into sawdust in the United States would make not less than 2,000,000,000 feet of lumber. To make this amount of lumber would require 15,384,615 logs six feet long and 16 inches in diameter. If these logs were placed end to end, they would reach from Boston to San Francisco 13½ times. In other words, the sawdust made in the United States every year, if in logs, would build a solid log fence across America from east to west 18 feet high. That certainly would be a good deal of a wood pile. Now let the men who are feverish because in a few years they expect we will have no timber from which to cut lumber, to say nothing about fuel, in 10 or 15 years, go to work and utilize this sawdust, if they want their names handed down to future generations as public benefactors.—*Northwestern Lumberman.*

THE AUSTRALIAN TRADE.

Messrs. Gemmell, Tuckett, & Co.'s report, dated Melbourne, April 11th, says :—Since last issue the Easter holidays have intervened, causing a check to business, but notwithstanding this deliveries from the storeyards continue unabated for actual consumption. Dealers report an excelleut demand for all descriptions of building materials, and certainly the result of late harvest and splendid prospects of the pastoral and other staple interests of the colony fully warrant the belief that the demand will continue during the balance of the current year at least.

American lumber : At the sales ex Grandee, S. F. Hersey, &c., prices realized are in advance of late rates. Stocks held by the trade are light, and we look for an advance at future sales. We quote for Michigan clear pine, £20 15s. to £16 2s. 6d. ; Canada do., 1¼ to 4 inch, £12 7s. 6d. to £17 10s. ; w. p. shelving, £9 to £11 15s. ; w. p. ceiling £7 5s. to £9 12s. 6d. ;

per m. feet super according to quality. Norwegian and Scotch flooring: At the sales of cargoes ex Zenobia, Marco Polo, &c., rates realized are somewhat in advance of those obtained last month, and we look for further improvement shortly. We quote for 6x1$\frac{1}{3}$ red t. and g., 10s. 9d. to 11s.; 6x1$\frac{1}{3}$ white, 10s. 6d. to 10s. 9d.; 6x$\frac{7}{8}$ red, 9s.; 6x$\frac{7}{8}$ white, 8s. 9d. to 9s.; 6x$\frac{3}{4}$ red, 7s. 6d.; 6x$\frac{3}{4}$ white, 7s. 6d.; 6x$\frac{5}{8}$ red beaded, 7s. 6d. to 7s. 3d.; 6x$\frac{5}{8}$ white do., 6s. 9d. to 6s. 6d.; 6x$\frac{1}{2}$ red do., 5s. 9d.; 6x$\frac{1}{2}$ white do., 5s. 9d.; 4-out red and white weather boards, 5s. 9d. to 6s. per 100 feet lineal.

Messrs C. S. Ross & Co. say:—A fair amount of business has been done since last report in nearly every line of building materials, and prices generally have slightly advanced. The deliveries from the yards for consumption have fallen off, and the trade report a smaller business than that done for the previous twelve months. Money for building operarions can be obtained at reasonable rates, but the demand for tenements is not so active, and speculative building has declined. The store in store yards is very heavy, and a large portion will be in hand to meet the shipments from the Baltic of the coming season. The recent arrivals have been the Andora, Brenhilda, Loch Ness, Eivion, Essex, Sikh, Marsala, Siren, and Hornby Castle, from the United Kingdom, with flooring laths, &c., Vanadis, from Frederickstadt, and Callao, from Soderhamn, with red deals, flooring, doors, laths, &c., and others.

OTTAWA VALLEY NOTES.

Mr. Thomas Mackie's square timber made on the South River and Sturgeon last winter, was safely towed over Lake Nipissing to the C. P. R. siding for loading. In all there will be about 5,000 pieces, nearly two thousand of which is board timber. It was expected that the first train load of this timber would leave the siding on Wednesday last for Papineville where it will be unloaded and rafted up, Mr. Mackie having now a gang of men at that point. It is expected that should cars be supplied, two hundred pieces could be loaded per day. The general average of the whole cut will be about sixty feet.

It is said that the Scotch Syndicate intend driving the timber loose to the Des Jacobims, where it will be rafted up. Messrs. W. R. Thistle and O. Sills have a large number of logs on Centre and Carty Creek, Pettewawa, which cannot be got out this season owing to low water.

The saw logs are beginning to come down at a more lively rate.

Yesterday the steamer C. O. Kelly passed down with a large tow.

So far this season no less than five men have been drowned in the Black river alone. Of these, one was in the employ of Messrs. Fraser & McCoshen, one in the employ of J. R. Booth, one in the employ of Mr. Murray, and one in the employ of Hamilton Bros.

Mr. James C. Armstrong, manager for Barnet & Mackay, has arrived at Eganville. He reports that Messrs. Barnet & Mackay's drive will be there in about ten days if the weather is favorable.

Captain Young's drive commenced running out into the Ottawa at the mouth of the Pettewawa several days ago.

Perley & Pattee's drive on Chalk river has arrrived at Burned Bridge.

Mr. John Rowan is getting out all his drive. He had over 20,000 turned into the main Schyan last week.—*Pembroke Observer, June 8th.*

MONTREAL NOTES.

The *Gazette* of June 15th, says:—The local demand has been fair although not equal to that of a year ago, when it was exceptionally brisk. There is not much lumber arriving, which is rather a favorable feature than otherwise, as stocks in the city are already large. The only American inquiry reported is for ash. Laths are steady at last week's rates, and it is thought they have reached bottom, although they are still 10 to 12c. per M. above prices ruling a year ago. There has been an advance in the price of pine lath in Boston, where they have sold up to $2.50@2.75 per M. The export trade is commencing to show more activity, and we hear of charters being made to load lumber for the River Platte, of the barque Wolfe, 940 tons, at $14.50, and the Peter Crerar, 628 tons, at $15.50. There is a brisk export movement in deals. Two ships have just been chartered for London at 67s. 6d. The Deodarus is loaded with deals for Swansea and the Polstjernan with deals for Hull. The vessels Wimmera, Cupid, August, Leffler, Latona, Carla and Lorna Doone are now loading. The following vessels have been chartered to load at Montreal: Soy, Guelph, Murlet, Tiviot and the Bolivia to load at Three Rivers. Contracts have been given out for the construction of the new basins to be built above the present one, for the accommodation of the lumber, cordwood and coal interests. The work will be pushed forward with despatch, as improved facilities for meeting the increasing business of the port in the lines referred to are greatly needed.

STANDING PINE.

When the amount of standing white pine timber in the country is considered in connection with the annual production of lumber, it becomes apparent that without an unforseen, unexpected and disastrous business panic amounting to a veritble cyclone in its baneful influence, unsettling all values, there can be but very little prospect of any further decline in the price of white pine lumber, either in the near future or thereafter. The supply of standing timber is gradually and swiftly being reduced, and the demand is rapidly and constantly on the increase, while the capacity and number of mills keeps full pace with the demand. The effect of this increased demand and constantly decreasing supply is perceptible in the enhanced value of pine stumpage within the past few years. Standing timber which could have been purchased in Michigan less than a decade ago for $2 per thousand would to-day command from $5 to $7; and when we consider that a very material portion of it has changed hands at the latter price, within the time specified, it becomes apparent that any material reduction in the price of lumber must involve serious loss to the holders thereof, to which they would not be very liable to submit, as withholding the same from the market for a time, involves no expense further than the taxes on the lands, and such action must inevitably, by the action of the inexorable law of supply and demand, re-establish prices. Only one conclusion can therefore be arrived at in a consideration of this question, and that is, that the price of white pine lumber must be maintained. —*Lumberman's Gazette.*

NORTHWEST TIMBER LANDS.

Information is to hand going to show that the Canadian Northwest is going to experience a boom soon in the sale of timber land. A large number of American buyers have recently invaded that section with capital, and are making selections of the best tracts that are more easy of access.

The timber of that country, or at least the portion of it fit for lumber manufacture, has as yet been very little drawn upon. Hitherto lumbering has been little more than a system of culling from the best districts within easy reach of Winnipeg. The lower portions of Lake Winnipeg were, until very lately, the only locality where operations were carried on to any extent, and these have only recently been supplemented by cutting in the Lake of Woods country. As yet the vast timber fields on the upper Lake Winnipeg, where the finest spruce limits in the Northwest are known to exist, are almost untouched, although the establishing of a more extensive system of navigation on that lake is all that is necessary to bring these timber lands within easy reach of the Manitoba lumber market. It can scarcely be expected, with the present system of rapid development and ever-increasing demand for lumber which is now going on in the Northwest, these timber resources will long remain untouched, and it is just possible that American capital and American enterprise will soon assist much in their development. A number of lumbermen from this side of the line have been visiting the section around Lake Winnipeg, and it is expected that regularly organized parties will soon explore the country in that neighborhood and report on the prospects.—*N. Y. Lumber Trade Review.*

Chips.

NINETY-THREE thousand acres of land were planted with timber in Kansas last year.

THE low water this season in the streams around Rainy Lake and the Lake of the woods in the Debateable Territory, has very materially interfered with lumbering operations, and it is said will diminish this year's cut 30,000,000 feet.

THE Kingston *Whig* of June 11th, says:—Yesterday the biggest cut of timber for the season was accomplished at Gilmour's mill, Trenton. In ten hours 347,000 feet of lumber were cut. This is at the rate of 35,000 per hour.

AN Ottawa despatch says that a considerable quantity of square timber is passing through the Chats and Chaudiere slides. It is somewhat above the average, and timber-men are under the impression that prices will be good this season.

A HANDSOME maple planted by the Prince of Wales in 1860, a Canadian oak planted by Prince Arthur in 1869, and a Scotch fir planted by Princess Louise in 1882, are among the attractions of the Horticultural Gardens at Toronto.

FEW people are aware, or even stop to think, how much lumber is consumed in car-building. It is estimated that there are 400,000 cars in the United States, and, as three thousand feet in round numbers are used in the construction of a car, it follows that the cars that are rolling around the country represent 1,200,000,000 feet of lumber.

CULTIVATION should at all times be given to young trees to keep them in healthy growth and free from weeds. Where they have been set in rows it is a good plan to plow a light furrow towards them at the end of the season, this is called laying them by, or putting them to bed; it protects them from heaving and provides for the outflow of surface water.

THE *Monetary Times* says that a company of Montreal gentlemen consisting of Messrs. R. Hersey, M. Babcock, J. E. Rasin, W. F. Hutchins, E. R. Whitney and G. F. Cleavland, is being organized to engage in the manufacture of barrels, kegs, &c., under the corporate name of the Tomlinson Patent Barrel Company. The capital is to be $100,000 in shares of $100 each.

THE Glasgow correspondent of the *Timber Trades Journal* of June 2nd, says that in the list of arrivals here for the week will be noted the first of this season's imports of Canadian deals, several shipments having arrived per steamers—altogether 45,250 pieces. There has been no auction sale yet of any of these fresh arrivals. The yarding of them is going on busily meantime. The arrivals of spruce deals during May have been very heavy, amounting to 118,039 pieces, and the total since the beginning of the year is 192,555 pieces. Last year, at corresponding date, the total was 140,000 pieces.

SPEAKING of pitch pine, a correspondent of the *Timber Trades Journal* says:—"All along the west coast of France this class of wood goods is coming more and more into use. Not only for parqueting, but even for joinery and carpentry, it is rapidly finding favor. The pitch pine flooring has one great advantage over that from the north of Europe, viz., greater durability, and being free from knots, it has a finer aspect. The price is about the same as that from the northern countries, and an improved consumption of this wood may be auticipated. In Spain there is also a fair consumption of this class of wood goods."

THE Bristol correspondent of the *Timber Trades Journal* says that an auction sale of spruce deals (comprising about three cargoes) was held at Bristol on Wednesday, May 30th, by Messrs. Booth & Co., of Gloucester, Mr. Abraham Booth acting as auctioneer. The sale took place in the saleroom of Messrs, King Bros., at Canon's Marsh. There was a large attendance of buyers, and every lot was sold. The competition was fairly spirited, and the prices realized ranged from £6 17s. 6d. to £7 15s per standard, averaging all around a trifle over £7 2s. 6d. For lower port deals these prices must be considered satisfactory.

THE Selkirk *Herald* says:—Mr. G. H. Bradbury, general manager of the Northwestern Lumber Company, returned from Bull Head Bay, Lake Winnipeg, on Wednesday last. While in Selkirk he called at the *Herald* office, and in reply to enquiries stated that a raft of logs, containing about 400,000 feet of lumber, was ready for towing across the lake, and that he expected the Colville would start out for that purpose in a day or two. Mr. Bradbury had a very rough experience on his way in. He came in a canoe, and had to lay up the day after starting on account of the ice. When the lake was clear he resumed his journey and crossed the water in the storm of Tuesday, having a very exciting and dangerous voyage. Mr. Bradbury is looking well, and camp life apparently agrees with him.

THE Keewatin correspondent of the Winnipeg *Commercial* says:—The water is very low in the lakes, and all mill owners complain of the scarcity of power. Mr. Hall, of the Northwestern Telegraph Company, has been in town for the past week, looking for cedar telegraph poles. The steamer N. Mosher, Captain McMurdie has brought in three tows of logs and one tow of telegraph poles during the past week for the Keewatin Lumber Company, Messrs. Dick & Banning's drives, on Grassey and Pine rivers are lying up for the want of water, and will not come out this season, unless heavy rains come on during the summer. The steamer Lillie Macaulay, with a tow from Hungry Hall for Dick & Banning, was caught in a storm in the Grand Traverse and had to abandon the raft. The logs were all swept into Buffalo Bay, and are a dead loss, as it would cost more than they are worth to collect them again.

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily and honorably. Address TRUE & Co., Augusta, Maine.

Market Reports.

MONTREAL.

From Our Own Correspondent

JUNE 25.—There is a good demand for laths which are scarce both in Ottawa and in this market, and the price has advanced about 50 cents per M, the quotation now being $1.75@ $2.00 with every probability of another rise shortly. Ash is in good demand, and very scarce; desirable quality cannot be had under our outside quotation. There is not much dry wood in the maket just now, and there is not any demand for green. The general demand has not been good, and our quotations, though unchanged, are weak. Export trade is beginning to show rather more life. Two vessels are at present loading for the River Plate and a third is in port and will begin to load for that destination as soon as her cargo is discharged. We quote prices ex yard as follows :—

Pine, 1st quality, ₩ M	$35 00@40 00
Pine, 2nd " ₩ M	22 00@24 00
Pine, shipping culls, ₩ M	14 00@16 00
Pine, 4th quality deals, ₩ M	11 00@12 00
Pine, mill culls, ₩ M	10 00@12 00
Spruce, ₩ M	10 00@13 00
Hemlock, ₩ M	9 00@10 00
Ash, run of log culls out, ₩ M	20 00@25 00
Bass, " " ₩ M	17 00@20 00
Oak, ₩ M	40 00@50 00
Walnut ₩ M	60 00 100 00
Cherry, ₩ M	60 00@00 00
Butternut, ₩ M	35 00@40 00
Birch, ₩ M	20 00@25 00
Hard Maple, ₩ M	25 00@30 00
Lath, ₩ M	1 75@ 2 00
Shingles, 1st, ₩ M	3 00@ 0 00
Shingles, 2nd, ₩ M	2 50@ 0 00

FREIGHTS AND SHIPMENTS.

Shipping for South America has begun, although there have been no clearances as yet. The last vessel taken up for the River Plate was at $15.50. The rate to the United Kingdom is steady at 67s. 6d. The shipments from this port since last report up to date have been as under: To Liverpool, SS Quebec, 7,838 pcs deals; SS Sarnia, 12,694 pcs deals; SS Parisian 12,225 pcs deals; Bk. Bolivia, 49,500 ft deals; Bk. Cupid 553,417 ft deals. To London, per SS York City, 11,057 pcs deals; Bk. Wimmina, 36,609 boards, 13,165 deals and 2,036 pcs deal ends. To Plymouth, Bk. Echo, 3,736 pine deals and 112 ends. To Swansea, Bk. Deodarus, 5,989 pcs deals. To Bristol, SS Somerset, 9,156 pcs deals. To Cardiff, Bk. Casta, 10,818 pcs white and red pine, 680 pcs white deals. To Hull, Bk. Latona, 12,213 pcs white deals and 739 pcs deal ends.

LIVERPOOL MARKET.

Advices by last mail state that the market is sadly wanting in animation and for some articles prices are easier. Spruce deals have been sold at £7 2s. 6d. per std. ex quay, both by private bargain and by auction. American walnut was placed at 4s, 6d. to 6s. 9d. ex quay. Quebec square white pine 1s. 7d. to 2s. 5d. per cub. ft. Quebec red pine 1s. 3d. to 1s. 8d. Quebec 1st quality pine deals £21 to £22 per standard.

CORDWOOD.

There has been no improvement in the domand, but as the imports are still very limited, they are sufficient in the present state of business to keep prices about steady. Notwithstanding the endeavor by the coal dealers to raise the price of that article it is still relatively cheaper than wood, which would require to fall considerably lower to induce people to purchase to any extent.

TORONTO.

From Our Own Correspondent.

JUNE 23.—The lumber trade from the yards and over the docks is extremely quiet at present, consequently there is little worthy of record to give you. The docks are piled up full with lumber, and a considerable quantity remains on cars waiting for shipment. So that unless shipments are soon made a large portion of the R. R. Company's rolling stock will be tied up for want of sufficient room to pile it on the docks. The quantity of really good lumber coming forward is small compared with previous years, owing, doubtless, to two causes. First, the price offered by dealers on the other side for clear and picks will not induce holders of dry stocks to send forward; secondly, owing to the late starting of the mills this season none of the new cut is yet in a fit condition to ship. The quantity going forward to Manitoba is not as large as was anticipated previous to the opening of the navigable season. The reason for this is not hard to define. Manitoba has become largely self-supplying; therefore, any lumber now sent from here has to compete with that manufactured on the spot. Still, in spite of this home competition, with reasonable freights through from the Georgian Bay a considerable quantity of lumber will find its way from there to the Northwest Territories.

The Midland and Grand Trunk Railway Co.s have so arranged matters between themselves so as to admit the shunting of cars to Parkdale without charge, as formerly, which will prove beneficial to all concerned, and if the former company would go a trifle farther while they have their hand in and give dealers somewhat lower rates from Midland to this city, it would not come amiss. Eight and a-half cents per hundred weight for lumber for the distance travelled is considerably higher than it ought to be; 7½ cents would be ample rates and at the same time confer quite a boon on dealers and consumers alike.

Although trade from the retail yards is dull there does not seem any tendency to cut on figures hitherto demanded. Shingles and lath are quite firm at former quotations. Manufacturers hold out stiffly for 2.35 per M. for 16 in. shingles at the mill, so that it can easily be seen that $3.00 per M is not out of the way at all when delivered from the yards.

WINNIPEG.

From Our Own Correspondent.

JUNE 19.—Before quoting prices in the principal northwestern lumber market, a brief description of the building methods and the different kinds and grades of lumber would be in place.

The scantling frame is the usual style of construction for wooden buildings. This is set on a timber foundation, resting on oak posts sunk in the ground, stone being very costly. The sills of some houses are several thicknesses of plank laid flat on the prairio. The lower floor is always double dressed, sheeting is first laid upon its joists, on this is laid one thickness of tarred building paper which cuts of dampness and cold air currents from below. On this is laid the floor proper, usually of dressed pine ⅞ in. x 6 in. or 4 in. tongued and grooved. This would be considered thin in Ontario, but the wear on floors seems not quite so great here, the absence of grit in the soil no doubt accounting for it. Good average buildings have always a course of dressed sheeting on the outside of studs, then a course of plain building paper, then the siding 6 in. x ⅞ in. tongued and grooved similar to flooring except that the shoulder of the joint on tongued edge is entirely cut away in the form of a broad concave chamfer. This makes by far the best outside wall. It is solid, neat and tight, not penetrated by either rain or snow. The old fashioned thin siding and the perpendicular board and batten style are almost unknown here. There is a small quantity of re-sawed siding with thick and thin edge; its cheapness is its only recommendation. It is but little used. Roofs are of all varieties and styles. Tin is pretty freely used on flat and mansards. There is an American pressed iron slate or shingle which is used on the faces of mansard roofs, which appears to be neatly adapted to its purpose. A course of the usual tarred building paper is spread on the sheeting and upon it the shingles are generally laid.

In those mushroom towns that elevate their heads on the prairie in a season, if not in a night, there is a poor chance for the plasterer and painter. The inside walls, ceilings and partitions are of dressed lumber. The walls and ceilings are generally done with a kind called ship lap, about 6 in. x ⅞ in. Its name comes from the half lap joint with which it is made. The partitions are of narrow boards planed and beaded on each side with tongue and groove.

The lumber sawed here is of the exact size, that is, a 10 in. board is just 10 in. wide and barely 1 in. thick. With regularly manufactured lumber in Ontario it would be 11¼ in. wide and 1⅛ thick. That is what we sell to the Americans. When we buy from them in the Min neapolis or St. Paul market the bare size is all we look for and we do well to get it.

The extra dimensions of Ontario siding and the odd foot of 13 feet lumber is about as good as wasted in this market.

The prices to builders here are as follow:

Common boards	$28 00@00 00
Sheeting	25 00@00 00

BOSTON.

Cotton, Wool and Iron of June 23, says:—Trade is of fair proportions and the range of genoral values keeps along pretty steadily. Eastern lumber is held at about previous prices, with a moderato enquiry. Western pine seems to hold it own. Southern pine shows rather a firmer undertone at the low prices ruling of late. Hardwoods are in fair demand for desirable selections, with no particular change in values.

CHICAGO.

The *Northwestern Lumberman* of June 23rd, says:—The arrivals of cargoes at this port for the week ending on Wodnesday were a little in excess of thoso of the week previous, numbering up to 252. A large proportion have also stopped at the sale docks. On Monday, always a great market day, when the wind has been favorable, there was a numerous fleet on the market, the cargoes going off rather slowly, but steadily. Big fleets followed on Tuesday and Wednesday, so that the market hardly had time to recover its wind, as it were, after its effort to unload tho heavy offerings on Monday. The week thus far has been one of plethora, while buyers have been apathetic about taking hold. On Wednesday particularly, the market was very quiet, a limited number of buyers being in attendance, and the few present having a poor appetite for lumber. There were largo offerings of shingles, which were neglected and weak. The tone of the market generally was characterized as "soft" by both buyers and sellers, and inclined to sag fully 25 cents below last weeks figures, short piece stuff selling often at $9.75 that last week brought $10, desirable stock running 20 per cent. to 18 feet and upward, generally selling for $10, with an occasional cargo containing 50 per cent. long stuff brought $10.50. Long timbers continue to be a drug, and sell for $11.50. Some cargoes of piece stuff, having an objectionable percentage of "spindling" lengths, have sold for $9.50. The expression of the commission men and buyers being unanimous that the market was soft and sluggish, leads to the inference that the figures quoted are the top notch, and that some transactions may have taken place on private terms at lower figures. The tendency since Monday has been to give a slight advantage to the buyer.

NEW YORK.

The *New York Lumber Trade Review* says:—We would be most happy to report a favorable change in the condition of the general market had we the facts to back such a statement, but in the absence, we are obliged to chronicle the same position of affairs that we have reviewed for some weeks past. The demand for the season is exceedingly slow and uncertain. An occasional bill will make its appearance on the market, but when it does a brisk competition is encouraged and the result is it goes low. The tone of the market continues easy, in the absence of the

usual summer trade. Prices are favorable to buyers, but this fact does not serve to stimulate interest, as purchases are only made in accordance with actual wants, and this line of policy laid down will not seemingly be overstepped.

Spruce has been received in more liberal quantities, and with some little anxiety to work off the increased stock, consignees have been obliged to modify slightly their previous prices. Sales of ordinary random cargoes have been made at $13, but at the close this quotation was considered rather low, as the market having been cleared, the inside price named for anything afloat to arrive was $13.50, while up to $15.50 was asked for strictly desirable lots.

BORDEAUX.

The *Timber Trades Journal* says:—Some of your readers may be interested in knowing the present state of this market, but though I cannot write much of an encouraging nature, there is a better prospect from the fact of the splendid weather we are enjoying, which imparts new hopes for the near future, and promises a good harvest, which is much needed. The last few months have really been a period of entire stagnation, though the season did not open so very badly. Fair prices were paid by the leading firms, but, instead of being contented with the results thus obtained, the sellers continued to press their stocks, thus giving the smaller houses opportunity to buy at even cheaper prices, and causing the larger ones to lose confidence.

What has surprised the timber trade here has been the firmness on the part of the spruce shippers, or rather their unwillingness to accept the prices offered by the importers; but the former have gradually given way, and now offer to close business at something like 7s. less than their opening quotations, but which sum the buyers here are not even prepared to pay.

CARDIFF.

The *Timber Trades Journal* of June 9 says: The timber market here remains far from satisfactory. As far as we can learn, very little has been done with the Baltic during the past week. One lot of from 400 to 500 standards of deals has changed hands, but the exact price, although not yet disclosed, is not believed to point to any improvement. Steamer charterers are holding out strongly at 33s. 6d. from the lower Baltic ports. From Quebec there is almost nothing being done. In the pitwood market overstocking seems to be still the order of the day. French and Scotch fir are selling freely at 17s. 6d. to 18s., which means a severe loss to the importers, when we say that prices at Bordeaux are maintained at about 14s., free on board.

LONDON.

We take the following from Messrs. Churchill and Sim's London circular of June 10th:—The stock of wood in the docks on the 31st May was—foreign deals and battens, 3,545,000 pieces, against 4,150,000 in 1882 and 3,767,000 in 1881; pine and spruce battens, 935,000 pieces, against 1,309,000 in 1882 and 1,681,000 in 1881; on the quays, 267,000 pieces, against 368,000 in 1882 and 259,000 in 1881; boards, 5,565,000 pieces, against 7,328,000 in 1882 and 4,483,000 in 1881; total, 10,312,000 pieces, against 13,155,000 pieces in 1882 and 10,190,000 pieces in 1881. The delivery from the docks from the 1st of January has been to June 2, 1883—foreign deals and battens, 4,573,000 pieces; pine and spruce battens, 1,158,000 pieces; boards, 4,571,000 pieces; to June 3, 1882—foreign deals and battens, 4,594,000 pieces; pine and spruce battens, 1,401,000 pieces; boards 4,790.000 pieces; to June 4, 1881—foreign deals and battens, 4,852,000 pieces; pine and spruce battens, 1,563,000 pieces; boards, 4,435,000 pieces. Or in cubical contents to June 2, 1883—sawn wood, 84,896 P. S. H.; prepared boards, 15,265 P. S. H.; timber, 44,467 loads to June 3, 1882—sawn wood, 88,773 P. S. H.; prepared board, 16,876 P. S. H.; timber, 40,211 loads; to June 4, 1881—sawn wood, 97,355 P. S. H.; prepared boards, 15,010 P. S. H. timber, 41,356 loads. The market in the past month has been lifeless, there having been but little demand either for the landed stock or for cargoes to arrive.

The *Timber Trades Journal* of June 9, says: Messrs. Churchill & Sim's forthcoming sale will be interesting from the fact of the catalogue including several parcels of Gefle deals of this season's shipment from one of the leading mills over there, some of which are for absolute disposal, besides other clearing lots from this port of favorite brands. There are also several lots of deals, &c., from Dickson's ports for those who hold to the reputation this shipment has so long enjoyed. In respect to other descriptions, the Quebec pine, ex Red Jacket, without reserve, is likely to prove attractive, and in anticipation of the forthcoming shipments, which cannot be here for several weeks yet, ought to meet with plenty of bidding. The recent heavy sales of Fredrikstadt flooring have apparently not diminished the confidence of sellers in the ability of the market to go on consuming, and several such cargoes are distributed over the pages of the catalogue in the usual marketable sizes. Oak wainscot and sawn white oak planks as well figure amongst the unreserved lots, and a good assortment of pitch pine timber makes the sale altogether a specially attractive one, presenting an opportunity to the trade to suit themselves with almost every description they require.

LIVERPOOL.

The *Timber Trades Journal* of June 9th says:—Trade remains in a quiet condition all round, and the quays and wharves wear an aspect the reverse of animated. This, however, is not unusual at this time of year, seeing that the import season will soon be upon us, and many buyers refrain from putting their orders in the market until it has fairly commenced, and others are deterred from operating so late in the half-year.

The import for the past month, as we have reported from week to week, has been light. In pitch pine, both hewn and sawn, it is less than half the quantity imported in the corresponding month of last year, and the supplies of spruce also show a large decrease when compared with the same period. The demand for these articles, however, appears to have diminished in like proportion, leaving the stocks of timber but little below those of last year, whilst the stocks of deals of all kinds, flooring, &c., are in excess.

Prices continue low, and so long as the present condition of trade continues they are likely to do so. On all sides we hear complaints of the unsatisfactory state of the building trade, and until it assumes a more healthy tone it is useless to look for any marked improvement.

GLASGOW.

The *Timber Trades Journal* of June 9, says: The wood market here does not give the indications of briskness that might be expected, looking at the activity that prevails in the shipbuilding trade and the improved condition of housebuilding shown by the advance of a half-penny per hour given last month to the house joiners. On the contrary, it is rather dull for most descriptions of goods. There is an opening for birch and walnut logs, of which the market is comparatively bare. The large cargo of lower port birch that was recently brought to auction, as noted in the *Journal* of the 26th ult., is now all cleared out of first hands.

The public sale held at Greenock on the 31st was well attended. Of the goods offered, a large portion belong to a wrecked cargo (sold without reserve), and some portions were more or less damaged or chafed, so that the prices realized must not be taken for the market rate.

WASTE IN SAW DUST.

The Winnipeg *Commercial* says:—In the vast country extending from Lake Superior to the Rocky Mountains, in parts of which timber is plentiful, and in other sections of which fuel is scarce, the question of utilizing the enormous quantities of sawdust produced in the lumber districts as a source of fuel supply is one deserving of attention. The immense lumber cut of our mills every season will produce a quantity of sawdust, which if it could be made subservient as fuel would go a considerable way towards solving the problem of how our western country is to be supplied. Upon this subject the *Lumberman's Gazette* of Bay City, Mich., says:—"The timber converted into sawdust by the circulars on the Saginaw river is a very important consideration, and amounts annually to millions of feet, and any invention which would be successful in saving any considerable portion of it and still compete in the amount of lumber produced would be a rich bonanza to the inventor, equal to an interest in the best flowing oil well or the richest silver mine in the country. Necessity is said to be the mother of invention, and as the forests disappear and timber becomes scarce, the necessity for economy becomes more and more apparent, and it is not beyond the range of possibility that great accomplishments in this direction are in store for the future."

SPEARING FOR TIMBER.

A new industry has recently been developed in Ireland—a sort of timber prospecting never dreamed of by our American pine hunters. It is a well known geological fact, says the *Northwestern Lumberman*, that immense tracts what are now bog lands in Ireland were once covered with forests of oak and pine, and that in cutting peat, immense trees of these varieties are found embedded in the earth at depths of ten, twenty and thirty feet, in many cases whole groves being found standing just as they grew. To find out the location of these miniature subterranean forests is now the speculative work in which some industrious Irishmen are engaged. The timber, when brought to the surface, is found to be perfectly sound, and the oak, which is as black as ebony, is used extensively for ornaments of jewellery and fancy cabinet work, and sells at a high price. A recent visitor to the wild moor and mountain region of Donegal thus describes the way in which the seekers after burried forests operate. Two men, armed with steel rods about thirty feet long, traverse the bog, and by running their rods into the ground are able to ascertain where the trees are to be found. They work by what may be termed natural mathematics, and quickly determine the length of their prize, its approximate diameter, whether it is pine or oak, and is or is not a clumper—one of a company or clump. They fix on twenty or thirty feet square, and cross it with their searchers, say north and south, and then east and west, search it across each way, a stab to each foot or so, and in the course of a few minutes they know whether that area contains what they are looking for. The square lying next and next, and all near each other, are so searched, and the discoveries, if any, marked for future action. The unprodnctive are also marked, to avoid future loss of labor.—*Scientific American.*

WOOD WORKING MACHINERY.

The question is often asked, will the machinery, especially wood-working machinery, of one hundred years hence embody any special advantages not possessed by the most improved tools of to-day? In some particular tools there is undoubtly room for improvment, while in others perfection seems to have been attained. Many so called improvements are only such in name, and there are those who claim that the planing machine for instance, is no better to-day than ten years ago, and hence is not liable to be improved upon to any great extent. In saw mill machinery there is room for improvement, noticeably in the direction of closer economy in the production of lumber. As our timber becomes scarcer these improvements will gradually assume shape.—*Wood Worker.*

Convincing Proof.

Having suffered from rheumatism for a long time I was indnced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to buisness, thanks to your wonderful medicine.

I am yours truly,

MINNESOTA LUMBERING.

Respecting the drives in Minnesota, the *Mississippi Valley Lumberman* gives the following information :

"The Prairie River logs have been abandoned probably for the year. There have been no logs got out of the Big Swan River drive so far, and the water is low and falling. Unless heavy rains occur in a very few days it will also be deserted. The main upper Mississippi drive has commenced to run at Aitken ; the jam at Pokegama Falls having been broken, this drive will come in O. K. The lower Willow, including Quadno and Moose, are running into the Mississippi, and no fears are entertained but they will come. The upper Willow is coming hard and in sad need of rain to make the work easy. No logs out of Split Hand, but the boys are working like beavers to bring them. One drive on Sandy Lake can be had if it seems to be needed, but lower Prairie, Tamarac and Sandy rivers are all very low, many logs will be hung up. It is reported that some 18,000,000 or 20,000,000 feet of logs off the waters of Platte River are in Rice Lake, but upper Platte and Hillman drives are stuck. The main East branch of Rum River is safe on present water. The rear of main East branch drive is below Princeton and most of the logs are in Anoka boom. There is no news from the West branch drive, beyond the fact that a half crew are on the river working, but cannot get out unless there is heavy rains. The probabilities are that this drive will be hung up."

QUEBEC.

A correspondent on June 14, says :—This season of navigation has brought a considerable increase both in numbers and tonnage of shipping to our port as compared with last year, and business generally is good. One great drawback is the scarcity of skilled men to load the vessels, many of them having left the city. This large fleet is fast using up the stocks of square timbor which our merchants wintered over at the several coves, and the new timber now on its way to this market will no doubt meet with ready sale at remunerative prices. Deals have been slow of sale so far this season, although within the last few days two mill cuts of spruce have been disposed of. Joly's, of Lotbiniere, sold at $41.75, $26.75, $24.75 and $19.75, for firsts, seconds, thirds and fourths, respectively, f. o. b.

The *Chronicle* of June 15th, says :—Notwithstanding that we have a large number of ships loading, our merchants are, generally speaking, well supplied, and do not show any inclination to purchase. One new Ottawa raft, belonging to Messrs. A. & P. White, has arrived, and two or three others are reported to be near at hand. We understand there has been more enquiry for deals, owing to the large shipments which are being made, and the general opinion seems to be, that prices will be well maintained for the present.

HALIBURTON, ONT.

From Our Own Correspondent.

Shingle and Lumber Mills.—The new shingle mill of A. Sperry, of Peterborough, is now ready to run, and he has a lot of logs to start with. They were brought up the stream as there is no current. They are very fine logs for shingles. The mill is fitted up in first class style ; the mill proper is 30x60 feet, two and a half storeys, an engine room 20x30 of one storey. A lean to to the main building about 12x30 for the drag saw, which is on the ground floor, where the logs are cut in blocks and split and taken up stairs by an endless chain. The lower floor of the mill consists of sawdust carriers, and all the shatting except one line of shaft is over head on the lean to that drives the two Perkin's patent shingle machines and the Covel saw sharpener, made by Wm. Hamilton, of Peterborough, which are on the second floor, also a circular saw for ties and lumber, a saw to trim the shingle block and four saws for jointing shingles. The two shingle machines are of first class make, and are under the management of John Belleghem, of Peterborough, who has been with Mr. Sperry for a number of years. The jointing and packing machines are under the control of Messrs. H. and A. Dunn, of Peterborough. The circular saw has not started to run as yet, as men of the right stamp are rather scarce, in fact what men are at work in the mill come from Peterborough. Haliburton may be proud of having such a mill in the village, as it has increased the population by about forty people, young and old, and there must be still more, as it will take about 25 or 30 hands to run all the machinery in the mill. Haliburton is located on a very pretty lake called Head Lake on the north branch of the Burnt River. At the north end of the village, Mr. Irwin has a water saw mill, one circular saw, double edger and trimmers, which turns out over 30 M of lumber per day ; and alongside we have a grist mill which does all the gristing for the surrounding country.

YOUNG'S POINT, ONT.

From Our Own Correspondent.

The Drives.—Mr. Geo. Chalmer's drive arrived here on Thursday last, consisting of 36,000 peices. After sorting out here, the pine logs are to be driven down to Hilliard's mill to be cut into market lumber. The cedar logs and ties will be cut at the saw mill here. Mr. P. Cassidy is foreman, and he has a good gang of men. The cook and cookery are second to none on the river for clealiness and good food.

The Drives in Eels Creek.—The two remaining drives in Eels Creek are getting on splendidly. Messrs. Ullyott & Saddler havo a large number of saw logs and about 45 men. Mr. Barr foreman. Mr. Geo. Chalmers has a large quantity of saw logs and square timber ; he has 20 men, A. Wynn, foreman. They have done well and expect to be at the mouth of the Creek, in Stony Lake, if all goes well, in about two weeks' time, when the two firms will assort out their respective logs. From what I can learn these two drives have made tho best run that has been made on Eels Creek.

Large Saw Log Drives.—Messrs. Rathbun & Son have three large drives lying here ready to run. This firm has a great quantity of stuff to pass through here this summer. They employ a great many men. Mr. Erwin, of Nassau Mills, has a large drive of saw logs, 18,000, and, 4,000 peices of square timber, ready to run over the dam here. Mr. Douglass is forman.

The Water.—The water is very high for this season of tho year and is still rising.

The Sawlog Drives.—Messrs. Ullyot & Saddler's and Mr. Geo. Chalmers' respective drives of sawlogs and square timber arrived at the mouth of Eel's Creek, on Friday, June 15th. A. Wynn, foreman for Mr. Chalmers, has brought his sawlogs and square timber, a distance by water of 75 miles, and he has accomplished this inside of three weeks. Mr. Barr, foreman for Messrs. Ullyot & Saddler, is also to be congratulated for his success. No doubt his employers will say he is a good man for this work, as he has driven nearly tho samo distanco as Mr. Wynn. The two firms aro now busy assorting their respective logs at tho mouth of the creek in Stony Lake, where they will make a start for their saw-mills. Mr. Burke, foroman for Messrs. Ullyot & Saddler, is now ready to run over here with 30,000 fino sawlogs for the Harwood steam saw mills. He has been detained here for a few days with head winds and by Messrs. Rathbun's drivo which was ahead of him.

Square Timber.—Mr. Irwin, of tho Nassau Mills, is going to have all his square timber that has been cut back of Haliburton, brought down those waters and shipped at Lakofield. In previous years he had it shipped at Lindsay.

WASTE IN SAWDUST.

The Winnipeg *Commercial* says :—In the vast country extending from Lako Superior to the Rocky Mountains, in parts of which timber is plentiful, and in other sections of which fuel is scarce, the question of utilizing the enormous quantities of sawdust produced in the lumber districts as a source of fuel supply is one deserving of attention. The immense lumber cut of our mills every season will produce a quantity of sawdust, which if it could be made subservient as fuel would go a considerable way towards solving the problem of how our western country is to be supplied. Upon this subject the *Lumberman's Gazette* of Bay City, Mich., says : "The timber converted into sawdust by the circulars on the Saginaw river is a very important consideration, and amounts annually to millions of feet, and any invention which would be successful in saving any considerable portion of it and still compete in the amount of lumber produced would be a rich bonanza to the inventor, equal to an interest in the best flowing oil well or the richest silver mine in the country. Necessity is said to be the mother of invention, and as the forests disappear and timber becomes scarce, the necessity for economy becomes more and more apparent, and it is not beyond the range of possibility that great accomplishments in this direction are in store for the future.

LOST IN THE WOODS.

A very sad accident took place at St. Rose a few days ago. One Joseph Desjardins, a laborer of the place, left the village about a week ago for the woods, some five miles off, for the purpose of felling trees. He had been for some time absent, when the villagers, at the request of the family, instituted a search for him. After much trouble, the unfortunate man was found lying at the foot of a tree, with two large wounds on his head, and in an insensible condition. He seemed to be dead, but upon closer examination was found to have life in him. He was conveyed home with the greatest care, and is now in a very weak condition, and little hopes are entertained of completo recovery. When he regained consciousness, Desjardins told those around him that he had been felled to the ground by the falling of a tree upon him. On trying to reach home, he was exhausted by loss of blood and fell down at the foot of the tree were he was found. He remained there two days and two nights, exposed to a pouring rain during several hours, without food, and bleeding. He had heard tho villagers calling him on the first day of the search, but was too weak to answer, Desjardins, as has already been said, is very poor, and has a family of five children.

A YEAR WITHOUT A SUMMER.

During a cold spring like that which is just now drawing to an end, people generally console themselves with the reflection that the sun will eventually get the victory, and that summer will certainly come at last, though its coming may be delayed. Uncertain as the weather is, the general features of the seasons recur with a regularity which warrants the confidence thus reposed in the annual return of seed-time and harvest ; but there are instances on record in which even the seasons seem to have lost their characteristic features, as if the ordinary laws of meteorology had been temporarily suspended. A remarkable case of this kind, and one which the long continued cold weather of this spring makes particularly interesting just now, is that of the year 1816, which has been called "the year without a summer." A communication printed in the *Congregationalist* gives the following summary of the weather of this remarkable year :

January and Feburary were mild : March was cold ; April began warm, but ended in snow and ice. Ice formed an inch thick in May, and fields were planted over and over again till it was too late to replant. June was the coldest ever known in this latitude ; frost and ice were common. Almost every green thing was killed ; fruit nearly all destroyed. Snow fell to the depth of ten inches in Vermont, seven in Maine, three in the interior of New York, and also in Massachusetts. There was a few warm days. It was called a dry season. But little rain fell. The wind blew steadily from the north, cold and fierce. Mothers knit extra socks and mittens for their children in the spring, and woodpiles that usually disappeared during the warm spell in front of the houses were splendidly built up again. Planting and shivering were done together, and tho farmers who worked out their taxes on the country roads wore overcoats and mittens. In a town in Vermont a flock of sheep had been sent out as usual to their pasture. On the 17th of June a heavy snow fell in New England. The cold was intense.

A farmer who had a large field of corn in Tewskbury built fires round it at night to ward off the frost ; many an evening he and his neighbors took turns watching them. He was rewarded with tho only crop of corn in the neighborhood. Considerable damage was done in New Orleans in consequence of the rapid rise of the Mississippi River. Fears were entertained that the sun was cooling off, and throughout New England picnics were strictly prohibited.

July was accompanied with frost and ice. Indian corn was nearly all destroyed, some favourably situated fields escaped. August was more checrless, if possible, than the summer months which preceded it. Ice was formed half an inch in thickness. Indian corn was so frozen that the greater part was cut down and dried for fodder, Almost every green thing was destroyed in this country and in Europe. On the 30th snow fell at Barnet, forty miles from London. Very little corn ripened in New England and the Middle States. Farmers supplied themselves from corn produced in 1815 for seed in the spring of 1817. It sold at from $4 to $5 per bushel.

September furnished about two weeks of the pleasantest weather of the season, but in the latter part of the month ice formed an inch thick. October had more than its share of cold weather. November was cold . and snowy. December was comfortable, and the winter following was mild. Very little vegetation was matured in the Eastern and Middle States. The sun's rays seemed to be destitute of heat during the summer, and nature was clad in a sable hue, and men exhibited no little anxiety concerning the future of this life.

The average price of flour during the year in the New York market was $13 a barrel. The average price of wheat in England was 97 shillings per quarter. Bread riots occurred throughout Great Britain in 1817, in consequence of the high price of the staff of life.

Big Trees.

To give some idea of the magnitude to which some of the cypress trees attain, which are cut on the river above and brought to this market, I will state that two weeks since I surveyed a raft that came from Calhoun County (Louis Refoe), four logs of which were sawn from one tree and scaled as follows :

36 in. diameter,	16 feet long,				1,024
38 "	"	"	"	"	1,156
40 "	"	"	"	"	1,296
42 "	"	"	"	"	1,444

Making a grand total of 4,920 feet—Doyes Rule. The top log was perfectly sound, and all of the best quality of white cypress. There was not a knot visible on the surface of any of them. The lowland forests contiguous to the river and tributaries abound in similar monsters, and it only requires capital and enterprise to unlock these treasures of wealth.—*Apalachicola Tribune.*

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

DR. FOWLER'S

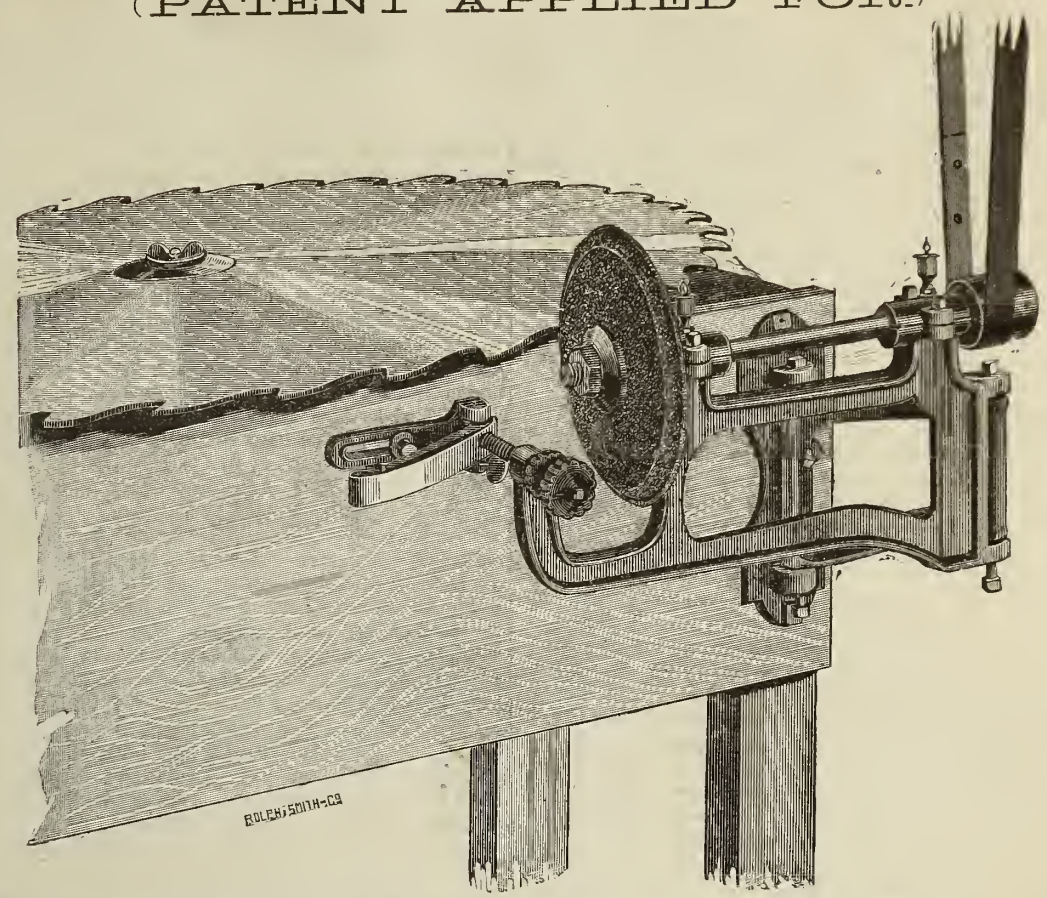
ROGERS' SAW GUMMER

(PATENT APPLIED FOR.)

No Heating!

Quick!

Simple!



Exact Work!

Cheap!

Complete!

POSITIVE STOPS! ADJUSTABLE GUIDE! Every Tooth made exactly alike!

JUST WHAT IS WANTED in every Saw-mill in Canada!

A REVOLUTION IN GUMMING SAWS WILL BE EFFECTED WHEREVER

ROGERS' SAW GUMMER

Is Introduced to replace Burr Gummers, or Grindstones, or where Emery Wheels have been run in the usual way. Every Machine Guaranteed to work as represented or No Sale. *It works EASILY; is so SIMPLE and COMPLETE that Sawyers can keep their Saws CONSTANTLY in FIRST-CLASS ORDER and thus LARGELY INCREASE the DAILY OUT-PUT.*

Price Complete, with Countershaft - - $40.00.

HART EMERY WHEEL COMPANY, Limited

HAMILTON, CANADA.

☞ Manufacturers of **HART'S PATENT EMERY** and **CORUNDUM WHEELS.**

NEW YORK LUMBER FREIGHTS.

The Ottawa *Citizen* of June 20, says:—It will be remembered that the American captains struck this spring for $4 per thousand on lumber to New York and $3.75 to Albany, to which the mill men had to accede, but very reluctantly, being 50c. per thousand more than they had calculated on. In order to conciliate the feeling and work harmoniously, it was unanimously resolved at a meeting of the boatmen held in the company's offices, 23 South street, New York, on Saturday, the 7th instant, to establish the following rates:—

Ottawa to Burlington and Whitehall	$2 25
" Troy and Albany	3 50
" New York	3 75

Twenty-five cents extra on strips to Albany and New York. This is acceptable to the Ottawa mill men, and shows that the boatmen are desirous of doing what is right and do not wish to take advantage of their customers. The boatmen are thoroughly organized under a charter in New York State, and are styled the "Northern Boatmen's Transportation Company." The company comprises a carrying capacity of about five hundred (500) boats of about one hundred and fifty tons each. Their affairs are managed in New York by Mr. Geo. F. Hastings, 23 South street, their agent in this city being Messrs. D. Murphy & Co.

It is most satisfactory that an amicable arrangement is arrived at between boatmen and lumbermen, and the association will now have the hearty good will of American men generally.

HANDLING LUMBER.

Here is some good advice for saw mill men. It is furnished by a correspondent of the *Southern Lumberman*: When the lumber is taken from the saw by the off-bearer, never allow it to be thrown down, but lay it down carefully, and keep up this rule every time it is handled until placed in the car for shipment. When lumber is bulked down, always put each length down in separate piles, for instance, 10 feet lengths in one pile, 12 feet in another, and so on; this prevents splitting from exposure. When different lengths are piled together in a bulk as it comes from the mill, the result is that the ends of the longer boards crack, and thus the value of the lumber is reduced. Have your lumber properly trimmed before it leaves the mill, bad ends cut off square; rip out all hearts, even if by so doing you get a three-inch clear strip from each side. These strips are more valuable if clear and straight than the whole board with a bad heart in it, besides, you save the expense of handling so much surplus wood. Having your lumber properly trimmed and assorted as to lengths at the mills, keep it that way all the time while hauling, piling on sticks, hauling to cars and shipping, and never allow your men to handle fine lumber roughly, but in piling, loading on cars or waggon, hand the boards carefully from one to the other, and lay them down easily. You will make money by this, even if it requires one-third more men to do the work; the increased price that your lumber brings will pay all this extra expense and leave you a handsome margin besides.

BRAZING BAND SAWS.

The Hoyt & Bro. Manufacturing Co., of Aurora, Ill., gives the following directions for performing this operation.

File the ends of the band on opposite sides, to form two wedged shaped ends, having a lap of say ¾-inch long, which, when laid with their bevelled and filed sides together, shall form a good joint of the same thickness as blade. Now clamp the ends on a piece of board, with the back of the blade toward you, with the lap brought fair together. Cut a piece of "silver solder," large enough to cover the lap, lay it between the lapped portion with a little pulverized "borax." Now, having a piece cut out of your board, say three inches wide, directly under your lap, heat your soldering tongs to a bright "cherry-red," and hold them pinched firmly on the lap until the solder flows freely from under the joint, then cool off the tongs and soldered portion of saw by pouring water upon the same, without relieving the pressure until nearly cold. Try a file on both sides the blade, and should it be harder than the other part of the blade, reheat your tongs a little, and draw the temper by pressing the tongs upon the hard portion of the blade till partially heated, but not upon the lap, as it will weaken your joint. File off the solder and joint to the same thickness as other parts and the soldering of your band is completed.

COOPERAGE STUFF.

Handlers of cooperage stuff in this city comment seriously upon the character and quality of much of the staves, heading, etc., that is offered or shipped to this market. In many cases the manufacturers of the stuff do not understand their business sufficiently to turn out a product that is desirable or even available. Some owners of mills seem to imagine that if a lot of staves and heading is chopped out in a cheap way it is sufficient, and often they are not particular about the quality of the timber used. This is not gencrally the fact, but it is true to too great an extent. Instead of an indifference among users of packages as to the quality of the stuff to go into them, there is, on the contrary, a most rigid system of inspection applied. A Chicago commission man would not dare to send a car-load of stuff to a Minnesota consumer that did not come within the proper range as to quality, knowing too well that it would be useless, for the stock would be mercilessly culled. Before buying stocks of a producer to furnish to the trade catered to by Chicago operators, assurance is always wanted that the manufacturer knows what to send, and will turn that knowledge to proper account. Numerous inquiries regarding the placing of stocks are received in Chicago, to which little attention is paid, because the commission men are afraid to touch the product of a mill which they know nothing about. Improperly made stuff is disposed of by hook or crook, generally being supplied to local consumption, for there are apt to be coopers who are no more particular than the unskilled manufacturers of raw material. But at such a point as Minneapolis, to which a large amount of stock is annually shipped from Chicago, there is little demand for poor stuff. All this points to the necessity for the utmost care in studying the wants of consumers of cooperage material, and an earnest endeavor to meet those wants. When the markot is dull inferior stuff has but little show, for if stock is wanted it is easy enough to get what is good.—*Northwestern Lumberman.*

RAFTS ARRIVED.

The *Chronicle* gives the following list of rafts, etc., arrived at Quebec:—

JUNE 14.—Henry Connolly, deals, Mill cove.
Thos. Duck, white pine, &c., sundry coves.
A. Fraser & Co., timber, Clint's wharf.
E. L. Kelsey, staves, Point-au-Pizeau.
Jas. Gibson, jr., birch, South Quebec.
John S. Murphy, elm, &c., Indian cove east.
Wm. Simpson, birch, &c., Hadlow cove.
A. & J. White, white pine, &c., St. Lawrence docks.
Jos. Bolduc, deals, Mill cove.
JUNE 21.—Joseph Bolduc, deals, Mill cove.
Malcolm McDougall, white pine, &c., St. Michael's cove.
Peter McLaren, white pine, St. Lawrence Docks.
J. J. Calvin & Co., elm, &c., Point-au-Pizeau.
J. J. Calvin & Co., oak, &c,, sundry coves.
John McRae & Co., timber, Indian cove west.
D. C. Thompson, staves, Bridgewater cove.
Flatt & Bradley and D. C. Thompson, staves, Bridgewater cove.
Wm. Simpson, birch, Hadlow cove.
A. Fraser & Co., white pine, &c., Clint's wharf.
Hilliard & Dickson, pine, &c., St. Lawrence Docks.

LOGS AND LUMBER.

Last week the *Lumberman* contained an extract from the Tonawanda, N. Y., *Herald*, that uttered a bitter complaint of the decline and threatening collapse of the saw-mill industry at that point, on account of the high cost of logs. The complaint alleged that the operators who raft logs from Lake Huron to Tonawanda have squeezed the millmen to the point of bankruptcy by charging exorbitant prices for logs delivered, several of the manufacturers having failed, and the remaining ones barely holding out, while they are making nothing. In the *Herald* of the suceeeding issue a "timber" dealer, as they there call the men who trade in logs, takes issue with the complaint, and denies that the high price of the raw material at Tonawanda is the result of excessive value placed on it by the dealers. He says that the reason why logs cost more in Tonawanda than formerly is because they cost more at the stump. He cites the alleged fact that those mill owners who have undertaken to get their own logs from the woods and raft them to Tonawanda have made a failure of it, while those who have devoted their care and capital exclusively to their mills have succeeded. "The truth is," the timber dealer proceeds to say, "the enormously increased price of stumpage, amounting to over 400 per cent. in the last few years, together with the excessive price of labor and supplies to carry on the business, is what has embarrassed the timber trade, and not the excessive profits imposed by the timber dealers." And, he adds, "the writer has well nigh quit the business for this reason." So it seems that the trouble is thrown back on the stump and the cost of labor and supplies. It is the same that the Michigan manufacturers complain of; the high price of stumpage and labor, that oblige them to ask so much for the product of their mills that there is no margin left for the trade. It seems as if either stumpage were too high or else assorted lumber were too low. A just relative level will have to be reached sometime in the very nature of things.—*Northwestern Lumberman.*

VENEERS.

This may properly be called the age of veneers. At any rate the art of veneer making has been brought down to a fine point. As adept as the grainer is, his business has fallen into disrepute, and there are prospects that in the future there will be no great demand for him. Not many years ago pine was the leading finishing wood, but now, in the finer class of houses, it is crowded out. Hardwood for inside finishing is the thing, and ingenious man has studied the problem, how to make the finishing present the appearance of being solid hardwood without being so. This effort is not one of the most laudable, for at the present time the cost of hardwood lumber is so low that if a man builds for durability, he certainly ought to feel able, if able to build at all, to use solid lumber. But so long as he will not always, the veneer makers step in and supply him with a substitute. The perfection of veneers that are turned out is remarkable. It was not long ago that the kinds of veneers were few, but one by one the different woods have been added, until now they are numerous. The veneers are cut remarkably smooth, requiring but little finish brfore being oiled or varnished, and made as thin as a hundred and seventy-five to the inch.—*Northwestern Lumber man.*

Across Lake Winnipeg.

The Winnipeg *Times* of June 19th says:—George Bradbury, the general manager of the Northwest Lumbering Co. has just returned from a trip across Lake Winnipeg from Bull's Head. At this point a raft of 300,000 feet of square timber was taken in tow by the steamer Colville, and was carried safely across and was safely landed at Selkirk. The trip was made in four days, the greater part of the time being spent at the mouth of the Red River, the water being too low to get across the bar without great difficulty. This is the first raft ever towed across the lake, and the timber is for the saw mill of the company at Selkirk.

THE *Timber Trades Journal* of June 9, says: It would have been astonishing if the fine clear weather and strong northeast winds which have prevailed for the last ten days or so had not brought into London a numerous fleet from the Baltic, for, in fact, the early spring shipments may now be considered due, and these are some of them. Fifty-four timber vessels would sound large enough for any week of the year, but no week would be likely to bring in a greater number than this, because everything favored the arrival in good time of every Swedish sailing vessel that had got her loading by May 20th and some from Norway much later. The import season may be considered fully on now, and we must expect a longer list of arrivals than we have lately been accustomed to record.

THE Toronto *Globe* says:—In a paper by Mr. Charles Gibb on "Trees and Shrubs of Northern Europe and Asia," in which he records his observations on forestry and horticulture in the fruit growing areas of the Russian Empire, the author alludes to the lack of botanic gardens in Canada. These institutions are to be found throughout Europe, even in Russia and in most of the tropical and other colonies of England, for the interchange of botanical products growing in similar climates. "That this great Dominion of Canada," he says, "which stretches from the Atlantic to the Pacific should be without a botanic garden or a series of such gardens, is a fact without parallel in British colonial history.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

$500 Reward!

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C. WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. FOR THE

Canada Lumberman

FOR THE FOLLOWING REASONS:

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☛ TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

PORT ARTHUR TRADE.

The lumber business at Port Arthur seems to have grown like a mushroom in a night. Two weeks ago lumber could not be had here for love or money, and now you can get any quantity of it. Since the middle of May there has arrived here, on different vessels, about 2,500,000 feet of lumber, the principal portion of it being for the Northwest. But this is only a beginning of what is to come. The barge Lothair, Capt. Symmes, with her consorts, the Staubenzie and Corrisande, have a contract for landing here, from Parry Sound, for Ogilvie & Co., of Winnipeg, 6,000,000 feet of lumber, to be used in building elevators in the Northwest. After this contract is completed he will probably continue all the season. They carry about 1,000,000 feet each trip, and it is estimated that they will land here during the season about 10,000,000 feet. G. A. Priest, who has opened out in the lumber business here, will also do an extensive business. He will have vessels running here regularly with lumber, which he will ship to the Northwest. It is estimated that he will ship through Port Arthur several millions of feet. Graham, Horne & Co., of this place and Fort William, also have their fleet of vessels, which will be constantly employed in bringing lumber here for the Northwest trade. Their shipments will go into the millions. We have heard today of another large lumber yard that will shortly be opened out here by a Mr. Wells, of Winnipeg. We understand he will go into the business on a large scale, and will ship several million feet to the Northwest during this season. With these large lumber firms operating here, it will be safe to estimate that between 25,000,000 and 50,000,000 feet of lumber will be transhipped at Port Arthur this season. And still business in this line is only beginning. The coming events are casting their shadows before, as it were. Where now are the people who a few weeks ago asked what we were going to do with our docks? The vastness of the trade that will eventually go through Port Arthur can scarcely be estimated at the present time.—*Herald.*

SAW MILLS IN THE DOMINION.

The business of sawing timber gave employment in Canada in 1881, as we learn from the census returns of that year, to 41,509 persons in 5,390 mills, at an average wage of about $200 a year each. The value of the logs sawed in that year is placed at $20,798,000, and the wages amounted to $8,146,000. The value of the product is placed at $38,569,000.

The census enumerators have located the 5,390 saw mills in operation in 1881 as follows:—Ontario, 1,761; Quebec, 1,729; Nova Scotia, 1,190; New Brunswick, 478; P. E. Island, 165; Manitoba, 37; British Columbia 27, the Territories 3.

The number of hands employed was: In Ontario, 16,846, of whom 69 were women and eight girls under ten years. In the province of Quebec 12,461 hands, of whom 37 were women and eight girls. In New Brunswick 7,175, of whom 20 were women and eight girls. In Nova Scotia 4,160 hands of whom 34 were women. P. E. Island returns 419, British Columbia 404, and the Territories 44 employes, making a total of 41,569 persons.

The following are the statistics of the annual wages, value of raw materal and value of these 5,390 saw mills arranged by provinces:

	Yearly Wages.	*Raw Material.*	*Products.*
Ontario	$3,581,223	8,985,797	16,629,075
Quebec	2,237,191	5,101,884	10,542,649
New Brunswick	1,243,628	4,355,735	6,532,826
Nova Scotia	549,480	1,446,858	3,094,137
Manitoba	208,190	513,158	885,173
British Columbia	202,420	223,961	550,321
P. E. Island	58,262	127,194	240,153
Territories	17,000	43,802	95,318
Grand total	$8,146,996	20,798,389	38,569,652

Figures of shingle manufacture are not included in this table—the Provinces standing as follows in the product of the shingle mills:—Ontario $154,803, New Brunswick $128,714, Quebec $98,130, Nova Scotia $69,344, P. E. Island $10,406, British Columbia $5,597. Commenting on the return the Montreal *Herald* says:—"The art of shingle making was either not understood or remained uncultivated in Manitoba and the North-West up to 1881. Doubtless in the manufacture of lumber of all descriptions great strides have since been taken in that quarter."—*Monetary Times.*

THE LAKE OF THE WOODS.

We take the following extract from the Montreal *Herald's* report of the interview of a reporter with Major Lewis:—

"Is there a good timber country east of Winnipeg?" was asked by the *Herald* representative.

"Not until you reach," Major Lewis replied, "the Lake of the Woods or rivers and lakes connected with it. Of course, Lake Winnipeg is renowned for being plentifully supplied with spruce, but, in order to get red or white pine, you must go to the Lake of the Woods or east of it, and then it is only found in very small quantities, and in groves or bunches."

"Is the timber of large size such as we usually cut in Ontario?"

"By no means," the Major answered, "but I think it is sounder and better, although smaller, and will average, *per centum*, more stock lumber.

"Why is it that there are complaints about the want of lumber if the timber is there as you say."

"In the first place because millions upon millions of the timber have been burnt, I think chiefly on account of the carelessness of travelling Indians lighting fires. Some people think that the destruction has been caused by lightning. This may have occurred in some localities, but it never could have caused such wholesale destruction as has taken place, as the country shows evidence of. In the second place, on account of the great expense that pertains to the getting out and manufacture of timber, aside from the fact that there is no permanency in the present regulations, that would justify a capitalist in investing his money.'

"Are there any facilities at or near the Lake of the Woods for the manufacture of lumber?"

"Yes, we have at Rat Portage on the Canada Pacific Railway, mills, steam and water power, as fine as there are in the world, with all the latest improvements."

"Does Rat Portage possess any natural facilities for manufacturing purposes?"

"It not only possesses an immense water power, which is now being used for a large paper mill, but, I have been informed, will, in a very short time, be utilized by the Hudson Bay Co., for the working of the largest grist mills in Canada. In addition, I may say, that Rat Portage is destined to be the watering place of the whole great Northwest. There will be many who will go to Port Arthur, which in my opinion, will be the Chicago of the Northwest, but for real pleasure, canoeing, boating, tenting and fishing, the Lake of the Woods is *par excellence* the place there."

HEAVY IN HEMLOCK.

F. Shaw & Bros., with headquarters at Boston, are said to be the greatest manufacturers of hemlock extract and tanners in the world. They own seven tanneries in Maine, an equal number in Canada, besides six large establishments in Maine and New Brunswick, for the manufacture of hemlock extract. Two years ago, they owned or controlled 14 tanneries in Canada, but, as bark grew scarce they gradually closed their works there, until but six are now in operation. The location and capacity of their tanneries, as given by the *Mining and Industrial Journal*, of Bangor, are as follows: Grand Lake Stream, 700 vats; Kingman, 550; Vanceboro, 500; Jackson Brook, 400; Forest City, 300; Lincoln, 200; Princeton, 100; total capacity, 2,700 vats. Their extract works in No. 39, near Burlington, consume 8,000 cords of bark yearly; in Houlton, 5,000 cords; Sherman, 6,000; Woodstock, N. B., 7,000; two sets of works on the St. John river, 6,000 each; total, 38,000 cords.

The same authority says: The tannery at Grand Lake Stream is said to be the largest in the world. The buildings consist, first, of a drying house for the leather, 80 feet square and eight stories high. Connected with and running north from this is the building containing the 700 vats, which is 600 feet long and 80 feet wide. Adjoining this is the bark mill, leach room, and furnace room, 220 feet long; and running eastward from the dry house is a building 225 feet in length, which contains the dry hide and finishing rooms. There are 13 steam boilers and 12 furnaces for burning the waste bark or tan. The motive power of the establishment is furnished by six water wheels and three steam engines. The works run night and day, the year round (Sundays excepted), and the premises are illuminated during the night by the Edison Electric Light. The firm has its own saw mill, which furnishes all the lumber required in the construction of its factory buildings, and also all the houses in the village occupied by its own and other laborers. It has steamers on the lake for towing its 12 scows, which bring in about 100 cords of bark daily, that which is not required for immediate consumption being stored for winter use. The bark required for tanning the leather must be got out a year ahead, and the firm has at the present time some 11,000 cords of bark—peeled and yarded in the woods last year—which it is now bringing forward in its scows for this summer and next winter use. As an illustration of a single item of expense in running this tannery, it may be stated that this bark is valued at $7 per cord. The company has a single pile of bark, up the lake, containing 4,000 cords.

This immense establishment turns out 1,000 sides, or about nine tons in weight, of finished leather every working day of 24 hours. To produce this quantity of leather requires the grinding and consumption of 40 cords hemlock bark, in connection with 15 barrels of hemlock extract, equal to 15 cords more—or 55 cords daily. South American hides are mainly used. —*Northwestern Lumberman.*

THE lumber trade of St. Paul, Minn., in 1881 was reported as having amounted to $1,348,000, and in 1882 it rose to $3,439,522, thus gaining more in one year than all the previous years of St. Paul's existence.

THE city council of Pueblo, Colo., has received a remonstrance against cutting down a cottonwood tree which is 26 inches in circumference, and probably 1,000 years old. It is regarded as the largest and finest cottonwood in the state.

A large elm tree growing at Norwich, Conn., is over 70 years old, and the limbs are 30 feet from the ground. It stands alongside a house, the chimney of which has been swept away by the overhanging branches, while the tree has raised and moved the house one foot by the force of its growth. A similar instance has occurred at Nassau, New Providence, one of the Bahama Islands. A cotton silk tree growing there has attained such mammoth proportions that it has actually lifted a large Government building.

FORESTRY IN GERMANY.

A writer in an English paper treats this subject as follows :—"Forests in Germany were originally common property, ownership of forests being unknown. Of the lands suitable for agricultural purposes each one took possession yearly of a fixed portion for cultivation. From the forests, however, each one took as much as he desired, and from wherever he pleased, excepting those groves which were set apart for religious purposes. Traces of the ownership of forests by private persons are found in the sixth century. At this stage of proprietorship, one could only claim particular woods, and prohibit the use of the same by others, unless the felling and using of the timber had actually commenced. Mr. Zimmerman, the United States Consular Agent in Berlin, states that the earliest forest properties were so-called privileged forests. By privileged forests are meant such as were the property of emperors, kings, princes, and other rulers and nobility. The privileges at first extended only to the exclusive right of hunting, fishing, etc., in the forests ; but later complete control of them was claimed, and they were appropriated by the nobility, and held as property belonging solely and entirely to themselves. In the earliest times traces of forest protection and preservation are to be found. In the middle of the thirteenth century a penalty of three 'schillings' was attached by law to the cutting of wood in a forest without permission. After the privileged forests came the private proprietorship of forests, then the county forests, and lastly the state forests of to-day. The laws and regulations under which the utilization of forests was most justly and equitably permitted, occur between the years 1500 and 1800. Proper management of forests and discretion in felling the trees first began to be practised in the mining districts. Then it was necessary to have at hand the wood absolutely required there in connection with the working of the mines, and the mine owners were compelled to preserve the existing forests. After the mining districts the forests in the neighborhood of cities and towns began to be cared for. The 'Erfurt' forest economy dates back as far as 1359. In the Nuremburg district in 1368, and in the Frankfort-on-the-Main district in 1423, the planting of the pine tree was introduced.

"The first forest schools were established in Germany about the year 1717. They were so-called high schools, in which certain district officials (Revierverwalter) were the teachers. These schools were at first self-supporting ; later, they received assistance from the state, or were made state forest schools or academies. Thus, forest academies were established at Dreissigacker in 1801 ; Tharandt in 1816 ; Nelsungen in 1816 ; Aschaffenburg in 1820 ; Hohenheim in 1820, and at Eisenach in 1830. To each of these academies three professors were detailed for duty, one to instruct in forest economy, one in natural history and science, and one in mathematics. In Baden, forest culture was added to the list of subjects studied at the Polytechnic Institute at Carlsruhe in 1832, and in 1838 the same was done at Brunswick. A chair of forestry was established at Giessen in 1825, and later also at Heidelberg, Munich, Tubingen and Leipsic. At the last three, however, because of the forests being too remote for the practical instruction necessary for a student of forest culture to have, and for other reasons, the subject was dropped. In Prussia, the incitement to the study of forestry came from the state. From 1770, on the proposition of Minister Van Hagen, lectures on forest botany were delivered at Berlin, and excursions into the forests were made for the purpose of examining on the spot the subjects treated in the lectures. In 1821 a forest academy was established at Berlin in connection with the university there. This academy was, in 1830, removed to Eberswalde, where it now is. The instructors at this academy consist of the director, three master foresters and five professors, and the subjects taught are as follows: Forest culture in general, method of forest appraisement, the manner of keeping and rendering accounts of incomes received and expenditures made on account of forests, the protection of forests, utilization of the same, and huntsmanship, history of forest culture and statistics relating to same, geodesy and draughting, mathematics, physics, and mechanics, botany, zoology and entomology, mineralogy, geology and chemistry, and Prussian civil and criminal law. Excursions are made into the forests three times weekly, and lectures and practical demonstrations are then given. In 1868 a second Prussian forest academy was established at Minden on the same principle and with nearly, if not quite. the same course of instruction. In the opinion of Professor Daukelmann, of the forest academy of Eberswalde, a re-organization of this course of study will take place within the next ten years, so that forestry subjects alone, such as preservation and cultivation of forests, botany, zoology, etc., will be taught at the forest academies, and general or relative subjects, such as geodesy, draughting, mathematics and law will be made a separate course for the forestry student at a university. Before admittance to the forest academy can be obtained the applicant must be over twenty years of age. He must also have certificates to the effect that he has passed the requisite final examinations at a Prussian gymnasium or 'realschule' of the highest grade, that he has passed examinations as *eleve* forester, and that he has a good character, and also the means necessary for his subsistence while studying at the academy. A thorough forester, in Prussia, is an adept in natural history relative to forests and their inhabitants, at the same time a geologist, botanist and chemist, and the possessor of a good general knowledge of the laws of his country. He knows every foot of land in his district, at the various stations he notes the rainfall, the force and direction of the prevailing winds, their humidity and dryness, the temperature, etc. For the encouragement and assistance given to these men by the state, the return made by them in the management of its forests interests is of the greatest value. The Prussian forestry corps at present consists of 1 chief general master forester, 3 general master foresters, 30 chief master foresters, 1 forest director in Hanover, 93 master foresters, 685 chief foresters, 3,351 district foresters, 356 forest keepers, and 70 minor officials."

THE U. S. LUMBER TRADE.

Bradstreets in a recent issue discourses thus on the lumber trade. The lumber interest of the country, second only, it says, in importance to that of iron, represents an annual output exceeding eight billion feet, of which amount Chicago, the leading market for the vast pineries that crowd the northern slopes of Michigan and Wisconsin, distributes one-fourth. The consumption of lumber tends to increase in the eastern, middle, western and southwestern states, and following on this progressive demand and augmenting cost of securing supplies is a general advance in price. The Chicago dealers testified before the Tariff Commission that the average has risen from $9.63 per thousand feet for the three years 1877, 1878 and 1879 to $11.63 in 1880, $13.92 in 1881, and over $14 in 1882. It is difficult to imagine a great industry like that of lumber suddenly arrested for want of supplies, but the most reliable authorities place the period of comparative exhaustion at fifteen years. The estimate of ten years formerly entertained was based on the amount of timber which would yield not less than 20 per cent. in grades common to fine, when government selections were neglected even at prices of $1.25 to $2.50 per acre ; and no pine timber was considered worth cutting which measured less than sixteen to eighteen inches diameter at the butt ; when the logging district of Michigan and northern Wisconsin was almost unknown, and the merchantable timber of the south, now extensively made available by railway connection, was underrated. The encroachments, however, on the pineries of the west and south-west, cannot be made good, the land being too serviceable for agriculture, while in the south crops of cotton, sugar, tobacco, corn and oats prove far more profitable than timber growing. Each year timber has to be sought further back. After damming up every available creek by which the logs could reach the rivers, logging railroads have been constructed to the water. The process of denuding lumber lands is hastened by the "butchering" going on to supply the quantity demanded by the various mills. Did lumber command a far higher price much of the timber brought to market would be reserved for further growth. It is a common saying that not one tree in four, owing to inherent defects, is suitable for logs. Anticipatory of future requirements, and with the prospect of heavy advances in price, large sections of land containing choice descriptions of white and yellow pine are, with a limited extent of hardwords, being bought up to hold by eastern and New York capitalists. Of the profitableness of such investments there can, of course, be no question. The forthcoming failure of supplies exercises no immediate effect on the market ; the probable and actual supply of each successive lumber season is the main concern of the trade, the future being left to take care of itself. The general policy of the lumber trade is to buy for the present demand, based on a large supply and in this it is pursuing the same course as last year. As to outside resources, Canada offers immense supplies. Nova Scotia and New Brunswick will long continue their exports of spruce ; Mexico, with her rich timber lands of qualities of wood suited to this market, including walnut, ebony, mahogany, oak, hard cedar, hickory and sycamore, promises in no long time to be an important source of supply, as railroads, cutting through her forest reserves, are now being rapidly built under the influence of state and government concessions.

Among the influences operating on the course of trade, and slightly affecting prices, are the rates of freight between competitive points. The opening of navigation on the lakes is always the signal for material reduction by the trunk lines between the west and east. Freights on the lakes this season are somewhat lower, while canal transportation has risen, owing to the successful demands of the boatmen for higher wages. Railroads are getting more into the lumber trade than formerly through trunk lines reaching wooded belts previously untouched, the building of new lines depending as a source of revenue on lumber traffic both for neighboring consumption and distant shipment, and the extension of tributary lines to the ever receding sources of supply.

PRODIGIOUS PINE TRANSACTION.

In this country we are becoming familiar with immente pine land transactions, and sales involving hundreds of thousands of dollars have become common occurrences. A recent sale of pine lands, however, by the Mobile and Ohio railroad is so enormous, involving three quarters of a million acres, that we give a full description of it, with the aim and purposes of the purchasers, as furnished by the *Mobile Register*, whose reporter interviewed Mr. Danner, one of the contracting parties :

"A. C. Danner & Co., have purchased," said Mr. Danner, "all the pine lands of the Mobile and Ohio road. These lands lie in the counties of Washington, Mobile, Choctaw, Clarke and Baldwin, in the state of Alabama, and in the counties of Wayne, Greene and Jackson, in the State of Mississippi. These lands comprise about 750,000 acres, extending about 15 miles on either side of the Mobile and Ohio road. Some of the land is tributary to the Pascagoula mills, and some to the Bigbee river. It is all tributary to the road which runs through them."

"What sort of lands are they ?"

"Mostly good timbered land. Along the road a good deal has been boxed for turpentine, and a small portion of the land has been cut over. The depredations have been considerable, but lying back from the road is a quantity of the finest timber in the country. All the land is rated above one dollar and a quarter an acre, and some of it is a good farming land which has been held by the road at five dollars an acre."

"What is the object in buying this vast quantity of land ?"

"My main object was to secure plenty of timber for mills. People are around picking up lands here and there, and there was danger that some day I might find myself like the negro with the pocket book with no money to put in it. I wanted enough timber to last me my lifetime, and now I have got it."

"What was the railroad's object ?"

"The railroad wanted to get rid of the land and the depredators at the one time, and it sold to my firm. We think we can stop the depredations and make those who have depredated pay for what they have taken. If we can't get the money, we can bring a criminal suit against them and against those who have received the stolen property."

"And how do you propose to utilize this vast territory ?"

"We expect to form a land and lumber company to be known as the Danner Land and Lumber Company, and will use up as much of the lumber as we can. We will build several mills along the line of the railroad, with tramways running into the heart of the best timber country. We think we can utilize a great deal of this territory." Here Mr. Danner unrolled a map showing the land divided off into sections and colored to show to what extent the purchase has been encroached upon. This map shows that about one-half of the 750,000 acres is virgin forest. A quarter has been more or less turpentined and another quarter has been more or less cut. "This is a pretty big enterprise," suggested the reporter.

"I believe," answered Mr. Danner, "that it is the largest sale of pine lands ever made to one firm. You have perhaps, an idea of the size of 750,000 acres. Well, it is a trifle less than the area of the State of Delaware and something more than the area of Rhode Island. The lumber business is becoming better systemized and the time is passing when a man with a thousand dollars and any sort of a saw mill can succeed. The mill men will have to own the timber and we are but taking a step now which in a few years will become a necessity. We shall, of course, put our other land into the company, and may consider ourselves amply provided with material."

"How much land will the company own ?"

"About eight hundred thousand acres."

THE WASTE WOOD IN SAW MILLS.

The following letter appears in the London *Timber Trades Journal* and may suggest ideas to our own saw mill owners :—

SIR,—I have machinery fitted up for the chair trade, but have not sufficient work to keep it going. It consists of a portable rack saw bench, a plain circular saw bench, 42 in. band saw machine, and lathes, all driven by steam. This is a beech wood country, but it is dear. We are fairly supplied with ash and oak of good quality, also fir. Elm is rather scarce, but it can be got at. Can you indicate to me any way by which I can manage to work full time by the manufacture of small work to use up the waste wood from the chair works? Such things as spools and reels for cotton have occurred to me. What prospect do you think there is for oak spokes, ash handles, packing cases, or toys ? In a country place like this we are not able to find out what uses and purposes wood can be applied to—Yours, &c., H. T.

[There are no doubt some of our readers who can assist "H. T.," and we shall be glad to forward any letters to him that may come to hand. This question of the utilization of the waste wood is one of great importance to proprietors of saw-mill and other wood-working establishments, and we invite correspondence on the subject.—Ed. *T. T. J.*]

A WOODEN COSTUME AT A CARNIVAL.

A very unique costume was made for the use of Mr. Charles H. Reed at the Olympian Club carnival, says the Boston *Globe*, the entire outfit of dress, boots, mask, wig and parasol being of wood. Mr. Reed wore a costume representing half man and half woman at the last carnival, but at this one will appear in full lady's attire. The chief garment is a princess dress made of various kinds of Spurr's papered veneers. It has a brocaded front and basque and trimmings of knife-plaiting, fichus and loops of wood ribbon, and it is ornamented with rosettes and leaves in wood of various shades in their natural colors. At the sides there is a substitute for embroidery in inlaid work of fancy designs. The sleeves are of cork paper, trimmed to imitate puffing, and at the bottom is a deep border of black walnut knife-plaiting The boots and gloves are of birch bark, and the mask of matched woods with a fringe of plaiting. The wig is

composed of about 100 curls, consisting of white pine shavings artistically grouped. The parasol is of Chinese pattern, covered with vari-colored veneers and similiarly lined. The effort has been made before to make a dress of wood, but without success. This attempt is thoroughly successful, the effect of the different kinds and colors of wood in the combination being very striking and artistic. The veneers are so thin that the costume is not very heavy, and so flexible that it is not liable to injury.

POSSIBILITIES OF PAPER.

An exchange says :—The daily papers notice, occasionally, some newly discovered use for paper, paper taking the place of wood in cabinet work, in joiner work, superseding iron in some instances, used for building material to withstand the action of the elements, and even for railway sleepers. Some of its recent applications are of importance enough to be recorded, but in many instances paper receives credit that should be shared by other materials. Paper, itself, is simply a vegetable pulp, mode coherent in sheets, or "boards," by the aid of glue, sizing, or similar material, and compression under rolls. It is subject to the action of moisture, and is more or less combustible. Evidently, to resist the elements and heat, it must be subjected to changes from its original character. These changes are induced by a mixture of other materials, to such a large proportion in some instances that the paper pulp is only the matrix, or gauge, holding the other substances in connection and form. Plaster of Paris, whiting, ground asbestos, and even clay, are among the materials that may be incorporated with paper pulp to change its nature, and fit it for peculiar and unusual service. Paper is waterproof by saturation in tar, and thus resists, for a time, the pelting of storms. Some descriptions of wall-paper hanging are surfaced with clay, that not only gives a glossy finish, but also makes the paper partially resistent to the action of flame. It is possible, undoubtedly, to so charge paper pulp with an incombustible material as to allow it to be used as a chimney flue. Even without the addition of foreign material, the paper pulp is formed, by immense pressure, into barrels for merchandise, the body of car wheels, and other articles requiring great stiffness combined with lightness. Paper mache, a union of paper pulp and glue, and subjected to pressure, may be made almost indestructible when the surface is defended from outward attack by a proper enamel. The possibilities of paper pulp treated for particular uses is suggested by occasional additions to its employment seen in the markets. No two uses could be more directly opposed than vessels for holding water and articles for resisting fire ; yet paper pails, wash-basins and other similar utensils are common, and excellent tobacco pipe bowls are made of paper. In the first instance, the material is defended by a water-proof paint or varnish, and in the other the pulp is mixed with ground asbestos to resist the heat of the lighted tobacco. These possibilities may be greatly extended, a paper pulp charged with other materials yields steadily to pressure in moulds, as well as to formation in sheets between rolls. There would appear to be no obstacle to its extended employment in interior house finishing as doors, door-frames, mouldings, etc., and the framing for furniture."

AN INNOVATION IN PULP MAKING.

A new machine for preparing wood fibre for pulp, invented by a Gardiner, Me., man, is described as follows :—The purpose of the machine is to shave the wood off so finely that it is ready to go into the paper engines. It takes a piece of log 12 inches in length, which is revolved at a speed of 1,000 revolutions to the minute. A sharp cutter shaves the log, taking off a shaving so thin that it would take 750 of them to make an inch. As it takes about 200 sheets of ordinary paper to make an inch, one can judge somewhat of the thickness of the fire made by this machine. The knife has a sliding motion, and gradually moves forward as the block decreases in diameter. In the first machine made, the principal trouble was found in keeping the knife sharp. As the knife became dull the fibre turned off became of uneven thickness ; but this has been remedied by an ingenious arrangement of whetstones that keep constantly at work on the knife while the machine is at work. The pulp the machine makes has not been tried upon the better class of paper, but it will work on the coarser grades, and the inventor is confident it will also be practicable on better grades. If it proves so, it will result in a great change in the manufacture of pulp. It makes it much faster, besides saving labor, and the saving in cost of transportation, the pulp being dry and therefore with no water to pay freight on, will be a good profit.—*Northwestern Lumberman.*

Mahogany Spurs.

A noticeable peculiarity of the mahogany tree, of which very few have knowledge, is seen in the numerous spurs, which are thrown out from the body of the tree, at regular intervals from the ground up the tree to the height of 12 feet or more, all of which grow downward like roots and finally enter the earth and become real roots. These spurs, often from 12 to 16 inches in diameter, are incomparatively superior to any part of the trunk for beauty of texture and color. These spurs are rarely cut by the loggers, on account of the great labor necessary, to avoid which the axemen build a hasty scaffolding of sufficient height, to enable them to cut off the tree above the spurs. So highly are these secondary roots valued for their beauty of grain and color, that of late years dealers are having them cut for the market, as an extraordinary prize. Some of these mahogany spurs have been sold for $250 per 1,000 feet, board measure, while the body of the tree brought but $40, at the port of exportation.

A Full-Fledged Saw Mill.

It is an interesting sight to witness a large full-fledged saw mill in working order. Logs come in at one end and go out of the other sawed into lumber, lath, pickets and shingles, while the refuse not worth sawing goes by means of elevators into the huge burner, where it is consumed. The slabs suitable for wood are hauled away and piled. Thus this process goes on day after day, until the close of the season, when a fresh campaign is inaugurated and crews go into the woods and chop down the monarchs of the forests, preparatory for another season's sawing. How long will this business last? Many years yet, but the day will come when 400,000,000 feet of lumber will cease to be sawed on the Menominee in a single season. Other industries ought to be started up and the resources of the upper wilds be fully utilized.—*Menominee Herald.*

A Boom Promised.

The Buffalo *Lumber World* says :—It is predicted that there is soon to be a boom in the timber lands of the Canadian Northwest. The *Lumber World* some months ago mentioned the probability that American capitalists would invest largely in Canadian timber lands, and it is now reported that American buyers are actually selecting the best and most accessible tracts of timber land in Manitoba. A thorough exploration of the section about upper Lake Winnipeg is to be made, and if its results are satisfactory, heavy purchases will probably be made. It is claimed tha the finest spruce limits in the Northwest are to be found about upper Lake Winnipeg, a section where forests have yet been scarcely touched.

Then and Now.

The Orillia *Packet* says that Mr. John Knight, Manager of the Medonte Lumber Company, and Mr. Haddon, of Fox Mead, took a saw mill from Hamilton to Fort Garry, some twelve years ago. Then they would not take the whole country as a gift, because there was no means of ingress or egress. Now the immigrant may travel from Liverpool to Winnipeg in twenty days.

We have received an admirable little work "The Woods and Timbers of North Carolina," by P. M. Hale, published by him at Raleigh, and by E. J. Hale & Son at New York. It contains a mine of valuable information and is another proof of the growing interest in such subjects. An excellent map of the whole adds to the value of the work. Such descriptions of the forest wealth of the various districts of North America would be of great public service.

M. Violette's experiments on the action of steam on wood show that certain temperatures improve the tensile strength of the wood. Thus elm obtains its maximum point of strength at a temperature between 150° and 185° cent.; oak receives an increase of strength of five-ninths, fir two-fifths, ash two-thirds, walnut one-half, the temperature in these cases varying from 225° to 150°. Other processes of artificial drying, based on a heated blast of air, have been used with more or less success.

An Ottawa despatch of July 9th says :—The lumbering business is progressing well this season. Owing to the water being so high, there was no trouble this season in drawing the timber into the main stream. The cut of square timber last winter was a very large one, and numbers of rafts are now on their way to Quebec. They will reach that market earlier this year than formerly. The demand for square timber is quiet as yet, but the market, it is expected, will revive in the fall. It is thought that not so much square timber will be cut in the limits during the next season as in the past winter.

150 FRONT STREET EAST

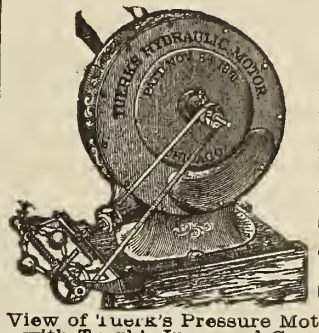
TORONTO.

FILES FOR SALE. FILES RE-CUT.

TUERK'S

WATER MOTOR.

Patented November 8th, 1881.



View of Tuerk's Pressure Motor, with Tuerk's Improved Governor Attachment.

For running Sewing Machines for families or for manufactories; also, for running Lental Lathes and Engines, Telephone Generators, Coffee Mills and Roasters, House and Church Organs; also for running one Printing Press or six, at the same time. Paper Cutters, Sausage Machines of any make or size; GRAIN, FREIGHT OR PASSENGER ELEVATORS, Straw Cutters, and all kinds of Machinery by Water Power.

HYDRANT PRESSURE.

Cheaper, Quicker & Safer than Steam

Over Fifty Motors of other makes have been taken ont and replaced with the TUERK MOTOR; among the list are the Backns, the Sabin, the Little Giant, the Hayward, Clark's Piston Engine, and others.

Names of a few who have taken ont Backns Motors and pnt in the Tuerk Motor in their place:

C. W. Meikel, Indianapolis, Ind.
Columhus Telephone Co., Columbus, Ohio.
James Egan, Chicago, Ill.
H. C. Hawkins, Cleveland, Ohio.
Printing Office, Hannihal, Mo.
A. Solmens, Hat Manufactory, So. Norwalk, Ct.
Lake Shore & Mich. So. R.R. Shops, Elyria, O.
Index Printing Office, Evanston, Ill.
Republican, Johnstown, N. Y.
Trihune, Salt Lake, Utah.
Alton Printing Co., Alton, Ill.
A. F. Worthington & Co., Cincinnati, Ohio.
Lemon & Co., Waverly, N. Y.
Braun & Jones, Cedar Rapids, Iowa.
Gates, Douglas & Co., Cedar Rapids, Iowa.
Village of Rutland, Rutland, Vt.
W. L. Randall, Chicago, Ill.
A. J. Stoll, Sandusky, Ohio.
Killits & Wayland, Chillicothe, Ohio.
S. A. Morrow, Springfield, Ohio.
R. Putnam, Chillicothe, Ohio.
N. Shelton, Omaha, Neb.
H. J. Lewelling, St. Helena, Cal., and others.

☞Do not fool your time away trying other Motors, but send for the Tuerk Motor, which is warranted to do better work with less water than any other Motor or Water Engine made.

Send for Catalogne, and state what yon want to run,—give full particulars and Water Pressnre per sqnare inch.

TUERK BROS. & JOHNSTON,

86 and 88 Market Street, Chicago, Ill.

WHAT THE BOARD OF TRADE RETURNS REVEAL TO US.

The *Timber Trades Journal* of June 16, says: In the returns under consideration there is nothing very reassuring. Nor is there much to lament over. Our imports have slightly increased, on the whole, but the timber trade is innocent of all participation in that excess, which is, however, too small to be of any importance. The total value of our imports for the month was £36,257,443, against £35,935,954 the May previous, the difference boing only £312,488, or less than 1 per cent.; whilc our exports are not materially changed either, though the difference is on the wrong side. Last May, that is in 1882, they were valued at £25,421,000, this May at £24,851,000, the difference being but £570,000 on the month, or about 2 per cent. on the total; which, when we consider that an enormous business is still doing, and that some trades fluctuate materially at different periods of the year, might easily be accounted for without signifying any general downward tendency. But unfortunately it is below the average of the previous months of the year, and must therefore be taken to prove that the favorable turn we are all looking for has not yet demonstrated itself.

The difference may be said to be accounted for entirely by the lessened value of the woollen goods exported, for, though there are considerable fluctuations in other articles, they pretty nearly neutralize each other. For instance, in metals there is a deficiency in the export of iron, tin, and copper of £260,000, but an increase in machinery of £211,000, and arms and ammunition £68,000, &c. We need only touch on the salient items and general tendency of these returns, as the particulars have been discussed by the daily press before our chance to notice them came around. It is remarkable, however, that the trade which employs the largest quantity of shipping tonnage very seldom obtains any special notice in these monthly revelations, so that what has to be said therenent usually appertains alone to this *Journal*.

If there were but a reasonable resuscitation of trade, the timber returns of the Government officials would appear sufficiently encouraging. We may account for a certain degree of business dissatisfaction by the numbers contending in almost every branch of trade, which has the effect of subdividing it into so many minor establishments that, though much is doing, few individual firms, in proportion to their staff and appointments, are doing a great deal. But when we find that the timber import of the country itself is diminishing, that, in fact, though the number of people competing in the trade is increasing, the business they do, as a whole, is smaller than it was a year ago, then it must be admitted that the dulness of trade has a deeper foundation than the number of competitors in it accounts for; and that appears to be the case with the timber interest now.

It happens, however, from the position of the trade itself, that this curtailment is not an evil at the present time. It is a consequence of the action of the import merchants themselves, and though indicating some restriction of trade, has the recommendation that it does not load them, as last year, with superfluous stock while they are still tolerably well supplied for the requirements of the country. It would be more satisfactory on the whole, perhaps, to see the trade expanding instead of pulling itself together, as the phase goes, but to find our wharves groaning under accumulations of wood goods for which the retail dealers seemed to have no room, and trade altogether more quiet than usual, would make but a gloomy prospect for the importer of the property. We might see greater figures on the import side without corresponding benefit to the merchants importing,

In May we called attention to the fact that the importation of foreign building timber up to the end of April was some 127,000 loads behind that of 1882, to the same period of the year; but the falling off in May was still greater, as the importation was short of that of May last year by 140,534 loads, so that up to the 31st. the total deficiency of the quantity imported at that date is 258,111 loads. Now this amount of timber, though very great, is not any considerable portion of the British annual supply; but, at any rate, it is equal to about 5 per cent. of it, and assuming the total to average yearly about 5½ millions of loads, the first five months of 1883 have left a gap to be filled up of more than a quarter of a million loads. Now we are quite aware that this apparent deficiency—for it is so by comparison—may vanish away in a single month, because, on some occasions, such as occurred last year in the month of August, when over 900,000 loads came forward, exceeding the supply in August, 1881, a year of large importation, too. by about 180,000 loads—such a quantity is not a third part of a month's supply. But this is just the reason why it is reasonable to suppose it will remain in arrear. The supply was so full last summer that this season is not likely to surpass it, and a full importation henceforward cannot be expected to do more than keep pace with it; and what state of affairs may rule in the autumn it is too early yet to discuss, but the same reasons that ran up freights last fall are in existence still, and the later months of the year may find the import of timber checked, as it was then, for the American harvest is likely to be a plentiful one, and it is to Europe they look for their principal market, which will tempt ships away from the timber trade.

It will, therefore, during the summer be almost a matter of simple calculation that the state of supply, if it does not further recede, will stand at about a quarter of a million behind last year, a difference that may be safely predicted to hold good to the end of September, and it would not surprise us if the marginal difference were increased in the same direction, though great efforts are being made to induce English importers to extend their purchases abroad.

There is one peculiarity in the Board of Trade returns which we should have noticed in its right place, but we may interlope it here rather than pass it over unnoticed. This country had to pay in 1881 and 1882 for corn food, and potatoes from foreign parts, a little over £23,000,000. For eateables and drinkables altogether about £61,000,000, from January to May inclusive. This year, for cereals and potatoes only, we have already paid £6,000,000 sterling more than ever before; and this largo sum going out of the country for what appears to be a supurfluity of food, instead of being spent at home, may have something to do with the depression among British agriculturists. If the Chancellor of the Exchequer were to put an additional tax upon us that would fetch him in another six millions of money the whole country would be loud in his condemnation. Yet, somehow or other, we have been made to pay that immense sum for more catables, when we had plenty for our money in the preceding years, and did very well without enlarging our sale of dietary. The effect of this extra draw on the public purse must be injurious to the farming interest at home, and that is reflected back on trade generally. It is believed that it is beneficial to the people at large, but it may be reasonably doubted if it does not make trade harder to live by here than ever it was before. Food is cheap and plentiful among us, yet we covet it so much that to propose to check its importation by a small duty is regarded as worse than high treason. But in America their only anxiety is how to get rid of it, and by-and by, with this immensely increasing influx, we shall have to find some new market and become corn exporters ourselves. Our merchants have been doing something in this way to the extent of about three millions, including drinkable, for the first five months of each year. But, with the increasing imports of this season, our exports of commodities was only slightly augmented. Strange that those who resent the idea of a duty on the import of corn, which might lessen the quantity brought in, have no objection to offer to its being sent away again, if a market can be found for it elsewhere.

That trade is still in a very unsettled condition the returns under consideration do not contradict. But neither is there anything in them that can be regarded by the timber trade in particular as affecting their interests prejudicially. Abbreviation of the importation is shown to be, so far, continuous, and that under the circumstances will be counted a positive good. Had it taken the course of the corn export from America (which was not any more needed in this country that we can hear of), the mischief it would have done, it will be more easy to imagine than describe. We cannot tell what is before us, but of such a calamity it is not apparent that the trade need be under any apprehension during the rest of the current year.

CARE OF SAWS.

Ewing D. Craddock, in a letter to the Cincinnati *Artisan*, says:—The saw is one of the most essential and sensitive tools used. A saw, to do the work that is required of it, should be kept in a condition to do the work. First, the saw should be well balanced on the mandrel and hang true, presenting a straight face on the log side; hang the saw plumb up and down: second, keep your saw well pointed, so that every tooth will do the same amount of work that is required of it; these are the first elements of successful mechanics; these, too, should always be closely observed; third is the shape of the teeth, to which, as a rule, but little attention is paid by the majority of sawyers. Every man has his own ideas about putting his saw in order; therefore all cannot be right. My idea is this; A saw tooth should come in contact with the kerf that is to be removed at an angle of 45 degrees. This will produce a thin cutting edge, and will be found to produce the desired result, cutting with the least power, and to economize power is a matter of interest to all. It makes the lightest running saw. As to swaging the teeth, or spring them, I sometimes run one, then the other, but the spring-tooth is, by far, the lightest running, and cuts smoother lumber. The full swage, with plenty of power, will do as good work as any. The objections I have to the full swaged tooth is that it takes more power to drive it; consequently there is more strain on the plate of your saw; besides, it cuts more kerf than the spring-tooth, making your saw more liable to buckle. All sawyers know the wider the kerf the more power it takes to drive the saw, and the less feed can be carried; but a spring-tooth will cut a quarter less than full swaged, and, as a matter of course, makes the lightest running saw. Still, each tooth cuts the same distance into the timber, and, therefore, I recommend the spring-tooth. I always spring the teeth at the extreme points, to prevent them from losing the set, for the nearer the point a tooth is set the longer it will retain its set; and file the under sides of each tooth a little beveling, say, 12 or 15 degrees, and the back straight, and you will find this kind of dress will give satisfaction in all kinds of timber. In this country, most all the sawyers run the chisel-tooth, or, as some call it the full swage, no set, and meet with good success. The reason of this is that a full swaged tooth is easier filled than a spring-tooth. Yet a spring-tooth does not require half the work to keep it up that a full swaged one does, and will make great saving in files and emery wheels.

CEDAR.

Cedar timber, which a few years ago was entirely ignored in calculations as to the value of land in the northern portion of Michigan, has now obtained a rank among the valuable timbers of the state.

Thousands of acres of land from which the pine has been cut have been allowed to revert to the state in years past because considered of insufficient value to admit of taxpaying, on which hundreds of thousands of cords of cedar was standing, and which at the present time is of inestimable value because of the demand which has sprung up for cedar for railroad ties and fence posts and fencing, telegraph poles and paving. The former owners of these lands now comprehend their shortsightedness, and realize that other men are reaping fortunes from that which was discarded by them as worthless because of the then prevalent but foolish idea that the pine lands of the northwest were valueless, except for the standing pine timber, and that when that was once removed the most sensible thing the owner could do was to let the state repossess it. Now, however, a thousand acres of land, well stocked with cedar, is a bonanza, and the possessor thereof may be looked upon as a "bloated monopolist landholder."—*Lumber Trade Journal*.

HEMLOCK BARK.

The great slaughter of hemlock trees throughout the country, says the St. John, N. B., *Globe*, in order to get the bark, has led to an application to the Dominion Government to place a duty on the export, in the hope that this duty will have some effect in stopping the destruction. This application will not be successful, and, if soccessful, it will hardly have the desired effect. The Provincial Government has just adopted some new regulations, in regard to the hemlock licenses, which will have some influence in preventing the destruction now so prevalent, while, at the same time, adding to the Provincial revenue. No doubt the Surveyor-General will give official notice of these in the next *Gazette*. We understand that in substance they are as follows:—

Applications to be made in the usual form for licenses.

All licenses for hemlock will expire on the 31st day of March in each year.

Each application for license must not be less than two or more than six square miles, and the upset mileage at the rate of 8 dols. per square mile must accompany the application.

The stumpage charged will be at the rate of 1 dol. per thousand superficial feet of logs cut, and the bark is not to be removed from the landings until the stumpage has been paid.

In setting the stumpage the mileage of 8 dols. per square mile will be credited for all licenses actually operated on.

The licensee is prohibited from unnecessarily destroying other growing trees on his license, and in case of violation of this section the license to be forfeited and the bark subject to seizure.

THE ELM.

The elm is by far the best and cleanest tree for the city.

The best size are those trees of about three inches in diameter four or five feet from the ground. It does not pay to set out those that are smaller than a man's wrist, because up to the size of three inches in diameter the trees can be transplanted with perfect safety, and the additional dollar cost is cheap for the four or five years' additional growth.

In digging up, the roots should be cut at least a foot and a half from the foot of the tree, making the ball three feet in diameter. For trees six inches in diameter a much larger ball should be left—a very good rule being to make the diameter of the ball in feet correspond to the diameter of the tree in inches, taken four or five feet from the ground, thus: Three inches, three feet; six inches, six feet.

It is well, but unnecessary, to keep a large mass of earth around the roots (as some seem to think very important) provided the roots are kept moist by wet straw or moss, etc. If the ground in which the tree grew should have been poor soil, it is better to remove it carefully and sift the good earth about the rootlets. Roots once dried and parched are like faded and dried bouquets—they may be soaked in water, but will never live again.

The stem should not be chopped, but in good bark, and should have a healthful appearance, straight and tall, not having the branches shoot out too low.

Some fools cut off the entire top and set out a row of bean poles. This should not be done. It is merely a trick of the nurserymen, who say: "You must cut off the top as much as you do the root." Few, its a poor rule that won't work both ways. Therefore, cut off the root as much as you do the top, and what have you? The tree men advocate cutting off the top merely to save trouble in hauling the trees. They care nothing for the looks of your trees as soon as you have paid for them. The root of the tree is its mouth and stomach; the leaves its lungs. Cut out the lungs and stomach of a boy you wish to live, will he thrive? If, however, the top be very large, it may be trimmed in a little, that is cut of the tips of the largest branches.

A single-stemmed top is better than a double-stemmed top, and less apt to split apart in after years, when the branches are heavy. Here lies

the success provided the tree has good and moist roots. Dig a hole large enough to receive the ball easily and deep enough to have a half-foot of good earth under it. Have plenty of good earth, best of all a mixture of swamp muck and garden loam. Don't be mean and niggardly to a tree that will live 50 or 100 years. Now, fill the hole half full of good earth and put the tree in place, so that its general appearance is good from the most important standpoint.

"The same side south" is all humbug. Keep the tree plumb!

When all is well arranged, begin to fill in the good earth, using only the best and finest in contact with rootlets; gently sift and shake it between the roots; be careful you do not leave an air-space just under the tree, across which no rootlet can throw itself and in which mould is sure to form. This is often a cause of failure, to avoid which it is well to make the earth in the middle of the hole a little higher than the sides before putting in the trees.

After a few inches of earth have been placed over the roots the earth should be pressed down with the feet, gently at first, so as to break them, firmly afterward.

Keep the tree plumb all the time.

The nurseryman's work is now done, yours just begun. Do not let the young trees be shaken by the boys, nor bitten by the horses. Do not forget to give each tree a pail of water during the hot days of the first summer, during which time you must expect the tree to have a little "set back," but all will be well the second summer.—*Brooklyn Eagle.*

STEAM HAULING.

Throughout the yellow pine section in the South, manufacturers generally are adopting the steam tramway system, as a better and a more economical way of reaching their mills or streams that are remote from the forests. Under the old manner of logging with trucks, with its many obstacles and delays, the cost would frequently run as high as $1 per M., but by the use of steam this sum is cut down to 15 cents per M., on distances covering five to eight miles.

Through this latter system over one fourth more timber can be brought to the mills, and the poorer grades handled, which heretofore have been left standing, as the cost of moving was too great. Another benefit derived through this same source is the ready connection of forests distant from streams, and the improved value of lands, thus connected, making them worth nearly as much as those more favorably situated.

The expense of building these roads has been calculated to be from $2,500 upward, of course depending on the material used. The advantages in moving timber by the process, and the difference in cost of transportation, is so discernible that the speedy erection of numerous roads is certain, and the profitable returns as assured as in the Northwest.

The introduction of steam tram roads, the improvements in milling machinery, and the erection of dry kilns in the South show that the people of that locality are determined to keep abreast of the times, and are willing to adopt measures that will promote the industry, and cheapen the cost.—*N. Y. Lumber Trade Review.*

Northwest Timber Limits.

There are upwards of eight hundred applications for timber limits in the Northwest now before the Department of the Interior, a great many of which are from persons who desire them purely for speculative purposes. The demand for lumber is growing faster than the supply is coming into market, and the establishment of additional mills will benefit the country. It is hard for the Department to distinguish between the honest and the speculative applicant, as all have to make the same declaration as to their intentions; but the popular policy of protection should lead to a strict enforcement of the conditions on which limits are granted, that those who do erect mills may be enabled to secure enlarged limits, if they require them, without having to pay middle men who prey upon the necessities of their neighbors. Selling limits by auction, as is proposed to be done with coal lands, would lighten the labors of the department, secure to it the amount paid by the *bona fide* mill owners to the interloping speculators, and at the same time enable the former to secure his limits at their intrinsic value.—*Saskatchewan Herald.*

Compressed Sawdust.

The *Canadian Manufacturer* in an article on compressed bran, sawdust, &c., says:—"If the problem of compressing bran were satisfactorily solved, a large export trade with England would spring up immediately.

It is now claimed that the problem is at last positively and satisfactorily solved, not only for bran, but also for sawdust, coal dust, and other kinds of waste products too numerous to mention. The Chicago *Industrial World* publishes a cut and description of "The Smith Consolidator," with which it is claimed that sawdust, coal screenings, tan bark, etc., can be compressed into convenient form on the large scale and at small expense. For instance, one of these machines of medium size, will turn out sawdust in blocks, solid and easily handled, at the rate of a ton and a half per hour. We would like to hear more of this machine, which really promises far greater results than people might at first imagine. In this wooden country, which we call Canada, its capacity for usefulness ought to be almost unlimited.

The English Timber Trade.

The *Timber Trades Journal* says:—Great depression still prevails in the English timber trade in the North Midland, Lincolnshire, and Yorkshire districts. Nearly all trades are in a sluggish condition, the railway carriage and wagon building trades being also very quiet. There is a slight improvement in the coal trade compared with the corresponding periods of the two previous years. The large falls of timber that have taken place this and three or four seasons back, with increased import from the Continent, America, and other places, coupled with bad trade, is the principal cause of the extremely low prices. There are a few kinds of the best qualities inquired for, but no better prices are to be obtained; the over crowded state of the market for oak is beyond recollection in several instances in this district. Previous years' falls are still lying in the woods, with a larger fall than usual this year, and also an increase in imports of foreign logs and manufactured spokes, &c.

Care of Belts.

A well-known belting manufacturer says: First, See that your belt is put on with the grain or hair side next the pulley, as it adheres closer to the pulley; then the flesh side, which is out, is stronger and not so liable to crack. Second—See that the belt is put on so that the joints run with, and not against, the pulley; you will, by this means, avoid tearing and splitting up. Third—Every person using belts should keep on hand the "Eureka" belt oil, for oiling purposes, applying the same just before stopping in the evening. It should be applied lightly. No. 1 beef tallow is also good, and where a belt has lain idle for a long time, and becomes hard, pure Neat's foot oil can be used, but under no circumstances should any other animal oil be used. Fourth—Give special attention, and impress your employes with the fact, that resin, coal-tar, pitch, and anything of a like nature is worse than useless, and will ruin your belts.—*Wordworker.*

Falling Lumber Dock.

MUSKEGON, Mich., June 30.—A dock with 800,000 feet of lumber fell into the lake on Thursday afternoon, precipitating twenty men at work on it into the water. Three or four of them are missing, but the men are Hollanders and their names are unknown. A boy named Frank Barnhardt was crushed under forty thousand feet of timber. Two immense piles of lumber adjoining which threaten to fall, prevent search for the bodies.

A VOICE FROM THE UNITED STATES.—I have suffered for the last twenty years with Dyspepsia and General Debility, and tried many remedies, but with little success till I used Burdock Blood Bitters when relief was quick and permanent. A. LOUGH, Alpena, Michigan, U.S.

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily and honorably, Address TRUE & Co., Augusta, Maine.

CONSUMPTION
POSITIVELY CURED.
All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humbug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**
We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.
Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address

Cards not occupying more than 6 lines per annum	5 00
Cards not occupying more than 6 lines, for 6 mo's	3 00

Special rates will be made for page, half page and column advertisements.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont. JULY 16, 1883.

A NEWSPAPER has been started at Deseronto, with the appropriate title, "Buzz Saw."

LARGE quantities of lumber are arriving at Quebec from the West over the North Shore Railway.

RECENTLY 2,800 logs were sold by the Titta-bawassee boom company, as unclaimed logs, and to pay the boom chargos against them.

THE farmers living along the River Moira, where lands have been flooded owing to the damming back of the water by the saw logs, have entered suits against the lumbermen.

A LARGE number of dock sticks, some of them 100 feet long, are being hauled from the mountains on either side of Lake George, N. Y., and shipped by way of Ticonderoga to New York city.

WE would call the attention of our readers to the important auction sale of valuable timber limits to be held at Ottawa on August 28th, the particulars of which may be found in our advertising columns.

MICHIGAN parties have recently bought 56,000 acres, and Iowa parties 16,000 acres of timber land situated in Escanaba, Conecuh, Butler and Crenshaw counties, Ala. It is proposed to ship lumber north.

AN old record recently unearthed contains the information that in 1823 lumber sold in Maine as follows: Clear pine, $18; merchantable, $12; refuse clear, $9; refuse, $6; mill refuse, $2.50; shingles, $3.

FRED. L. HEWINS, of East Winthrop, Me., and Louiscount Lyon, of Manchester, have purchased a tract of 200 acres, lying five miles from Augusta, on which grows what is known as "Widow Sanford's pines," the price paid being $6,000. The pine is all medium sized, second growth, and is in demand for box-making, for which purpose it will be shipped to Augusta after being sawed where it grows. A large steam mill will therefore be erected.

A. BANNING, at Ludington, Mich., lately made a contract with Aldrich & Brayman to unload 1,500 cords of hemlock bark from the cars to the railroad dock, at $1.25 per car. The bark goes to Milwaukee.

THE Rat Portage correspondent of the Winnipeg *Commercial* says:—On account of the low water not much more than 15,000,000 feet of lumber will be sawed at this point and Keewatin during the present season.

A LOG train on the St. John & Maine railroad makes five trips of 30,000 feet each per day, for James Murchie & Sons, from Magaguadavic lake to Vanceboro, Me., from whence the logs are floated to the Milltown boom.

THE planting of 100,000 eucalyptus trees on the Roman Campagna has counteracted the effect of the malaria to such an extent that the Tre Fontaine, the abbey of the Trappist monks, is rendered habitable through the entire year.

THE Winnipeg *Commercial* of July 3rd says: Owing to the dullness in building operations the demand for lumber is not great. There are several large contracts being let in the city which will rid the yards of some of their stock.

A RAILWAY being projected into the interior, British Honduras will be able to export larger quantities than ever of the mahogany, cedar, ebony, indiarubber, and other products with which she abounds, and of which this country can easily absorb large quantities.

A DESPATCH from Ottawa dated July 5, says: In the Department of the Interior, yesterday, tenders were opened for the limits in the Bow river country recently advertised. It is said that the bonuses offered are very satisfactory. The result will likely be made public in a few days.

THE Franco-American Trading Company, recently contracted for 500,000 feet of yellow pine in New York to be used on the Isthmus of Panama, in the building of 150 houses for the Do Lesseps Canal Company, the houses to be prepared and shipped in the knock-down from New York.

THE Belleville *Intelligencer* of July 9th says: Messrs. Gilmour & Co's. North River saw log drive, under the superintendence of Mr. Asahel Airhart, of Marmora, is now in Crow Bay. This drive takes the tail of the Beaver Creek drive to Trenton, and has been a highly successful one from the start.

A. C. DANNER & Co., of Mobile, Ala., will have a cypress plank on exhibition at the Louisville Exposition that will be 17 feet long, three inches thick, and four feet eight and a half inches wide. It will be free from knots and shake. The log from which the plank was cut was obtained in Baldwin county, across the bay from Mobile.

THE Orillia *Packet* says that Mr. John Knight, Manager of the Medonte Lumbering Company, was in Orillia on Monday. He says the rails on Medonte tramway will be laid as far as the mills within a month. Owing to the depth of snow last winter, only about three million feet of logs were got out which, will be cut within three weeks.

THE *Timber Trades Journal* says:—There can be no doubt but that the rage for American walnut, which gave to that trade such a spurt, has greatly subsided, and probably diverted the demand once again in the direction of mahogany and hardwoods. Fashion is everything, and the furniture and housebuilding trades form no exception to the general fickleness of taste; but we expect it will be a considerable time before there is such a run on American walnut as there has been. In suites of furniture there was a harshness about it which the other dark kinds of hardwood did not display. The straightness of the grain also, unlike the European descriptions, afforded very little to attract the eye after the novelty had worn off.

A SOUVENIR of this exceptionally stormy season was received by the Kirby-Carpenter Company from Edgar, Neb., recently, in the shape of an order for 600 window-blind slats to replace those broken out at that place by a late hail-storm. The storm was a terrific one and laid most crops dead over a space, a mile in width and two miles in length. Window blinds were no protection to glass, as the slats were broken, and all the glazing shivered, on the south and west sides of houses in the path of the storm.

THE *Lumberman's Gazette* says:—The F. & P. M. railroad is reaching out with branches after the pine which is accessible only by rail, and by this means has become an important feeder to the Saginaw river mills. About one and one-half miles has been completed from the main line just west of Farwell, upon which the first train of logs came out last week. This branch will be extended at least eight or ten miles this fall, and when completed will bring about 100.000,000 feet of logs within reach of this road, the log traffic of which has assumed enormous proportions.

TRADE WITH AUSTRALIA.

To the Editor of the Canada Lumberman.

SIR,—I happened to see your publication of the 2nd instant to-day for the first time, which I found full of interest.

I notice that you insert extracts from Australian timber circulars. I enclose you one of my firm's, Lord & Hughes, and if you think it worth while to make extracts from ours I will write by next mail requesting them to supply you with a copy every month.

We have been in the lumber business in Melbourne for about 25 years, and we handle nearly all the American and Canadian lumber that comes to those markets.

I am journeying through America and Canada picking up scraps of the lumber trade. I arrived last month at San Francisco, and have done America and part of Canada, and will leave here on Tuesday next for St. John, N. S., thence to Portland, Boston and New York, afterwards to England and Europe (Norway and Sweden).

I shall therefore assume that our monthly circulars will be acceptable, and will instruct my firm accordingly.

Yours truly,

SAMUEL HUGHES,

Of the firm of Lord & Hughes, Melbourne.

Quebec, July 7.

[We should be glad, not only to receive the circulars, but to have Mr. Hughes favor us with any remarks that he may think of value, as to his trip to Canada, and hints as to increasing the trade with Australia.—E. C. L.]

THE PRICE OF WHITE PINE.

The owners of white pine stumpage should try the ground a little more carefully before they venture forward loaded heavily with that kind of property. It is not so very clear, after all, that white pine lumber will advance in price in the ratio of its diminishment of supply. There is no good reason to infer that it is so essential in the building and mechanical economies that it cannot be supplied by something else. The history of the industrial world goes to show that commodities and useful material are valued according to their quality and intrinsic merit. Mahogany and black walnut are worth more than white pine for this reason, and not because they are so very scarce or hard to obtain. It is as handy and cheap to lay down mahogany in New York as Missouri walnut at the same place. The last pine tree sawed into boards, might be on the market, and it would not sell as high as some of the finer woods, unless somebody wanted it for a relic. Modern invention and progress do not enhance, but cheapen the necessaries of life. It is claimed by good authority that the staple, wool, has not been so cheap in forty years as now. Cotton yarns are cheaper now than since the spring of 1879, and it is thought that cotton generally will rule at a lower average during the ensuing year than at any time since the war. Iron and copper are ruling at the figures which were obtained in 1878. There has been no advance in the average price of food since one's boyhood, taking one year with another, unless it is in beef and butter, and events will regulate those when the vast Rocky mountain regions of this country and Mexico swarm with cattle and sheep. It may be said that over-production has kept down the prices of all these things mentioned, and that the capacity to produce them is unlimited, while the capacity to produce lumber from white pine is diminishing. But the tendency of modern invention and energy is to provide substitute commodities whenever there is money to be made by it. That which enters into common use, like white pine, must not cost too much. When the time comes that its scarcity necessarily forces up its price, the buyers rebel and reject it for something else. When white pine costs as much as walnut, mahogany, cherry and other finer woods, it will be scorned. When any of the woods cost more than the common people can afford to pay for ordinary uses, they will be rejected for iron, terra cotta, glass, or other substances, which will be cheapened to the grade of common use by invention. While pine will undoubtedly be a product of firm commercial value in the future, under the influence of a diminishing supply it will never reach a price much above what it averages to-day.—*Northwestern Lumberman.*

WHAT CAUSES THE TIMBER LINE?

A writer in the New York *Independent*, says: The cause of what is known as the timber line on high mountains continues to be discussed in scientific periodicals, and the attempt continued to connect the line in some degree with mean annual temperatures. The writer of this paragraph has had the matter in mind when on these high elevations, and the explanation seemed very simple. On all these high peaks there is a continuous, though in some cases slow, descent of the soil from the summit to the base of hill. He has never seen a case where there was soil enough to grow a tree, that trees were not growing. As the wash from the rain or melting snow will be nearly uniform in a given range, there will be of necessity some uniformity in the timber line. On Mount Washington and other high places, little plots of dark vegetable earth can often be found far above the present timber line, the remains of trees which existed before the earth was washed away. What is called the timber line seldom shows graduated sizes as a mere matter of temperature would call for. Generally the line is formed of very small trees, and immediately scrubby plants, from the absence of deep soil, begin.

NORTHWEST TIMBER BERTHS.

For several months past the Department of the Interior has advertised for the lease of five hundred square miles of timber berths of fifty square miles each, in the Northwest Territories, situated on Moose Mountain, in the district of Assiniboia, and on the Bow River, and on its tributaries the Kananaskis and Spray Rivers, in the District of Alberta. It was provided in the conditions that only one berth should be granted to the same individual or firm, but the same applicant was allowed to make a separate tender for each of the berths. According to the regulations governing the granting of yearly licenses to cut timber on Dominion lands under section 52 of the Dominion Lands Act of 1879, provision is made for the licensee paying a ground rent of $5 per square mile; for requiring that within a month after the date of the Order in Council granting a timber berth, the person in whose favor it is passed must pay the rent for the year in advance, the rent to bear interest at the rate of six per cent. per annum from that date until the same is paid; that when applications for licenses conflict, berths shall be laid off and described as the Minister of the Interior may direct, and tenders shall be invited for the same. Persons tendering are required to state the sum or bonus per square mile which they are willing to pay in addition to the ground rent and a royalty of five per cent. on the amount of the sales of all the products of the berth, and the limit is awarded to the person offering the highest bonus. Licensees are required to have in operation within a year from a date to be fixed in the license, and to keep in operation for at least six months of each year of his holding, a saw mill, capable of cutting daily at least two thousand feet board measure

of lumber. It is further provided that when a licensee has complied with the conditions above enumerated, and where no portion of the berth is required for settlement, or other public purposes, of which the Minister of the Interior is to be the judge, the license may be renewed for another year, subjected to such revision of the annual rental and royalty to be paid there for as may be fixed by the Governor-in-Council.

Tenders for the berths above referred were received by the Department on the second of July, and were opened on the third. The highest bonuses offered per square mile were the following, which were accepted :—

Berth A, J. G. Thorp	$104 20
" B, J. G. Ross & Co	81 00
" C, O. H. Ingram	124 80
" D, A. McLaren	44 20
" E, Vincent W. Bayless	104 20
" F, A. McFee	104 60
" G, John B. Kehl	104 40
" H, Franklin Holman	64 20
" I, W. A. Rust	124 60
" J, Isaac Kerr	124 40

Considering the want of facilities for moving the timber, the distance from the market, and the absence of other convenience experienced by purchasers of limits in the Province of Ontario, the above offers are considered good.—*Ottawa Citizen.*

DANGEROUS DOORS.

Adequate authority ought to insist, says the *British Medical Journal*, that all doors in the passages of large buildings, which are likely to become crowded, should swing freely both inwards and outwards. It is dangerously difficult, and it may become impossible at a critical moment, to open a door which can only be opened against the impact of a pressing crowd. The fastenings of such doors should be regarded as perilously faulty unless they are so arranged that they can be quickly and readily loosed without risk of fixity. Probably the most dangerous fastening for the doors of public places is one like that which contributed to cause the disaster in Sunderland—namely, a vertical trailing bolt at the bottom of a door, which becomes fast by dropping into an opening in the flooring over which the door moves. If these and some other important points in the number, capacity, and direction of the channels of egress from public buildings, and especially in the construction and working of the doors of such passages, were efficiently remedied we should probably hear of fewer instances of loss of life from the inevitable rushes and panics of persons confined in crowded spaces.

MONTREAL NOTES.

The *Gazette* of July 6th says :—The local demand has been light for all kinds of lumber, excepting cherry and ash, which are wanted for both the home and American trade. There is a fair business reported in laths at the advance previously noted. Deals continue to be shipped to British ports on nearly every steamer, and lumber is going forward to South America, two vessels having been chartered to the River Platte during the week at $15@$15.50.

Moving Lumber.

THE *Lumberman's Gazette* says :—The largest fleet of lumber-laden vessels which ever left the Saginaw river in a single day passed out of the river on Saturday afternoon in less than ten hours, between 12 o'clock noon and 10 o'clock at night. People who imagine that there is nothing doing in lumber in this market may be undeceived by scanning the list of vessels. A reasonable estimate places the amount of lumber on board this fleet at about 23,000,000 feet and this amount of lumber moving out of the river, just at this time furnishes food for reflection by those interested in lumber, indicating as it does the beginning of the lively times during the next 30 days.

Hoops for the Children.

Most of the plain wooden hoops which serve as toys for the children are made at Granville Corners, Mass., and the more expensive ones at Philadelphia, Pa. In making plain hoops, ash or beech is cut into straight, narrow strips and steamed, when the wood is readily bent till both ends meet, which are fastened together with tacks. An ash or beech stick goes with a hoop, and the ordinary price is 10 cents. Granville Corners turns out from 75,000 to 100,000 annually. The Philadelphia hoops are more stylish. After steaming and nailing the wood, the workmen bevel the edges of the rims, put on a few bright colors, and fasten diminutive bells on the under side at regular intervals.

DESTRUCTIVENESS OF FLOODS.

The recent floods in the Missouri and Mississippi have resulted in destructions to crops, land and property in general, which can only be estimated in millions of dollars. It appears to be almost certain that the increasing number of destructive floods of late years must be largely attributed to the rapid denudation of timber lands which has been going on. Of course floods will occur periodically whether forests are removed or not, but their frequency and destructiveness seems to increase as the extent of well wooded land decreases. The leaves and roots of trees, and the sod protected by them, all act as a sort of sponge, absorbing any heavy rainfall and giving it forth again gradually, thus measurably removing the danger of excessive floods. But when this gigantic natural sponge is destroyed by the removal of the timber, the rain runs off as it falls, violently swelling the small streams, which in turn rush on to the rivers, and a flood is the result. Tree planting certainly looks like a slow way of stopping floods, but that, judicially prosecuted, it would ultimately be successful, there can be but little doubt.—*Lumber World.*

The Spruce Dying.

A despatch from Bangor says there has been a great destruction of spruce trees in Northern Aroostook. The owners of pine lands have already lost thousands of dollars, and the matter is causing great anxiety. An entomologist is going to Aroostook to look into the cause of the decay and death of these trees. He will probably be accompanied by Franklin B. Hough, of the United States Commission of Forestry, who has recently been in the state making some investigations. Jacob Hardison, of Caribou, says that in five townships the spruce over eleven inches in diameter are dead or dying, and that the young trees are unaffected. His view of of the cause is that about eight years ago there were heavy rains, which loosened the earth. The rains were followed by a protracted gale and a hard winter. The root fibres were broken which caused decay ; then the worms followed. He says that on the northwest slope, where the wind had the greatest range, the trees suffered the most. The trees present a seared appearance first at the top, and year by year death passes toward the roots.

Texas Timber.

A Texas paper says : "The timber lands of northern Texas will be, in the course of a few years the most valuable of any lands in the state. Lumber can be bought, delivered at our doors for $1.50 per 100 feet, while in the western counties the same will bring from $4 to $6, and the demand on our almost inexhaustible forests is becoming greater every day. Thus far little timber has been culled beside the pine and walnut, while the thousands of acres of white oak, red oak, ash, hickory, bois d'arc, sweet gum, etc., remain in their virginity, not a stump showing that the destroying hand of man has ever been lifted against them. It is believed that these forests will necessarily be drawn upon to supply a demand for building purposes, railroad ties, etc., as fast as the tributary west is building up."

Timber Berths in the Northwest.

OTTAWA, July 10.—Some time ago the Department of the Interior advertised for the lease of 500 square miles of timber berths of 50 square miles each in the North-West Territories, situated on Moose Mountain, in the district of Assiniboia, and on the Bow River and its tributaries, the Kananaskis and Spring Rivers, in the district of Alberta. Tenders for these berths have now been opened, and the leases have been awarded to the following parties for the bonuses offered per square mile :—Berth A, J. G. Thorp, $104 20 ; B, J. G. Ross & Co., $81 ; C, O. H. Ingram, $124 80 ; D, A. McLaren, $44 20 ; E, Vincent W. Bayless, $104 20 ; F, A. McFee, $104 60 ; G, John B. Kehl, $104 40 ; H, Franklin Holman, $64 20 ; I, W. A. Rust, $124 60 ; J, Isaac Kerr, $124 40.

IN cutting wood, when the cutters revolve and the wood is only fed to them fast enough to allow them to operate, a much higher speed is possible than if the tool be stationary and the wood is driven at a rapid rate, as in turning. There are two causes for this. In the first place, each cutting surface in the former case is alternately working and resting, while in the latter instance there is a steady friction on the single surface, which, if the work be pushed too rapidly, will soon develop so much heat as to draw the temper of the tool. In the second place, the rapidly revolving cutters act as a sort of fan, producing a strong current of air which assists in preventing too great heating.

SPEAKING of the new docks at Tilbury, near London, the *Timber Trades Journal* says :—The timber mostly used in the construction of these docks is pitch pine and Danzig, and already about 10,000 loads of such have been consumed, besides considerable quantities of spruce. There are now two cargoes in the Thames close to the works of something like 1,500 loads of Danzig and pitch pine. We may observe, in reference to the latter, that the dimensions are especially large for sawn timber, the average length being 55 ft., and the square abont 14 in. The whole of this cargo, we are told, was cut at Pensacola by Mr. D. F. Sullivan (the largest shipper at that well-known southern port) to the engineer's specification specially for these works. One-third of the cargo was over 70 ft. long, a thing as yet never attempted at the port named.

THE London *Timber Trades Journal* says : Thursday June 28th at the "Baltic" showed little or no better result than that of the day before ; bidders had it apparently all their own way, and prices as usual took an exceedingly low tone throughout. It was only the few reserved lots that met with a buyer here and there which showed anything like a remunerative price, and it is questionable if the upset price had not been drawn on a very moderate scale, if even these would have been noticed at all. There seems no life in the bidding just now, and if the competition takes an occasional active turn, one or other of the bidders retires from the strife just at the point when prices are beginning to take a move upwards. Only bargains tempted the general body of buyers, and it was to the unreserved lots the dealers alone cared to turn their attention.

ROCK ELM WANTED.

A Few Car Loads of good ROCK ELM, cut into 1½, 2, 2½ and 3 inches thick, 12ft. length prefered.

DUFRESNE & JODOIN,
Lumber Dealers,
6L12 496, St. Joseph Street, Montreal.

SAW MILLS
AND
TIMBER LIMITS
WITH
Logs, Lumber, Store Goods, &c
FOR SALE
In the District of Algoma, Ont.

Eighty-Five Square Miles (54,400 Acres) of Limits, Good Pine, First-Class Water Power, Large New Water Mill, Steam Mill, Store and Dwellings.

☞ Canada Pacific Railway now running through part of the property.

For full particulars address :—

WILLIAMS & MURRAY,
L7tf GODERICH, ONT.

WATER POWER
TO LEASE.

THE UNDERSIGNED having largely extended their raceway at Lakefield, are desirous of corresponding with parties who wish to go into manufacturing, and they are prepared to sell or lease water power on the most favorable terms, or would erect buildings of any size suitable for factories.

R. & G. STRICKLAND
1d86 LAKEFIELD, ONT. w15L9

A RARE CHANCE!
Valuable Steam Saw-Mill
FOR SALE.

The Waba Creek Steam Saw Mills, situated on the Madawaska River, one mile from Arnprior. Capacity of Mill, Fifty Thousand Feet of Lumber per Eleven hours. Capacity of Booming Pond, Thirty Thousand Logs. Has Sidings through piling Grounds connected with main line of Canada Pacific Railway. The Mill is in good repair, having only run a short time, and is well found in all appliances required to run it to the above capacity. There is also a good water power connected with it from the Waba Creek, and good stabling, Barn, Boarding House, and other buildings. For information, price and terms, apply to John Robertson, 581, Seigneurs Street, Montreal, or to James McCuan, Arnprior, who will show intending purchasers the whole property, or to

ALEX. FLECK,
6L11 Ottawa.

AUCTION SALE
—OF—
VALUABLE
Timber Limits

I will offer for sale by Public Auction, on account of whom it may concern, at the Grand Union Hotel, in the CITY OF OTTAWA, on TUESDAY, the 28th day of AUGUST next, at the hour of 2.30 o'clock in the afternoon, Timber Limits as follows :—

PARCEL No. 1.

Also half interest in Licenses Nos. 343 and 344, season 1882-83, 87 square miles.

Timber cut on Kippewa Limits was sold in 1880, 30c ; 1881, 32c , and 1882, 32c. There is also a farm in connection with the limits which will be sold with a quantity of Clear Mess Pork, Flour, Oats, Beans, Hay, Horses and other rigging requisite for shantying.

TERMS—Cash, or one-third cash, one-third in 6 months and one-third in 12 months, with interest at 6 per cent., approved notes. For further particulars apply to the Crown Timber Agent, Ottawa, or to

R. C. W. MacCUAIG,
3L14 Auctioneer,

THE FORESTS OF MAINE.

The words "state-of-Mainer" in the woods of Michigan for many years was the synonym for what was understood as being well versed in lumber logic and in all the ramifications of the business from the cutting of the tree to its delivery in the boom in logs. But of late years this term has not been so common, and a "Canuck" has been considered fully equal to to the man from Maine. This naturally led to the inference in some circles that the lumber business in the Pine Tree state was about extinct, and the situation of that state has been very often referred to as foreshadowing what Michigan was inevitably coming to by the ultimate extinction of her pine timber. Later reports, however, indicate that the lumber industry is far from being "petered out." One of our Boston exchanges says that now that the returns are all in, it is ascertained that the output of logs in Maine is about 600,000,000 feet, and it is estimated "that there were employed in the neighborhood of 10,000 men and 3,000 horses and oxen. On the Penobscot choppers and sled tenders were paid from $25 to $30 per month, and it is guessed that the men on this river were paid $250,000 during the season. The season for sledding was one of the hardest ever known." The employment of ten thousand men in the lumber woods of Maine indicates anything else than that the lumber industry is a thing of the past in that state. Michigan men may take heart from the above facts.—*Lumberman's Gazette.*

RAILROAD TIES.

During the last five years the price of railway cross-ties has increased 25 per cent., and the quality offered for sale in open market seems to have decreased in about the same ratio. The specifications generally prepared by railway companies do not maintain the former high standard, either in manufacture or quality of timber used. The number of kinds of soft wood that may be used for this purpose has increased nearly two-fold, and a larger number of inferior hard woods, hitherto rejected, are now included in the specifications for cross-ties. Take, for instance, a hemlock tie, of which considerable quantities are brought here by lake vessels. They will last, ordinarily, about one-half as long as a white oak tie, yet they now bring as much in open market as a first-class oak tie sold for ten years ago. The best timber suitable for cross-ties is not entirely exhausted, but where good timber grows there is also good soil, which generally sustains a larger and more compact population than in a comparative treeless region, and there must of necessity be a greater drain upon the timber supply for houses, barns, fences, etc. In sections where the farming population is greater, so are the cities and towns proportionately larger, and they must also be supplied with the commercial woods for manufacturing purposes, as well as a supply of cordwood for fuel, from which the whole population draws largely, unless there is, as in Illinois, a coal mine within a reasonable, or rather economical, transporting distance. Many farmers have reserved a portion of the natural timber upon their farms for prudential reasons. If they have an unfavorable year and poor crops, they eke out their income to meet current expenses, taxes, etc., by selling a part of their reserved timber. They will make a few hundred cross-ties for the nearest railway, also several cords of wood for sale in town, and at the same time add a little more arable land to the farm.

The consolidation of railway lines has had a tendency to equalize the distribution of cross-ties, and in some instances it has saved the "mother" line from an unavoidable stringency in the annual supply absolutely required to run the road-bed. Oftentimes the branch lines absorbed by the larger company have in the region where located greater resources of tie timber to draw from than the entire main line. It used to be considered that 15 cross-ties to a 30 foot rail—or 2,640 per mile—were sufficient for the heaviest traffic. But with heavier cars and engines, and heavier loads, the number per rail has been increased to 17, or 3,000 per mile of track, and while we have been putting more wood on the road-bed, the rails have been increased in weight, with a tendency to a still heavier rail. The heaviest rail used in this country does not exceed 72 pounds per yard, the average being 60 pounds per yard, or 94 tons per mile, while the best English roads use a double-headed rail weighing 80 pounds per yard. Allowing an average face to face cross-tie of nine inches, and 3,000 ties per mile, we have a wood-bearing surface of 2,250 lineal feet per mile of track. The English roads, with a heavier rail, have a much less number of cross-ties. A rail weighing 80 pounds per yard equals 125.7 tons per mile, and with cross-ties of nine inches face (average), and 10 to each rail length, the English track has a wood-bearing surface of 1,432 lineal feet, about 33 per cent. less than our own roads. This is what we shall eventually come to in America—a heavier rail and less wood on our road beds. We think that it is not safe to use a softwood tie, such as white cedar or hockberry, save upon tangents, and then oak ties should be used at the rail joints, with only the best oak ties upon curves.

The English roads have no oak ties in their road-bed; their principal ties are made from "larch," which comes from the shores of the Baltic sea. The European larch is about the same wood as our tamarac, and said to be a little less resinous. We reject this wood in America for such purposes. In its native regions the farmers use it extonsively as fence posts. Whether it has ever been tried for cross-ties we cannot say, but think it would answer the purpose very well if it would not check too badly, a defect quite natural to the wood.

The time is coming when railway companies will have to use a greater number of soft wood ties, or ties of a less compressive strength than oak, and many woods not at present available because of their rapid decay when placed upon the ground, will come into general use by means of the increased durability given to them from some of the preservative processes now of a tentative character. This will necessitate a return to the use of iron chairs to prevent the rails from cutting into the soft wood ties. These chairs the English railways have always used. The cheaper methods now in vogue for manufacturing iron will undoubtedly give us a cheaper chair than we used 15 years ago, and it remains for the practical track man to give us one of better form and strength, and at the same time simple and effective in its use. The chair should be the same pattern both for end and intermediate bearings, and must be fastened to the tie with something that will retain its hold more firmly than the common spike.

The wooden cross-tie will never be discarded from the railway road bed. There is nothing that will take its place so well under all conditions; it is elastic, easy of renewal, little effected by frost, and at its maximum cost is much cheaper than any substance yet devised. We doubt if a metal cross-tie can be safely and cheaply used north of the fortieth parallel; we should think that the extremes of temperature common to higher latitudes would cause them to be an unsuitable support, particularly when exposed to the action of frost or the extreme heat of the summer sun.—*Railway Age.*

SAVE THE TREES.

We find that the views expressed by the *Chronicle*, with reference to the wholesale destruction of young maple trees on St. Jean Baptiste day, have met with the cordial indorsement of almost everybody in the community. Indeed, we cannot see how other views should prevail for a moment. It is quite clear that if we plant trees we do it with a view to preserve the forests, and it is equally clear that if the saplings are to be torn up by the roots and wasted six weeks after the planting the task is rendered useless, and all the work and bother go for nothing. Either Arbor Day must be made to mean something or else we had better abolish it altogether. There were more young trees destroyed in the city of Quebec on Saturday and Sunday last than we planted in the entire Province on the 9th and 18th of May last. This must not coutinue.

On the part of some sensible members of the St. Jean Baptiste Society, a well conceived resolution was passed early during the past week with regard to maple trees. We believe Judge Chauveau and Mr. Le Sage of the Agricultural Department, moved energetically in the matter and beseeched their fellow-compatriots to spare the young trees, and adopt some other mode of decorating the streets. They were over-ruled, but their words had some effect, and the better class of our people refrained from purchasing the car-loads of handsome young maples which stood before their doors. Now if moral suasion will not deter people from destroying our trees, the law must be invoked to protect them. We call on Mr. Lynch to use his influence, and to bring in a bill at the next session of the legislature, making it a misdemeanor for any one to cut down trees under a certain age, and providing a penalty also for the persons who use the trees as they were used, or rather ill-used, on Sunday last. We ask the *Cures* of parishes to employ their great influence with their congregations, and to ask the people who listen to their teaching to forbear from denuding the forest lands of their native Province. The labor of three years should not be thrown away on a single day's pleasure. We hope our words to-day will bear good fruit, and sink into the hearts of all true men who wish to see a prosperous future for our common country. To that end all must lend a helping hand. The conservation of our forests should be the national policy of Quebec.—*Quebec Chronicle.*

A FOREST AT THE BOTTOM OF LAKE TAHOE.

For some years past there has been a bank in Lake Tahoe, which in clear weather has generally been taken for moss formation. It lies at the right of the steamer's course between Tahoe city and Tallac house, about two miles beyond Idlewild. It looked as if a lot of trees had sunk to the bottom of the lake and that moss and slime had collected there until the whole presented a wavy semi-transparent appearance about 50 feet below the suface. During the past few weeks the moss and debris has disappeared, and now when the water is clear a forest of pine trees can be plainly seen with every limb and twig perfect. On Wednesday last some fishermen went out there in a boat, and, lowering some grappling irons, secured some splendid pieces of the petrification. One is a pine branch about three feet long, which, held a few feet from the eyes, has the exact appearance of a pine branch just taken from a living tree, and apparently fresh and green, the brittleness and weight distinguishing it from the freshly-cut branch. The forest occupies about two acres, and seems like a forest immersed, except that its stony branches are forever still and tall weeds and vines which cluster about the trunks of the giant trees are as motionless as the rocks. No wind ever stirs this strange verdure, and the birds which once sang in the branches centuries ago have given way to fish, which swarm through the forest in thousands.—*Carson Appeal.*

LAKE NIPISSING.

Beaucage Bay, June 26.—A large quantity of square timber belonging to Barnet & Mackie, David Mooro and J. R. Booth, is being loaded on cars at North Bay, bound for Quebec.

Fraser & Sereney are driving their timber down French River into the Georgian Bay. A forwarding company of Kingston has the contract of delivering it in Quebec. M. McDougall is also driving this river with several thousand logs.

The total cut of timber about Lake Nipissing this winter is not less than 1,000,000 cubic feet and it is all large and fine timber, both in size and quality. It is said to be much ahead of the average of what is taken out along the Ottawa.

A report is current that the extension of the Northern Railway from Gravenhurst is to be shortly commenced. This road is much needed in this section of the country to connect with Toronto and the west. It is supposed they will tap South East Bay, one of the finest harbors and booming grounds on Lake Nipissing. Here a number of lumber firms are likely to erect mills, and from this point, ship by rail. South East Bay is looked upon as the coming town of Lake Nipissing. North Bay will also be an important point, as the C. P. R. are taking considerable pains to make it a prominent shipping port for the lumber trade. Two or three miles north of this place there is said to be a very fine township of land, and already there are some thirty farms taken up.—*Ottawa Free Press.*

QUEBEC CULLERS' OFFICE.

JAMES PATTON,
Supervisor of Cullers.

Quebec, June 29.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. It cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

One of Many.—Mr. R. W. Carmichael, Chemist and Druggist, of Belleville, writes as follows:—"Your Burdock Blood Bitters have a steady sale, are patronized by the best families here and surrounding country, and all attest to its virtues with unqualified satisfaction."

LIVERPOOL STOCKS.

We take from the *Timber Trades Journal* the following Comparative Table showing Stock of Timber and Deals in Liverpool on May 31st, 1882 and 1883, and also the Consumption for the month of May, 1882 and 1883:—

	Stock, May 31st. 1883.	Stock, May 31st. 1882.	Consumption for the month of May 1883.	Consumption for the month of May 1882.

Chips.

THE Indians are threatening mischief in Spokane county, W. T., and the loggers have received arms and ammunition from the governor.

MESSRS. Wm. Bently and W. F. Fawcett, having purchased 3,000 acres of wood land in the township of Albermarle, Bruce county, intend going extensively into the lumbering busineas. Mr. Bently will take charge of the operations, with head quarters at Wiarton.

S. W. FOSTER, of the Muskegon Booming Company, is having a scow built, 20x45 feet, which is to be used in getting logs into the water that have been thrown on the shore. It will be furnished with a 50-horse power engine, and will use wire cables with which to pull the logs from shore into the water.

FELIX L. OSWALD says :—"The true basis of national wealth is not gold, but wood. Forest destruction is the sin that has cost us our earthly paradise. War, pestilence, storms, fanaticism and intemperance, together with all other mistakes and misfortunes. have not caused half as much permanent damage as that fatal crime against the fertility of our Mother Earth."

OUR cast iron pulleys are much lighter than formerly, and latterly, wrought iron pulleys have been introduced, having in addition to the advantages of being already balanced and being stronger than cast pulleys, that of being very much lighter. Wooden pulleys of very neat construction have been placed on the market, and paper has also been pressed into service as pulleys.

THE Rat Portage correspondent of the Winpeg *Commercial* says :—A tow of two thousand logs was brought in on the 22nd June by the steamer Couchiching for the Rainy Lake Lumber Company's mill, which started cutting on the 23rd and is running day and night. The Winnipeg Lumber Company's new steamer the Princess, was launched on the 14th, and the machinery is now being put in.

A SOUTHERN mill man, in a communication to a New Orleans paper, advises his southern neighbors to procure good machinery and improve their methods of manufacture so as to cheapen and perfect manufacture. He suggests they will find it true economy to erect steam dry-kilns, and provide proper planing machinery, thereby enhansing the value of their product and increasing their profits. It does not pay to ship water and shavings, rotten and otherwise valueless lumber.

AN estimate places the amount of standing pine beyond the headwaters of the Pike, a tributary of the Menominee, in Wisconsin, at 1,500,000,000 feet. This pine is at present inaccessible to a driving stream, and must be reached by rail. The Wisconsin and Michigan railroad will probably penetrate this district, and bring out the logs for manufacture. It is quite as likely, however, that railroad mills will be built, and much of the product shipped west and northwest.

THE Emerson *International* says :—The piles which have been lately arriving from Dakota for the pile work of the new bridge are of very inferior quality, and only a few of them can be used in the work. We understand the contractors are to send men up the Pembina River, to cut piles for themselves, as they will be able to secure any number there of the very best quality. This will delay the work somewhat. One of the pile drivers is at work on the west side of the river near the West Lynne coulee.

THE Boston correspondent of the *Northwestern Lumberman* says :—These Boston yards are at present very well stocked, although there have been times within a year when there was a larger amount on hand than now. Coarse lumber has sold right along better than fine grades, and the hardwood trade has been better than last year. The yellow pine trade dropped off in April and has not yet come up to expectation, although there is now a better feeling and prices are a little stronger. Spruce and hemlock are in very good demand, and prices reasonably strong, although the combination prices on spruce are being cut by some producers. There is some demand for shipping pine.

MESSRS. NELSON, MATTER & Co., of Grand Rapids, Mich., lately received a consignment of toa and tomano woods from the Sandwich Islands, and have made it up into desks. The former wood resembles walnut and the latter mahogany, both, however, being finer grained and susceptible of a better finish than the more common words. This is the first time that either toa or tomano have been sent east of San Francisco, and the experiment has proved so successful in every respect that it is likely to be repeated.

THE Muskoka *Herald* says :—The proprietors of the shingle mill at Matthiasville have adopted a novel and cheap way of transporting their shingles down the river as far as the Black bridge, thereby avoiding drawing them up and down the hills on the road. A number of saw logs are fastened together with lines and the shingles piled thereon, the loaded raft is then cut loose and allowed to float down stream to the bridge, the shingles are put ashore, the raft broken up and the logs of which it was composed sent on their way, rejoicing, no doubt, at having contributed to cheap transportation of shingles to the front.

THE *Timber Trades Journal* says :—The supply of Canadian deals to Clyde has been unusually early this year. These imports have come chiefly per steamers, and before any of the "fleet" of timber traders to Greenock have arrived. But it is not likely that the imports of deals will continue on so large a scale, as the results of public sales are not encouraging, the attendance at these having been smaller generally than was to be looked for at this season, and even when pretty numerous showing little disposition to purchase. Some lots are being sold privately, no doubt, but the public sales give evidence of an extremely quiet trade.

THE London *Timber Trades Journal* says :—Everything points to a good fall trade ; if sellers do not push stuff where it is not actually needed, the improvement may come earlier than a great many expect. The inclination seems to be to hold best goods and press the common qualities, sellers forgetting, probably, that by so doing they give a downward character to the market generally, which cannot fail to act unfavorably on almost every description of timber. With regard to the dock stock of deals, timber, &c., there is nothing in their present proportions that need cause apprehension of any over supply, and on most of the chief items they are considerably less than they were this time last year.

THE London *Timber Trade Journal* says :—It may be a matter for congratulation, or the reverse, that the shipments from the timber ports have hitherto been confined to such limited proportions ; but it is undoubtedly favorable for an advance in prices should trade become more active. Whether that would be an unmitigated blessing to the general body of consumers or not it is unquestionably what sellers would like to see speedily established, though probably a large trade at present prices would be more agreeable to the big stock holders on the other side than business on a smaller scale at 5s. advance. Just now, however, it is the smaller scale without the improved price, though the moderate shipments may naturally be expected to lead up to an increase in value.

Convincing Proof.

Having suffered from rheumatism for a long time I was induced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to buisness, thanks to your wonderful medicine

I am yours truly,

W H. DICKISON,
218 St. Constant St., Montreal.

To Henry, Johnsons & Lord, Montreal.

Arnica and Oil Liniment is sold by all Druggists.

A MINISTER'S EVIDENCE.—The all prevalent malady of civilized life is Dyspepsia. Rev. W. E. Gifford, of Bothwell, was cured of Dyspepsia and liver complaint that rendered his life almost a burden. The cure was completeed by three bottles of Burdock Blood Bitters.

WHAT EVERY PERSON SHOULD KNOW.—The grand outlets of disease from the system are the Skin, the Bowels, and the Kidneys. Burdock Blood Bitters is the most safe, pleasant, and effectual purifier and health-restoring tonic in the world. Trial bottles 10 cents.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O. ; W. EDGAR, Kilroy, P.O. ; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

NORMAN'S ELECTRO CURATIVE APPLIANCES

RELEIVE AND CURE

Spinal Complaints, General and Nervous Debility, Nervousness, Rheumatism, Gout, Liver, Kidney, Lung, Throat and Chest Complaints, Neuralgia, Bronchitis, Incipient Paralysis, Asthma, Sciatica, Sprains, Consumption, Sleeplessness, Colds and Indigestion.

Ask for NORMAN'S ELECTRIC BELTS and you will be safe against imposition, for they will do their work well and are cheap at any price.

A. NORMAN, ESQ.—Dear Sir,—Please send me a waist belt. Enclosed find price. Head band I got for my wife has almost cured her of neuralgia. Yours truly,

C. L. TILLEY, WATERVILLE, N.B.

Numerous of such testimonials can be seen at my office, proving that they are doing a good work and worthy the attention of all sufferers. Circulars free. No charge for consultation.

A. NORMAN, 4 Queen Street East, Toronto.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1t7

Market Reports.

TORONTO.

From Our Own Correspondent.

JULY 9.—Flat is the most expressive word to apply to the present condition of the lumber trade here. Stocks are accumulating on the hands of the wholesale dealers and vessels tied up at the docks, and plenty of lumber on the wharves to give them cargoes. In the face of this state of things dealers do not seem discouraged at all, there is a general hopeful feeling that shipments will move off briskly as the season advances, and as a reason for the faith that is within them, they point to the undoubted fact that there is less dry lumber of last season's cut on hand at the present time, than at any corresponding period for several years past, and, although trade on the American side is not as brisk as could be desired, still there are hopeful signs of an improving market. However, there is no use in denying the fact, that manufacturers cannot dispose of new cut stocks at $1 per M less than the same grade of lumber sold at this time last season. This, in the face of an increased cost of production, of at least $1 per M, makes a difference to the producer of $2 per M below last season's prices, which is a serious matter, especially to such as are working on borrowed capital. If the advice given repeatedly by Mr. Wm. Little, of Montreal, to lessen production, could only be acted upon it would be good policy. But the difficulty is, there are only a few manufacturers who could afford to let the capital invested be idle, so the work of destruction to our noble forests go on from year to year, and sold at a mere tithe of their ultimate value of a few years hence.

At the yards there is a slight tendency to break on prices, more especially in coarse boards and plank. Bill stuff holds its own fairly, and lath and shingles are firm at previous quotations, the market not being at all overstocked with either of the latter, and there is little doubt but that mill men who have a suitable class of timber for bill stuff will do a remunerative trade the season through, and any loss there may be will fall mainly on those who confine themselves to the wants of the American market. Cherry and butternut are in good demand and for which good prices can be obtained, if cut into squares, and 3 in. and 4 in. plank. The trade with western Ontario continues fair and considerable shipments by car are being made on through rates direct from the mills.

BOSTON.

Cotton, Wool and Iron of July 7, says:—There is no particular change in the situation. Trade is running along in a quiet and moderate way, and is expected to do so for the remainder of the summer. Prices also keep pretty even. Pine is in fair request at previous quotations. Spruce and hemlock hold pretty steady. Southern pine keeps along about as of late. In hardwoods the demand is principally for choice grades.

CHICAGO.

The *Northwestern Lumberman* of July 7, says: Not as many cargoes arrived at this port during the week ending at date as during the preceding week, the comparison standing 157 to 243. This considerable falling off is attributed to adverse winds by the consignees more than anything else. They generally take but little stock in the reports from the other side of the lake that shipments were to be withheld. A leading commission dealer said that he had received no instructions from his consignors that anything of the kind was afoot, and he thought it would be foolish for the manufacturers to pursue that policy, for the reason that should the market offerings be lean, Huron and Saginaw lumber owners would seize on the opportunity to rush their stock in, where the east shore lumber might have been. By reference to our cargo market reports last year at a corresponding time, we see that there were then adverse winds and a falling off in receipts; but after July 4 a big fleet came in, and the succeeding week the receipts aggregated 65,000,000 feet of lumber and 18,000,000 shingles. It is probable, therefore, that by the time this issue is in the hands of its readers the receipts will again be heavy. The national holiday, and the extremely hot weather, together with the adverse winds, have conspired to keep back arrivals to some extent. without taking into account the reported application of brakes at Manistee and Muskegon.

Though the market has not been over crowded with cargoes on any day of the week—not even on Monday—the enquiry has not been very active. Offerings have been got rid of to be sure, but there has been an inclination to stand around and wait on the part of buyers, and make the riffle at the last moment only. It is presumed that when the market has this sluggish feature about it, prices are not very firm at the quotations. The heaviest drag is noticed on Norway dimension, which the yard men persistently and conscientiously pound in every case. This cannot be wondered at, since the question of weight in freight rates has become such an important one in delivered lists. Norway piece stuff is undoubtedly good to use, but it is bad medicine to ship to Kansas and Nebraska, when A is trying to beat B on prices of delivered stock. The yard men this season delight to hammer prices anyway, and Norway comes in for the beating every time, and it has to go for about $9 a thousand.

The asking price for a fair run of white pine, short dimension, is $9.50, and it is doubtful if its selling value is appreciably lower than that. If deals are made at a lower figure, it is "just because it is you, you know," or some peculiarity in the schedule is taken iuto account. Where there is a large proportion of long lengths in the cargo, the top range of our quotations only are reached, which is not as high as in former seasons.

On the whole, the market is barely holding its own at the recent decline. Buyers are still troubled with indigestion, and do not take hold eagerly. Still the offerings move off in time, and an immense amount of lumber is changing hands. It is reported that one commission house last week sold 23,000,000 feet of lumber, but the story sounds as if it carried in it an ingredient of the Fourth of July.

Quotation are as follows:

Short dimension, green	$ 9 00@10 00
Long dimension, green	10 50@11 50
Boards and strips—No. 2	11 00@13 00
Boards and strips—Medium	13 50@16 50
Boards and strips—No. 1	16 00@21 00
Shingles, standard	2 25@ 2 40
Extra A	2 45@ 2 80
Lath	1 75@ 1 80

The official figures giving the arrivals of lumber and shingles for the past week are omitted in this issue, being unobtainable in full, owing to the non-session of the board of trade during a part of the week. No comparisou could be made between the figures at hand, and the oues representing the receipts for the week ending July 5, last year, consequently they would be of little interest. Our next report will include the receipts for the two weeks.

OSWEGO, N. Y.

From Our Own Correspondent.

We correct former quotations; since our last the market has been dull, and the decline in prices has not had the expected result of increasing the demand. Stocks are large and still increasing; dealers from the interior are buying very sparingly, doubtless expecting a still further decline as the new cut will soon be dry enough to come forward.

LONDON.

The *Timber Trades Journal* of June 22, says: There is very little to say in regard to the freight market. Rates from the Baltic to London remain very weak; in fact, it is said by those closely connected with the trade for many years, that such a dearth of inquiry for both deals and firewood tonnage for London has never previously been known. As a counterbalance to the miserable state of the market here, a brisker demand for the out-ports and France, with a slightly higher rate, has to be reported. From Canada the market still remains firm, with a slight inclination upward. No arrivals from Quebec are reported, yet probably some steamers from thence will put in an appearance before we again meet our readers.

A tolerably large contingent of wood-laden vessels have entered the port since we last wrote, the total amounting up to 57, of which 29 were steamers, the others being the usual class of sailing ship. Not many of them are, however, with deals from Sweden, only four are from the latter country. The bulk of the arrivals seem to be made up of firewood, with a couple of Pensacola shipments to add to the already sufficient stocks of this description. Amongst the list is the steamer Viking, from Montreal, with some deals, but the quantity is uot much to add to the limited stocks of pine. The mahogany cargoes are plentifully distributed throughout the list. As yet the steamers preponderate over the sailing ships, a state of things that could hardly have been imagined, much less realized, ten years ago.

Last year at this time there were only 24 ships arrived during a similar period, but these were subsequently improved upon, and the arrivals were quite on a par with those we have now to record. Nevertheless the present tot up is a very formidable fleet coming on a flat market, and prices can hardly recover in view of this large increase. The winds have been up to the last day or two very favorable for ships from the northward, and though not so material a point with steamers, nevertheless greatly facilitates their voyage.

LIVERPOOL.

The *Timber Trades Journal* of June 23, says: The imports have come forward a little more freely, and include some cargoes of pitch pine, which will be placed in the open market on account of the shippers. The general condition of trade, so far from showing any signs of improvement, tends rather the other way, and the complaints of the continuance of a bad state of business in the manufacturing districts are as rife as ever. The suspension of a small house in the wholesale trade here, with liabilities of about £6,000, has had a disqnieting effect upon the market in Liverpool, and it is also rumoured that a dealer in Manchester has been compelled to make an arrangement with his creditors, who are principally Liverpool timber merchants. Though the amounts involved are not large, yet they influence business very materially, and tend to check what little life there is in the market.

There is but little doubt that this was felt at the auction sale of Messrs. Alfred Dobell & Co., who offered a very fine cargo of Mobile hewn and sawn pitch pine timber and deals, just landing. The local trade was well represented, but there were hardly any country buyers in attendance, and the sale, therefore, was slow and dragging, the prices realized being very low, considering the quality and large size of the timber. As neither the cargo of Darien sawn pitch pine nor the parcel of Savannah hewn pitch pine had arrived, they were not offered.

GLASGOW.

The *Timber Trades Journal* of June 23, says: The past week's imports here comprise some further supplies of Canadian deals, the arrivals of which since the season began, now sum up to 89,700 pieces, as against 69,000 pieces at corresponding date last year. Of lower port deals (chiefly from St. John, N. B.) there have been imported this year 237,000 pieces, as against 171,500 pieces last year at corresponding date. The only arrivals to note at Greenock for the week is a cargo of pitch pine timber. Imports of this wood to date compared with last year's are, 1882:—30,500 logs, hewn and sawn; 1883, 22,000 logs. The arrivals of teak to Clyde since the beginning of the year have been 9,869 logs, as against 13,717 logs last year at corresponding date.

The stock on hand of the various wood goods in Clyde ports will be taken at the end of this month.

Of Quebec log timber the quantity held is comparatively light. At the end of March last the aggregate was 31,000 loads, as against 42,000 loads at the same time 1882. The consumption of Quebec log timber during the quarter ending 30th June, 1882, was about 18,000 loads, and if the curreut quarter comes up to this, it is evident a comparatively small total will be shown on hand at the end of this month.

Besides the leading imports that have been noticed, parcels of wood goods arriving weekly, per steam liners from New York, amount to a large total. Of staves, for instance, there have been 410,000 pieces imported this year, also a cargo of 116,000 pieces per sailing vessel. Last year's total at date was 454,000 pieces.

There have been no public sales to note since last writing, but several are announced, and will be duly reported.

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* writing on June 16th says:—Since my last letter the great bulk of the first spring fleet has sailed from the lower ports of the Bothnian Gulf, and it is now seen that the

aggregate export has been larger than anticipated. A gratifying feature of the present spring shipment is, however, the proportion to which the outports on the Continent and in Great Britain have contributed, as contrasted with the quantities shipped to what are called the head entrepots. If we analyze the clearances, for example, in the Sundswall district, from whence the heaviest export has taken place, from May 22nd to June 12th, we find that out of a total of 255 wood cargoes exported within that period, only 19 cargoes have been despatched to the four principal ports of the United Kingdom, viz., 10 cargoes to London, eight cargoes to Hartlepool, and one to Hull. Grimsby is conspicuous by its absence. From the Gefle district, again, the clearances during the time above named were 144 wood cargoes altogether, of which eight were despatched to London, five to Hull, two to Grimsby, and eight to Hartlepool. It must also be borne in mind that a considerable portion of the above eighteen cargoes for London from the Sundswall and Gefle districts consisted of firewood. The above fact would seem to sufficiently dispose of the apprehensions that importers in London and other important centres would be likely to be swamped by consignment shipments.

Notwithstanding that production continues on a smaller scale than last year, and that the statistical position of the trade, as expressed by logs in the water and stock on hand, is decidedly better than it was then, I am sorry to have to report increased weakness for the lower qualities of redwood. It is generally the case that the smaller firms have to bear the brunt of the censure that falls to the lot of those who spoil prices, or rather who are popularly supposed to spoil prices, by their erratic and plunging mode of doing business consequent on loading themselves with too much stock; but now we find that wealthy firms, in an anomalous state of the trade like the present, suddenly turn round from their former high standpoint and reduce their prices considerably without the excuse that their poorer brethren generally have. Such, unless I am wrongly informed, is what has lately occurred south of Sundswall, and if persisted in will be likely to demoralize the trade. An immediate further decrease in the production of both red and whitewood is now imperatively needed, and should be acted on as far as it prudently can.

A reduction, has, it is said, been made at Hudikswall, 80 men having been dismissed from one of the yards at that place a few days ago. As soon as importers in the large English centres are convinced that they have nothing to fear from consignment shipments, and that last winter's "log-get," with the present production, are both moderate, they will soon to cease their persistent waiting policy, and I therefore consider the Society of Saw-mill Owners, &c., at Stockholm would do the trade a service were they to publish at once the actual figures showing the quantity of logs cut during the late winter in Norrland, as compared with 1881-82 cuttings, and which they have presumably now received from the different districts.

As we have been favored with heavy rainfalls during the last fortnight, the streams in Norrland are now in better condition for floating, and complaints of want of water are not so much heard. In the Ljusne and Dal River districts floating has been tolerably successful up to date, while further north the late fall of rain will have helped the small streams considerably.

THE AUSTRALIAN TRADE.

We take the following extracts from the May circular of Messrs. Lord and Hughes, of Melbourne :—

The amount of business done in timber and building materials since the date of our last issue on the 10th ult., has been considerably below the usual monthly average, arising from the fact that the trade are in fair stock and importers not pressing sales. The demand from the yards for consumption still continues active, but during the winter months there is likely to be a falling off. Stocks of most lines held by importers are large, and we do not look for higher prices than those now ruling before the spring of the year.

LUMBER.—Imports: *Nil.* Sales by auction have been parcels ex "H. G. Johnson" and "Leading Wind." Michigan clear pine realized £17 12s. 6d. per 1,000 feet super; white pine shelving, 12 inches wide, £10 2s. 6d. to £10 3s. 6d.; over 12 inches, £10 15s.; T. and G. Ceiling. £8 15s. Particulars fully reported below.

AUCTION SALES.—17th April—Ex "H. G. Johnson," 8,576 feet 2½ in. Michigan clear pine, £17 12s. 6d. per 1,000 feet super.; 20,000 feet 3 in. do. at £17 12s. 6d. do.; 25,000 feet 12 in. white pine shelving, at £10 2s. 6d. do.; 59,194 feet do., at £10 3s. 6d. do.; 35,182 feet, wide do., at £10 15s. do.; 26,352 feet 10 in. T. and G. Ceiling, at £8 15s. do.; 1st May—Ex "Leading Wind," 2,500 feet 2½ clear pine, at £13 per 1,000 feet super.

Messrs. Gemmell, Tuckett & Co.'s May report just received from Melbourne, says :—Since last issue we have to report a steady demand for all descriptions of building materials, and prices realized during the month fairly sustain our late quotations. The building trade continues active, and the deliveries from the store yards are well up to the average of several months past. American lumber.—A shipment per H. G. Johnson realized at auction for Michigan clear pine, 2½. 3, and 4 in., £17 12s. 6d. to £17 15s.; w. p. shelving, 15 in., £10 2s. 6d. to £10 3s. 6d.; do. wide, £10 15s.; w. p. t. and g. ceiling, 10 in., £8 15s. Ex Leading Wind, 2½ in. clear (inferior), £13 per m. ft. super. Unless large shipments come forward prices will advance, as the trade stocks are moderate.

RAFTS ARRIVED.

The *Chronicle* gives the following list of rafts, etc., arrived at Quebec :

JUNE 28.—Collins Bay Co., oak, &c., sundry coves.

G. Germain, deals, Portneuf.

McArthur Bros., white pine, &c., New London cove.

British Canadian Lumber and Timber Co., white pine, &c., St. Michael's cove.

R. H. Klock, white pine, etc., Cap Rouge.

Flatt & Bradley, oak, elm, Sillery cove (Sharples).

E. P. Moor, white pine, &c., Cap Rouge.

E. L. Sewell, deals, Jacques-Cartier Mills.

Collins Bay Co., staves, Union cove.

Smith, Wade & Co., birch, St. Raymond Station.

John McRae & Co., staves, New London cove.

John McRae & Co., staves, Indian cove west.

JULY 5.—Sundry persons, oak, &c., sundry coves.

John McRae & Co., staves, Montreal.

E. L. Sewell, deals, Les Ecuriules.

Cook & Gibbons, ash, &c., St. Michael's cove.

YOUNG'S POINT, ONT.

From Our Own Correspondent.

SAW LOG DRIVES.—Mr. R. C. Strickland had a drive of saw logs arrive here on Saturday July 7th of 13,000, B. Loraque, forman, *en route* to the mills at Lakefield. Messrs. Ullyott & Saddler have two large drives at present in Clear Lake. F. Bell, foreman, has 40,000 and John Barr has 35,000, all *en route* to their saw mills at Harwood. This completes their drives for the season. A. Wynn, forman for Mr. Geo. Chalmers, arrived here on Monday, July 9th, at the snubbing ground with his large drive of saw logs, having made a splendid run from Boschink Narrows. From all appearances it will be a few days before any drives can pass through here, as several booms have broken loose between this place and Lakefield.

HIGH WATER.—The water still keeps very high, and the high winds we are frequently having of late retards the progress of saw log driving very much. This time last year we had scarcely water enough to float a tie from here to Peterborough; the steamers had to quit running, and the saw mills on the Otonabee had to shut down. This year it is quite the reverse.

THE *Timber Trades Journal* of June 30, says: The imports are pretty numerous this week; seventy-three vessels, sail and steam, have brought timber of one sort and another to the Thames since the date of our last report. Of these rather more than half are sailing ships. Still the steam-shipping trade is fairly represented, and apparently shows no sign of being out of favor with wood freights. Some people there are who attribute the unsettled state of the wood market to the fact of vessels of this class being now so largely employed in it. But this an opinion we do not exactly coincide with. Although steamers have undoubtedly brought about a great change in the shipment of deals, &c., we think they are so well recognized now that the market fluctuations which they caused at their first introduction have subsided, and the general body of importers, we expect, would rather lament their withdrawal, should such an event occur.

IT is said that nearly 100,000 acres of Kansas lands have been planted with trees under the act of Congress authorizing additional preemption where trees are planted. The Cottonwood tree is mainly planted because it grows rapidly. Besides these trees thus planted in masses, there is more or less tree planting on all farms for shade, ornamentation or fruit. In time these trees must favorably effect the climate, and perhaps break the force of the fierce winds which now sweep with but little check across the state.

THE *Timber Trades Journal* of June 23rd says :—There was a good average business done at the London docks this week, though the deliveries were not excessive. About the same as at similar date last year, something less in deals and flooring, but more in square timber. Though trade can hardly be said to be very lively, there is no laxity to be worth taking notice of in the dock business. It is remarkable that the timber deliveries from the Surrey Commercial Docks are always smaller in the summer months than in the spring and fall.

THE weight and density of different kind of woods are extraordinary. In Brazil there is a variety of tree the specific gravity of whose wood is less than cork, 0.206, while that of the ironbark of Australia is 1.426. The formation of the cells of soft and hardwood differs insomuch that the fibres of the one are more densely or compactly laid than in the other. It is the straight-grained woods that have the greatest flexibility, though the beautiful effects of color, and woods best adapted to ornamental work are found among the tough, cross-grained and knotty varieties.

This issue of the CANADA LUMBERMAN is printed for the first time by means of power supplied by a water motor from the factory of Messrs. Tuerk Bros. & Johnston, of Chicago. The water is supplied by the Peterborough Water Works Company, which draw their supply from the Otonabee river. This motive power is most satisfactory in every respect, being thoroughly efficient, with steady regular motion, economizing fuel and labor, and adding greatly to our comfort by the lowered temperature. This motor seems especially well adapted for printing offices.

CORRECT GRADING.

The advantages of uniform grades are many. In the first place, a man new in the yard business can buy of reputable houses with safety. A demand for a certain grade will bring it. There are a few handlers of lumber in this market who pass over to the consumer material that would not pass muster, if inspected by a man of experience, but those handlers have no connection with our best yards by any means. They thrive on the ignorance of their customers, and were it not for this ignorance their business would bo very moderate in proportion.

It is not every retail dealer who understands that it is best for him to sell uniform goods from one end of the year to the other. This is specially true if he has dealings with carpenters and contractors who known what lumber is. A dealer may go to a market in which he does not buy regularly, and buy a better grade of any particular description than he has been used to handling, and, strange as it may appear, his doing so may injure him as much as though he were to buy an off grade. The one lot will please his customers, but unless he can duplicate it, the next lot will be a disappointment. His customers will either want him to duplicate the better lot, or ask for a reduction on the other.

A strict uniformity of grades is as necessary for a retail dealer as for a large market. There should be a standard rigidly adhered to, and many a dealer has learned that it is dangerous to step away from the line in either direction.—*Northwestern Lumberman.*

ABOUT SAWS.

In a little work on "Hand Saws," by F. T. Hodgson, we find the following:—

"Heating spoils saws. Some sawyers will run a saw until it is tremendously hot, and, to make it worse, they throw cold water on the side, thus causing sudden contraction on that part of the saw, and after a few such times the saw has to go the factory to be hammered and put in order, and to come back to meet the same fate as before. If the saw is round, hangs true in mandrel, is in line with the carriage, filed square at top and bottom, the backs of the teeth lower than the points, with the required amount of spread set, and the teeth kept well chamfered with a gummer, so that when the saw runs only the point will come in contact with lumber, then a saw will run free and cool, and there will be no extra strain on the plate, no heating or danger."

Regarding the bursting of saws, the author of the work says: "Circular saws sometimes burst from what may appear as unknown causes. There can be no doubt, however, whon a saw does fly in pieces from some apparently unknown cause, but that a thorough investigation would trace the occurrence to one of the following causes:—

1—Square corners at bottom of tooth.

2—Out of round, with the backs higher than the points, so that instead of cutting, they scrape the dust off with the back.

3—Undue strain put upon the saw by the plate rubbing against the timber, causing it to heat, which takes the life out of a circular saw."

CYPRESS.

Although cypress has been in use many years at the South for building purposes, it is only within the last two or three years that its value has commenced to be appreciated at tho north; but the demaud for it is said to be steadily increasing, and the probability is that ere long it will form a very considerable portion of the supply of lumber sent to this market. There are two varieties of the tree, usually called the yellow and red. The latter, which is the harder of the two, grows upon the highlands, and as it takes a high polish, is extensively used at the South for furniture, shelving, counters and wainscoting. The yellow variety grows in swamps and bottom lands in the State of Alabama and all along the Gulf Coast, and throughout these sections is used as a substitute for white piue, although whon thoroughly dried it is rather hoavier and does not work quite so easily. It is claimed that it is stronger than white pine, that it can be nailed without splitting, that it does not warp, and does not readily absorb moisture. It is used exclusively for hogsheads, barrels, tanks, cisterns, etc. It is also used for picket fences, sashes, blinds, door sills, clapboads, shingles, tanks, and vats for breweries and mills, and is said to be growing in favor for dyeing and chemical vats, as the dye does not effect it as much as other woods.

The most important quality of the wood is represented to be its great durability, which has been amply tested with the most satisfactory results. In this respect it valuable for the foundations of buildings upon filled-in land, where the wood is apt to become wet and then dry, as it will not rot easily. Since it has been systematically placed upon this market, it has been growing steadily in favor witb builders, and as its merits become better appreciated, the consumption of it will no doubt increase. The lumber generally runs large and clear, and the price at which it can be laid down here makes it a cheap wood for almost any purpose.—*Lumber Trade Review.*

DULUTH AS A LUMBER CENTRE.

The Duluth *Times*, of a late date, refers to the rapid growth of the lumber manufacturing interest at that point, since Michigan men have taken hold, purchased land and built mills, and predicts that this branch of industry and trade is to be one of the chief elements of Duluth's progress upward toward the "zenith" of its hope long deferred. There is no question but that Duluth is as well situated to become a great lumber manufacturiug and market centre, as any point in the Northwest. All it needs is ample railroad facilities, directly west into north Dakota, and northwest into Manitoba. Rail communication southwestward is already secured, and will be added to in the near future by connecting branches and links. The Lake Superior region and northern Wisconsin might all be made tributary to a great distributing market at Duluth, which should become second only to Chicago. The hundreds of miles of shore encircling Lako Superior afford as ample a means of reaching out and gathering pine by the cargo, as does Lake Michigan for this market. Duluth stands to the treeless agricultural regions of Dakota, Nebraska, and tho prairie sections of the nearer states of Iowa and Minnesota, as Chicago did to Illinois, Missouri and Iowa, when the lumber trade grew up here. But Duluth lumbermen must realize the necessity of building up a trade in wholesale yard assortments before it can become a great market.—*Northwestern Lumberman.*

QUEBEC.

The *Chronicle* of June 29th, says:—The timber market continues in a very quiet state, and tho rafts now arriving are hardly even examined by shippers, which show that there is no inclination to purchase. Some very choice timber has reached the market, and especially we may mention a raft from Nipissing, about 60 feet average, as woll as one from Kippewa—last year's timber—about 51 feet average, and sold at 28 conts. We also hear of a dram of white pine, 42½ foet average, just arrived, at about 26 cents. A small quantity of red pine, about 39 feet average has been sold at 16 cents. Very little inquiry for hard woods, except for ash and walnut; both of these woods are wantod for shipment.

SHIP KNEES.

Most people are probably not aware that for the past eight or ten years a rathor extensive business has been carried on in the shipment of hacmatac kuees for ship buildiug from Ontario to the states of Maine and Massachusetts. Maine has been so long looked upon as a land of inexhaustible forests, that it is with surprise we learn that the fine ships of which its people are so proud could not be built but for the assistance of Canada. There are plenty of small knees in Maine, but large knees of eight inches and upwards are very scarce, and those that exist are in places not easily reached. Among the first to operate in the shipment of knees to Maine was Mr. J. S. Edgerley, of Fox Meade, Ont., although a Maino man. There are eight or nine persons now engaged in the business. Most of the knees go to Bath, and the cost of carrying them over the 1,100 miles of railway between the place where they are cut and Bath is $85 a car or about $2 each. The price at Bath varies from $7 to $8 and $9 each, so that ship knees are by no means cheap. During the present summer it is expected that large shipments of knees will be made to Maine from Ontario.—*Montreal Herald.*

A BIG UNDERTAKING.

When the North-West Lumbering Co. first signified their intention of erecting their saw mill, at Selkirk, Man., and of rafting their logs across Lake Winnipeg, many who possessed a knowledge of such work predicted the failure of the enterprise. There was no vessel on the lake they claimed powerful enough to tow a raft. It was also stated that the storms so frequent and sudden on the lake would prove disastrous to the raft, no matter how strongly it was constructed. All these predictions were totally uncalled for, as a few weeks ago a very large raft was successfully towed across the lake by the steamer Colville. This raft, which was 1,200 feet long, by 80 feet in width, was the first brought across the lake. A two-inch hawser was stretched through the centre of the raft, and was secured to each joint by side ropes. The actual running trip was fifty hours or two miles an hour. Mr. G. H. Bradbury, formerly of this city, one of the managing partners of the North West Lumbering Co. superintended the work of towing, and he has proven that such a voyage can be made with safty and security.—*Ottawa Free Press.*

LARGE LOSS IN DAMP FUEL.

Burning wet or damp wood or coal, instead of dry is much more wasteful and expensive than most people imagine and the subject is worthy of attention. An extensive series of experiments, recently made at Bochum, Germauy, shows that six tons of finely broken dry coal gives as much heat as about seven tons burned as wet as it would be if water were dashed upon it and drained off after a short time. And this is the condition of much coal kept in damp vaults, leaky sheds, or out of doors. The lesson is obvious: keep the coal in a dry place and condition, and 5 to 14 per cent less according to its fineness, will he needed to obtain the same heat. There is a good scientific explanation of this. Water, in changing to steam or cold vapor even—that is, in drying off—conceals or makes latent, about 1.000 degrees of heat.§ If heated to 212 degrees, the boiling point, the steam really contains about 1,200 degrees of heat, alihough only 212 degrees are sensible, or are shown by the thermometer.

The waste of heat is still greater in hurning green or wet wood. The sap or water uses up—that is, carries off in latent state—a very large portion of the heat produced by its carbon, or its dry material. As much man and team power is required to haul three or four cords of green wood as for six or eight cords of dry wood. The lesson is: cut the fuel and split it as finely as it is to be used, in the grove; haul it home when well dried, and it in a dry place for use. It will he worth far more for heating purposes than if hurned green or wet, or damp even. The only exception to this rule is only when, by reason of easier hauling on snow, and on account of the leisure of men and teams in winter, it may be expedient to haul home the green wood then; but in all cases let it he well dried before it is used.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

CHARCOAL AND BI-PRODUCTS.

Readers of the *Lumberman* will remember that several times mention has been made in its columns of the Mathieu retort for making charcoal. Mr. J. A. Mathieu called at this office recently on his way to Detroit from the South. He has been putting in four retorts for the Shelby Iron Company, at Shelby, Ala., and will put in 76 more for the same concern. The 80 retorts will turn out 10,000 bushels of charcoal per day. The gentleman has now 56 retorts in Michigan, 24 in New York, and 82 elsewhere. As everybody knows, wood in the South is very cheap, and there are many who may be interested in knowing the financial result of making it into charcoal. Mr. Mathieu gives it as follows, per cord of yellow pine, the prices representing the values of the different products on the ground at Shelby.

68 bushels of charcoal,	7 cts.....	$4 76
12 gallons of turpentine,	30 cts...	3 60
2 gallons of wood alcohol,	90 cts	1 80
Tar		1 50
Total		$11 66

The entire cost of treating a cord of wood, including labor, interest on the investment, wear and tear, etc., does not exceed $2.50. To place the price of the products considerably lower, the profit would be regarded large considering the outlay. Mr. Mathieu, as will be seen elsewhere, has been giving his attention to a new style of refuse burner. Aside from being safe, it is profitable. A safe and profitable "hell" is certainly a new idea. A safe burner has been desired by many a mill owner after an unsafe one has been the cause of the burning of a stock of lumber. A large mill firm recently wrote to this office regarding refuse burners, saying that sparks from its old one set on fire 6,000,000 feet of lumber which was consumed. Smaller fires from the same cause have been frequent. The burner in question is said to be absolutely safe, and, besides, to pay a profit of about $5 for every cord of refuse wood thrown into it. The slabs, edgings, etc., are put in at the base of the burner, and the charcoal is taken from the top. The fire can be kept continually burning. The charcoal is suitable for locomotives, blast furnaces, etc., and the cost of the burner is about the same as that of an ordinary burner. From the acetic vapors are made turpentine, alcohol, and other marketable liquids. The *Lumberman* thoroughly believes in Mr. Mathieu's retorts for making charcoal, insomuch that it turns wood, that would otherwise be of no use, into dollars and cents, and being pretty well acquainted with the ability of tho gentleman as a chemist and inventor, it has no reason to doubt that his refuse burners will be as great a success as his retorts are.—*Northwestern Lumberman.*

MINNESOTA PINE.

The alleged pine land frauds in Minnesota have again been brought into prominence by the indictment in the United States Court of four men, charged with fraudulent practices in obtaining lands and timber belonging to the public domain. The individuals indicted are John McGuire, S. R. Wentworth and J. H. Caldwell, of Duluth, and C. B. Sleeper, of Crainard. The latter is county clerk of Crow Wing county, and it is charged that he was in collusion with the other parties mentioned, by which Sleeper gave them bogus certificates, which were issued to fictitious names, and on the strength of these, entrios in tho land office were duly filed, and the timber on the lands entered afterwards cut off and sold. Almost simultaneously with these arrests and indictments W. W. Spalding was removod from tho government land office at Duluth. Since his removal he has spoken out loud, and declares that while the arrests were just enough, they were not brought about by the vigilance and enterprise of the federal officials, but through the connivance of a ring of much larger and more powerful fellows who picked up only a quarter section at a time. The *Lumberman* has before described the alleged method pursued by the great pine land owners, who promoto public sales, like the late one at St. Cloud, at which it is said they freeze out outsiders and small would-be buyers by high bidding, and afterwards letting the bids lapse, until the outsiders are discouragod and give up in disgust; whereupon the alleged ring steps in and gobbles the land at a minimum price.

The capitalist always enjoys the advantage of being able to do that legally, by the overbearing power of money, that the man of but little or no means is forced to do, if he does it at all, by fraud or crooked means. For instance, numerous individuals in the Duluth district, and other parts of Minnesota, have wanted to get possession of the pine on government lands in that state. The land was subject to entry as homesteads, under the pre-emption law, but not otherwise, except when the government should order special auction sales in districts that had been set apart and surveyed for the purpose. It was the most natural thing in the world for operators in logs to use the pre-emption dodge in getting possession of timber, inasmuch as they wanted nothing at all of the land after it was stripped of pine. It is well known that the pre-emption scheme has been worked for years with great success, so far as securing the pine was concerned; but the chickens of illegal procedure are apt to come home to roost sooner or later, and the men recently arrested have an example of the truth couched in this homely saying.

The capitalists who, it is said form a Minneapolis ring, and have promoted the prosecution of the fraudulent pre-emptors, have evinced much righteous indignation against the men who were picking up quarter section lots, but it is presumed that their virtue was pricked as much by their own moneyed interests as by the loss that the government was sustaining. They wanted that pine, and they did not want it slashed into here and there by so-called pre-emptors. They wanted it all, in untouched, virgin blocks, and at government price. So it has been all along the schemo of the capitalists to dog the small oporators out of the pine woods by shouting fraud, and sotting on the federal officials whon that was possible. The bill that was pending in the last congress, introduced by the Hon. R. D. Washburn, and said to be backed by Senator Sawyer, of Wisconsin, and favored by the new Senator Sabin, of Minnesota, to repeal the pre-emption law, has its motive in the desire to wrest the pine lands from the pre-emptors, and give the capitalists at Minneapolis and Stillwater an opportunity to buy it up in blocks.

The difference between the scheme of the large operators and the small operators is this: that of the first is legitimate; that of the other is illegitimate. One is the method of the monopolist; the other that of the swindler and thief. Poplar prejudice puts both on a par, but there is a wide difference in favor of the monopolist. The Minnesota pino capitalist, of course, want all the pine land they can legally get their feet on. There is nothing essentially wrong about that, in a business sense. They want to secure the land as cheaply as possible. There is nothing surprising about that, since they are human. They want it before the small operators have "hogged" over it and spoiled the best tracts. They don't want to see men from down East at the sales, and do not mean to let anybody but Minnesota men buy up blocks of the lands they covet. They have for years had men in the woods, going over the government lands prospecting, and know where the best pine is to be found. They have the inside track and intend to keep it, and make the most that is to be made out of Minnesota pine. It is likely that there is a combination among the wealthy pine owners of Minnosota to secure tho results indicated in the foregoing; there may be, or there may not be. There can be no doubt, however, about their intention to own the most of the government pine in northern Minnesota.

But when it is alleged that there is anything particularly reprehensible about the designs of the alleged ring, it seems like straiuing the question. If thore is auything wrong in the Minneapolis scheme, it is in the alleged freezing out of would-be buyers by high biddiug, and then refusing to take the lands as bid in. If there is collusion betweon the bidders and the government officials in this scheme, it amounts to a swindle, and should be ferreted out and punished. But if the government agents, who conduct the sales, know nothing about the motives of the straw bidders, all that can be said is that the alleged ringsters perpetrate a clever trick on the outsiders. It may not be strictly honorable and business-like, but it could not be called illegal, or even preventible.

So far as the public are concerned, the general good would be better subserved by allowing the pine lands of Minnesota to pass into the hands of the great operators, who have capital enough to cut and manufacture the pine and distribute it for use. The growth of Western Minnesota, Dakota, Wyoming, Montana and Idaho depend on the ability of their expanding community to obtain lumber for building purposes. A dog-in the-manger policy of restricting the sale of these lands to pre-emptors, and by auction sales at long intervals, will not contribute to the progress of the New Northwest. It is not sufficient to say that a few capitalists should not be allowed to monopolize Minnesota pine. Capital will control it in the end, despite all that can be done to prevent it. It will be manufactured and distributed more economically by a few capitalists than by hundreds of owners of limited means.—*Northwestern Lumberman.*

A BOTANIC GARDEN.

The current number of the *Farmer's Advocate* has the following suggestive paragraph:—In a paper by Mr. Charles Gibb on "Trees and Shrubs of Northern Europe and Asia," in which he records his observations on forestry and horticulture in the fruit-growing areas of the Russian Empire, the author alludes to the lack of botanic gardens in Canada. These institutions are to be found throughout Europe, even in Russia and most of the tropical and other colonies of England, for the interchange of botanical products growing in similar climates. "That this great Dominion of Canada," he says, "which stretches from the Atlantic to the Pacific should be without a botanic garden or a series of such gardens, is a fact without parallel in British colonial history." We cannot think of a city or town in Canada which has a more suitable and beautiful spot for a botanical garden than Saltor's Grove, near London, Ont. And in what other city in our Dominion can such assistance for the successful organization and management of such a most elevating school be found as with us? We need only mention the names of Wm. Saunders, Esq., F. R. S. C. &c.; Dr. Burgess, A. R. Murdock, and so many others. By all means have a botanical garden at once, and let London have the honor of having such a worthy addition to our fine schools and colleges.—*London Free Press.*

THE Bohn Manufacturing Company, of Winona, Minn., has taken a $25,000 contract to supply all the woodwork for the new building of the Northern Pacific road at St. Paul. The entire inside finish will be in Wisconsin red oak. The same company has the contract for trimming what is expected will be the finest bank building in Dakota, to be erected at Pierre.

A DESPATCH of July 9 from Portland, Oregon, says:—Tremendous forest fires are raging south of Ralama. Six miles of railroad and two locomotives have been destroyed at Oak Point logging camp. The loss reported up to this morning is $200,000. The flames extend for miles and are so fierce that it is unsafe to attempt to investigate the losses. It is believed the fire will continue until it rains.

A correspondent of the *Northwestern Lumberman* says:—New England in those good old days was a well-wooded section; as to that matter, it is far from being lumberless to-day. In certain sections there are large tracts of woodland which, if properly protected, will within another decade prove a valuable source of profit to its owners. Investigation goes to prove that New England is well adapted to the growth of timber, especially white pine, and who knows but in a few years those of us who may live may witness the shipping of New England pine, the same as to-day pine is shipped to us. In parts of Maine, at this time, pine is being cut, from which large quantities of good width aud strictly clear in grade are sorted out. Large quantities of clear strips are cut, which are used by moulding manufacturers, who in former times used western strips.

THE Grand Haven *Courier* says:—G. W. A. Smith, this week closed a bargain with Chicago parties for the firm of Smith & Field for 1,100 acres of choice pine lumber on White river, estimated to cut 30,000,000 feet. Average haul, one mile to the river. The most of said pine is within a mile of their old camps. Consideration $120,000.

THE *Timber Trades Journal* says:—The fact of the present low prices is causing a curtailment of the production at several of the shipping ports; and we hear that some of the largest concerns in Sweden have ceased night sawing, confining all their operations to day work, and as the night cutting has been carried on somewhat extensively hitherto, this action on their part is likely to make a considerable difference in the supplies.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

FITS EPILEPSY

OR

FALLING SICKNESS

Permanently Cured—No Humbug—by one Month's usage of Dr. Goulard's Celebrated Infallible Fit Powder. To convince sufferers that these powders will do all we claim for them we will send them by mail, **post paid, a free Trial Box.** As Dr. Goulard is the only physician that has ever made this disease a special study, and as to our knowledge thousands have been **permanently** cured by the use of these **Powders. We will guarantee a permanent** cure in every case **or refund you all money expended.** All sufferers should give these powders an early trial, and be convinced of their curative powers.

Price for large box $3.00, or 4 boxes for $10.00, sent by mail to any part of the United States or Canada on receipt of price, or by express, C. O. D. Address

ASH & ROBBINS,
20L24 **360 Fulton Street, Brooklyn, N. Y.**

FOR THE

Canada Lumberman

FOR THE FOLLOWING REASONS:

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☛TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw mill men and lumber and timber dealers of the Dominion.

AMERICAN SAWS: We represent Four of the Best American Saw Factories

SAVE YOUR TIMBER
By using THIN Saws.

McLAUGHLIN Bros., Arnprior, run two 66-in. Brooke Bit Saws, 800 revolutions per minute, on 6 to 10-inch feed.

They use Steam Feed

THE BROOKE BIT-TOOTH SAW

No. 1 TOOTH.

With this Saw you have either a Bit Tooth Saw or ordinary Inserted Tooth Saw, with teeth two-and-a-half inches long, both fit same socket and are interchangeable in a few minutes. These Bits require no gumming, and very little filing; are so firmly held that they will stand all necessary swaging, and can be worn down to dotted line shown in cut; they rest on lugs, saving the strain on the rim of the saw. For these reasons they will cut more and better timber at less cost than any other tooth. EXTRA BITS (per 100) No. 1. $9; No. 2, $8.— (per 1000), No. 1, $80, No. 2, $70.

Two sets No. 1 Bits have cut 500 m. feet pine, in 60-inch saw, running 800 revolutions per minute, on 6-inch feed. E. E. PARSONS, Arnprior.

VIZ.

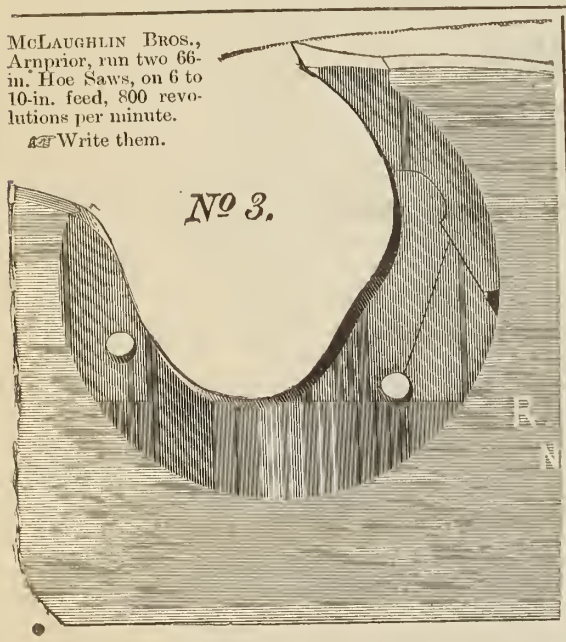
AMERICAN SAW Co.
Emerson, Smith & Co.
R. HOE & Co.
Hubbard, Bakewell & Co.

Inserted Tooth, BIT TOOTH, AND SPECIALLY THIN SOLID SAWS

We run 60-inch to 72-inch Solid Saws, as thin at center as 10 guage at rim—saving, over a 7 guage saw—1000 feet of lumber in every 25,000 cut.

McLAUGHLIN BROS., Arnprior, run two 66-in. Hoe Saws, on 6 to 10-in. feed, 800 revolutions per minute.

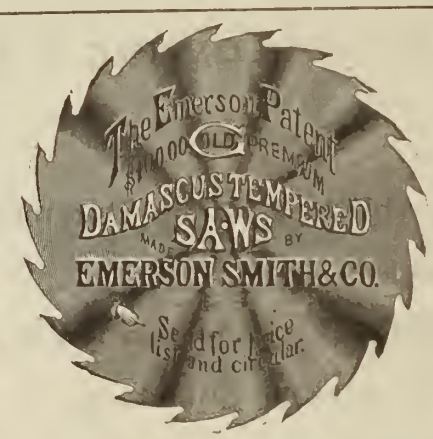
Write them.



HOE'S PATENT BIT SAWS.

One of the best Bit Saws made, above cut repesents usual size tooth, one size larger and smaller made. Send for particulars and prices.

SAVE TIMBER



GROW RICH

EMERSON'S EXTRA THIN SOLID SAWS

Having special facilities for the manufacture of extra thin saws for board mills, we are prepared to receive orders for Circular Saws as follows: 54 inches in diameter, as thin as 12 guage at rim and 11 at center, 54 to 56: 11 guage at rim, 10 at center, 66 to 72; 10 at rim, 9 at centre. Our unparelleled success with thin saws during past few years has induced us to recommend them to our customers. Our superior facilities are:—1st, Evenness of Temper; 2nd, Perfect Accuracy in Thickness, Saw balances perfectly; 3rd, Properly Hammered, to have equal strain in all its parts and at same time run true. This department is under the special supervision of J. E. Emerson, who has had 30 years experience and is without doubt the most successful circular saw maker in the world.

NO EXTRA PRICE FOR THIN SAWS.

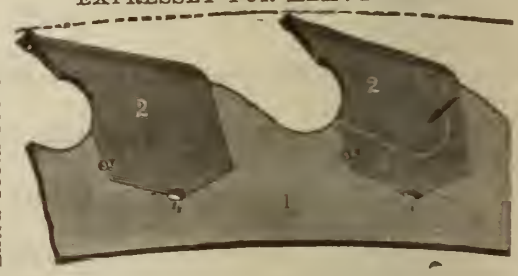
EMERSON'S LUMBERMAN'S CLIPPER SAW

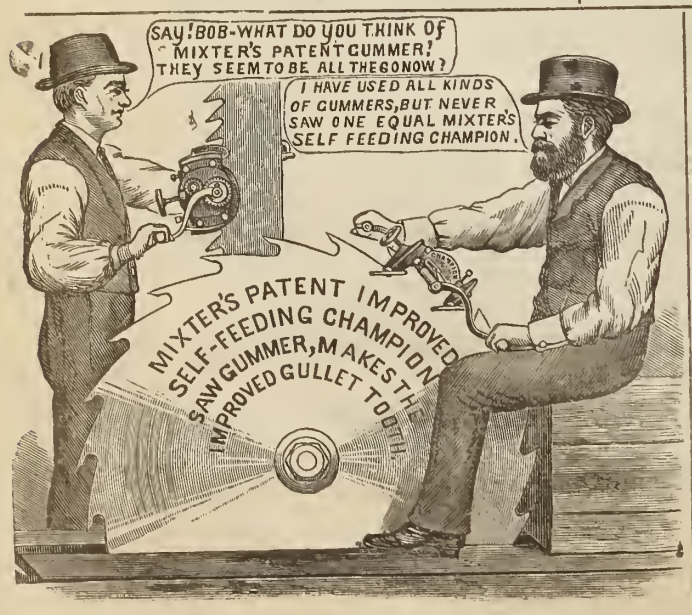
Can insert one tooth for every inch in diameter of Saw.

Designed specially for Thin Saws not thicker than 6 gauge at rim, or thinner than 15 guage at rim.

The CLIPPER FLANGE SAW

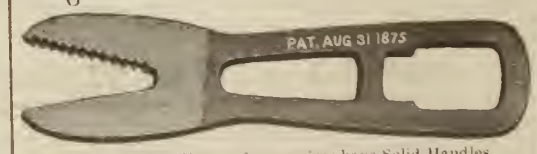
EXPRESSLY FOR HEAVY FEED.





Alligator Jaw Wrenches

5 sizes, grip from ½ to 3 inches, Iron. Solid Steel Jaw. Price 50c. to $5 50.



Cut represents No. 1. Larger sizes have Solid Handles.

WE KEEP IN STOCK ALL KINDS OF

Saw Mill Furnishings

SAW GUMMERS:—Stone's Original, large and smal size Mixter's Self-feeding Champion; Emery Wheels and Stands

SAW SWAGES:—Hoe's, Emerson's, Mixter's, and American Saw Co.; from $1.50 to $6.00.

SIDE FILES, BELT STUDS, Detachable Belt Fastners.

JARECKI'S PATENT SCREW, PLATE, and PIPE CUTTER, ⅛ inch to 2 inches, $28.00: smaller ranges in proportion

Band Saws, Scroll Saws, Rainbow Saws for felling trees, American Shingle Saws, Lace Cutters. Cant Hooks. Flue Scrapers, Leather, Cotton and Rubber Belting.

SPECIAL AGENTS FOR GANDY'S PATENT MILL BELT, runs wet or dry; the best and cheapest main driver.

WORTHINGTON and BLAKE'S PATENT STEAM PUMPS. ECONOMIST PLANER and MATCHER COMBINED, large range of work, light, handy, durable, cheap.

Ewart's Detachable Chain For Log Jacks, Refuse Carriers, Sawdust Carriers, all sizes, Live Rolls, Tranfers, Slow Speed Driving Belts, Tie Loaders, Slash Tables, Trimmers, Lumber Sorters, Shingle Block Elevators, and many uses about a saw mill.

HIGH CLASS HEAVY and PORTABLE SAW MILL MACHINERY our Specialty.

Waterous Engine Works Co., Brantford

Send for New Price List and Chain Circular. Mention this Paper.

THE CANADA LUMBERMAN

SUBSCRIPTION $2.00 PER ANNUM.

VOL. 3. PETERBOROUGH, ONT., AUGUST 1, 1883. NO. 15.

The New Orleans *American Lumberman* calls in question our criticism of Southern pine as a material for car sills. It claims that it is not brittle or lacking in toughness of fibre, that experiments prove it to rank very high as a weight carrying wood, and that its specific gravity is considerably less than that of white oak.

Several kinds of hardwood lumber are gradually coming into use which a few years ago were unnoticed. Beech is one of them. It is cheap and abundant, while the more popular hardwoods are becoming comparatively scarce and consequently high priced. Beech has a fine grain, is quite durable, and is used in the manufacture of school and church furniture, chairs, and to a certain extent in furniture. The red variety has a handsome appearance and can be made to imitate cherry.

A Winnipeg correspondent says:—Building continues fairly active, but only for actual requirements, not for expectations. The speculative element is generally absent. Carpenters and laborers are far in excess of demand. The drives down the Red River are arriving slowly, Mr. Sprague being the only one who has received a respectable instalment. There is low water this season; the same condition prevails on the Assiniboine, but if anything in a greater degree. Much of the stock will, no doubt, be carried over to next season.

THE QUESTION OF WASTE.

There is more absolute waste in the manufacture of lumber than in that of any other line of goods. In this respect the lumbermen are far behind all other manufacturers. Their enterprise and sagacity seem to be exhausted in increasing the amount of their output and decreasing the amount of the saw bill, while 30 per cent. of their logs go to waste and is absolutely worthless. What small proceeds are obtained from slabs sold are eaten up by the expense of getting rid of edging and sawdust. Here and there the more enlightened saw mill men have attempted to make something of what they call nothing, but in the usual run of mills the effort has been to get the cost of throwing it away down to the lowest point. One concern in Minnesota grinds up all its edgings and small slabs, and runs the grindings together with the sawdust by means of conveyors to a dumping ground where they lie and rot until winter, when they are used under the boilers of a neighboring machine shop. Most of the large mills run their edgings, bark and sawdust into burners where "their fire is not quenched" from May till December. At Minneapolis the stuff is dumped into the river, and causes much profanity and many legal proceedings on the part of the St. Paul people below.

The amount of fuel thus destroyed every year is simply stupendous. Anyone who has watched ton after ton of material, good to make steam with, to make paper fibre of, to extract wood acids from, dumped into a $10,000 burner, run at a pretty heavy expense, cannot help feeling that terrible waste is one of the characteristics of the manufacture of lumber. Impressed with this conviction, the *Lumberman* has watched with closest interest, and has always noted all efforts to utilize the waste. Among others, it has been especially interested in the experiments of Mr. W. H. Smith, of this city, carried on during the last three years. Mr. Smith has been backed up financially by several Chicago lumbermen, among whom the Messrs. Houghteling, of the Menominee River Lumber Company and the Mackinaw Lumber Company have been been most active. These gentlemen, incorporated under the name of the Smith Consolidation Company, have been unwilling to bring the process and machinery before the public until its value was fully demonstrated to their own satisfaction and to that of other competent judges. We are now glad to bring before the manufacturers a process so practical and so well backed up by practical lumbermen.

Mr. Smith's experiments demonstrate that the sawdust from saw mills can, at a total expense of 70 cents per ton, be consolidated into blocks weighing from 60 to 65 pounds to the cubic foot, and having a steam producing capacity equal to Illinois and Indiana lump coal. One ton of this consolidated sawdust will make more steam than two and a half cords of slabs, and will take up but one-tenth as much room. The fuel makes no preceptible smoke, no clinkers, and has no sulphur or other ingredient injurious to flues. It can be made of any size and shape, and makes a clean fuel for domestic purposes. The company has a written tender for 1,000 tons a year from one house in Chicago, made after undergoing a rigid competitive trial with a dozen kinds of coal. The company claims that Chicago will use hundreds of thousands of tons as soon as it is introduced. The fact of it being a smokeless fuel ought certainly to make it a favorite.

The process of consolidation is as follows: The sawdust is run through a drier and the moisture expelled, and the dust warmed up to a point where the resin is softened and exudes from each particle. While in this sticky condition it is run into the consolidator and impacted into solid blocks, the exuding resin becoming the medium of cohesion. No foreign substance is in any case admixed. The consolidator consists of a heavy steam hammer operating upon the material contained in one of the group of three steel molds. The molds being passed through one-third of a revolution at each movement brings them under the hopper for filling, the steam hammer for consolidating, and the discharging hammer for discharging the mold of the block just formed, in such manner that the three operations occur simultaneously. One blow of the hammer usually suffices to consolidate the block, which weighs from ten to thirty pounds. Four blocks per minute can be readily made. The capacity of the machine represented is 3,000 pounds of fuel per hour from white pine sawdust. It has just been finished for the Rathbun Company, of Deseronto, Ont., who cut about 50,000,000 feet of lumber and who have expended thousands of dollars in the utilization of its waste, which investment is paying handsomely.

The machine will take up, in connection with the drier, a floor space of 12x18 feet, and will require about thirty-five horse-power. The profits of consolidating sawdust should be very large. The fuel costs 70 cents a ton delivered on board of car or vessel at point of manufacture, and is worth about three times as much per ton as slabs are worth per cord. At Menominee, Mich., slabs sell in large quantities to tow boats, propellers, etc., at $1.25 per cord, which would make the consolidated fuel worth over three dollars per ton. A machine turning out 15 tons per day would clean up a net profit of say $2 per ton, or $30 per day; or, say $5,000 for the sawing season. It might be said further, that the process applies equally well to planing mill shavings, and furnishes a solution of the difficulty of disposing of the bulky offal of city planing mills. The mill would also save the present cost of disposing of the sawdust.

The usefulness of the present process is not limited to sawdust, but extends to all kinds of loose, coarse and bulky materials. The table given below is based upon three years' careful investigation and practical experiment:

COMPARATIVE TABLE SHOWING THE REDUCTION OF VARIOUS MATERIALS BY CONSOLIDATION.

	Bulk unconsolidated per ton of 2,000 lbs. Cubic ft.	*Bulk consolidated per ton of 2,000 lbs. Cubic ft.*	*Wt. unconsolidated. per cubic foot. Pounds.*	*Wt. consolidated per cubic foot. Pounds.*
White pine saw-dust	400	33	5	60
White pine shavings	800	33	2½	60
Yellow pine saw-dust	333	31	6	65
Yellow pine shavings	666	31	3	65
Tan bark	125	31	16	64
Bran	153	31	13	65
Middlings		28	26	70
Ground feed	76	33	26	60
Corn meal	76	31	35	65
Cotton compressed	57	..	..	56
Hay, straw and grasses in mow	....	..	..	..
Hay, in common bale	500	31	4	65
Bituminous coal dust	142	31	14	65
	40	25	50	80

The *Lumberman* has been fully posted in the facts of the case by the president of the company—J. L. Houghteling, treasurer of the Mackinaw Lumber Company—to whom we would refer those of our readers who desire to investigate the matter further.—*Northwestern Lumberman.*

THE PACIFIC HEMLOCK SPRUCE.

Great forests of the Pacific hemlock spruce (Morton's) extend along the coast from California to Alaska. It is one of the most beautiful and delicately-foliaged of evergreens, and very spiry, with a broad ground base. They are even more spiry than the eastern Canadian. These tall spruces, farther north, are clad in denser masses of darker green verdure, clothed from the base 100 to 150 feet upward, or more. The body is from two to six feet, and occasionally eight feet in diameter. But along the coast territory mentioned the tree is only from 60 to 75 feet in height, and rarely over two feet through. The thickened lower branches aid in tempering the clime in all seasons, and the foliage, unlike redwoods and their like, precipitates little moisture. It is noteworthy how admirably this tree rallies and thickens in the top when broken off by the tempest—which often takes the conceit out of its too ardent aspirations, nature's testimony that it bears training to any reasonable extent, responsive to the bidding of the Master. It is one of the best shelter trees known, wherever it will flourish at all, whether for the orchard, garden, yards, or for game of all sorts.

Contrary to experience and observation relative to most other timbers, the old matured heart-wood is more perishable than the young and sappy poles and branches where they are exposed to the seasons, the latter being less shaky, and absorbing and retaining moisture less readily. For this reason the heart-wood is almost solely used for interior work, where it is little subjected to the extremes of outer temperature, as in the case of rude rafters, where, duly seasoned with the bark on, they are singularly lasting and very elastic, with much of the snap and spring of the yew and cedar, combined with a due degree of strength.

Only in the cold forests of California, contiguous to rivers or cold creek banks at the southern limit of its growth, is the Pacific hemlock spruce never found much over 2 ft. in diameter, and about 60 or 80 feet high. Up to extreme age it preserves the perfect, symmetrical, spire form, and is altogether less marred by unsightly dead limbs, than its kindred of the east. The same observation applies to Alaska. If the tree were more exposed than in its native coast clime, it might take on a somewhat broader conic style. In the young state, say from 10 to 14 feet high or more, the bark is relatively smooth and even, branches exactly level, thin, fan-like, long and slender, with cherry-brown bark.—*Lumberman's Gazette.*

OUTLOOK OF THE COMING HALF-YEAR

The *Timber Trades Journal* says:—The Board of Trade returns for June were not issued in time to be taken notice of in the present number of the *Timber Trades Journal*, but the expiration of the first six months of the current year, nevertheless, calls for a few remarks as to the aspects of the trade and the indications with which it begins the second half of the year, 1883.

We have already pointed out that the season has been full of contradictions, and we may add that the usual effects have not followed causes with that regular succession which generally enables experience to predict, with tolerable accuracy, how things are going to rule in the immediate future. Take our Liverpool report published last week as an example. With a continuence of moderation in the import trade we naturally look for an improved demand and firmer prices, especially when there is a tendency to rise in the rates of freight. But no, these local advantages appear to be of little or no account in Liverpool, for the report begins by stating that they have "not affected prices to any material degree." It claims some credit for an improvement in the price of spruce deals and birch timber, but the trade in Liverpool must be thankful for small mercies if it is satisfied to see the best sizes and qualities of St. John deals fetching no more at the public sales than £7 7s. 6d., while the highest price to be got for 3x9 did not exceed £7 5s. per Petersburg standard, or at least 5 per cent. below the public sale prices there twelve months ago, and they were understood at that time to be selling badly. It is also intimated that tonnage for the spruce deals ports was not so easily obtained as usual, yet the average price of the deals sold by Messrs. Mackay on the 22nd ult. was not more than £7 2s. 6d. Last year it was made to appear as if the supply of spruce were really falling off, as the shipments from the lower ports fell away considerably in comparison with those of 1881. But it seems to have been not for want of the goods out there so much as buyers on this side, or a paying market to send them to. For, instead of a diminished supply this year, which would be the case if the difficulty lay with the lumberers in getting out the usual quantity, it is seen that shipments up to date are far greater than they were then. In fact, the returns from Miramichi for spruce and pine have more than doubled upon last year at this time, the figures being, for 1883, up to 14th June, 28,394,696 feet super., against 1882, 13,-015,026 feet, and it is doubtless the evidence of this fact which keeps down the price on this side. For who will speculate in a material which is already coming forward faster than it is likely to be wanted?

But the sales recorded in the Clyde in the same number present the trade under a far more favorable complexion. Some pine deals, all the way from Oconto, in Wisconsin, fetched, for best sizes—sold by Messrs. Edmiston & Mitchells, at Glasgow, on the 25th ult.—3s. 8d., and even 3s. 9d., per cubic foot, the last price being at the rate of nearly £31 per Petersburg standard; while 2nds, from the same locality, fetched 2s. 9d. or as much as £22 13s. 9d. per Petersburg standard; and 1st ends, 6 to 8 feet, did not go under £24 15s. Even 4th quality regulars went to nearly £10. Norwegian and other battens also fetched fairly remunerative prices, though, coming by way of Grangemouth, they had to pay larger proportionate freights, and this too in the face of a larger importation both at Glasgow and at Grangemouth.

At Greenock, however, things were less promising. Waney board timber at 1s. 10d. per foot cube is a shilling below prices that are not uncommon at Glasgow.

The object is to come at the prevailing tone of the trade in various localities in order to ascertain to which side, for better or for worse, the balance inclines. Now Cardiff has been complaining of dulness in the timber trade throughout the spring; but all at once it turned about and began to look at things in quite a different light, "merchants are clearing out their stocks with more rapidity, and some are again in the market for buying." Again, "the market both for mining timber and pit-props shows a great deal more animation, and a smart rise of two or three shillings per load has taken place." This statement is supplemented by an admission that the timber market had been "for some time in a depressed condition," and that the advance would "be welcomed by importers." There is no question of a better state of things now existing at Cardiff than the trading authorities have been previously able to recognise since the season began, and as Cardiff is a kind of local metropolis which gives the cue to an extensive district, a trade revival there reanimates the whole of the south coast of Wales from Newport to New Haven. We may, therefore, assume that trade on the northern side of the Bristol Channel is in a much more satisfactory state than it has been for some months past.

Crossing over to see what is doing at the great emporiums of the east coast, we get at the following paragraph in our last week's Hull report: "This market is remarkable for its scarcity of Canadian birch, mahogany, and best Quebec pine, and, if holders can be found for these goods, the prices are very high."

And further on we are told that at West Hartlepool "a very rapid development of activity has been witnessed in this market since our last week's report. As about fifty ships had arrived in the interval this might moan merely that a good deal of work was going on in discharging and landing their cargoes. But on this point we are not long left in doubt, for we have the following affirmative explanation: "As regards the demand, an active trade is doing from the ships discharging. Undoubtedly the stocks in the interior of the country are at a very low ebb, as from all the shipments large quantities are going away inland from the quayside." It is seldom that our correspondents commit themselves to circumstantial optimism. Their testimony may therefore be accepted without reservation when they boldly declare an improvement and give a substantial reason for it in the same paragraph. Nor are there wanting equally favorable conditions of the trade in Great Grimsby, which last year was thought to have imported more wood than was good for it in its attempts to contest with Hull for pre-eminence in trade of the Humber. Up to the end of May, Grimsby had not imported anything like half the quantity that it did last year. And what is the cry now? "We are surprised at the small amount of arrivals for the time of the year, and cannot think the weather has been the case of no more ships coming to port, as we are well aware there is a good demand for all kinds of timber and yellow pine especially. . . We hope to chronicle a greater amount of arrivals next week."

This representation of the state of trade in Grimsby requires no comment. When a port that was understood only a few weeks back to be overflowing still with its last year's supplies is anxiously looking for further arrivals (and some heavy ships had just been announced too) we need not ask any further questions as to the progress of business there. In the Tyne and the Wear also the reports are favorable, and the shortness of the supply in comparison of the importation of last year is spoken of in both as if there were already, or would shortly be, plenty of room for more.

The Scottish ports on the east coast, from Leith to Aberdeen, seem to be in no want of trade, and in no apprehension of supply exceeding the demand. Nor can we detect anywhere that continuance of dulness in the trade which was so marked in the early months of the year. On the contrary it appears in all directions that there is a considerable revival of business and that the retardation of the spring shipments abroad has had all the beneficial effects at home that we predicted for it.

So much has been said of the spiritless nature of the import trade, and the general dulness prevading the country, that it seemed desirable to inquire a little more closely into the question and ascertain from recorded facts whether there were any gounds for expecting the latter part of the year to be more propitious for the trade than its beginning.

Nor has the result been unsatisfactory. Without a critical inquiry, from place to place, and giving undue importance to isolated circumstances, it has been considered sufficient to take the prominent facts recorded by responsible representatives of the trade in some of our chief depots—whose statements are open to contradiction if they are colored with their own peculiar views, and do not fairly record the facts that are taking place in the trade of the port they are speaking of. Of these the reader can form his own judgment. But it seems absurb, in the face of the extracts we have here brought forward, to persist in believing that the timber trade is not in as fairly a thriving condition now as it has been at this time of the year for many seasons past. Whatever may have been the trade of the spring, that of the autumn is likely to restore its equilibrium. Let us hope also that it will render the year, as a whole, one to be remembered, as by no means among those that were unfavorable to this branch of trade, and that important section of the community who have invested their skill and their capital in it.

NEW BRUNSWICK.

The St. John, N. B., correspondent of the Montreal *Gazette* writes as follows:—The Crown lands are the principal source of local revenue which the province possesses, and their management is one of the most onerous tasks of the provincial executive. The usual war between large and small operators goes on, and there is the customary tendency toward waste of lumber on the part of temporary lessees. The late Government, for the purpose of breaking the power of the timber ring to some extent, sold licenses to cut for one year only, thus exposing the operator to competition every year. This regulation was kicked against vigorously by the larger number of operators, who protested that they would be prevented from making necessary improvements, such as the clearing out of streams for driving purposes, if they had no guarantee for more than a year's tenure. The Government remained firm, however, and no disastrous consequence followed the adoption of the short-lease rule. The big men bought timber berths as usual, and the little men squeezed in between them and secured small areas. I am told by many small operators that the one year regulation has been beneficial to them in many ways. They say that the Jumbos of the business have been more gracious to them, more tolerant of them, and much more disposed to give them sub-contracts on fair terms when there was the possibility of their bidding on the land and operating upon it on their own account. The change of Government was effected, to some extent, by the influence of the lumber kings, and the new men were asked to display their gratitude to the McLeods, Gibsons, Snowballs, Kings and others, by selling ten-year leases of timber berths. The new regulations have just been published, and show an attempt to compromise between the demands of the conflicting interests. Two sets of licenses are: The first is for one year, with the right of renewal for the two following years, which is really a three-year license. The dodge of calling it a one-year license is merely a quibbling attempt to make believe that the one-year principle has not been wholly abandoned. All long-time licenses are practically on the same plan. That is, the holder pays every year, and abandons it when he ceases to find it profitable. After this substitution of the three-yoar for the one year licenses, which, it is fondly hoped, will not be too displeasing to the small-fry lumbermen; an attempt is made to keep the promise to the ear and break it to the sense in regard to the long licenses that were promised the big fish in reward for campaign services. Five year licenses are offered with the proviso that those who accept them must pay $1.25 per thousand stumpage instead of the eighty cents which holders of the shorter licenses are asked for. This is the largest official joke of the season, but the lumber kings will hardly smile at it or own it. I am safe in predicting that not one five year lease will be asked for or taken on the terms proposed. It is absurd on the face of it to offer such conditions as these to men of business. The Government organs graciously intimate that ten year leases may be offered, the stumpage to be placed at $1.50, and the milcage reduced. Thus will the campaign promises be kept, after a fashion. If the Government can find anybody to pay $1,50 per thousand as stumpage, on condition of having a ten year lease, it will be perfectly justified in adopting the long lease principle, but I do not believe any such men are to be found—that is, if the lands are sold according to custom, subject to the payment of an upset price of $8 per square mile yearly. The hemlock bark policy of the new Surveyor General has proved so unsatisfactory that the Government organs are meanly laying the blame of its oppressive character on the scalers. The new regulations require payment of stumpage, in addition to the bark tax, on all the logs that are peeled, without regard to their fitness for sawing, and, as a very large percentage of the logs is perfectly useless for any purpose, the regulation is peculiarly oppressive. There has been, I know, a great deal of merchantable hemlock left in the woods to rot, after having been stripped of the bark, and the regulation was, no doubt, inspired by a desire to remedy this evil, but it should have discriminated between merchantable and useless logs. This is a great hemlock country, and an immense business is done in the shipping of bark and the manufacture of bark extract. The latter industry, though of recent origin, has developed into large proportions, and anything which should cripple it would be a provincial loss of no small magnitude. The Messrs. J. & J. Miller & Co., whose head offices are in London, and who have extract factories in Hungary and Quebec, have the most extensive works of this kind in New Brunswick, the chief of which is on the Miramichi, where they keep two or three small steamers almost constantly employed in towing bark scows to the factory and loads of extract to the railway station. They are genial, enterprising gentlemen, very popular with the large communities they afford so much employment to, and the Government must soon see the necessity of amending the regulations which interfere so much with their business. The true hemlock policy, in the opinion of those who have given the subject much thought is the placing of an export duty on the bark, so as to encourage its manufacture into extract or leather before exportation.

YOUNG'S POINT.

From Our Own Correspondent.

THE FASTEST TIME ON RECORD.—Thirty thousand logs belonging to Messrs. H. B. Rathbun & Son were brought from the head of Stony Lake to Young's Point in six days by the well-known foreman, Robert Horan, and from Mount Julien to Young's Point with thirty thousand ties with a hand capsin and fourteen men in three days. This is river driving extraordinary.

JULIENS' LANDING MILL.—The saw mill lately burned down owned by Mr. Hull, of Lakefield, is, it is said, to be rebuilt this fall. Its destruction by fire was a great loss to the settlers in and around that section of Burleigh.

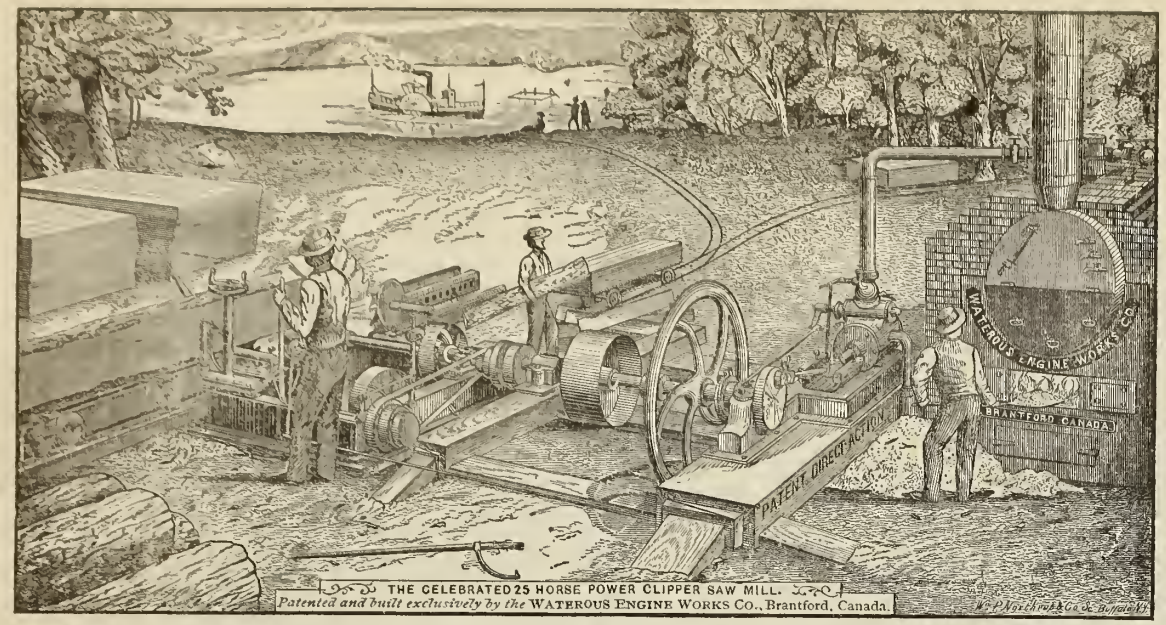
THE DRIVES.—There are no less than five large drives between here and Lakefield. That of Messrs. Rathbun & Son has been occupying the entire river from Lakefield to Rice Lake for the last three weeks, and very likely there will be some fun before they complete their entire lot of logs, as some of the drives behind them are determined to have their logs run to their respective mills without any more delay. One or two foremen having already made threats to run into them and get mixed up, and sort out at Harwood. The first to run to Lakefield is Mr. Chalmers' drive of logs, P. Cassidy, foreman, *en route* to Hilliard's mills. Ullyott & Saddler have two large drives, Jno. Barr and F. Bell, foremen, *en route* to Harwood mills. Messrs. R. & G. Strickland also have a drive *en route* to Lakefield mills. There are four more drives besides those enumerated to pass through here, which will complete the season's work. It is to be hoped all will be run over here before the A. C. A. begin their camp in August.

A Good Example.

The Quebec *Chronicle* says:—It is with pleasure we notice that the Ontario Government, following the example of several States in the Union, and perhaps quickened to action by the steps taken by the Quebec Ministry, has turned its attention to the important subject of Forestry so far as that science relates to the conservation and propagation of trees.

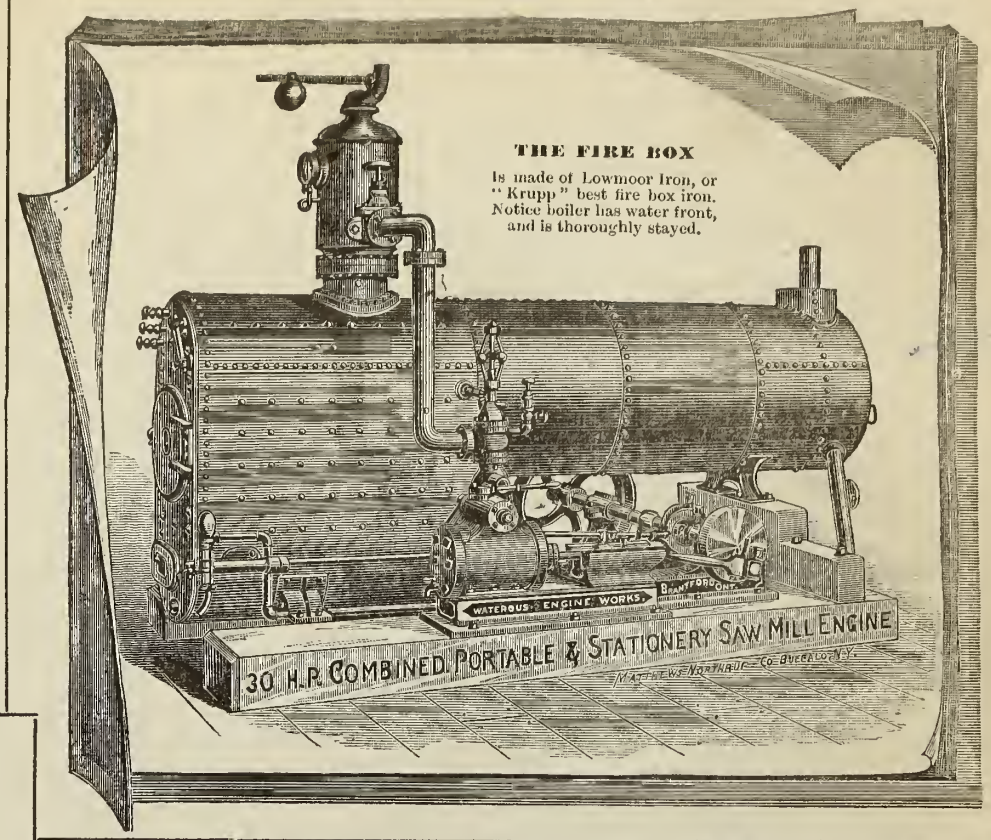
Semi-Portable and Portable Direct Action and Belted Saw Mills!

TEN DIFFERENT SIZES.



Above cut represents **Our 25 H. P. Patent Direct Action Mill** which we guarantee to cut 8,000 to 12,000 feet of lumber per day of ten hours, and to be the most efficient, economical and durable mill built in America, and will saw lumber cheaper per thousand than heavy large size belted or gang mills. For over a quarter of a century the leading pioneer mill of Canadian settlers. ☞Specially constructed for hard work.

☞This Cut represents the Engine furnished with Nos. 8, 12, 16 and 18 Saw Mills.

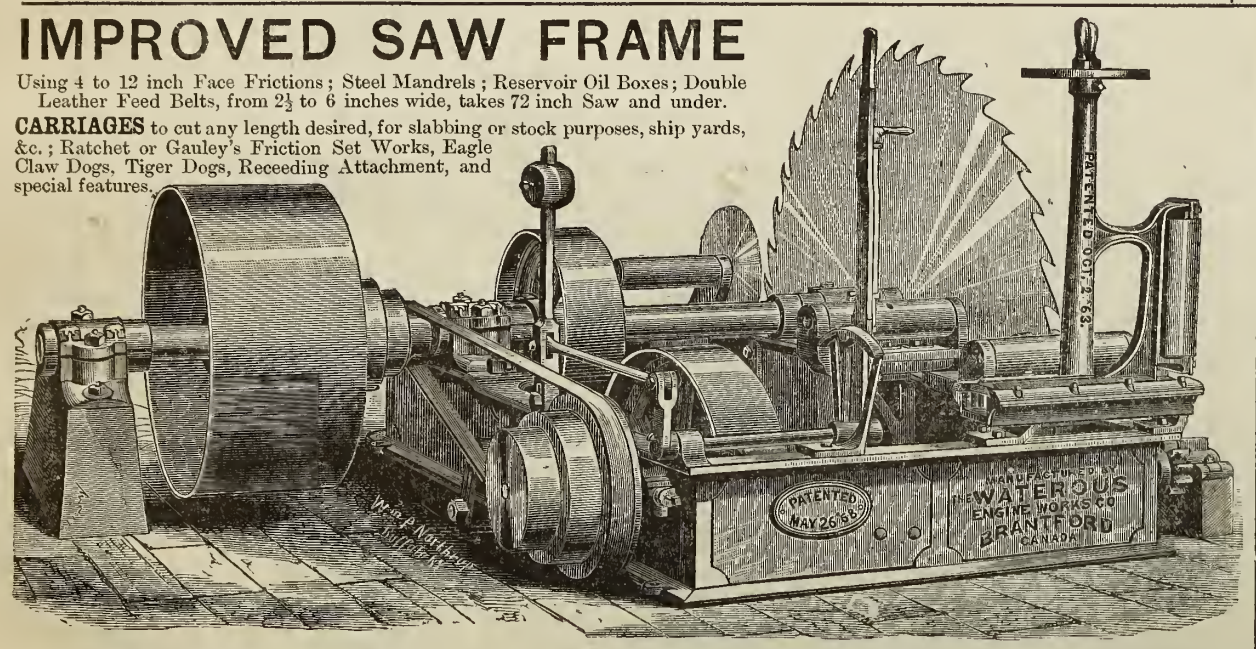


A. & P. White, Pembroke, have one of these 30 H. P. mills at Deux Rivieres, C. P. R. R.
G. C. V. Hall, Quebec, has one of these 30 H. P. mills at St. Agnes, Quebec.
Also, W. & R. Wallace, Gardner's Creek, N.B., with 60 foot Ship Yard Carriage.

IMPROVED SAW FRAME

Using 4 to 12 inch Face Frictions; Steel Mandrels; Reservoir Oil Boxes; Double Leather Feed Belts, from 2½ to 6 inches wide, takes 72 inch Saw and under.

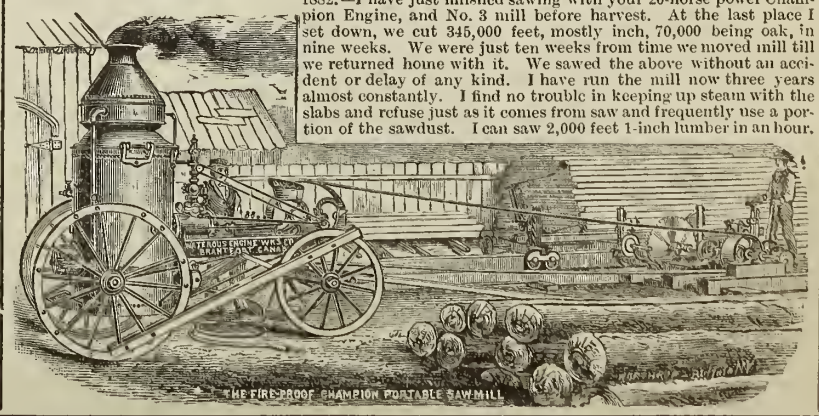
CARRIAGES to cut any length desired, for slabbing or stock purposes, ship yards, &c.; Ratchet or Gauley's Friction Set Works, Eagle Claw Dogs, Tiger Dogs, Receeding Attachment, and special features.



Champion Portable Saw Mills

12, 16, and 20 H. P.

GEORGE BOOK writes as follows:—"ST. ANNS, ONT., July 27th, 1882.—I have just finished sawing with your 20-horse power Champion Engine, and No. 3 mill before harvest. At the last place I set down, we cut 345,000 feet, mostly inch, 70,000 being oak, in nine weeks. We were just ten weeks from time we moved mill till we returned home with it. We sawed the above without an accident or delay of any kind. I have run the mill now three years almost constantly. I find no trouble in keeping up steam with the slabs and refuse just as it comes from saw and frequently use a portion of the sawdust. I can saw 2,000 feet 1-inch lumber in an hour.



The following are a few who have bought these mills:—

Canada Pacific R. R. Co.
G. B. Hall & Co., Que. (2)
Dominion Land & C. Co. Sherbrooke, Que. (2)
Sorel R. R. Co., Que. (2)
Cochrane Rauche Co. Bow River, N.W.T.
Nor.-West Milling and Mining Co., Bow River, N.W.T.
Toronto and Nor.-West Colonization Co., Near Brandon.
Morton Dairy & Farming Co., Turtle Mountain.
Allan Grant, Ottawa.
Geo. Perley, Ottawa.
Michipicoten Native Copper Co.,
W. W. Stewart, Montreal

Double Edgers, 2, 3 and 4 saws; Automatic Lumber Trimmers, 5 to 9 saws each; Log Turners, Slash Tables, Log Jacks or Haul-up of all Capacities, Endless and Single Chain; Automatic Log Rollers, Transfers, Live Rolls, Shingle Machines, Drag Saws, Knee Bolters or Block Splitters, Shingle Packers, Gang Lath Mills, Stave Machines, Automatic Sawdust Feeders for Gangs of Boilers, Sawdust, Slab and Refuse Conveyors, Elevators, Pickering Governors, Worthington and Blake Steam Pumps, American Planing and Matching Machines, American Saws, Solid and Inserted Tooth, Extra Thin Circular Board Saws a specialty, Swages, Gummers, Emery Wheels, and all kinds of Saw Mill Furnishings kept in stock.

☛WATEROUS ENGINE WORKS CO., Brantford, Canada.

Send for New Price List and Illustrated Circular, of special interest to saw-mill men. ☞Mention this Paper.

FOREIGN WOODS.

There has lately arrived in New York a cargo of logs from Havre, of the kind known as Circassian walnut, and comprising among it some trees of extraordinary size. It does not apparently differ in grain or quality from American walnut. A dealer, who is familiarly acquainted with the nature and extent of the importations, said to a New York *Commercial* reporter that the cargoes had arrived here because of the scarceness of our timber. "Formerly," said he, "Ohio and Indiana were covered with excellent black walnut, but the former state has been cleared off for years, and the latter finds her power of answering the demand greatly lessened. These states are comparatively woodless, and few very fine trees are found standing. I have seen logs brought in by the Katie, and cannot notice any difference between them and our timber, except, perhaps, they are a little redder. They came here from Havre, but where they were grown I cannot say. The United States still have much wood, but the immediately accessible supply is rapidly diminishing. We have for a long time imported the more precious woods, and I suppose the time cannot be far distant when other woods will be brought in. There is no duty on them, and in many places where they can be obtained there will often be short cargoes of other things."

A prominent firm of importers said: "There never has been a time when some of this commodity was not brought in; just as in Brazil to-day, covered as it is with forests from end to end, they import pine and other lumber from the United States and Canada. But until lately the kinds sold here have only been of the varieties we do not grow. Prominent among them is Spanish cedar. It seems to have some qualities which American cedar does not. Its use is almost entirely for cigar boxes, while the Florida cedar has its chief utility in lead pencils. What is not consumed here is bought by the Fabers, and other European manufacturers, and taken abroad. The size of the Spanish logs is from twelve inches to three feet square, which is true also of mahogany, the next largest article of importation. This is very rarely used in a solid shape, but is worked up in veneers, the cutting being done in this city and elsewhere in the union. For a long time this wood defied the ordinary cabinet maker, but the machinery now in use is capable of sawing off a shaving scarcely thicker than a sheet of paper with the greatest of ease. Mahogany has been out of favor for a number of years, but of late seems to be regaining its hold. The new methods of combing it with lighter woods relieves it of that sombreness which formerly characterized it. There never was a time, however, when some people did not admire it and have articles of furniture made from it. Next in order to these in value I would place rosewood. This comes from Rio de Janeiro and Bahia, and is more largely used in pianos than for anything else. Many people admire it very much. Its value depends upon the richness of its color and upon its figure. It is sold differently from other woods, being disposed of by the pound at prices varying from two to seven or eight cents. The importation of mahogany in this country last year might have been about 25,000 logs; of cedar, 25,000 logs, and of rosewood, 12,000 logs."

Another importer thought that we had much to gain by the introduction of more varieties of foreign woods. "There has grown to be a too great sameness about our household furniture and decorations. Those who have watched the trade for many years can remember when curled maple was the rage, and when cherry was considered the proper material out of which to make everything. Mahogany and black walnut have each had their day, although they will still continue to be used largely. The last fashion has been for French walnut red wood. But there exist in South America and Africa, to say nothing about Asia, many trees of whose qualities we are almost entirely ignorant, and which would serve an admirable purpose in decorating our homes. We still have considerable satinwood, although that is now out of favor; ebony is of great value in affording a contrast, and lignum-vitæ is used for blocks to pulleys and similar purposes. A considerable quantity of these various kinds are imported year by year, but not so much as we ought to have, considering the wealth of our people and their disposition to spend money."

"Do the native woods of the United States compare with those imported as to beauty?" inquired the reporter."

"No," was the answer. "The foreign woods are the hardest, have the best color and the finest graining, and the most specific gravity. Lignum-vitæ is so heavy it will sink in water. But we still possess an admirable variety of woods. Our oak is excellent, although we occasionally import some from England, as it is of a darker color and has more knots. No material for general use can be more effective than black walnut, and our butternut, ash, redwood and other trees give us a variety to choose from. Bayard Taylor had much of his house finished off in pine, and it looked well. The furniture which is made in Grand Rapids is sold in considerable quantities in Scotland, and it is sent abroad more or less all over the world. There is no reason why the rarest products of the East Indies and of Africa should not be used here, except the difficulty of getting people out of the ruts of old habits."

The total imports of wood and manufactured wood for the last year reported was $14,532,604. Of this, there was for box-wood, $48,991; cedar, $330,962; ebony, $72,334; granadilla, $3,111; lancewood, $10.634; lignum-vitæ, $60,-839; mahogany, $569,412; rose, $260,757; sandal, $702, and all other cabinet woods, $315,-410.

ECONOMY IN SAWING.

The more economical production of lumber is a matter which is attracting considerable attention from mill men in all parts of the country. It is claimed by many sawyers that it is impracticable to run large circular saws of a thinner gauge than those now in general use. This impractibility is probably more fancied than real, and in a few years we expect to see thin circulars running as successfully as thick ones do now. Mill men cannot afford to waste so much good timber in sawdust. Thinner saws are certain to come into general use in the not far distant future, and it would be far better for mill men to adopt and learn to use them at once, than to wait until the scarcity of timber forces them to do so. A practical sawyer writes to a contemporary:—"I started on a 10 and 12 guage saw three years ago, as my previous boss said saws thinner than 8 could not be run. I did not venture on a very thin saw to start with. I ran the 10-guage saw about thirty days; then I had it ground to a 13, it being a 52-inch with 40 teeth. I used it as a 13 until about three months ago, sawing a vast amount of lumber of good quality. I had it ground to a 16 and a double number of teeth put in it. It stands to-day a 47-inch 16-guage saw, and runs as true as a file and as straight as you can stretch a string on an inch-feed in hard oak with plenty of knots. I run my mill with a 10-horse power engine, and have plenty of power. I do not find a thin saw any harder to run than a thick one, if kept sharp. A thin saw requires more filing than a thick one. But I think any saw ought to be filed four or five times a day. I like to see a saw cut keen, with plenty of speed. A saw that drags along at 350 or 400 revolutions does not saw much. Any saw should run 10,-000 or 12,000 running feet or rim measure per minute. I am going to try a 52-inch 16-guage this fall. I think it can be run successfully, with a great saving in timber. We still have some old 'Brogne' sawyers who think nothing but a 6, 7 or 8-guage saw will run, and are ready to denounce thin saws. But I picked the ticks off some of them in this section. The most skeptical one I know of in this section says I have knocked the wind all out of him, and yet he has run a saw mill ever since circular saws came into use."

WALNUT FOR EXPORT.

A southern paper reviews the subject of walnut operations in Kentucky, as follows:—In walnut producing sections, near mines and railroads, even the stumps have been dug from the ground, and the material used in the manufacture of costly veneering. Messrs. Bry & Horn have made Frankfort their headquarters for the purchase of walnut and other hardwood timber to be shipped to Louis Bry, of Berlin, Germany. They began business last March, and have already shipped 2,467 logs containing 675,912 feet of walnut, at an average value in this city of $55 per thousand feet, or a total value of about $37,000. It required 162 cars, costing for transportation $80 per car, to carry the logs to New York, Newport News, and Baltimore. Thence the logs were put aboard sailing vessels and carried directly to Hamburg, at a cost already told of $15,000. These agents claim that Frankfort offers many advantages to buyers, both in the facilities for the purchase of the logs and for the transportation of the freight, which is chiefly carried by the Louisville & Nashville railroad direct to the shipping points. The firm employs an average of 30 men, and pays out to them about $400 per week. These men cut the bark off the logs to relieve them of all superfluous weight, and then paint the ends red as a preparatory course to shipping. The timber is very valuable in Germany, and is used for furniture and other household purposes, just as it is here, but chiefly for purposes of veneering as a means of economy in the lumber. The season is now about over until next fall, when the freshets come to let the logs out into the river, but by that time the firm expects to branch out into the business on a much larger scale, by building log booms, etc., in the head waters of the Kentucky and Cumberland rivers. Mr. William Ray, a well-known Louisville capitalist, who is largely interested in the extensive saw mills of the Cumberland Lumber Company, at Williamsburg, Ky., will start for Europe in a few days, partly for the purpose of negotiating the sale of a quantity of walnut timber.—*Northwestern Lumberman.*

ARRIVALS IN THE THAMES.

The *Timber Trades Journal* says:—Of the long list of 78 timber-laden vessels, reported at the London Custom House this week, 37, or not quite the half were steamers, which, in the middle of the season, when almost any old vessel can trade with the certainty of fine weather, is a further indication of the growing increase in the demand there is for steam tonnage. It is not so long ago when the trade would have been taken by surprise if they had noticed two or three steamers in such a fleet of arrivals as we have to record this week, but now that the novelty is worn off, the immense amount of steam tonnage employed ceases to astonish anybody and is received by the trade as a matter of course. Thirty-seven steamers, out of a list of 78 vessels, means that nearly two-thirds of the of the wood brought has been by steam. As a rule, the sailing ships—allowing for coal and engine space—average quite a third less tonnage than the competitors, and if we deduct that from them, and place it to the account of the steamers, we shall get an approximation of the quantity of timber brought by steamers over that of sailing vessels quite equal to what we have stated. To London, at any rate, this preponderance of steam tonnage is not unexpected, and increases every day. We expect steamers will play the most prominant part in the timber trade to almost every country in the world by and by. To small coast ports sailing ships will continue to trade, but the big depots will be entirely monopolized very soon by the more paying class of vessels.

In the list mentioned, the first of the Quebec spring fleet are noticeable—as usual the Hovding is the soonest in the docks, followed next day (June 29th) by a large vessel, the Victory, but excepting the New York regular liners, there is nothing else from the other side of the North Atlantic.

The list recorded shows a large importation for one week, even in July, and exceeds by ten vessels the number that came the first week of July last year. However, we must recollect that no less than twenty of the recent arrivals are laden with firewood from Northern Europe. Still almost every Swedish and Baltic port is represented with other goods, and a plentiful supply of deals and battens may now be depended on of whatever kind or quality the buyer may be in search of. The fine weather and variable winds have brought us ships from all directions, besides large numbers of steamers.

Freights to London from the Baltic are rather depressed, and we understand there are a lot of steamers, now in the Mediterranean, that loaded out coal unchartered, and ready to accept anything they can get, so that the prospect of any improvement is not encouraging to shipowners. 27s. 6d. Gefle to London and 28s. 6d. Soderham, both steamers, has been done, which we believe are the lowest rates closed this year. The coal trade has been apparently active, the price having risen 2s. per ton, but we do not hear of any advance in the rates as freight, which seem by latest advices to be about stationary. Colonial freights, on the other hand, are firmer. Still there is not much doing. Plenty of vessels are wanted, but the position between the charterer and shipowner is somewhat strained, the former trying to obtain some reduction in the market rate, while the latter is rather inclined to demand an advance. So that, as neither seems disposed to give way, like last year, the season may slip away without anything being done.

That steamships are working at little or no profit seems palpable from the fact which we recorded at the time of a steamer leaving London awhile since in ballast for Miramichi to load deals back at 64s. a standard. We can hardly see how such a voyage can possibly be a profitable one to the owners. The coal consumed and the other expenses might, not unreasonably be expected to almost equal the freight she would earn.

There seems nevertheless to be a tendency to replace sailing ships by steamers, and we expect it will not be long before vessels of the latter class get well into the pine and spruce trades.

BAD POLICY.

The Winnipeg *Commercial* says:—Not many months ago a leading firm in this city which pays spot cash for every thing they buy, wished to contract for between two and three million feet of lumber. They had no intention to go beyond the limits of the province for their supply. But when the dealers were approached their prices were beyond ordinary reason, hanging on to the old boom time rates. Instead of ordering at home then this firm ordered their supply from eastern points, and it is now being delivered at Port Arthur. Two millions and a half feet of lumber would make a big hole in many a lumber yard in this city, and only the grasping avariciousness of those connected with the trade, who thought they controlled everything, is responsible for the result. What we have mentioned is only a case in sample. There are doubtless many others of a similar character.

The *Timber Trades Journal* says:—A considable proportion of colonial stock has been placed since our last communications from Quebec and other of the St. Lawrence ports, and judging by the large inquiry for tonnage, many of the spruce shippers as well must have found a market on this side of the Atlantic for their goods. Still chartering for the reasons mentioned seems to drag slowly on, and if shipowners decline any abatement, those who want ships must give the rate or lose the chance of getting tonnage for the second voyage altogether.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

Do not attempt to remain over night without a bottle of Dr. Fowler's Extract of Wild Strawberry near at hand. This is the season for Bowel Complaints, Colic, Cholera Morbus, etc., and the remedy above named is the unfailing specific.

A CURE FOR CHOLERA MORBUS.—A positive cure for this dangerous complaint, and for all acute or chronic forms of Bowel Complaint incident to Summer and Fall, is found in Dr. Fowler's Extract of Wild Strawberry; to be procured from any druggist.

"WHEN all other remedies fail," for Bowel Complaint, Colic, Cramps, Dysentery, etc., "then Dr. Fowler's Extract of Wild Strawberry comes to the rescue." Thus writes W. H. Crooker, druggist, Waterdown, and adds that "its sales are large and increasing."

WOODS FOR SPECIAL USES.

The following list of woods and purposes for which used will be found interesting:—Shipbuilding—cedar, pine, fir, larch, elm, oak, locust and deal. Wet constructions, (such as piles, foundations, flumes, etc.,) elm, alder, beech, oak, plane tree, white cedar and palmetto. House carpentry—pine, oak, whitewood, chestnut, ash, spruce and sycamore. Machinery and mill-work, frames—ash, beech, birch, pine, elm, mahogany and oak. Rollers, etc., box, lignum vitæ, mahogany and service tree. Teeth of wheels—drab tree, horn beam, locust and service wheel. Foundation patterns—alder, pine, poplar, walnut and mahogany. Furniture, common—beech, birch, cedar, cherry, pine and whitewood. The best amboyna black ebony, cherry, mahogany, maple, oak, rosewood, satinwood, sandalwood, chestnut, cedar, tulip, walnut, zebrawood, ebony aud ash. The elastic woods are ash, hazel, hickory, lancewood, chestnut, yew and snakewood. The tough woods are beech, elm, lignum vitæ, oak, walnut and horn beam. Carving woods—pear, box, lime tree, dogwood and ebony. Scented woods—camphor, cedar, rosewood, sandalwood, sasafras aud satinwood.—*Wood-Worker.*

AN IMPORTANT CHANGE.

The saw-mills recently stationed at Bradford have been removed to Orillia. Bradford's loss is a great gain to Orillia. "It means," says the Bradford *Witness*, "the diverting of the immense traffic to result from the development of eighty miles of the extensive timber limits of Black river from the Northern Railway and Toronto to the Midland Railway and Peterborough. If the canal to connect Lake St. John with the Couchiching is built, and there is little doubt—the distance being only 400 yards and the cost only $30,000—the product of the Messrs. Strickland's sawmills and their timber making operations (their timber on the Black river amounts to 150 million feet) will be sent over the Midland Railway *via* the Missing Link, and will pass through Peterborough. Last year the firm sent 250 thousand cubic feet of timber over the Northern Railway, and this year so far they have sent 125,000 cubic feet. Their timber cut, which amounted to 7,000,000 feet last year, and this year so far to 4,000,000 feet was also sent ov the Northern Railroad. This is only the usiness of one firm, but when the operations of all the other timber and lumber business of the Black river become tributary to the Midland and Peterborough some idea may be formed of the immense traffic that will be diverted from the Northern to the Midland."

DESTRUCTION OF SPRUCE FORESTS BY WORMS.

A good deal of alarm has been created of late, especially in New Brunswick, by reports of the destruction of the spruce trees by worms or borers. As that Province largely depends upon its spruce forests for its export trade the prospect of having them destroyed was well calculated to excite apprehensions and to stimulate nquiry. We observe by the Maine papers that the same decay of the spruce trees has been noticed in that state, especially in Northern Aroostook. There has been already in that district a loss to the owners of the land of tens of thousands of dollars, and the matter has caused a great deal of anxiety. During the present season a noted entomologist is going to Aroostook to look into the cause of the decay and death of these trees, and he will probably be accompanied by Franklin B. Hough of the United States Commission of Forestry, who has lately been in the state making some investigations. A township north of New Sweden was operated upon last winter for the first time, and was supposed to have an immense quantity of spruce upon it. It was found that a large number of the trees were dead. This is true of all the other towns in which the spruce is reported fast dying only from old age, that the young trees are not affected by worms or insects, that in the old spruce the worms follow, but do not precede decay. In order to get at an intelligent conception of the matter the Boston *Globe* obtained the views of a number of practical lumbermen and woodsmen. One old lumberman of Caribou, Aroostook county, who has had charge of a number of townships of land for several years, and who has had great experience in the woods, says that on five ranges of townships the spruce down to eleven inches are dead or dying, and that the young spruce are unaffected. His view of the cause is that about eight years ago late in the fall there were very heavy rains, which loosened the earth, and that the rains were followed by a protracted gale and a hard winter. The root fibres were broken, which caused decay; then the worms followed. On the north-west slope, where the wind had the greatest range, the trees suffered the most. The trees at first at the top present a seared appearance, and year by year death passes towards the roots, some times one side at a time and at other times on both. He says it would be impossible to estimate the loss in Aroostook county.

Other gentlemen well acquainted with the lumber districts of Maine and New Brunswick expressed substantially the same opinion. They agreed that the worm did not attack young and thrifty trees, but only those which had begun to decay, The spruce is not a long lived tree, but grows rapidly and, after it reaches maturity, which is in from sixty to ninety years, begins to decay. We do not know whether a similar state of affairs exists in this Province, but the matter is one which invites inquiry.—*Montreal Herald.*

The Pine a Barometer.

THE *Illustrirte Garten-Zeitung* says it is the easiest thing in the world to foretell the weather by observing the common American pine (*Pinus Strobus*). If we expect rain or snow within a reasonably short space of time the branches of the last two season's growth will be pendulous. If such weather be a long way off, the branches will be raised rather than drooping.

A Short Output.

The *Lumberman's Gazette* of Bay City, Michigan, says:—By the middle of July last year over 40 per cent. of the mill cut of the Saginaw river of 1882 had been put on to the docks, but an immense reduction from the figures of 1882 is shown this year. First a very late opening interfered, and then the mills have been subjected to continual and annoying delays from high water and lack of logs, and the present prospects are not of the most flattering description for anything like last year's output. Long ago we predicted the lumber cut on the river would be 250,000,000 short, and we see no reason for a change of opinion, while the *Call*, of this city estimates the shortage at 300.000,000 feet. It is safe to assert, however, that the output of lumfor 1883 will not much exceed 75 per cent. of that of 1882.

Immunity from Fire.

The freedom of the yellow pine from the blighting effects of forest fires is a problem which, as yet, has not been satisfactorily solved, and it is one which has excited the admiration of many old Michigan and Pennsylvania lumbermen. Many reasons have been given, but the latest is from a lumberman who hails from Pennsylvania. He has watched the progress and effect of many fires, and some especially hot ones, upon individual trees, around which dead limbs were piled ten and twelve feet high. The tree would be burned black, but no injurious effect was observable afterwards, as the tree grew steadily on. He has about reached the conclusion that the heat from the fires draws a superabundance of sap to the heated portions of the tree, and thus prevents the wood from burning.—*American Lumberman.*

THE *Timber Trades Journal* of July 7th, says:—During the past three months the consumption of Quebec pine logs (waney boardwood, yellow pine, and red pine) amounts to about 9,000 logs; and of oak, elm, and birch, 3,200 logs. Of pitch pine logs, hewn and sawn, the quarter's consumption has been about 15,000 logs.

IT is now in season to warn our readers against the sudden attacks of Cholera, Cramp Colic, and the various Bowel Complaints incident to the season of ripe fruit, vegetables, etc. Dr. Fowler's Extract of Wild Strawberry is the grand specific for those troubles.

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.
"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont. AUG. 1, 1883.

WE would call the attention of our readers to the important auction sale of valuable timber limits to be held at Ottawa on August 28th, the particulars of which may be found in our advertising columns.

AN estimate has been made of the timber lately levelled by the tornado near Hubbard lake, Mich., by which it appears that Fletcher, Peck & Co. have about 4,000,000 feet flat, and Jackson's fallen timber amounts to 8,000,000.

A GREAT deal of rafting is being done on the Ottawa just now. Timber cribs are being formed into rafts at the foot of Government Hill, and large rafts are being made up, near Gatineau Point, of small cribs of railway ties from up the Gatineau river.

THE *Northwestern Lumberman* says:—The Canadian propeller Bruno lately loaded at Ashland, Wis., and cleared for Quebec, with a full cargo of first-class, gang-sawed deals, manufactured by the Superior Lumber Company. It was the first of four cargoes sold by that Company to Quebec parties.

MR. MCALLISTER'S drive of 40,000 logs, after all, has stuck in Snake River. The water was high enough but the rank weeds that grow to such an extraordinary height in the water there prevents them being further driven this year. Many of our citizens will be sorry to hear of the mishap, after the efforts of Mr. McAllister and his men to get them through.—*Standard.*

THERE are about ten thousand pieces of what is known as "piling" on the river above the falls, says the St. John *Globe*, intended for the American market, chiefly New York. The usual freight on these articles would be about fifteen thousand dollars, almost as much, if not quite as much, as the first value of the tree. Instead of sending them to the States by schooner, the owner intends to do them up in large cribs, which will be six or seven feet below the surface of the water, and three or four above, and thus tow them to their destination. This, it is believed, will cost much less than the usual mode of conveyance.

AN Ottawa despatch of July 23rd says that an extensive jam of logs on the Gatineau broke this morning in the vicinity of Gilmour & Co.'s mills, carrying away a portion of the boom and allowing thousands of logs to float down the stream. The damage done will reach several thousand dollars.

THE St. John, N. B. *Telegraph* says that today very little pine, spruce, hemlock, or cedar is permitted to go to waste. What used to be waste is now made up into casks, barrels, and kegs, for lime, sugar, and nail manufacturers, and the rough bark of some of the lumber is eagerly sought for by paper-makers. Our contemporary adds:—"If a 'penny saved is twopence earned,' our mill men may be congratulated upon the opportunities made available by discovery and necessity during the past few years."

THE Ottawa *Free Press* says:—The probabilities are that the output this season of the Ottawa and Hull lumber mills will be far in excess of that of any former year. By the numerous improvements and additions the capacity of the mills has been increased fully fifty per cent. and the facilities for removing lumber have been greatly improved. Though considerable quantities are being shipped away, the piles are rapidly increasing and piling ground is at a premium.

A Winnipegger recently returned from the extreme end of the C. P. R. track, has brought from the Belly River a specimen of lignite coal of bright, clear character, burning excellently and giving out strong heat. He has also specimens of petrified pine showing perfect formation of the ancient tree, and proving the existence in the country at an earlier period, says the Manitoba *Free Press*, of trees of mammoth growth. Clusters of quartz, showing indications of gold, clung to the specimen.

THE Fredericton, N. B., *Capital* of July 10th, says:—The work of rafting logs at the Douglas, Mitchell and Glazier booms is now rapidly pushed forward by strong crews, numbering in all about three hundred and fifty men. With this force and favorable weather, the average number of joints put up per day ranges from 400 to 450, or, in superficial feet amounting to 1,250,000 per day. Rafting at the Glasier boom only commenced last week, previous to which there has been rafted at the Douglas and Mitchell booms 30,000,000 feet this season in 10,000 joints. All the lumber to come down the river this summer is now on the booms, which are estimated to contain, at present, about 90,000,000 feet. This amount, with the present crews and favorable weather, can be put out in about 80 days. The company expect to have all the logs rafted by the middle of October at the farthest.

THE FORESTS OF ONTARIO.

THE report compiled by Mr. R. W. Phipps on the necessity of preserving and replanting our forests, will, we hope, call general attention to a matter of which we have constantly urged the importance, namely, the wasteful system adopted by Ontario, in common with the other Provinces of Canada, in regard to the forest wealth of the country.

The constant and rapid denudation of our forests and woodlands has already done an amount of damage which will be difficult to remedy, and which, if continued much longer, would be irreparable, except at an enormous expense. Already the removal of shelter has affected the climate and deprived our arable land of protection, till smaller crops are obtained from the cultivated lands than would not be the case if a less area were under the plough and a portion of it left wooded. Our forests have been trenched upon until already in many large districts our lumbermen are unable to find timber of the quality formerly obtained, and no distant period must see our Province importing instead of exporting. The capital of the Province is being seriously impaired, for forests, which ought to be a perpetual source of income, are being extirpated once for all, in many cases leaving the cleared land almost valueless.

Under our present system the settlers and lumbermen are invited and indeed almost compelled to join in a race for the destruction of our forests, resulting in the least possible benefit either to the public or to themselves, and causing between them a feeling of antagonism which is to be lamented.

The principal remedy for this improvident system which has been hitherto in vogue in Canada, without distinction of Province or of party, is the setting apart of public forests to be reseved in perpetuity. In Ontario the necessity for this measure is especially pressing. There should without delay be established a separate Department, or at least a Bureau of Woods and Forests, under a a competent head and with an efficient staff.

The first and most pressingly important duty of this Department would be to examine and map out the Crown Lands, the public domain of the Province, so as to discriminate between agricultural lands to be opened for settlement, and forest lands where the existing timber, the nature of the soil, or other circumstances, render advisable the reservation of a certain area as a public forest. Of course these recommendations should be subject to proper checks, and the final reservation of forests shoutd be a matter for cabinet action and ministerial responsibility. Hereafter, too, the boundaries of the forest areas might be modified, enlarged, or restricted, as circumstances might demand. When such a separation of our public lands is effected, settlement should not be allowed in the forests, and the operations of the lumbermen should be at least restricted in the lands to be devoted to agriculture. In this manner much of the present friction, antagonism and waste would be avoided.

The forests, when once established, should be treated as such public property is managed in Germany, which is the head quarters of the science of forestry, in the British Isles, in other European countries, and even in India and Australasia, which are more provident in this respect than we have been. There an annual crop is obtained from the forest as from the farm, and this important portion of the public capital is not exhausted at one fell swoop.

Though it would have been easier to have adopted these measures at an earlier period, it is not yet too late. We may instance the height of land running across Ontario northwesterly from the Thousand Islands to the Georgian Bay and Lake Superior. Much of this is far better adapted for forest culture than for agriculture. Much of it is still covered with valuable timber, though it is fast disappearing. There are large tracts of it where little of the land has been alienated to settlers, and some of it is still in the hands of the Crown. A great portion of it is under license to the lumbermen, but it should not be impossible to devise some plan by which their vested interests may be protected, while the value of the public domain is preserved. With settlers excluded from the forests, one great reason of the haste of the lumbermen to strip their limits of the timber would disappear. By limiting the cut to mature trees, by sparing those still immature, by providing for the removal of fire-spreading debris, and by encouraging the young growth, or replanting where necessary, a perpetual supply of valuable timber might be maintained. This is done in other countries very similarly situated, and we see no reason why it cannot be done in Canada, with great advantage both to public and private interests.

To establish such a forest staff as would be necessary to carry out this plan, recourse might in the first place be necessary to an experienced forestry officer from Great Britain, or even from Germany, where the science has been practised and studied for centuries. Soon we should be able to produce our own qualified forestry officers, and pending other arrangements, the Agricultural College might be utilized for such training, its head officer having already displayed much interest in forestry.

If any good is to be done, early action is of the utmost importance, and we hope that the next session of our local legislature will see steps taken in this direction.

THE LATE DR. JOHN A. WARDER.

WE regret to have to record the death of Dr. John A. Warder, whose zealous efforts to promote forestry are well known to our readers. He was a valued contributor to the columns of the CANADA LUMBERMAN, and we will miss his genial correspondence, advice and even criticism. The *Northwestern Lumberman* says of him:

"Dr. John A. Warder, of North Bend, Ohio, who died recently, was an enthusiast in everything that pertained to forestry. He labored earnestly and vigorously for forest protection and extension, and was always a leader in the meetings called to consider these questions. The last time he visited the *Lumberman* he spoke in detail of what he hoped to accomplish, but it was plain to an observer that owing to his age and state of health his aspirations would never be realized. He has written much on subjects pertaining to forestry, and while practical men might easily find an opportunity to differ with him on some points, no one ever questioned his earnestness, or that his intentions were of the very best."

Does Lightning Strike the Pine?

It has been often said by the so-called wise old "Say So's" in this locality that the lightning never strikes the pine tree; but the fact was very conclusively demonstrated to the contrary to-day at this place—Mr. James Fenwick's. Mr. Fenwick's place is the one adjoining that of Admiral Lee. Just after 1 o'clock p.m. the storm passed directly over Mr. F.'s house from the northeast, and soon after a vivid flash of lightning came, which struck two pine trees only ten or twenty feet from his house. A part of the electricity passed down the trees into the ground, tearing off great strips of bark and cutting a groove into the trees for some distance just before it passed off into the ground. The rest of it followed a wire clothes-line attached to one of the trees to the other end of the wire and then passed down a cedar post to which the wire was attached into the ground. It split the post the whole length and broke off large pieces from it. It was a very narrow escape for the house, for if the cloud had discharged a moment sooner it would certainly have hit the house, and perhaps have done a great deal of damage. There are a quite a number of Washington people spending the summer here and all who were at the house were very much alarmed, and also the animals. The horses in the stable never tried to break away and run, the flash was so vivid and the report so loud.—*Sligo (Md) Letter to Washington Star.*

Damage by Logs.

DETROIT, July 27.—Yesterday morning three piers of the Detroit, Grand Haven, and Milwaukee bridge went down before the pressure of one hundred million feet of logs, and the logs passed on and tore out the Grand Rapids and Indiana and Chicago and West Michigan railroad bridges. The logs are now at rest against the Lake Shore and Michigan Southern, which will probably give way. Seventy million feet of the logs are owned in Grand Haven, and 30 million in Grand Rapids. The damage to the Detroit and Milwaukee bridge will amount to $20,000; Grand Rapids and Indiana destroyed, cost $20,000; Chicago and West Michigan damaged, $30,000; Sixth and Seventh wards flooded, creating damage estimated at $20,000; different factories damaged, $15,000, and those on the canal will shut down for three weeks. The city bridges all stand, but some are shattered.

THE Indianapolis, Ind., Wooden Dish Company has perfected a machine, which takes the veneer from the mill, cuts out the blank, shapes and scores it, folds it up, makes, drives and clinches the wire staples, and throws the dishes off complete, at the rate of one a second. The company's work's, burned last March, have been rebuilt, and $12,000 worth of new machinery has been purchased. The works will start up August 15, and have a capacity of 200,000 per day.

ROCK ELM WANTED.

A Few Car Loads of good ROCK ELM, cut into 1½, 2, 2½ and 3 inches thick, 12ft. length prefered.

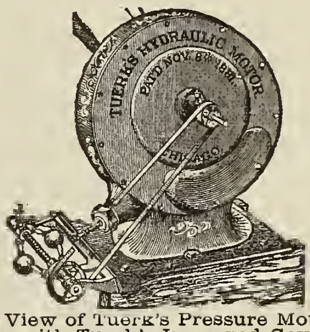
TUERK'S
WATER MOTOR.
Patented November 8th, 1881.



View of Tuerk's Pressure Motor, with Tuerk's Improved Governor Attachment.

For running Sewing Machines for families or for manufactories; also, for running Dental Lathes and Engines, Telephone Generators, Coffee Mills and Roasters, House and Church Organs; also for running one Printing Press or six, at the same time. Paper Cutters, Sausage Machines of any make or size; GRAIN, FREIGHT OR PASSENGER ELEVATORS, Straw Cutters, and all kinds of Machinery by Water Power.

HYDRANT PRESSURE.

☞Cheaper, Quicker and Safer than Steam.

Over Fifty Motors of other makes have been taken out and replaced with the TUERK MOTOR; among the list are the Backus, the Sabin, the Little Giant, the Hayward, Clark's Piston Engine, and others.

Names of a few who have taken out Backus Motors and put in the Tuerk Motor in their place:

C. W. Meikel, Indianapolis, Ind.
Columbus Telephone Co., Columbus, Ohio.
James Egan, Chicago, Ill.
H. C. Hawkins, Cleveland, Ohio.
Printing Office, Hannibal, Mo.
A. Solmens, Hat Manufactory, So. Norwalk, Ct.

R. Putnam, Chillicothe, Ohio.
N. Shelton, Omaha, Neb.
H. J. Lewelling, St. Helena, Cal., and others.

☞Do not fool your time away trying other Motors, but send for the Tuerk Motor, which is warranted to do better work with less water than any other Motor or Water Engine made.

Send for Catalogue, and state what you want to un,—give fu l part culars and Water Pressure per square inch.

TUERK BROS. & JOHNSTON,
86 and 88 Market Street, Chicago, Ill.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

$500 Reward!

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C. WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. ORMOND & WALSH, sole authorized Agents for Peterborough Ont. w46d112L22

PLANTING IN WASTE PLACES.

The following paper by Bernhard E. Fernow, of Slatington, Pa., is taken from the *American Journal of Forestry* :—

Most of the methods recommended and described in American papers for planting forests, presuppose that the ground to be planted is arable, or at least workable with the spade. This may be all right for the Prairie States ; yet there are probably on every farm in the mountainous regions more waste places than anywhere else, that will never pay to get the stones out—that wont't grow any grass of value, and that defy all cultivation. There are others which are too wet, and on account of their nature drainage for agricultural use is impossible and unprofitable ; others again, which on their dry, shifting sand will not bear any crop.

These are the very places to which, in time, the forest in every well settled country will be more or less confined, the better portions needed for farming purposes; and fortunately enough, not only can such places be made to bear forests, but, being so used, they are improved, and often after some time, gain in value, even for agricultural crops.

To find out cheap methods for covering such places with a tree growth is therefore a task not to be neglected.

With this object in view, I give the following description of a very valuable instrument, to be used in places where the spade is not easily applied, or where it is an object to quickly cover a large area. It is especially applicable for one and two year-old-plants (in most cases the best age for planting), and is most extensively used in Germany, for the inforestation of the large heaths, in the sandy plains, and in mountain lands. Millions of young pines are planted every year in this way.

This instrument consists of two parts: a shoe made of iron with one rounded and one flat side, tapering towards the end, in shape like a half cone, so that two of these shoes placed together, with flat sides, would represent a perfect cone, or nearly so; in the centre (somewhat nearer the flat side) of the base is a threaded hole to receive the handlo, which consists of a five-eighths inch rod, three and one-half feet long, with a squarely set wood haft. The shoo may be made eight inches long and three and one-half inch at the base, and to make it somewhat lighter it may be cast with a square oblong hole half way through the back.

The *modus operandi* is to thrust this iron dibble into the ground where the plant is to stand, somewhat open up the hole thus made, by moving the dibble back and forth ; withdraw, put the plant into the hole to the straight side, thrust the dipple again into the ground one to one and a half inch back of the first hole, somewhat slantingly towards the bottom of this, press forward to fasten the plant in its stand ; then by a few irregular thrusts close the last made hole and proceed to the next place.

The original instrument had a short, rounded handle, and the whole operation was done by one man, who could dispose of 1,200 to 1,700 plants, according to locality.

Where the planting is done on a large scale, the work progresses most expeditiously, if an active boy, or still better as my experience goes, a woman, serve two planters with the plants. The planters manipulate the dibble, whilst the boy with the plants, in a mixture of loam and water (to keep the roots not only moist, but also heavy for better dropping into the plant hole), holds the plant in the hole, first serving the one and then the other. With this force, if accustomed to the work, 5,000 plants may be disposed of per day, or as for such planting of yearlings, at least 7,000 plants should be set out per acre. The planting will cost from $4.50 to $5.50 per acre.

FOREST PRODUCTS AT CHICAGO.

The Chicago *Times* says that a comparison of the total shipments of lumber for this season shows a decline, as contrasted with the number of feet received during the same period of last year, of over 200,000,000 feet. The falling off is said to be due to a disagreement between shippers and dealers with regard to prices, and there is a general belief that while the shipments have fallen off the production has been about the same, and that great piles of it are held at the saw mills to await a favorable market. In spite of the decline in the amount of shipments, the prices remain about the same as last year, the reason being, as given by the secretary of the exchange, that dealers think the production has been about the same as last year, and, farther, that they could not afford to compete with Mississippi river prices if high rates were maintained. The effect of the decline in lumber shipment has been to force a good many vessels in carrying other freights, and there has been an increase in the receipts of slabs, bark, cedar posts, railway ties, and telegraph poles. The lumber reciepts of last year up to the 7th of July, were 806,117,000 feet, against 599,869,000 during the same time this year, leaving a difference of 209,248,000 feet in favor of the season of 1882.

The following statement shows the receipts of forest products at this port as reported at the custom house from January 1st to July 1st, 1883 :

Lumber feet	542,797,000
Shingles	369,105,000
Lath pieces	15,745,000
Wood, cords	9,741
Cedar posts	1,432,459
Cedar railway ties	608,758
Cedar telegraph poles	78,481
Bark, cords	3,177
Slabs, cords	9,270
Spiles	120
Lumber (hardwood), feet	740,000

HOW LINE SHAFTING SHOULD BE CARED FOR, AND THE LOAD.

In all buildings of large dimensions the foundations are more or less defective, to the extent of settling down and permitting a very considerable variation, from time to time, from a true level. This is not less the case in mills of all kinds, whether large or small, than in government and other large buildings, the bases for which have been put in without regard to cost, or any other economic consideration. So universally is this the case, that it may almost be considered a general rule from which there is very little deviation.

In running all power machinery, close attention to its condition is imperatively demanded ; at least once a month, the foreman, or some other competent expert, should carefully inspect all the shaftings, attentively noting its condition, whether truly level or more or less out of line, and also the journals and their boxes, examining the babbitt metal in them, and if there is undue wear or cutting, examine into the cause, and proceed without any delay whatever to remedy any defects that may be discovered.

The shafting, journals, hangers and pulleys are all necessary intermediates between the steam or water power and the productive machinery. On their good condition depends all the prosperity of establishments driven either by steam or water, and the skill, care and attention that should be exercised in properly placing them and caring for them afterwards ought to be as great as in the construction of the building itself, or the selection of the tools and machinery that make the product. It is imperatively necessary that the shafting should not only be strong euough to sustain the weight of the pulleys, but to withstand the strain of belts without springing, as well as to hold up the weight between supports placed at considerable distances, on a main line 10 or 12 feet apart. If the shaft does spring at all, it is instantly out of line, the boxes soon wear out, and the iron journals heat and cut, and while the friction is excessive, it is also a wasteful destroyer and absorber of valuable money-costing power, all of which may be needed to operate the machinery of the coucern, eveu when none is wasted. The adjustment of bearings, etc., of shaftings, is a matter of much importance. If useless bearings are placed, it is at the expense of much additional power wasted in friction. The matter of size of shafting and distance between bearings are all parts of a great whole, that has never received the attention its importance deserves. The object of the millwright is of course to have his shafting heavy and steady enough to withstand all the strain and pull to which it may be subjected, and have plenty of strength left over and beyond that limit. But all this weight, whether needed or useless, must be kept in motion by the motive power, at as great an expense in proportion to the force exerted as the working machines themselves.

The lighter the shafting can be made and used, to obtain all the torsional or twisting non-bending strength needed, of course the easier it is to be moved. This, of course, includes all the attachment of pulleys, hangers, etc. Much progress has been made in this direction within the past twenty five years, but much yet remains to be accomplished in this direction. Cast-iron pulleys are not only much lighter than in former years, but improved processes of swaging have produced a wrought-iron article that leaves but little to be desired in this way. Both wooden and paper pulleys are also made now, of greatly improved construction.—*Milling World.*

TAPER GROUND SAWS.—THIN SAWS.

The *Wood-Worker* contains the following contribution by M. Covel :—

The majority of mill men and filers know but little of the changes that have been made in saws in the last twenty-five years. When the circular saw was first introduced no one knew anything about hammering them open ; it was thought the stiffer the plate the better. Then they were all made straight gauge. Following came the taper ground saw, which has been in use twenty years, and is still in use by the majority of mills. Now I would like for some one to bring proof that it is better to have the plate thicker in the centre than elsewhere, and convince me of any benefit to be derived therefrom. It would be much easier to convince me that I am wrong than to convince the great number of mill men who are using taper saws that they are wrong. Since the motion of circular saws has been increased, the extra steel in the centre is a detriment instead of a benefit. It is well known that a saw will not run well when it is stiff in the centre. I would by all means prefer it thinner there than otherwise. My reasons are theso: First, a straight saw will run with less set ; second, it requires less hammering to put the saw in good condition for running. The less set, the less power it takes to drive it, the lighter it cuts, and the less liable it is to buckle and dodge. Everything that will lighten the running of a saw should bo sought for by all interested in its use. For a long time there were but few changes made, but within the last five years there has been much discovered that nearly doubles its capacity. And other thing, when better understood, will add to this efficiency twenty-five per cent. more than is now realized by the majority of mills.

Many mills are now running thinner and straight gauge saws. Some are making a success of straight 8-gauge 60-inch, and some do well with 10-gauge 72-inch. I have faith and confidence that five years hence 10-gauge saws will be run with as much success as 8-gauge saws now are.

This using of thin saws is a subject of interest to all persons engaged in the mannfacture of lumber. Timber is becoming too scarce and expensive to waste 25 per cent. of it in sawdust. All that can be saved by the use of thin saws over thick ones is clear gain. Many try to run thin saws, but fail for lack of knowledge how to run them and how they should be made. There are several causes why mill men are not running saws three or four gauges thinner than those now in use. Thin saws can be run if they are properly handled. One prominent cause of their failure to run satisfactorily is in not having the proper number of teeth. Another cause is lack of skill to dress the teeth. It is not all in filing ; much depends upon the hammering of the saw. I have seen 10-gauge 72-inch saws run in hardwood and carry as much feed as was carried ten years ago in soft timber by 8-gauge, and with good results.

A BONANZA IN LOGS.

L. Hirsh, a New York importer of fancy woods, has recently returned from a trip to Europe in search of desirable foreign veneer material. He found a large stock of old logs in the Liverpool, Eng., market, many of which have been stored from two to 15 years, being in consequence regarded worthless by the expert importer. The London market was destitute, and has almost ceased to be a centre for the shipment of foreign walnut and veneers to the American markets. At Paris the Germans had made a raid on all the available veneers, and in March the market was absolutely bare, and what came in April was seized by dealers with hungry avidity. In Marseilles there was a surplus of inferior burls, and only a few choice lots, which were held at very high prices. Some of these it required considerable bantering to secure at a reasonable figure. By over-hearing a conversation, while making a railway trip from London to Paris, *via* New Haven and Dieppe the importer was put on the track of some desirable trees in the south of France. They were reached by going from Bordeaux to Bayonne, and thence to the little village of Perigeaux, in a wild, mountainous forest, a spur of the Pyrenees, far from railroads or other avenues of transportation. Lying within a radius of seven or eight miles from the town were the trees. Sixteen huge logs were bargained for. Fifteen of them were shipped away with considerable difficulty, but the largest and biggest trunk, in the language of the importer, "was a terror." When felled, it measured from the butt to the first limb 12 feet in length, and seven feet in diameter, with a wart or burl on it weighing about a ton. The whole log weighed seven tons. It was taken to the nearest railway station by 22 horses, arranged in tandem teams, and 40 men, and shipped to Paris. Eighteen large Normandy horses were used in transferring the log from one depot to another at Paris, the procession attracting crowds and calling forth copious newspaper mention. The manager of the Jardin des Plantes, or Bureau of Agriculture, viewed the log and visited its owner, and wanted it placed on exhibition as a great curiosity. He took the owner's refusal sorrowfully, and regretted that the New Yorker was not a Frenchman so that he might receive the red ribbon of the Legion d' Honeur, to which he would have been entitled for the discovery of the giant log. The latter was transported to Havre, and at last accounts no steamer that would take it to America had been found. The importer pronounces the log a great beauty as well as a monster, and says it shows fine figure and color at both ends. It is estimated to cut about 50,000 feet of veneer.—*Northwestern Lumberman.*

A Tow.

The largest tow of lumber barges ever seen on Lake Champlain recently cleared from Rouse's Point for Whitehall, pulled by the steamer R. H. Cook. The boats, (called canal boats on Lake Champlain), numbered 62. At Gravelly point they met the steamers Tisdale and Grand Isle going north with a tow of 40 boats, and the scene looked decidedly like business. At Plattsburg the R. H. Cook took on 24 boats more, making 86 in the tow. Such a string as that would make even the Marinette Barge Line Towing Company protrude its eyes with wonder. Yet one of the big barges on Lake Michigan would probably swallow a whole schools of Lake Champlain pollywogs.—*Northwestern Lumberman.*

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it. mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

A Valuable Discovery.—One of the most valuable discoveries in the medical science, for the benefit of mankind, was made when Burdock Blood Bitters were invented. This medicine positively cures all diseases of the Liver, Kidneys, Stomach, Skin and Blood. 25,000 bottles have been sold during the last three months.

Chips.

MORE than 3,000,000 trees were planted in Great Britain during the season of 1882.

A MANISTIQUE, Mich., paper says that the loading of lumber barges does not seem to make much impression on the piles at the mills there, and stock is fast accumulating.

THE pulp mill of Messrs. Angus & Buck, at Angus, on the St. Francis river, 18 miles from Sherbrooke, is making quite a village of what was hitherto a wilderness.

LATELY there has been a jam in the Muskegon, reaching from Hersey, Mich., towards Big Rapids, 20 miles by the river. It was represented to contain $1,000,000 worth of pine.

THE Port Arthur despatch of the Winnipeg *Times* under date July 9th, says :—The schooner Woodruff arrived at seven a. m. with three hundred and fifty thousand feet of lumber for W. Latch, Winnipeg.

THE Emerson *International* of July 11th says :—A drive of ten million feet of logs is now on its way down the river from Red Lake. It will not reach this point for a couple of weeks or more.

DULUTH and its immediate vicinity has 13 saw mills, with a daily capacity of 1,165,000 feet of lumber. This year the expected cut will be, according to estimate, 142,000,000 feet as compared to 84,218,000 last year.

THE Emerson *International* of July 11, says : Something like 5,000,000 feet of lumber is being shipped from the American markets for the C. P. R. line west. All this lumber will be transshipped here, which will give employment to a considerable staff of men for some time.

THE department of the interior has caused to be posted throughout the Puget Sound country a general warning against starting fires in timber on public lands, under pain of prosecution. The Northern Pacific road has made the same announcement regarding its lands.

The borers in the maples having been attended to, a new pest has appeared in certain parts of the country. The balsam trees are now attacked, the trunks being infested with millions of small insects, which threaten to destroy the trees unless attended to.

ABOUT the last concern on earth which it would seem possible to run with prison labor is a saw mill, and yet Texas has tried it. Recently a saw mill near Hunstville in that state, while being conducted on this method, was blown to atoms by a boiler explosion.

THE Winnipeg *Times* of July 7th, says :—A second raft of 400,000 feet of timber has arrived at Selkirk for the North-West Lumbering Company. It was towed by the Colville, and the rough weather experienced made it extremely difficult to get the raft safely into port.

THE Tittabawassee boom company was compelled to suspend operations again recently, owing to high water, which rendered work impracticable if not impossible. How long this condition of things will last it is impossible to predict, but officers of the company say that the probability is that the suspension will last ten days, or two weeks.

IN Crawford county, Kansas, there are two plantations of 500 acres each. Catalpa is the favorite tree, and is being cultivated for railroad ties by the Fort Scott & Gulf Railway company ; a block of 100,000 seedlings planted four years ago range from 10 to 15 feet in height ; in circumference the trees range from 8 to 11 inches.

THE Cobourg *Sentinel-Star* speaking of the returns of that custom house for the past fiscal year says :—Amongst the free goods imported—raw material for our manufacturers—we find the following figures :

Walnut lumber	$3,126
Pitch Pine	7,835
Mahogany	8,152

A REPORT comes from Alpena that 7,000,000 feet of pine was blown down by a wind storm near Hubbard Lake. At the rate at which the pine stumpage is held now, this would involve a loss of over $30,000. The destruction in the forests is said to have been extensive. Roads are also reported to be rendered impassable on account of being filled with fallen trees. In some places the trees are piled seven deep on the road.

CLOTHES pins are made of white birch and beech. The logs are sawed by three operations into blocks five inches long and three-quarters of an inch square. In this shape they are fed out of troughs into automatic laths, each of which turns out eighty rounded pins per minute. With equal rapidity the knives of a slotting machine, set to work like a circular saw, bite out the sloping slot of each pin.

THE Indianapolis Wooden-Dish Company has just perfected a new machine for making wooden dishes. This machine takes the veneer from the veneer mill, cuts out the blank, shapes and scores it, folds it up, and takes the wire from the spools forming the staple, drives the staple at each end of the dish, drives and clinches it, and throws the dishes off from the machine complete, at the rate of sixty per minute.

THE *Lumberman's Gazette* of July 18, says :—A river jammed full of logs for forty miles would doubtless be a matter of astonishment and great interest to the millions of people who witness the daily consumption of lumber in their immediate vicinity, but who have no adequate conception of its method of production, and yet it is no common sight in Michigan ; and the river from Alpena to Hillman is in just such a condition at present. Before snow flies, however, this floating wealth will have been submitted to the dissecting and separating processs of the circular, gang and edger, and probably be undergoing the distributing process which precedes consumption.

THREE millions and a half feet of yellow pine lumber were recently sold in New York within a week, on three contracts. A half million feet were taken for a building to be erected by the Trinity church estate, at $25 per thousand delivered. The contractors for the new building to be erected on the site of Booth's theater took an equal amount at the same figures. The third contract for two and a half million feet was made by the Franco-American Trading Company, to be used in the erection of 112 buildings on the isthmus af Panama for the great Lesseps Canal company. At this rate of consumption southern pine mills will be under no necessity of shutting down, trade will remain active, and good prices be assured.

MR. SAUNDERS, of London, the well known entomologist, draws attention to the rapid increase of an insect injurious to maple trees. They prefer the soft or red maple, laying their eggs on the bark. The larvæ hatched out in a few days, penetrates the bark and feeds upon the sapwood, very much to the injury of the tree. Mr. Saunders recommends coating the trees immediately with a mixture of soap and a solution of washing soda or lye, made about the consistence of ordinary paint, and applying it with a brush from the base of the trees upwards to the first branches. The soap solution may be made either from soft or hard soap—if the latter it should be warmed so as to melt it, when it will be the more easily mixed with the solution of washing soda or lye. To prevent increase, the remedy should be applied at once.

THE Sherbrooke *Examiner* says :—Angus, recently a wilderness, is being made to blossom as a rose. Instead of what was a few months ago an almost unbroken forest, it is fast assuming the proportions of a thriving village. The place is named after the senior partner of the firm of Angus & Buck, who have built a splendid pulp mill here, besides saw mill, blacksmith shop, and nearly a dozen dwellings, having also cleared about 50 acres of land. The mill is built on the bank of the St. Francis river, 18 miles from Sherbrooke, on the line of the Quebec Central Railway, in the midst of a wooded country, the timber of which they are commencing to use up in the manufacture of wood pulp for making "news" and other papers. It is fitted up with the most modern machinery and employs some sixty hands which gives the place a decidedly busy appearance. The works are under the able superintendence of Mr. A. Ayerst, a gentleman from Ontario, while Mr. Buck, one of the firm, is usually to be found about the works looking after its interests. They are now turning out about 12 tons daily which finds a ready sale, and this production will soon be largely increased. They will very likely erect a mill for making paper themselves another year.

THOS. GRAHAM & Co.,

File Manufacturers

ETC.,

150 FRONT STREET EAST

TORONTO.

FILES FOR SALE. FILES RE-CUT.

THE Winnipeg *Commercial* says :—The lumber business is exceedingly quiet. Beyond the supplies required for a few considerable contracts now on hand, there is very little demand. The mills are getting to work, but there is no doubt that if the logs taken out last winter are cut into lumber the supply will be far in excess of the demand. Large quantities are being shipped into the country via Port Arthur, one firm alone bringing in 2,500,000 feet for its own use in building elevators. Had the local dealers shown a disposition to sell at reasonable figures this large order might as well have been supplied by mills in the North-West, and it would have made a big hole in the surplus stock which will be left on hand this fall.

A EAU CLAIRE dispatch says that the log drives in the Chippewa and Black River pineries have been virtually abandoned, and the crews have returned to seek their employment. The water in the main rivers has receded to such a low stage that to keep the crews at work would be a mere waste of time and useless expenditure of money. The drives on the Red Cedar have proved the most successful of any point in Northwestern Wisconsin, but have been the most expensive. Unless the usual September floods are heavy, there will be a shortage of logs for the Chippewa mills, and they will be compelled to shut down much earlier than was calculated. There is now at least 250,000,000 feet of last winter's cut hung up, which cannot possibly be removed till there comes a heavy natural raise.

THE Port Arthur *Herald* of July 11th says that WM. MARGACH, Government Timber Inspector, returned home this morning. He has been up in the neighborhood of Pine and Jarvis rivers, where he is having surveyed for the Ontario Government, two townships. The surveyor expected to be through in about six weeks, but it will take him considerably longer than that, owing to the obstacles in the way. He reports large forest fires raging in the neighborhood of Pine, Pigeon and Jarvis rivers, and the amount of good timber that has been destroyed is large. The fire seems to have come from the American side of the boundary line. This is not the first year that fires have been through the forest in this neighborhood, as the timber used to be very large, and it can be seen where the fires have gone through some years previously. The water in the different rivers is very low, and is much against the driving of logs.

Orange Boxes.

The only manufactory in the United States of orange and lemon boxes, is located on the borders of Lambert Lake, Maine, five miles east of Vanceboro, and turns out some 3,000 boxes daily, most of which are shipped to Italy and other foreign countries. Two million feet of hard wood timber are consumed yearly. The logs are taken into the mill from the lake, cut into necessary length (one inch thick) then stacked to season, and afterward placed together and secured for transportation. Arriving at its destination, each piece is sawed twice, making three pieces—two for ends and one for the middle of each box. For the top, bottom and sides of the box the logs are sawed 20 inches long, and then placed in the steam room, remaining three hours ; each piece is then placed under the peeler, whence it issues 3-16 of an inch thick. It is separated to the desired length, and then placed in seasoning or drying houses. The pieces thus prepared are shipped in bundles, being put together where they are used.

PACIFIC COAST CEDAR.

A correspondent of the *Northwestern Lumberman* says :—A well informed gentleman who has made a visit to Alaska, brings back a specimen of the yellow cedar growing there, with the following information. The forests of Southeastern Alaska are made up of three species of evergreens, all of good size, growing closely together and covering the slopes of the mountains up to the height of about 2,000 feet, the most important of which is the yellow cedar or cypress (*Cypressus Nathatensis*) which grows to a height of 150 feet, with a diameter of from three to five feet. The branches are feathery and drooping, like those of the California *libocedrus*, with more delicate plumes. The wood of this tree is the best the country affords, and one of the most valuable on the Pacific Coast. The specimen at hand shows it to be pale yellow, close grained, durable, and admissible of a good polish. To these qualities is added a pleasant fragrance, like that of sandalwood. Some of it has been sent to China and made up into fancy boxes, returning here as sandal-wood boxes. Some three or four ships have been built of yellow cedar, and a few thousand feet at a time have been sent to Portland and San Francisco. It deserves to be much better known, not only by shipbuilders, but carpenters and furniture makers. The Indians make paddles of it and weave matting and coarse cloth from the inner bark of the tree, which is quite durable and of a brown color. It is the favorite fire wood of the coast region. It burns freely and does not last long. The open hearth has to be screened with a wire netting to keep the cinders from reaching the floor. The timber is very durable, the largest of them lasting for centuries. There are large forests of this species reaching from Vancouver Islands to Sitka. Other species are mixed with it. The fragrance of this wood is retained indefinitely. —*Bing.*

TREES BY THE ROADSIDE.

There are miles of road that are dusty and hot in summer which might be greatly improved by the setting of trees upon each side. In narrow streets the trees had better be set inside the wall, but where the streets are wide and the sidewalk wide as well, then the trees may be set between the side walk and the street. They should not be set too near together, 40 to 50 feet is near enough when they get large. A good way is to set them every 25 feet, and when they get large enough to touch each other let every second tree be cut out, and that will leave room for the others to grow and spread. The best trees to set in streets are the American elm, sugar, scarlet, silver and Norway maples, American lime or bass. When there is little or no soil a large hole should be dug and loam filled in. Trees should be of at least medinm size when set, and should be protected by stakes or otherwise. Set only good trees. Better a few good trees from the nursery, well taken up, than many poor ones from the woods and pasture with poor or mutilated roots. Remember that what is worth doing is worth doing well.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

Market Reports.

TORONTO.

From Our Own Correspondent.

JULY 23.—There is little change to note since my last letter to the journal, and but little lumber has left our docks of late, all of them devoted to the storage of lumber being filled to their utmost capacity.

Shipments by carload from Midland to western points continue fairly active. The above line in connection with the C. V. R. R. have become favorite roads with the lumbermen over which to ship to points in western Ontario, and whenever shippers can reach consignees by this route they do so. The cause for this is easily accounted for. The managers of the former road have endeavored by all means at their command to encourage shipments of lumber over their line, and extremely liberal in granting low rates to lumbermen and their inspectors for travelling over their entire system, and the C. V. R. R. company have emulated the same spirit by promptly forwarding all shipments consigned to their care. In marked contrast to this is the conduct of the N. & N. W. R. R. company, who never seem contented until they have squeezed out the last available dollar from the lumberman, without whose patronage the road would be nothing. Were it not for the large amount of money paid into their coffers by the lumbermen of the past and present the bond holders of that line would have nothing left to-day as security, but the right of way and two streaks of rust, and yet those are the men who have to pay $150 per year for the privilege of passing over their road to look after the material that keeps the company's rolling stock employed, and this smallness is more pronounced in their management to-day than at any time of the road's history.

Now in regard to the retail trade here, I have visited most of the dealers, and nearly all agree on one point: quietness all along the line, and yet they say we cannot afford to break on prices, as we could not replace stocks much, if anything, below the cost of our present stock, this is undoubtedly true, although some sales of mill run stocks have been lately made at fully $1 per M less than would have been accepted three months ago, but the bulk of such stocks are only fit for the Eastern market, being comprised largely of 13 feet and 15 feet lengths. XXX shingles are scarce and prices have slightly stiffened, lath is more plentiful and some lower in car load lots.

MONTREAL.

The *Gazette* of July 27th says:—Dealers report a better local enquiry during the week for both hard and soft kinds, but there are complaints on the part of buyers of the new supply not being sufficiently seasoned to suit their requirements. There has been very little change in values. The shipments of deals from this port continues on an active scale, and from the opening of navigation up to date has been the heaviest in the history of the trade. Deal charters to U. K. ports are reported at 75s. to 70s. steam, and last engagements of lumber to the River Platte were at $15@15.50 sail. There has been a sale of 36,000,000 feet of lumber, the total mill cut of Blodgett & Byrne, of Muskegon, Mich., to Chicago parties on private terms.

QUEBEC.

The *Chronicle* of July 20 says:—The market for timber continues dull and the only sales we have heard of are two parcels of white pine of only ordinary quality and about 50 feet average at about 19 cents measured off.

In hardwood we have not heard of any transactions.

DEALS.—40,000 pine deals, Montmorency 1883 sawing, have been sold at $108, $72, $36, $24, for 1st, 2nd, 3rd, and 4th, respectively f.o.b. bateau at mills.

BOSTON.

Cotton, Wool and Iron says:—General trade is moving along with the usual midsummer quietness. Stocks are light, but there is not much disposition to largely anticipate future wants. Eastern lumber is arriving pretty freely. Spruce boards are selling rapidly, except narrow, coarse lots which are dull and weak. Eastern pine are fair at steady prices. Laths are quick of sale. Western lumber is arriving freely and is generally having a fair sale. Poplar and ash have fallen off in price, with a large supply. Choice lots of cherry command good prices. Walnut is dull, with little of the very best arriving. Western pine is quiet, with a limited demand, Southern pine is very quiet, with prices for timber very low. Flooring and step plank are quiet and unchanged.

CHICAGO.

The *Northwestern Lumberman* says:—A midsummer quietness is resting on the lumber business all over the country. Manufacture is going on steadily, though it is somewhat hindered on Saginaw river by high water. Sawing is not being urged at a speed characteristic of last season, because there is not the same motive of high prices and a speculative demand that was then felt as an influence carried over from the preceding year. While the consumption of lumber this season has been large, and probably fully equal to that of last year, the demand has to a greater extent than usual been allowed to draw on the yard supply, the stocking up process having been deferred to as late a date as possible, in the hope that prices would be adjusted on a more satisfactory basis. This disposition to defer buying in supplies is not peculiar to the West, but is as prevalent at the East. The merchants in lumber have a settled conviction that lumber in first hands is too high. Whether that conviction is right or wrong, it is doubtless true that the intense competition to sell on a falling market during the past year has depressed yard stocks below what they should be, considering the general demand for lumber to consume. But that does not destroy the fact that dealers are impressed with the opinion that the margin between prices at the mills and the yards is too narrow for profit, and that their hesitancy about restocking their yards this season is owing to that impression. It is this cause that has made business drag this season, and appear dull as compared with the two preceding seasonss:

OSWEGO, N. Y.

From Our Own Correspondent.

We make no change in quotations; dealers are striving to maintain present prices. The past week has been a very dull one, with wet weather and high water very little has been done. The old cut has about all come forward, nothing now but new lumber, and pretty green at that. Receipts to date 1883, 73,000,000 feet; 1882, 94,000,000 feet.

GLASGOW.

The *Timber Trades Journal* of July 14, says: A quiet demand was met at the sale of deals, &c., held here on the 5th inst., by Messrs. Singleton, Dunn, & Co., and the goods catalogued were, with the exception of a few lots, withdrawn. The catalogue comprised Quebec yellow and red pine deals, and Quebec and St. John, N. B., spruce deals, also a parcel of salvage timber. St. John, N. B., spruce deals, 15 to 24 ft. 12x3, were sold at 11d. per cub. ft., and 10 to 14 ft. 12x3 at 10¾d. Of the salvage timber, 18 logs teak sold at 5s. 7d. per cub. ft., 1 log ash at 1s., 274 sleepers at 8d. Further sales were made privately.

Probably the near approach of the summer holidays is having an unsettling influence on the market. Imports to Clyde during the past week have been moderate. The timber traders from Quebec will soon be dropping in, and it is expected that the spring fleet will be larger than last year's. Stocks being comparatively small, as shown by statement in last issue, gives opening for a pretty large import of fresh goods. Arrivals of wood goods at Grangemouth recently have been very heavy, the tonnage employed in conveyance amounting within the last two weeks to 12,596 tons. But this year's total imports to Grangemouth to date compared with corresponding period of last year are much lighter.

LONDON.

The *Timber Trades Journal* of July 14, says: There is a curious coincidence in the amount of timber-ship arrivals in London this week and last. Numerically they are exactly the same, numbering 78, but there are fewer steamers recorded this week, though the number of those is 32. In this fleet again firewood is very largely represented by about 20 cargoes, and some of these very heavy ones. Being now in the very middle of the import season, and the North American spring fleet fully due, we must expect large arrivals; but this week is not swollen by ships from the New Brunswick ports, which are yet to come forward. But the supply of pitch pine knows no cessation.

We hear that several steamers without engagement have gone on speculation to load from New Brunswick ports at 62s. 6d. to 70s.; also from Pensacola at 42s. 6d. and £6 10s. to United Kingdom and Continent.

Among the quick passages across the Atlantic this season we may mention that of the Hugh Cairns, chartered by Messrs. Cowie & Williams, of Birkenhead. She left the Mersey on the 19th of April and arrived in Quebec on the 16th of May, was loaded and despatched on the 5th of June, and arrived back to the Mersey on the 5th July, thus completing her voyage out and home a fortnight under three months. There would be small need of steam in the timber-carrying trade if sailors could be generally depended on to make such quick voyages as that of the Hugh Cairns.

We notice a company is being formed, called the California Redwood Company (Limited), with a capital of £900,000. The object of the company is to acquire extensive tracts of forest land where redwood grows. The trees are of gigantic size, and are said to very suitable for this market.

LIVERPOOL.

The *Timber Trades Journal* of July 14th says:—With a continuance of a moderate import, recent prices are maintained, and in some cases show a slight advance upon the rates recently obtained. Spruce has a firmer tendency, but whatever gain is made by increased prices here will not benefit the shipper, as any advance is discounted by the increased rates of of freight which have now to be paid in St. John, N. B., and other shipping ports. As the present quotations are below the cost of importation, it is only reasonable to suppose that the supply will be curtailed as much as possible, and this appears to be the determination of many of the producers of the Dominion. Birch timber is also somewhat scarcer and dearer, as will be seen from the result of the last auction sale held here, particulars of which will be seen below.

The strike of the iron-workers in the Midland districts will doubtless affect the timber of this port to some extent, and it is to be hoped that an amicable settlement of the dispute will soon be arrived at.

LIVERPOOL TIMBER SALES.

On Friday last, the 6th inst., Messrs. A. F. & D. Mackay offered one cargo of St. John, N. B., spruce deals, birch, &c., timber, two cargoes of Shediac deals, and other woods. All the fresh cargoes were sold at fair rates, the St. John, N. B., birch showing an advance upon previous prices.

SWEDEN.

The Stockholm correspondent of *Timber Trades Journal* under date of June 30th, says: Within the last fortnight the character of the vessels arriving to load wood cargoes at the lower ports of the Gulf have changed. Instead of the small sailing ships loading for the outports, we now see a very considerable number of steamers for London, Hull, Grimsby, Hartlepool, Bordeaux, and Antwerp. This is corroborative of the reports flying about relative to sales in large lines by extensive concerns at a reduction of price, and to which I referred in my last as likely to demoralize the trade on this side. This has no doubt to some extent taken place, and prices for the moment may be said to be an expression of the sellers' position in regard to unsold stock rather than to anything else. Each individual firm presumably knows best its own business, but there is a prevalent feeling that the firms who have suddenly turned around and taken the plunge in the downward movement of prices have scarcely acted loyally to their numerous Continental customers, who had

relieved them of a large proportion of stock at comparatively high prices, and who find themselves encumbered with goods bought probably at 15s. per standard higher on an average than their compeers in the United Kingdom are now being supplied at. With so large a proportion of the leading stocks sold, no evidence that I have yet seen seems a justification for the alleged necessity of taking the low prices recently accepted for the three lower qualities of redwood deals and battens. The present depression has, however, it is reported, caused an expression of opinion on the part of the shareholders of some of the large companies, who have lately held their annual meetings, as to the advisability of a further large reduction in the production next winter.

The export of sawn and planed wood from Sweden for the first five months of the present year, as compared with a similar period in 1882, was 140,583 Petersburg standards 1883, and 147,604 Petersburg standards 1882, showing but a slight difference in favor of last season. This return, although of little importance as reflecting the probable extent of the export for the current year, shows that a larger business has been transacted than has been anticipated. The ports south of Stockholm have been evi dently taking time by the forelock, and getting all off they possible could before the Gulf ports were accessible.

Transactions are reported of good brands from the lower Gulf as follows :—Red 9 and 11 in. deals—mixed, £10 15s. ; 3rds, £8 5s. ; 4ths, £6 5s. ; 5ths, £5 5s. Red 6½ and 7in. battens —3rds, £6 5s. ; 4ths, £5 5s. ; 5ths, £4 5s. ; and unassorted white battens at £4 10s. But holders of good fresh sawn redwood are not anxious to quit any large weight of goods at such low rates, which are quite unprofitable, with the prevalent strictness in assorting redwood in the districts referred to. Old-established firms, holding leases of forests bought fifteen or twenty years ago, may possible make such rates pay, but new concerns that have paid current prices for growing wood will find it hard enough to make ends meet at those figures. The price obtained for mixed, consisting of only about 10 per cent. of the production in favorable cases, is of much less moment than the figures at which 3rds and 4ths are disposed of. A large parcel of 3rd red deals is reported as having been sold at £9 f.o.b. Gothenburg, which is proportionately better than rates obtained in Norrland at present. I presume the sale has been of the Uddeholm, or similar good brand, that buyers can rely on as being of a quality very little inferior to Gefle, and not the mixed stock held by many of the Gothenburg middle men.

The position of the freight market has changed but little, as far as steam tonnage is concerned, for the last fortnight. Sailing ships, however, under 150 standards are somewhat scarce, and quotations for such keep stiffening. That this is only the natural consequence of the almost entire cessation in the building of such vessels will be apparent.

Of the tonnage built in 1882 the steamers numbered 21, of 3,509 tons, showing that same consists nearly exclusively of small coasters. In that year 33 steamers were purchased abroad, of a tonnage of 14,458 tons. The building of sailing ships has also almost ceased in Sweden. Both of the united Scandinavian nations are going pretty extensively into steamers suitable for carrying wood goods, for the building of which Sweden is well adapted.

A destructive fire broke out on Wednesday last in the wood-yard belonging to the Skelleftea Aktie Bolag at Klementsnas, resulting in the destruction of over 3,000 standards of sawn wood, as well as the laborers' dwellings, &c. The property destroyed was insured in local offices for £12,250, which, however, only covers part of the company's loss. The saw mill and flour mill are both intact.

The Korsnas Sagwerks Aktie Bolag had its yearly meeting at the mill a week ago, and divided 8 per cent. for 1882. It is understood that considerable amounts have also been written off. The neighboring Stora Kopparbergs Bergslag has also lately held its annual meeting, at which a dividend of 500 kronor per lot was declared. The capital of this concern is, if I remember aright, 6,000,000 kronor in 1,200 lots of 5,000 kronors each, and its history stretches as far back as the English "Wars of the Roses." I have reason to suppose that the directors of both these concerns meditate a very large reduction in the "log-get" next winter. This resolution comes somewhat *post festum*, but better late than never.

The weather is again very dry, and the rivers in Norrland are low, so low, in fact, that floating on many of the smaller streams has been stopped. The Ljusne river especially has unusually little water.

OTTAWA LUMBER RETURNS.

JAMES PATTON,
Quebec, July 20. Supervisor of Cullers.

Utilizing the Attic.

At the saw-mill of E. & J. F. Webster, at Orono, Me., a plan has been adopted, which is described as follows : It was necessary to run a shingle machine in connection with the other machinery, and the construction of the foundation was such, the room upon the floor of the mill so restricted, and the need of removing the sawdust and other waste so great, that it was suggested by some of the workmen that the shingle machines be located in the attic on a floor over the gang and other saws. Accordingly a floor was laid, the machine located upon it, a railway track built under it so that the car receiving the waste could be easily tipped in and burned, the needed shutes for sending the waste into the cars were built, and last, but by no means least, an endless chain with block so arranged that the bolts could be sent up to the machine to be sawed. Now the logs are received upon the bed or main floor of the mill, there cut into bolts each the length of a shingle, then sent up to the machine, there sawed into shingles of the various qualities and trimmed for bunching, then sent down to the floor again and there bunched for market. This arrangement has now continued for several months, and is found to work admirably, so that the cost of sending the bolts up stairs and the waste down is much less than it would cost to get rid of the waste in any other way.—*Northwestern Lumberman.*

PORT HOPE.

A SUCCESSFUL INVENTOR.—The *Times* says : "We are very much pleased to learn that Mr. Thos. H. Ambrose, of this town has disposed of the right of his patent for his automatic freight car coupler for the United States to an American firm for the handsome sum of $15,000. This is a solid indication that Mr. Ambrose's patent possesses sterling qualities. Patent couplers can be counted by the hundred, every one of which we presume has some merit, but the fact that the majority of them lay dormant for years shows that Mr. Ambrose's must possess not only utility, but cheapness, strength and simplicity. We congratulate our esteemed townsman on his success.

A Rush of Logs.

GRAND RAPIDS, Mich., July 26.—An immense jam of logs extending up Grand River for miles has been lodged against the bridge of the Detroit and Grand Haven railway near the city. It was hoped the bridge would resist the tremendous pressure, but it fell with a crash this forenoon. The bridge of the Grand Rapids, Indiana & Chicago followed. Millions of feet of logs have gone down, sweeping all before them. It is feared the losses will reach many hundred thousand dollars.

MARET trestle on the Northern Pacific road, near O'Keef, beyond Missoula, and high up in the mountains, it is said to be the highest structure of the kind in the world. It is 866 feet long and 266 feet high, and contains 800,000 feet of timber. Track was recently laid across it, and a heavy construction train tested its strength to the satisfaction of the engineers.

An Ancient Breech-Loader.

A discovery which has just been made at Aleppo is likely to cause considerable surprise in military circles, for, according to the Turkish official gazette of that place, a party of engineers, while making excavations beneath the citadal of the town, have come upon a large wrought-iron, breech-loading cannon, which must have been buried for at least 250 years. That the weapon should be a breech-loader is in itself sufficiently astonishing; but the most extraordinary part of the affair is that the breech mechanism is almost exactly similar to that which has for so many years been fitted by Krupp, of Essen, to the artillery of the German army. The gun bears the name of its maker, Halebli Mustapha Osia, and is in a fairly good state of preservation.—*Mechanical News.*

MR. FRASER, Secretary of the Ottawa Iron and Steel Company, has returned from England after six months' absence. He reports that he has succeeded in organizing a company, with a capital of £350,000 to commence operations this fall. The company's mines are in Ottawa County near the line of the proposed Gatineau Railway, and are said to be very rich. The new company will establish blast furnaces and eventually go into the manufacture of steel rails.

Health is Wealth.

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, a guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain, resulting in Insanity and leading to misery decay and death, Premature Old Age, and Spermatorrhœa, caused by over-exertion of the brain, self-abuses or over-indulgence. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars ; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by use for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by ORMOND & WALSH, sole authorized Agents for Peterbbrough, Ont. JOHN C. WEST & CO., Sole Prorpietors, Toronto

Burdock Blood Bitters

FREE TRADE WITH CANADA.

We would commend the following "open letter" taken from the July number of the *Century Magazine* (N. Y.,) to the attention of our readers as, although intended only for the "American" ear, it is upon a subject and contains statements of very great interest to Canadians :—

It seems to me strange that the question of an American zollverein was not brought prominently before the Tariff Commission. The people of the United States have been so educated to a belief in protection that it would be folly for any political party to work seriously for free trade or a tariff for revenue only, but a change might, perhaps be made which, while seemingly a concession to the free-traders, would in reality strengthen the protective character of the tariff. A protective tariff should be a discriminating tariff, so arranged as to shut off the competition of strong manufacturing nations, while encouraging trade with counties likely to afford a market for manufactured products. The United States have nothing to fear from the competition of Canada or Mexico, and free trade with them would give American manufacturers a greatly extended field. American capitalists are now interesting themselves in the development of Mexico, and a great deal of attention has been paid, of late, to the resources of that country ; but the prevailing feeling with regard to Canada is one of indifference, occassioned by ignorance of its resources.

To the average American, the name of Canada calls to mind a narrow strip of inhospitable country lying to the north-east of the United States, and inhabited by an unprogressive class of people. It is now, in fact, the name for the whole of Europe, rich in minerals, and possessing the finest fisheries and the largest area of land adapted to the production of first-class wheat in the world. The most fertile part of Canada lies in the north-west, although the crop reports for 1882 show a higher yield of wheat per acre in Ontario than in any of the American states. Over the whole of the Canadian north-west territory, formerly known as the Hudson Bay territory, from the American boundary, line forty-nine, to latitude sixty degrees, the same flora prevails, and there is little difference in the climate, although it becomes warmer toward the west on account of the Chinook breezes which come through the passes of the Rockies and cause a rise of sixty degrees in the temperature in a few hours. The valley of the Peace river, twelve hundred miles north-west of Winnipeg, is said to have a finer climate than Manitoba. In explanation of this uniformity of temperature in such a wide range of latitude, Professor Macoun says :—"It was long ago asserted as a principle by goologists, that land in quantity situated to the southward of latitude forty degrees north, very materially raises the temperature of lands lying to the north of such parallel." He gives metcorological tables showing that there is almost no variation in the temperature between forty-nine and sixty degrees, and that the climate compares favourably with that of European couutries in the same latitudes.

Almost the whole of this vast territory will yield from twenty-eight to forty bushels of wheat per acre. United States Consul Taylor who has made a study of the Canadian north-west for years, has gained for himself the nick-name of Saskatchewan Taylor, on account of his praises of the section of the country bordering on the Saskatchewan river. He says three-fourths of the wheat producing area of North America lies within the Dominion of Canada. The Canadian Pacific Railway is being pushed through to British Columbia with an energy almost unparalled in railway construction ; and during the last three years, Manitoba has been filling up with settlers almost as rapidly as the Western States did in their most progressive days. Already a prosperous trade has grown up between this part of Canada and the cities of the eastern provinces, Winnipeg alone purchasing $12,000,000 worth of goods from them last year. As Manitoba and the north-west become thickly settled, and the wonderful resources of Canada's most western province, British Columbia are developed, this trade will grow to enormous proportions. At present, most of the settlers are Canadians and Europeans, but the time will come when the stream of migrants from the Eastern States will be diverted to this region, and then, unless free trade prevails, the United States will experience what Canada did during the rapid development of the Western States—a loss of population without any compensating advantages in the way of trade, while eastern Canada will be built up by the trade of the north-west.

But remove the tariff wall between the two countries, and the bulk of this trade may be secured by the United States, for settled Ontario is separated from Manitoba by a stretch of one thousand miles of rocky country, enormously rich in minerals and timber, but almost useless for agricultural purposes, while the territory of the United States is well settled to the borders of Manitoba. Chicago is many miles nearer to Winnipeg than Toronto, and St. Paul and Minneapolis are nearer still. These cities could control most of the north-west trade, if the tariff were abolished, and the cities of the Eastern States could compete on equal terms with those of eastern Canada.

Of course, this would not prove advantageous to eastern Canada, whose growth would be greatly retarded. The effect it would have upon the north-west is not so apparent, but it would certainly strike a blow at the future greatness of Winnipeg, Manitoba's chief city, which has in four years grown from a straggling village to a flourishing modern city with a population of about 30,000. So long as the protective tariff is maintained, and the Canadian Pacific Railway does the carrying trade for the north-west, Winnipeg will be the gate way of western Canada, and, controlling the trade of the largest wheat producing area in the world, will become a second Chicago. Already some of the manufacturers of Ontario, to save the expense of carriage, have started factories there, and others will doubtless follow suit. With free trade between the two countries, Winnipeg would have few if any advantages over St. Paul and Minneapolis as the distributing centre of the North-west, and would be exposed to competition not only with them but with Chicago.

Appearances would indicate that Canadians are strongly imbued with the protection idea, as at the last two elections, when it was made the issue, the Conservatives favoring and the Reformers opposing it, a large majority of the former were elected. But many of those who voted for protection did so merely with a view to forcing the United States, by retaliation, to entertain the idea of reciprocity. Americans could rely upon the full support of the Reformers, with a liberal sprinkling of Conservatives, in negotiations for free trade : and, as many of the Conservative members were elected by small majorities, a slight change in public sentiment might make a great change in parlimentary representation. The Conservatives themselves could consistently favor an American zollverein, for many of their leaders and newspapers expressed themselves in favor of actual free trade, but opposed the one sided policy that would confer upon Americans favors which they refused to Canadians. But that was before the north-west trade had developed ; and as the policy of the present Government is to build up trade botween the provinces, they might with reason object to a measure that would divert trade to the United States. The Canadian customs act of 1879, now in force, provides for the admission of natural products free of duty whenever the United States are willing to reciprocate ; and the people of Montreal favor the abolition of the duty on grain in any event, as a great part of the grain export trade of the Western States is lost to the city, it is claimed, on account of the bonding system.

WATSON GRIFFIN.

A WOODEN BOILER.

The *Northwestern Lumberman* says :—While we hear of so many substitutes for wood as to make the hearts of the forest denudation alarmists beat for joy, it is very rarely we hear of forest products being put to a use for which wood has been hitherto deemed entirely impracticable. Such a case, however, has just come to our notice, and, strange to say, it is not a Yankee invention either, and did not originate in the land of wooden nutmegs, but is to be credited to the inventive genius of a New Jersey youth. It is said : "A Paterson, N. J., mechanic named William Sutcliffe, is building a steam-boat with a wooden boiler, which will be placed in the Passaic river above the falls in a few days. The boat is a propeller 16 feet long. The boiler is made of a new ale cask and is said to be capable of standing a pressure of 200 pounds to the square inch. It has already been satisfactorily tested at 40 pounds pressure. This novel boiler is fitted with flues, and the fire, instead of being under, is on top of it, a draught being supplied by a tube from undeneath. Mr. Sutcliffe is a thorough and practical mechanic, holding a responsible position in one of the Paterson locomotive works. It is the first time in history that an attempt was ever made to raise steam in a wooden boiler, and it looks as though the experiment would prove a success."

NORTH-WEST NOTES.

To the Editor of the Canada Lumberman.

DEAR SIR,—The journey from Winnipeg eastward on the newly opened line of the C. P. R. is interesting in many respects. The first thing noticeable in the appearance of the country is the gradual change from prairie to woodland. The poplar bluffs, as the groves are called, because they are generally on the higher ground, are more numerous, and the intervening spaces of prairie have more than is usual of scrub or bushes. Farther on the groves increase in extent and the spaces grow less ; the trees also increasing in size with the extent of ground covered. Still to those who have seen the great forests of Ontario the timber seems insignificant. After a journey of 40 or 50 miles we begin to see the rounded weather worn heads of occasional Laurentian rocks, as they are geologically called. It is the same formation which extends throughout the northern part of our country from the Gulf of St. Lawrence, from wheuce comes its name, to this part of Manitoba. The change of timber now becomes more marked. The evergreens begin to occupy the landscape, and the grass retains sole possession only in the lowest meadows. The prevailing poplar of the west still claims a place, but the Jack pine spruce and tamarac are lords of the now more scanty soil. This Jack pine is a species unknown in Ontario ; the trunk resembles the Norway or red pine, except that the bark is darker in color, and has a rough, dead appearance ; there is a much thinner sapwood, which is quite an advantage. The heart wood is heavier and darker in color like tamarac. The foliage resembles white pine, but the leaves are short and scanty, giving the tree a stunted appearance ; it never grows large and is very suitable for ties and small timber.

As we progress on our journey the country assumes the appearance of a nearly unbroken forest. The slender conical tops of the spruce growing thickly in the hollow slopes of the rocky hillsides makes the landscape decidedly picturesque. Here, too, begins the lake region of the country. It is lakes to the right and lakes to the left and lakes to the front and rear. They cover about one-fourth of the whole surface, are of all sizes aud shapes, but are generally long and narrow. The waters are never muddy like prairie rivers aud lakes, but are always translucent, though sometimes brown in color from the peaty swamps, from which they come.

This is the country that calls out the skill of the railway engineer. There is not 40 rods of straight level track on the surface anywhere to be seen. Deep short rock cuts, then trestle work over the end or neck of lake. Next we seem to be clawing along the side of a high cliff, then through a short, then over a seemingly bottomless muskeg, or peat bog, and so on *ad infinitum*.

Stations are few and far between. Workmen's deserted shanties are plentiful enough, their dilapidated appearance and the burned portions surrounding, give much of the road the air of desolation. There is also yet much to be done in the way of levelling and ballasting the roadway.

Keewatin is a thriving looking place, springing up with this new move in gold mining, we can't call it an excitement, for there is none. Like nearly everything else now in the North-west, it takes the shape of business. Keewatin has also a few good lumber mills.

Yours, &c.,
W. H. TROUT.

Vermillion Bay, July 7th,
Manitoba or Ontario, 1883.

THE ENGLISH MARKET.

James Smith & Co.'s Liverpool wood circular pated July 2nd, says :—The arrivals since our last have been 55 vessels, 37,468 tons, against 52 vessels, 39,983 tons, in the corresponding period last year, and 43 vessels, 31,695 tons in 1881.

FROM 26TH JANUARY TO 30TH JUNE, 1883.

	Vessels.	Tons.
Quebec	8	5,050
St. John, N. B., &c.,	35	31,899
United States	40	29,841
Baltic	102	41,577
Total	185	108,367

FROM 26TH JANUARY TO 30TH JUNE, 1882.

	Vessels.	Tons.
Quebec	8	4,700
St. John, N. B., &c	34	32,788
United States	65	53,643
Baltic	74	34,211
Total	181	125,345

FROM 26TH JANUARY TO 30TH JUNE, 1881.

	Vessels.	Tons.
Quebec	7	5,847
St. John, N. B.,&c	23	22,722
United States	59	42,666
Baltic	60	24,235
Total	149	95,470

The prospects for the season are somewhat more cheering, caused no doubt by good reports from the agricultural districts, fine growing weather, moderate imports of timber and stocks, which taken as a whole are not heavy. If this state of things continues (with peace at home and abroad), confidence may be expected to return, and the doubtful feeling induced by the recent suspensions soon be removed, but great care and moderation will have to be displayed both on the part of shippers and importers to reach this good result. The money market continues easy, the bank rate remaining at 4 per cent. Freights appear firm in spite of the increased steam tonnage of late offering, and very ttle would cause them to advance. Insurance rates are slightly easier, but for the fall shipments are still so high that they must affect seriously both purchases and shipments.

COLONIAL WOODS.—Yellow Pine : None the new import is yet to hand ; there is a fair demand, the consumption for the past month having been 41,000 cubic feet, against 53,000 feet in June last year. The stock is ample, the fresh arrivals being shortly due. Sales have been private from the yard. By auction a few logs of St. John wood realized 2s. per cubic foot, and several parcels of Quebec and Miramichi, stored from last season, have been offered but not sold. Of red pine there is a stock of 11,000 cubic feet, whereas the quantity gone into consumption is but 1,000 feet. The sales have been by private only. Of ash there is no stock at present ; good wood is wanted. Elm : There is a fair enquiry, but no sales are reported. Birch is in good demand, and 32,000 feet have arrived during the past month. By auction 552 logs prime fresh wood from St. John, ex Palermo, were sold at from 16d. to 2s. 6½d. per foot, the average being 19d. per cubic foot. By private a cargo of Cape Breton wood has been sold to arrive at 15d. per foot for 15-inch average, c.i.f., and a cargo of Prince Edward Island, per Ethel Banche, at 16½d. per cubic foot, ex quay. The present stock is only 40,000 cubic feet. Oak : 6,000 cubic feet have been imported during the past month : 18,000 feet have gone into consumption, leaving a stock of 136,000 feet on hand. Sales have only been by private, as the 234 logs from Quebec offered at auction were withdrawn unsold. Oak scantling is in fair demand at prices ranging from 2s. 6d. to 3s. per foot, according to quality and selection. The stock, however, is large, 218,009 feet, and fresh arrivals continue to come forward too freely. New Brunswick and Nova Scotia Spruce Deals : There has been a full import for the time of the year, but no improvement in the consumption, and the stock of 11,715 standards may therefore be considered somewhat heavy. During the month the sales have been as low as £6 12s. 6d. c.i.f. for St. John

deals, but the latest sales have been at £6 16s. 9d. per standard; while by auction the cargo, ex Palermo, from St. John, realized from £6 17s. 6d. to £7 7s. 6d. per standard, and averaged £7 2s. 6d. per standard; lattely, there has been more enquiry from the outports as well as the continent. Pine deals, from St. John have been sold at from £7 7s. 6d. to £8 2s. 6d. per standard for small lots. Quebec pine deals have arrived, per steamer, in about the same quantities as last season, and few parcels have been sent on the market; the only sales have been of third quality pine deals, according to specification, at from £8 15s. to £9 2s. 6d., and red pine deals, mixed qualities, at £9 5s. per standard, ex quay. Quebec staves are quiet, and sales have been by private only, at rates below the cost of import. Palings and laths: The former have been sold at 85s. per 1,200 pieces for 5 feet x 1 inch, and at 70s. for 4 feet x 1 inch.

Ornamental and Timber Trees Not Native of the Province of Quebec.

BY CHAS. GIBB, ESQ., OF ABBOTSFORD.

Mr. Gibb has been at great pains, not only to introduce hardy fruits into the Province of Quebec, but also such ornamental and forest trees as are likely to prove valuable in that province. This little pamphlet of nearly eighty pages is full of information of great value, not only to the Province of Quebec, but also to those in the Province of Ontario who live in the colder latitudes. We note that he desires particularly to call attention to the Russian mulberry. He says it has been introduced into Minnesota, at latitude 54, where it has succeeded perfectly. It begins to bear fruit at two years old, that the fruit is valuable, and is produced in large quantities, that the timber is good for building purposes, and lasts a long time when made into fence posts or railway ties, and its leaves are the best food in the world for silk worms. We commend this pamphlet to the careful perusal of all who are interested in the growth of forest and ornamental trees in the northern portions of Ontario.

Piling Lumber.

Lumber should not be allowed to depreciate for lack of proper care in piling. Piles should be built so that the front cross pieces shall be higher than the back, and each in succession be overlapped, or laid out a trifle beyond the previous one. A pile 20 feet high should incline outward from base to top at least 18 or 24 inches. The sides of the pile should be carried up plumb, each cross piece directly on top of another, so that the weight shall rest solidly on each, and on the foundation timber. If the courser be placed a little forward or back of the previous one the weight above will twist, warp and perhaps break the lumber. Piles should never be placed less than three feet apart, and boards in the pile should always be laid with from two to three inches of space between them. —*American Lumberman.*

A Saw Mill Burned.

For several days the saw mill of Thompson & Avery, at Sharbot Lake, had been shut down for repairs. The machinery was out of gear and workmen were engaged in fixing it. About ten o'clock last evening the mill took fire and burned with great rapidity. Several of the workmen had a narrow escape from being burned. It is supposed that a light fell upon some of the waste oil about the machinery and hence the conflagration occurred, The loss totals about $3,000, with an insurance of $800. A considerable quantity of shingles and lumber was destroyed. The mill was burned in a very short time. Thompson & Avery may rebuild, or they may purchase one of the other mills in the vicinity.—*Kingston Whig.*

Convincing Proof.

Having suffered from rheumatism for a long time I was induced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to buisness, thanks to your wonderful medicine.

I am yours truly,
W. H. DICKISON,
218 St. Constant St., Montreal.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1yl7

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

REVIEWS.

PRESERVING AND REPLANTING TREES.—One of the most useful public reports that has come before us,is that compiled by Mr. R. W. Phipps, for the Ontario Government, on "The Necessity of Preserving and Replanting Forests." Though most of the matter is not new to those interested in this important subject, it is well selected and ar ranged, and so presented as to afford valuable and very complete information on the subject to the general reader, and especially to our agriculturists, who are not sufficiently acquainted with their own practical concern in this question. The teachings of scientific men as to the necessity of forests in a climatic and sanitary point of view are given at sufficient length, and it is shown how various countries have suffered from their improvidence in this respect by the impairment of their agriculture and in other ways. Still more valuable is the voluminous information as to the practice o forestry in other countries, and of the valuable results of the scientific treatment of public and private forests. Mr. Phipps, who seems to feel a great interest in this subject and to have been a close observer, points out how this information bears upon our own case, and urges, as we have often done, the necessity for a cessation of the present wasteful denudation of our forests and the perpetual maintenance of a portion of them. We hope this report will be of service in introducing a better system, and to aid in this we will hereafter present our readers with extracts from it.

ASSESSMENT OF TIMBER LIMITS.

The Bobcaygeon *Independent* says:—A case of considerable importance to lumbermen was tried on Wednesday, 25th July, in Haliburton, before his Honour Judge Peck. The township of Glamorgan, acting under legal advice, had assessed the various lumbermen possessing timber limits in the township, for the value of their interest in their limits. The lumbermen interested were M. Boyd, R. C. Smith, W. J. Trounce, and Green and Ellis. The assessments were as follows:—M. Boyd, $6,500; R. C. Smith, $12,000; Trounce, $8,000; Green and Ellis, $1,000. The assessor had made this assessment on the advice of Kerr, Blake and Carrels, which advice had been concurred in by Mowat, MacLennan and Downey. At the Court of Revision this assessment was appealed against as illegal, but the Court confirmed the assessment with some slight alteration; and this decision was appealed to the County Judge. Mr. Baron, of Lindsay, appeared for the lumbermen jointly. The case of Glamorgan was conducted by R. G. Sidley, Esq., the Reeve. Mr. Baron opened the case, and contended that the assessment was illegal as the lumbermen did not own the limits, which were Crown property, and as such were exempt. All that the lumbermen owned was the right to cut the lumber from year to year, a right which was determinable at any moment. Also he urged that it was not the intention of the Government that this property should be taxed, and although it was not especially exempted by statute, yet it was clearly not property which could be taxed. It was merely an occupation. The interest in the limits could not be sold under an execution, nor could the right be transferred from one person to another without the express consent of the Government, thereupon it was not a property liable to assessment. Mr. Sidley replied in an address of considerable length, displaying great knowledge of the subject, and treating it with great knowledge, tact, and ability. He said the township was not taxing the limits as real estate, that being clearly exempt, but they were taxing the interest of the lumbermen therein. Money was personal property, and just as much money as a lumberman invested in his limits was clearly taxable. If this interest in the limits was exempted, the exemption would be mentioned in the statutes, and he challenged Mr. Baron to shown that any such exemption was anywhere referred to. If a man had a sum of money invested in a bank, it was taxable, and if the same money were invested in a limit, it was absurd to suppose that it would be exempt. Mr. Baron had said the interest of the lumbermen could not be sold under execution, but Mr. Sidley reforred to the case of the Scott estate in Cavendish, when the interest left by Mr. Scott had proved most valuable after it had been in Chancery. The case of Bennett vs. O'Meara, 15, Grant s Chancery Reports, proved that the interest of the lumbermen was personal property, and he need not tell the Court that all personal property was liable to taxation. The case of the Queen *ex rel.* Latchford *v.* Frizzle was quoted by Mr. Sidley, in which it was held that a party having mere possession of a lot determinable at any moment, was rightly assessed. He quoted eight other cases in which it was decided that if an occupier of Crown property received a benefit therefrom he was liable to be taxed for his interest therein though the property itself was exempt. Thus Lady Emily Ponsonby had received a grant of gratuitous use of apartments in Hampton Court Palace, but her interest in those apartments was held to be taxable, though the property, being royal property, could not be touched. In the same way, interest in lumber limits could be taxed, though the land itself, being Crown property, was exempt. Mr. Sidley likewise dwelt on the injustice of such exemption, pointing out that whilst the lumbermen was receiving all the benefit of the construction of roads, and of municipal government, he did not pay one cent toward local burdens. He concluded by quoting a decision of Mr. Justice Burton, to the effect that every species of property should bear its just share of the burdens of the place of which it received the benefit. Mr. Sidley expressed the hope that the decision of the court would be such as not to compel a poor man to pay a rich man's tax.

The Court after hearing the arguments on both sides, and examining a few witnesses, proceeded to give judgment. His Honor observed that the timber licenses were out of date on the 30th of April in oach year. Consequently on that date the property reverted into the hands of the Crown, and as it passed into the hands of the Crown before the annual year's assessment had been completed it could not be taxed. This disposed of the case as to the timber limits, but the chattel property, the clearances and the shanties, were all accessible unless taxed at the head office of the lumberman. The case occupied three hours in arguing, the Court being crowded by lumbermen and parties interested. Mr. H. Junkin, for Smith of Fenelon, Mr. Austin, assessor of Fenelon, and Mr. G. Bick, of Bobcaygeon, were present. Mr. Sidley received the compliments of many friends on the able manner in which he had conducted the case.

Swedish Mills Burnt.

The *Timber Trades Journal* says:—We learn from our Swedish correspondent that there has been a large fire at Skelleftea, resulting in the destruction of several thousand standards of deals, &c. A considerable quantity of the timber destroyed had been placed, we understand, on the east coast, and steamers chartered to bring it over. These latter will have to be diverted somewhere, and thus take goods out of the market that would have been available for other bottoms. It was only last week we chronicled the great fire at Mersrs. Grigorieff's saw-mill at the mouth of the Neva, and now we have in addition to that of Skelleftea to notice a serious outbreak of fire at a Drammen mill destroying some thousands of pounds worth of stock. The great frequency of these conflagrations will add seriously to the rates of insurance on wood property.

Preservation of Forests.

The following letter appears in the Toronto *Globe*:—

SIR,—To-day's mail brought me from South Australia what should interest many of your readers, especially following your notice of Mr. Phipps' report on the necessity of preserving and replanting our forests, and as very ample references is made in this report to what is being done in South Australia among trees, under the supervision of my brother as conservator, I have the greater pleasure in submitting, as a lesson for Ontario, the most recent provision of that enterprising colony.

The sheet sent me has a list of 480,000 trees set aside for one season's distribution free, among "corporate bodies, farmers and others, owners of land." The conditions upon which young trees are obtained from the Government nurseries, of which there are five, are few and practical, so as to ensure a proper reciprocity between settlers and the Legislature. Directions are given for planting, as well as advice regarding the soil and situation most suitable for each kind of tree named.

So then Australia not only gives advice, but supplements with materials free to her settlers.

WM. BROWN.

Agricultural College, July 17.

The Metallization of Wood.

Les Mondes describes the following process invented by Mr. Rubennick for metallizing wood:

The wood is first immersed for three or four days, according to its permeability, in a caustic alkaline lye (calcareous soda) at a temperature of from 74° to 90°. From thence it passes immediately into a bath of hydrosulphite of calcium, to which is added after 24 or 36 hours a concentrated solution of sulphur in caustic potash. The duration of this bath is about 48 hours, and its temperature is from 35° to 50°. Finally the wood is immersed for thirty or fifty hours in a hot solution (35° to 50°) of acetate of lead. The process, as may be seen, is a long one, but the results are surprising. The wood thus prepared, after having undergone a proper drying at a moderate temperature, acquires under a burnisher of hard wood a polished surface, and assumes a very brilliant metallic luster. This luster is still further increased if the surface of the wood be first rubbed with a piece of lead, tin, or zinc, and be afterward polished with a glass or porcelain burnisher. The wood thus assumes the appearance of a true metallic mirror, and is very solid and resistant.

Narrow Escape at Eddy's.

OTTAWA, July 23.—About half-past eight this morning fire was discovered in one of the dry houses in connection with Eddy's works, Hull. The material within the building being of such an inflammable nature the flames soon spread around the roof of the building, and eye-witnesses made up their minds that a disastrous fire would ensue. The Union steam engine turned out and did good service, and Mr. Eddy s engine kept two continual streams on the north-west corner while the Union played upon the other end. The flames were confined to the centre of the building. The damage was small.

Strike of Raftsmen.

A Montreal despatch dated July 26, says:—Some forty or fifty raftsmen, working for G. B. Hall & Co., struck at Bordeaupluffe, and when other laborers were substituted for them they became dissatisfied, and tried to obstruct the new-comers. As the latter resisted any interference, the owners applied for protection to the authorities yesterday, when the police magistrate, high constable, and some detectives immediately proceeded to the scene. The strikers having heard of a force coming, they hauled down their colors and begged to be reinstated, which was done. The prompt action of the authorities prevented, it is said, a very serious disturbance.

LIVERPOOL STOCKS.

We take from the *Timber Trades Journal* the following Comparative Table showing Stock of Timber and Deals in Liverpool on June 30th, 1882 and 1883, and also the Consumption for the month of June, 1882 and 1883:—

	Stock, June 30th. 1883.	*Stock, June 30th. 1882.*	*Consumption for the month of June 1883.*	*Consumption for the month of June 1882.*

FOR THE

Canada Lumberman

FOR THE FOLLOWING REASONS:

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada. and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

—CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM—

for placing your goods or wares before the saw mill men and lumber and timber dealers of the Dominion.

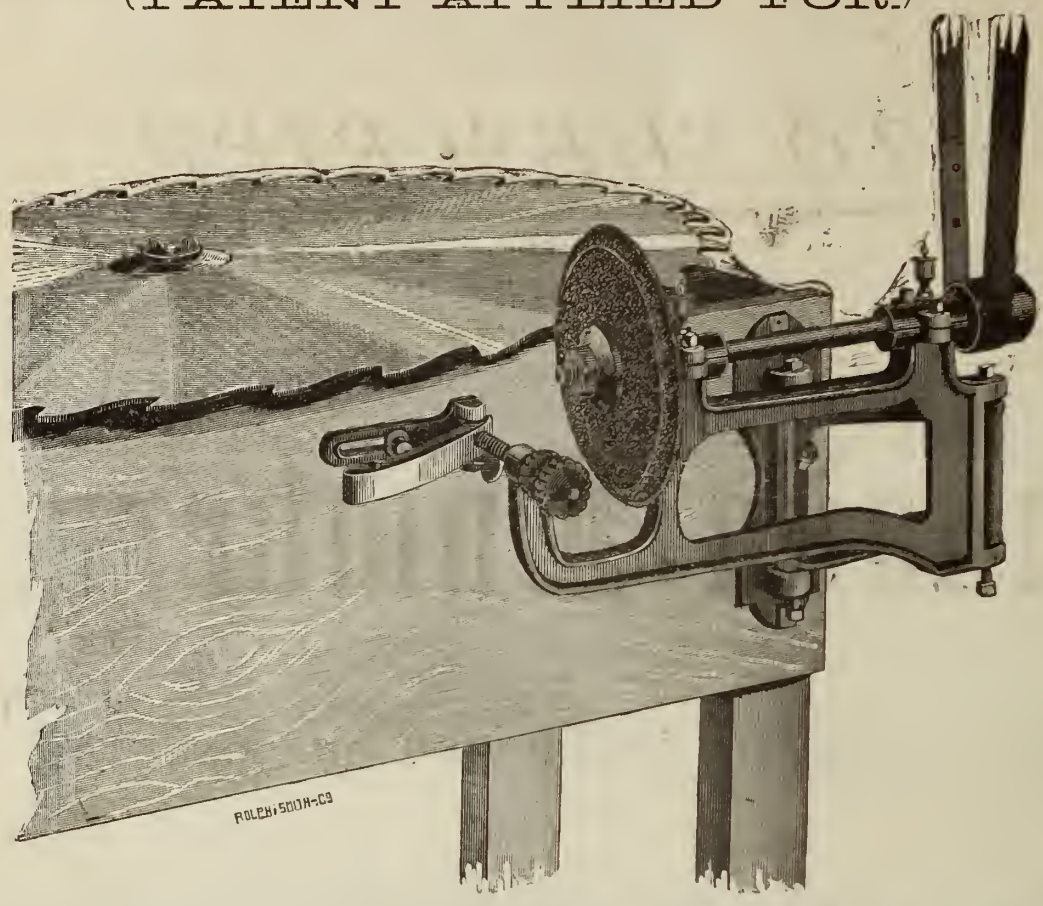
ROGERS' SAW GUMMER

(PATENT APPLIED FOR.)

No Heating!

Quick!

Simple!



Exact Work!

Cheap!

Complete!

POSITIVE STOPS! ADJUSTABLE GUIDE! Every Tooth made exactly alike!

JUST WHAT IS WANTED in every Saw-mill in Canada!

A REVOLUTION IN GUMMING SAWS WILL BE EFFECTED WHEREVER

ROGERS' SAW GUMMER

Is Introduced to replace Burr Gummers, or Grindstones, or where Emery Wheels have been run in the usual way. Every Machine Guaranteed to work as represented or No Sale. *It works EASILY; is so SIMPLE and COMPLETE that Sawyers can keep their Saws CONSTANTLY in FIRST-CLASS ORDER and thus LARGELY INCREASE the DAILY OUT-PUT.*

Price Complete, with Countershaft - - $40.00.

WOOD FINISH.

The patented preparations known as wood fillers are prepared in different colors for the purpose of preparing the surface of wood previous to the varnishing. They fill up the pores of the wood, rendering the surface hard and smooth. For polishing mahogany, walnut, etc., the following is recommended: Dissolve beeswax by heat in spirits of turpentine until the mixture becomes viscid; then apply by a clean cloth, and rub thoroughly with a flannel or cloth. A common mode of polishing mahogany is by rubbing it first with linseed oil, and then holding trimmings or shavings of the same material against the work in the lathe. Glass paper followed by rubbing also gives a good lustre. There are various means of toning or darkening woods for decorative effect. Logwood, line, hrown soft soap, dyed oil, sulphate of iron, nitrate of silver exposed to the sun rays, carbonate of soda, bichromate and permanganate of potash, and other alkaline preparations are used for darkening the wood; the last three are specially recommended. The solution is applied hy dissolving one ounce of the alkoli in two gills of boiling water, diluted to the required tone. The surface is saturated with a sponge or flannel, and immediately dried with soft rags. The carbonate is used for dark woods. Oil tinged with rose madder may be applied to hard woods like birch and a red oil is prepared from soaked alkanet root in linseed oil. The grain of yellow pine can he hrought out hy two or three coats of Japan much diluted with turpentine, and afterward oiled and rubbed. To give mahogany the appearance of age, lime water used before oiling is a good plan. In staining wood, the best and most transparent effect ohtained by repeated light coats of the same. For oak stain a strong solution of oxalic acid is employed; for mahogany, dilute nitrous acid. A primary coat or a coat of wood fillers is advantageous. For mahogany stains the following are given: 2 oz. of dragons blood dissolved in one quart of rectified spirits of wine, well shaken; or raw sienna in beer, with hurnt sienna to give the required tone; for darker stains hoil half a pound of madder and 2 oz. of logwood chips in one gallon of water, and brush the decoction while hot over the wood. When dry, paint with a solution of 2 oz. of potash in one quart of water. A solution of permanganate of potash forms a rapid and excellent hrown stain.—*Amateur Mechanics (London).*

THE DULUTH SQUABBLE.

Mr. R. C. Mitchell, the newly appointed receiver of the government land office at Duluth, was arrested by United States Deputy Marshal Bracket, at Duluth, on July 14, charged with fraudulent pre-emption of pine lands in Vermillion lake district of Northern Minnesota. Mr. Mitchell is editor and proprietor of the Duluth *Tribune*, and supported the Hon. Knute Nelson, memher of Congress elect, in his famous fight with Kindred in the late congressional campaign. A warrant was issued for the arrest of H. L. Gordon, who enjoys the title of "Thundering" Gordon in the upper country, and is alleged to have heen a partner with Mitchell in the pre-emption grab. The charges were brought hy ex-Gov. Marshall, of Minnesota, special agent of the United States land department, and in the main are to the following purport: It is alleged that H. L. Gordon and R. C. Mitchell did conspire, comhine, confederate, and agree together, with A. K. Lovejoy, Frank C. Gordon, G. Blades, W. Peak, W. F. Harley, Walter Gordon, Amos Malder, J. Malder, L. B. Draw, Proctor Morgan, Gus Marden, and nineteen others, to defraud the government of lands in township 63, range 16 west; that arrangements were made by Gordon and Mitchell with the others mentioned, whereby they were to proceed, and did proceed to the township indicated, and to took up lands under form of the pre-emption law. These lands were afterwards turned over to Mitchell and Gordon foe a sum of money that had been agreed upon before the pre-emptions were made.

Mr. Mitchell says that he will he ahle to refute these charges, and prove what he has done in acquiring lands is at least technically legal. He waived examination, and gave bonds in the sum of $5,000 to appear in the United States district court at Winona, Minn., in October. Gordon could not he found at time Mitchell was arrested.

This legal action against the land grabbers at Duluth caused much excitement in pine land, newspaper and political circles in northern Minnesota. It is the culmination of a fight that has heen going on over the receivership of the Duluth land office, and involved the politics of the 5th congressional district. When Knute Nelson was elected to congress, Receiver Spalding had to submit to the decapitating process, while R. C. Mitchell, who had worked hard for Nelson hy means of the Duluth *Tribune*, was appointed in Spalding's place. But Mitchel has not yet received his government commission, and his arrest is said to he a movement to prevent his ever getting it and heing confirmed in office. It is alleged hy the anti-Mitchell partisans that Gordon and Mitchell failed to pay the men whom they hired as pre-emptors for the service rendered, and that they have openly charged their employers with had faith.

The Duluth *Times* has an old score to settle with Mitchell of the *Tribune*, and the *Times* takes this opportunity to get even with its adversary. It says that it is known that Mitchell has for years been engaged in fraudulent pre-emptions. He was receiver in the land office when the pine boom first struck the Duluth district, and he had the opportunity to become familiar with the workings of the office. M. C. Russell succeeded Mitchell, though the latter tried hard to retain the place. He became interested with H. L. Gordon in land-grabbing schemes, and they employed Scandinavians and Finlanders in large numhers to pre-empt lands for them. The *Times* declares that at one time a representative of that paper counted twenty-seven Finlanders in Gordon's and Mitchell's office all waiting for their pay for pre-emption service. There are charges enough, if they can be proved, to convict Mitchell and Gordon of fraudulently obtaining pine lands, hut without a doubt the defendants will appear in court with a formidable array of counter-testimony. Mitchell has a powerful political influence to hack him, and great moneyed interests are involved on hoth sides. It is doubtful if either party in the contest can really afford to have the courts tear off the mask that covers the means whereby pine lands have been acquired in northern Minnesota.—*Northwestern Lumberman.*

ABOUT THE BIG CALIFORNIA TREES.

A correspondent of the Philadelphia *Bulletin* thus descants upon the size and antiquity of some of the California big trees: "We have seen so many illusions. What we take for little hills a half mile away, we find on walking toward them are mountains twenty miles off—and so we go till the dazed traveller is almost ready to take off his clothes and swim, when really the ditch may he jumped across. So with the hig trees. "Not so large after all," several of the party said: but when the tape line showed a fair 100 feet round, there was no use in disputing any longer. Imagine a tree standing in one of your 30 feet streets and going right straight up, so that you could only see down the sidewalks on each side, and it will give a fair idea of the enormous size of those trees. There was no room to douht the size. Then I took to questioning the height, and here I think there is room to question whether they can claim to be the monarchs of the forests hy any great degree. I find no measurements in print of the sugar, yellow or balsam fir of these regions. Prof. Whitney had taken a few of the larger trees hy triangulation with an instrument. There are about 600 of these monsters, besides innumerable younger ones coming on, and most of them have heen singled out for special names. I took one that had been named after our celebrated college, "Harvard," and, hy the same process which gave me the figures already noted for the sugar and yellow pine, I had 249 feet as the height of this tree. I have been on the other side, but am now converted. The age has been computed from the annual rings of wood. But some trees make more than one circle of wood a year. We would not compute the age of a cottonwood by its annual rings—and so we said of these trees that probahly they made more than one circle of wood a year—and so said I. Now all our known coniferæ make but one circle. Why should this be an exception? Well, we wanted the exception to account for its enormous size, as against its snpposed age. Well, I found a comparatively young one which had fallen across the wagon road and had to be sawed across. A fire had just scorched the surface cut across and made the rings easy to count. I first estimated the age by the annual tiers of branches, which, however, are not so easy to count in the giant trees as in the true pines. I was sure by this examination, however, that the tree ought to he less than 200 years old. It had 189 rings and a diameter of four feet. This would give abont 1,300 years for the largest trees. Thus, though I am not yet persuaded that these trees were growing when the Saviour was on earth, as some have asserted, an age approaching this must he conceded.

ONTARIO FORESTS.

There are, according to Mr. Phipps, in his lately published report on the preserving and replanting of forests, four elevated plateaux or ridges in Ontario. The first of these is that which is known as the Oak Ridges, about thirty miles north of Toronto, and which passes round to the west, coming at Hamilton close to the lake, then going around the head of it and eying away in the Niagara peninsula. If this height of land had been retained in timber, he thinks the henefit to the Province would have heen incalculable. The second watershed is that which extends, with a slight curve to the north, from Kingston to Nippissing. To the east of it all streams flow into the Ottawa; to the west into Lake Ontario. Much of the land is still in the hands of the Government, and it would be well he suggests that large masses of forest were preserved along the whole line. Hundreds of thosands and even millions of acres of it might, indeed, well he left in forest, which would be a reservoir of moisture and ensure fertility to the whole of Eastern Ontario. The third watershed is the height of land of Western Ontario, the locality of the great Garafraxa swamp. Much of it might be reserved for timber. Its central point is one thousand feet ahove Lake Ontario, and from its sides rivers run into Georgian Bay and lakes Huron, Erie, and Ontario. The Blue Mountains, at the extreme north of the Ontario peninsula, extending from near Collingwood, past Owen Sonnd, to the north of promontory between Lake Huron and Georgian Bay, is the fourth Plateau, and, as much of it is still in the Government s hands it could he easily preserved in timber. The forest left standing on these ridges would be much more efficacious as storehouses of moisture than a larger amount scattered through the country.—*Montreal Gazette.*

LUMBERING IN THE ADIRONDACKS.

Much has been said and is being written—says a correspondent of the *Daily Advertiser*, Boston, who contributes the following interesting facts anent the lumbering operations of this most romantic section of country—of the desecration of the Adirondack region by the building of railroads, the despoilation of its forests by lumbermen, the pollution of its waters by saw mills and tanneries. If an enterprising man enters within its sacred groves he is immediately assailed, anathematized and spoken of as enemy to man and defrauder of posterity. However pertinent these warnings may be to other regions, they are wholly inapplicable to the Adirondack region, and I believe to most lumber regions, for reasons that are patent to all who can or will study the subject. Like all primeval forests, ours consists of trees of every age and size, from the tiny sapling up to the mature tree that has defied the storms of a century, and its more venerable congeners that are passing down the other slope of the anticlinal of life. Some having lived their allotted time, converted all their vital energies, died, and are falling *pari passu* to their mother earth, reticulating it with their prostrate forms in every state of decomposition.

At present, the only means of transporting lumber of this region is by floating it, in the round log, down the streams to mills located on one of the railroads that skirt every side of it, None but coniferous trees, pine, spruce and cedar, will float well, therefore none other are cut, and of these none of less than 27 to 30 inches in circumference are marketable. The result is that the lumberman takes, on the average, ten or fifteen of the largest and most mature trees from an acre. When railroads are built through the region, which will be done sooner or later, probably an equal number of deciduous (hard wood) trees will be cut for the market. Even in this case no more trees (and those the maturest) will be cut than a scientific forester would take out, had he no other view than the health, beauty and vigor of those that are left—young trees that are awaiting their turn. Is it not better that those mature trees should be utilized by the present generation of men, than that they should fall and decay uselessly, except to generations of trees that may revel in their elements a hundred or a thousand years hence? When this subject was discussed in the New York Legislature last winter, a trustworthy expert stated that if he could take the whole assembly over the Adirondack region in a balloon, not one in 50 of the members could tell where the lumbermen had cut all the saleable trees and where he had not. He was right. None but an expert, and one, too, that had viewed the premises before the despoliation, could tell; and then by only missing the black tops of the firs. In 10 years these will reappear, and the territory can be profitably lumbered again.

That fire may follow the woodsman's axe is possible, but not so probable, nor are its effects half so deplorable as that of a virgin forest. The conditions favorable to the former are more so for the latter. The largest and most destructive conflagrations have occurred where the green timber was still standing. When a fire is once started in a resinous group it does not wait for dry food, but leaps from conifer to conifer, and from base to top with electric speed, incinerating the living with the dead. That prince of explorers, Baron Nordenskiohl, in his "Voyage of the Vega," in speaking of the pine forests that he discovered on the Veniset, within the Artic circle, in Northern Siberia, says: "It is of enormous extent, a primeval forest nearly untouched by the axe, but in many places devasted by forest fires." The most thrilling and awful sight I ever witnessed was a grove of terebinthine trees on fire, lighted from a match that had lit my cigar. Almost instantaneously each was a writhing pyramid of flame. It was Shelley, I think, who called the lightning the laughter of the clouds. This seemed like the revelry of the demons, in which the four winds joined and outvoiced the roar of the ocean.

I have said that the logs are all floated down the stream. They go principally to the mills at Potsdam on the Raquette and Glen's Falls on the Hudson. The current and gravity take all but a small percentage to the latter, in the course of three years, mostly in the first year, while owing to the wide bays, narrow gorges and rocky rapids only a small percentage would ever reach the former without other aid. A drive of about 750,000 logs, all just 13 feet 8 inches long, belonging to half a dozen owners, sufficient to make 50,000,000 of manufactured lumber, passes down the Raquette annually occupying several months. That which passed this place in April has not reached Potsdam yet. The cutting and running of these logs is an industry of some magnitude, the picturesque and novel features will be interesting to those not familiar with the subject. About the time the sun crosses the line in the autumn, gangs varying from 25 to 75 stout men may be seen passing from her genial rays into the shade of the great wilderness, like flocks of hybernating birds and, like birds, they do not reappear into force until the sun has recrossed the line and the vernal season is at hand. They go in with dampers down and in silence, but come out with throttle open, jostling the air with the outpourings of their long pent-up exuberance. When they reach the territory from which they are to cut marketable trees, they build a log shanty, with two communicating apartments, covered with long spars hollowed out trough-like, with the axe, laid side by side, the space between them covered by others inverted and locked into them, making a water-proof, and, when calked on the inner side with moss, a warm roof. One apartment is used by the men, who sleep in berths or bunks built, in tiers of three, against the wall, of saplings fastened with withes, and filled with fragrant boughs for mattresses. These berths are made without the use of nails or tools save the axe. The other apartment is used for a storeroom and kitchen, where the food is cooked and served to the men, which is otherwise considered sacred to the uses of the women cooks, scullions, etc., and their families.

The most approved plan for these logging shanties is one inherited from early civilizations, but better adapted to the wants and health of its occupants than any modern conception. It is oblong, with an aperture some 6x12 feet in the centre of the roof, beneath which, on the earth, a fire fed by logs 8 to 10 feet in length is kept burning night and day, affording a genial heat and perfect ventilation, and around which the men, wet from melting snows and dripping trees, sit, dry their clothes, smoke their pipes, and while away the long evenings, and then turn into the surrounding bunks and sleep, without being assailed with fœtid air or unwholesome draughts, there being no other opening for light or air. The men in these camps are very rarely affected by the colds, coughs, sore throats and neuralgic pains that afflict almost constantly men in camps warmed by stoves and lighted by windows.

The most classical, best preserved and most superb specimen of the early style of construction, which these lowly huts follow in a very distant and feeble manner, is the Pantheon, in Rome,—

> The shrine of every saint, the temple of all gods,
> From Jove to Jesus.

Built 27 years before the birth of the latter, the opening in the dome (which is its only means of admitting light, or air) still bears the marks of sacrificial fires kindled to pagan gods almost 1,900 years ago. But I have wandered far from and far above my subject. Some of the logging camps on the Ottawa in Canada are so distant and inaccessible to wheeled vehicles that supplies for the autumn have to be hauled in on sleds the previous winter. This is rarely done on this side of the St. Lawrence. Late teams begin to run regularly after the men go in.

The logs are cut and placed on skidways, ready to be rolled on the sleds, in the autumn and early winter. As soon as there is sufficient snow, teams are sent in with large sleds that will carry from 15 to 20 good sized logs to the load, the roads are broken down and sprinkled with water, until they become, if the weather is favorable, sheets of glare ice. The logs are hauled on the river, where they remain until the ice breaks up in the spring. Every operator has his mark or brand registered in the county clerk's office. The die is cut upon the face of a hammer and indented upon both ends of the logs while they are on the skidways. They float at random, mixing with other logs, until they reach the assorting booms at the mills of their owners.

A gang of river drivers consists of a boss, a cook, chore boys and 40 to 60 men, who must be young and sinewy, as the work is rough and dangerous. They have to leap from log to log, and sometimes ride one ashore on the crest of a cataract or be carried over it; only experts can ride a log. It consists in balancing one's self on a log, keeping it from rolling and propelling it in the required direction, by a peculiar undulating and rocking movement, without paddle or other implement. Floating logs lodge upon projecting rocks and in narrow gorges, and pile upon one another until they form what are called jams, many feet high and extending back miles. A jam is not usually broken until the rear of the drive approaches, as the water thus held back helps the operation. It is a thrilling and sometimes fearful sight to see these jams broken and see the logs plunging down precipices of one hundred feet in as many rods, leaping, like a flying fish, entirely out of the watery abyss below, into the air, and bury themselves in the white foam of the next fall.

To return to the matter of preserving the sylvan beauties of the Adirondack region. The legislature of New York enacted a law at its last session restraining any further sale of the state lands, and I think I have shown that it is clearly not beneficial to the private owners of timber lands to despoil them, and self interest is a powerful motor in the conduct of men. But there is another, a meteorological reason, why this region is not likely to be shorn of its forests. No considerable area is ever deforested or (in the vernacular) "cleared," unless it is adaptable to agricultural uses. It has been demonstrated that in consequence of the long cold season of the Adirondacks, no land lying more than 1,500 feet above tide-water in that region can be cultivated profitably, or without frequent disaster. Nearly all the wilderness proper lies above this line; its finest and most interesting scenery, all its rock-riven and romantic passes, its affluence of lake and river systems, most of its summer and hygienic resorts, and its chief attractions lie above the line of profitable cultivation of the soil.

A LOST TIMBER SHIP.

Among the shipping casualties of the week, the most conspicuous and worthy of note is that of the abandonment of the Dublin timber ship Westminster, in the Atlantic Ocean, some 20 degrees of longitude westward of Cape Clear, on the 12th ult. It appears that the ship was caught in a heavy gale, increasing, it is said, to a hurricane on the 9th, when homeward bound with a cargo of timber from Quebec, and was struck by a heavy sea, which carried away the deck-houses, the boats, and the deckload, and also damaged the rudder, so as to render it useless; while up aloft the sails were blown out of the bolt ropes, after which the vessel became unmanageable, and apparently waterlogged, as the crew of 23 hands, under the command of Captain Morris, could find no place to occupy but the poop or the rigging, while the ship wallowed helplessly in the trough of the sea, which washed over her like a half-tide rock.

Five men, it seems, were at the steering gear when the sea first broke on board, and the second mate and several others were severely injured, apparently by the loose timber and wreckage flying about. This state of things continued until Thursday afternoon, and doubtless the sufferings of the men, especially those that were injured, must have been very great, from their want of shelter and being reduced to a biscuit a day and some lime juice, as they could not get at any fresh water or provisions. Fortunately, on Thursday afternoon the steamer Australian hove in sight, and her commander, observing the signals of distress flying on board the Westminster, bore down to her, and extricated all hands from their perilous and almost desperate condition, and brought them to Liverpool. The published accounts are very meagre, but there does not appear to have been any life lost, nor is mention made of any case likely to prove fatal among the injured men, so that it may be anticipated that all will recover and become again able seamen, whose lives were worth preserving for themselves and others. Nor is it found that the recollection of pains and perils past has any uncomfortable effect on the future lives and spirits of those who have suffered them if their health was not permanently damaged thereby. Neither are they discouraged from following their usual calling, and facing the same dangers whenever in the way of duty they chance to encounter them. They even obtain a sort of prestige among all their friends and acquaintances as heroes who have passed through a trying ordeal, and have a stirring tale of the sea to tell.

Now the Westminster was rather an old timber ship of 1,426 tons register, built at Quebec as long ago as 1867, and belonging to Mr. W. Murphy, of Dublin. But the trouble she fell into does not appear to have had anything to do with her age. There is no mention of her having sprung a leak, and the water that got into her seems to have come from above instead of below. In tearing away the deck-houses and cargo, rents would be made through which water bursting in huge masses over the decks would find its way below in tons at a time; and the pumps in such a case would have been useless, even had the crew been able to keep the main deck and work them. Here, therefore, was a case where the worst perils of the sea befell a timber ship, whose only merit was—and an immense one it turned out to be—that in the last extremity water could not sink her. Everything was lost but the lives of those she carried, and, whatever they suffered, they no doubt feel thankful that they are now safe in Liverpool, and that the old timber ship kept them up till succor arrived to redeem them from the jaws of death.

It is so much the fashion to deride wood built ships as something obsolete and out of date, that we are glad of an opportunity to show where they have an advantage over their iron competitors, and when it is a question of saving lives no one is indifferent to the incident.

In the last fatal collision in the Channel between two iron ships belonging to the same company, the Waitara was said to have sunk in four minutes after she was struck, and to have carried down with her twenty-six of the people on board, some of whom had not time to get on deck before she filled. A very shocking thought to follow out, which need not be done here, and which could not have happened to those on board the Westminster, which saved her people when all else was past saving, and gave them another chance for their lives.

It may be argued that with a Quebec timber cargo on board an iron ship would not sink, but that is very doubtful, and at all events she would be too near total immersion for any one to live on board of her if once the water got the better of her. Also the loss of the Westminster may be attributed to her deckload, which of course rendered her deeper in the water and less buoyant than she would have been without it, and it being summer time more would be carried that way, because bad weather is not anticipated to the same extent as in the wild winter months, and long dark nights, when more caution in loading is supposed to be exercised. But any way the deck load seems to have disappeared with the first heavy sea that broke on board, and in that way the ship was relieved of her superincumbent weight, and the people on board thereby found means to get at some food to avoid being washed off the wreck. All we profess to show in this brief allusion to the catastrophe of the Westminster is that timber ships wood laden are not liable to the same sudden destruction by accidents of the voyage as befall iron ships so often and so fatally if they come into collision with each other or are overpowered by stress of weather at sea.

In conclusion, we need only observe that too much praise can hardly be given to the captain of the steamer Australian (whose name by the by was not mentioned in the newspaper reports) for his prompt and efficient assistance in the hour of need to the crew of the Westminster. We so often hear of vessels hurrying past others in distress, like the Levite in the parable, that when we hear of a Good Samaritan at sea he ought to be made to feel by general acknowledgment that he has deserved well of his country.—*Timber Trades Journal.*

PROGRESS OF PAPER MAKING.

That the great bulk of paper now is not as good as it used to be is, I suppose, universally admitted. One reason is obvious. Far greater quantities are used every year ; the best paper is made from linen rag, and there is less linen rag available since the larger wear of calico and woolen goods. Ultiinately, of eourse, paper is now what it always was since first it was made from the fibers of the rush and papyrus. It was at first manipulated in no degree ; the outer peel was stripped off the rush and the strips were fastened together. Gradually it was discovered that the vegetable fiber, beaten and disintegrated into pulp, then allow under certain conditions to settle into a film and dried, was better. But the more the fibers can be disintegrated the better the paper ; and no process is so complete as the making it in the first place into another material, and allowing it to be worn and broken, as the completest mode of destroying its stringiness. Every kind of material has been tried, especially those on which St. Paul said it would not do to lay a foundation—"wood, hay, stubble"—the most common heing the coarse form of vegetable fiber known as Esparto grass, a species of broom. In Sweden, previous to 1866, a newspaper was printed for some considerable time on a paper made from horse-dung. It is not wholly fanciful that human wear and use has something to do with the excellence of paper, as with all other things of art. Mechanism is fatal to the higher and more spiritual qualities which make art. It has its great uses in cheapening and rendering plenteous much which is valuable and in a limited degree beatiful. But just as a chromo-lithograph is vile compared with an oil painting, just as a photograph of a picture compared with a beatiful print of it, so in exact proportion as in human work and human wear to bear on paper and printing you will have it, of its kind, surpremely good, or only tolerable. This brings us to another reason why old paper was better than all but the best to be now procured. It was all hand-made ; there was no machinery. The pest paper now made, such as Whatman's in England, or the best Dutch, which is all still made by hand, is better, or at least as good, as was ever made since the world was ; but the greater part of cheap paper is bad,—*Fortnightly Review.*

SUICIDAL BUSINESS.

When Norway lumber is sold for $8.25 per thousand, and the seller has paid $7 per thousand for the logs, how much money is there in the transaction for the manufacturer ? This query is suggested by the report from Alpena of a transaction of that character by O. E. Avery. Such childish business is not confined to Alpena, as we are aware of some of Saginaw river which will compare with it, and yet the "hears" in the lumber trade at many of the distributing centers are wondering why lumber dont come down, and persist in asserting that the manufacturers allow the dealers no chances for profit and are virtually driving them out of the trade. In regard to this Norway lumber foolishness and its influence on the white pine market, we have heretofore expressed ourself, and still maintain that it has been not alone detrimental, but destructive to the standing and demands for the coarser grades. There are many uses to which Norway can be applied, for which it is equally as good as pine, and in fact preferable to the coarser grades, and while men persist in slaughtering the former at ruinous rates, in order to get rid of it, they can only expect the influence of such folly to effect the latter. There has not been a time on the Saginaw river the present season when the finer run of lumber did not find ready sale at good prices, while the coarser grades have been slow to move ; and but for the almost unflinching attitude and persistence of the manufacturer, a break would have resulted months ago. This state of affairs is more directly traceable to the Norway lumber folly alluded to above, than to any or all other sources combined. Men who own Norway timber will display vastly more sound judgment by letting it stand than by putting it on the market in the shape of lumber, under present conditions, and owners thereof may rest content that Norway timber will in the not very distant future be excellent property to have, unless the suicidal policy of the present season is persisted in to its natural, inevitable and logieal conclusion.—*Lumberman's Gazette.*

DESTRUCTIVE FIRE.

OTTAWA, Aug. 8.—To-night the citizens on the street about ten oclock were startled by seeing the sky in the north-east suddenly becoming red and filled with smoke. A few minutes later the alarming sound of the Hull firebells told that the conflagration was on the Quebec side of the river, and going in the direction of the fire Gilmour's extensive steam saw mill, about a mile down the river from Hull, was scen in a mass of flames. The mill is situated on a point between the river and bay to the north, and is surrounded by large piling grounds, where millions of feet of lumber are piled. The fire was first discovered about 9:45, and a few seconds later covered the whole building. The water supply of the mill was at once brought into requisition, as was also the Hull steam fire engine, and the flames kept from spreading to the lumber piles. All attenpts to put the fire out were useless, and all efforts were put forth to confine to the building. By 11 o'clock the roof had fallen in, and the fire began to abate, while the piles were still untouched. The mill is the largest in the vicinity and run entirely by steam, and was rebuilt for the second time a few years ago. The value of the mill, machinery, approaches, etc.. burned will be in the neighbourhood of $100,000, and is believed to be covered to a great extent by insurance.

QUEBEC CULLERS' OFFICE.

The following is a comparative statement of Timber, Masts, Bowsprits, Spars, Staves, &c. measured and culled to Aug. 2 :—

JAMES PATTON,
Quebec, Aug. 3. Supervisor of Cullers.

Old Building Material.

An extensive trade in second hand building material has been carried on uninterruptedly in this city for fifty years, and is largely supported by builders and joiners. The stone and brick of an old building is used in the construction of a new one, the lime-whitened bricks making the inside of the outer walls and the partitions, and the stone going into the foundations. But it is not generally known that the inside wood work is used again, frequently without radical alteration. Many builders prefer this old timber because it is thoroughly seasoned, having been defended from the weather and been subjected to the influences of a measurably even temperature for years. The richer woods which are admired for their color acquire mellower tones by age and become more valuable as the years pass. Everybody knows that furniture of mahogany and rosewood that outlived several generations is much handsomer than that made from new wood. But it has an added value as mere materal. An artical made from the old wood will retain integrity in all its joints ; its shrinking days are over. For the same reason timbering, wainscoting, and flooring of old buildings has an added value, although its selling price is less than that of the new material.

Masts and Spars.

A correspondent asks about the Quebec inspection of masts. An extract from the Act in regard to the culling and measuring of timber, masts, spars, etc., reads as follows: "Masts, bowsprits and red pine spars shall be sound, free from bad knots, rents and shakes, and the heart shall be visible in spots, at or near the partners." The following is given as to dimensions : "White pine masts, 23 inches and upwards at partners, shall be three feet in length to the inch in diameter : 22 inches, three feet in length to the inch in diameter, and two feet extreme length : 21 inches, three feet in length to the inch in diameter, and three feet extreme length : 20 inches and under, three feet in length to the inch in diameter, and four feet extreme length." The bend must not exceed six inches for every 70 feet, and in proportion for any greater length.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O. ; W. EDGAR, Kilroy, P.O. ; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

NORMAN'S ELECTRO CURATIVE APPLIANCES

RELEIVE AND CURE

Spinal Complaints, General and Nervous Debility, Nervousness, Rheumatism, Gout, Liver, Kidney, Lung, Throat and Chest Complaints, Neuralgia, Bronchitis, Incipient Paralysis, Asthma, Sciatica, Sprains, Consumption, Sleeplessness, Colds and Indigestion.

Ask for NORMAN'S ELECTRIC BELTS and you will be safe against imposition, for they will do their work well and are cheap at any price.

A. NORMAN, ESQ.—Dear Sir,—Please send me a waist belt. Enclosed find price. Head band I got for my wife has almost cured her of neuralgia. Yours truly,
C. L. TILLEY, WATERVILLE, N.B.

Numerous of such testimonials can be seen at my office, proving that they are doing a good work and worthy the attention of all sufferers. Circulars free. No charge for consultation.

A. NORMAN, 4 Queen Street East, Toronto.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1YL7

LUMBER MERCHANTS

And MANUFACTURERS,

☞Dealers in WALNUT, BUTTERNUT, CHERRY, CHESTNUT, ASH, OAK, WHITEWOOD, and all kinds of Hardwood and Pine Lumber. PICTURE BACKING, HOLLY, EBONY, LIGNUM-VITÆ, RED CEDAR, &c. American and French VENEERS.

Orders for Lumber and all kinds of Factory Work promptly attended to. Lumber Kiln dried to order.

Yard : Cor. Wellington & Strachan Aves.

FACTORY : Corner Soho and Phœbe Streets.

OFFICE : 39 Adelaide Street East, (First Floor, nearly opposite the Post Office.

L5 TORONTO, ONT. 1y

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily and honorably, Address TRUE & Co., Augusta, Maine.

EXTENSIVE PURCHASES.

A syndicate of Eau Claire and Chippewa Falls, (Wis.) lumbermen and capitalists has recently purchased extensive timber limits in the British Northwestern territory. The Syndicate is composed of the following gentlemen : J. G. Throp, O. H. Ingram, V. W. Bayless, W. A. Rust, H. C. Putman, I. K. Kerr, J. B. and H. M. Stocking, H. D. Davis and Daniel Dolena, F. Holman of Eau Claire, and Alex. McLaren, A. Bruce, Irvine & McDonald, and L. E. Waterman of Chippewa Falls.

The nine berths purchased by this strong combination cover an area equal to about 13 townships and are estimated to contain 250,000,000 feet of pine, spruce and cedar stumpage. The limit is situated in the province of Alberta, on the Bow river, and its tributaries near the eastern footholds of the Rocky Mountains and some 700 miles west of Winnipeg. Tho conditions of these grants of timber limits from the Dominion Government are thus stated :—

According to the regulations governing the granting of yearly licenses to cut timber on Dominion lands under section 52 of the Dominion lands act of 1879, provision is made for the licensee paying a ground rent $5 per square mile ; for requiring that within a month after the date of the order in council granting a timber berth, the person in whose favor it is passed must pay the rent for the year in advance, the rent to bear interest at the rate of 6 per cent. per annum from that date until the same is paid ; that when applications for licenses conflict, berths shall be laid off and described as the Minister of the Interior may direct, and tenders shall be invited for the same. Persons tendering are required to state the sum or bonus per square mile which they are willing to pay in addition to ground rent and a royalty of 5 per cent on the amount of the sales of all the products of the berth, and the limit is awarded to the person offering the highest bonus. Licensees are required to have in operation within a year from a date to be fixed in the license and to keep in operation for at least six months of each year of his holding, a saw mill capable of cutting daily at least 10,000 feet, board measure of lumber. It is further provided that when a licensee has complied with the conditions above enumerated, and where no portion of the berth is required for settlement or other public purpose, of which the Minister of the Interior is to be the judge, the license may be renewed for another year, subject to such revision of the annual rental and royalty to be paid therefor as may be fixed by the Governor in council.

Several valuable timber limits in the same general region have recently been secured by Minneapolis capitalists, and the prospects for a large return upon the investment is excellent.—*Minneapolis Tribune.*

PREPARED FLOORING IN ENGLAND.

There is considerable discussion in England over the matter of importing prepared flooring, the dressed and matched article, furnished in bulk, being a comparatively new proposition to saw out a bill of lumber to order from the raw material, in the shape of deals. Assortments are hardly dreamed of, in the sense that is involved in the stocks of the Chicago lumberman. Recently a sample cargo of prepared flooring from Archangel was received at London, and bought by some merchant of a speculative turn of mind. On account of the high freights which obtain it is doubted whether a trade of any extent can be built up in prepared flooring. It is stated that the sample cargoes of such stuff which arrive, are generally the first and the last. The trade does not tackle kindly to the scheme. It is thought that if the extra freight and insurance could be offset by a lower free-on-board price, there might be a chance for White sea floor boards in the English markets. But in that event it is feared that competition would result in hammering prices till the Norway article would crowd out the now candidate for favor, and there would be necessity for insuring a supply of prepared flooring, if any considerable business in it was attempted. With Swedish flooring it is different, and the conditions will doubtless foster something of a trade with Swedish and Gulf of Bothnia ports. In this connection arises the question as to how American drossed and matched flooring will fare in the English market, such exports having been sometime ago proposed. How many obstacles there are in the way has not yet developed but if the cost of yellow pine flooring, dressed and matched, is not excessive, when laid down across the water, it ought to compare favorably, in quality and service, with the foreign prepared article, since in what the preparation consists is a rather obscure proposition. The question of superior manufacture is an important one in this country, and doubtless is in England.—*Northwestern Lumberman.*

THE CHAUDIERE MILLS.

A visit on Tuesday, July 31st, to four out of five of the "Chaudiere Mills," by a representative of the *Free Press*, revealed the fact that lumbering is not near as brisk as it has been for a few years back. Shipping is very dull, owing mainly to the stagnant condition of the American market, and in a measure to the greenness of the lumber. Matters may look up, however, as the season advances.

Mr. Booth's shipping is considerably ahead of that of last year, though his cut is behind. He hopes, however, to catch up before the season is out. The capacity of Mr. Booth's mill is 300,000 feet per day, and at that rate the cut for the season would be in the vicinity of 50,000,000 feet. He employs about 450 men inside and out, about thirty span of horses, 100 waggons, and about 30 shipping carts. There is in the mill amongst other new machinery added this year, a gang saw with a capacity of three logs at a time, or about 800 a day. There are also an innumerable number of "twin," "slabbing," "edging" and other saws. There are eight gates in this mill—the largest number in any mill on the Ottawa.

Closely adjoining Mr. Booth's mill is that of Messrs. Perley & Pattee, employing about 100 men night and day. The capacity of this mill is about 300,000 feet, for the day and night watches. The machinery in this mill is somewhat similar to that in Mr. Booth's. Near the large mill is a small one which turns out laths, pickets for window fixtures and such small wares. There are upwards of 90,000 laths turned out per day. In this mill are employed about fifty-three men during the day watch, and about 23 during the night. The wages of all these hands range from $3 to $8.50 per week. At the beginning of the season Perley & Pattee had on hand about 200,000 logs, and of this number about one hundred and fifty thousand are yet in the river.

The next mill visited was that of Captain Young, in which about 200 men find employment during the day and night watches. The capacity of the mill is about 100,000 feet per 24 hours. The season was opened with about 150,000 logs, and of this number about 50,000 are cut. There are three gates in each mill. Captain Young's mill is the only mill lighted with electricity.

The mills (2) of Messrs. Bronson & Weston are second to none on the Ottawa. The capacity of the two is upwards of 400,000 feet per day (24 hours.) Between 450 and 500 hands are employed. About 300,000 logs were taken out last winter, and of this number about one-half are cut. All the cuttings, edgings and slabs are run through another part of the mill, and come out either as laths, pickets, or boxing stuff. Thus scarcely anything else but the bark and the sawdust is wasted.

Mr. Eddy's and Mr. Rochester's mills will be referred to another time.

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* says :—The aspect of affairs in Sweden shows at length that the modifications made by extensive exporters in their prices reported a few weeks ago have been taken full advantage of by buyers in Great Britain, and have have resulted in important transactions to London and other large ports, of which the somewhat heavy shipments by steam at present going forward bears witness. At the present moment exporters have relieved themselves of a good portion of their stock that had previously hung fire, are a degree stiffer in their quotations, and the general opinion seems to be that the worst is past. The reports from the principal consuming districts, especially in England, are more favorable, while it is now seen that the aggregate production of the season must be considerably less than last year, even under the most favorable circumstances.

Notwithstanding the comparatively heavy shipments now taking place, all that I have been able to gather in respect to the probable export of the coming autumn leads me to the conclusion that the same will be decidedly less than last year, and that the total shipment of sawn and planed wood from Sweden in 1883 will, in all probability, be less by 50,000 standards than those of 1882, unless some of the smaller firms adopt the doubtful expedient of sending consignments.

A HILL OF TREES.

It is comparatively easy to render prairie farms beautiful by the judicious planting of forest and ornamental trees. A correspondent of the Country Gentleman writes : A friend of mine moved from the picturesque hills and lovely woods of western New York to a prairie country, treeless and level. Although at first he duly applauded his new home for its practical utility in being so level, and blessed his luck in having no stumps to pull, yet its monotony became unbearably wearisome, and he was homesick for a sight of rugged but beautiful Cattaraugus. Trees he had, for his first care was to plant windbreaks, and a ten-acre forest of soft maple and cotton woods ; but hills were missing. Finally he told his wife that he was "going to make a hill at least 100 feet high," about 1,000 feet in front of the house. When I saw his hill it was nearly 75 feet high, and one of the most beautiful sights I ever saw. This is the way it was made : In the center of a circular land about 200 feet in diameter he set a cotton-wood tree, and 20 feet away a circle of six cotton-wood trees. The centre tree was much larger and thriftier than the circle. Twenty feet distant was another circle—this one of willows, set 15 feet apart. Then followed catalpa, ailanthus, osage orange, and holly. These outer circles were closer, and the trees, being of smaller kinds, were set closer. By cultivation and manuring he endeavored incite the central trees to a more luxuriant growth than the outer ones, and has succeeded in a remarkable degree. The result is a solid green hill of foliage that soon will be one hundred feet high in the center, and slopes down to about ten feet at the base. My friend tells me that he does not think he made the best possible selection of varieties, but could do better now in making a uniform grade. My friend is "building" another hill on a modification of this principle. This is to be an evergreen hill, and for the place of honor he has a white pine surrounded by spruces, and the varieties graded as to size to the edge. To secure a greater hill appearance he allows five years to elapse between the planting of the different circles, so that when the last circle is set the central tree will be twenty-five years old.

PRESERVED WOOD.

We have from time to time called attention to the different methods of preserving wood from decay and from insect enemies, and urged that the processes in use abroad should give equally good results in this country. Though at different times considerable quantities of timber have been treated in this country by various methods the use has been somewhat spasmodic, and but little has been kept until lately in the shape of recorded results.

Lately, however, the American Society of Engineers has agitated the matter, and the results of their investigations have already been presented in our columns. Their exhibit at the railway exposition of wood and timber, both treated and natural, as exposed to different kinds of service for greater or less periods, is most interesting. It will be beneficial in directing the attention of those interested in the use of timber to the advantages of systematic treatment wherever there is to be exposure to the elements. The four methods of treatment represented creosoting, burnettizing, kyanizing and the Thilmany process. The first, as is shown by the name, consists in using the heavy oils distilled from wood ; the second in using chloride of zinc ; the third is the chloride of mercury process, while in the fourth system two salts are used, one being of zinc or copper and the other of barium.

The most systematic exhibit in this collection is that from the works of the locks and canals on the Merrimac river, and represents the kyanizing process. The samples of timber displayed are of twelve different kinds, and each kind is shown as treated, and also in the natural state. The pieces were all treated alike as regards exposure, and the samples exhibited were taken near the ground line, where the strongest action of the weather would be shown. The time of the experiment was twenty years which is certainly long enough to decide the matter in the most satisfactory manner. It certainly has in this case, as in every instance the treated wood has lasted remarkably well, while in every specimen the natural wood is decayed so as to crumble almost at a touch. The effect of the preserving material has been clearly shown in the sample of poplar which after twenty years seems in as good, if not better, shape than some of the harder woods. If it is generally so susceptible to treatment it will greatly raise it in the estimation of engineers from its present low condition. The samples of kyanized timber from Fort Ontario after an exposure of forty years, are also interesting.

The exhibits of the other methods of wood preserving are valuable, though not showing such marked contrasts as that which we have just described, but all of them seem to show very good results under different circumstances and for long periods of time. The creosoted ties of fir from the English roads may be considered as good samples of that class of treatment.

The double salts methods, though newer before the public gives promise of good record.

A curious feature is an exhibit of portions of ties from the line of the Union Pacific, where the natural soil is of such character as to preserve the wood. A glance, however, at the analysis of this soil, which is attached to the samples, would seem to show "salts" enough to preserve anything.—*Railway Review.*

H. M. Bruce recently cut a spruce tree, in Stowe, Vt., which made three logs 12 feet in length and measured 1,400 cubic feet, the butt log containing over 500.

E. Hall, of Detroit, is building a dam on the Tobacco river north of Clare, in order to run about 13,000,000 feet of Mr. Hall's logs which are hung up in that stream.

The *Lumberman's Gazette* of August the 1st, says :—The recent floods have destroyed numerous dams in this state, on which the only hope of securing logs from many of the tributary streams depended. Five dams on Hope Creek, a tributary to the Au Gres, went out last week, and over ten million feet of logs are thereby hung up high and dry. Some of our Bay City mill men will by this circumstance be considerably short in their expected log crop. Four dams on the Cedar were also carried away last week. It seems that the elements are persistent in their conspiracy to defeat any effort to overstock the lumber market on the Saginaw river.

The *Timber Trades Journal* of July 21, says : The torrent of wood goods from the Scandinavian and Finnish ports has abated this week and made room for our early North American fleet, as out of the sixty-six vessels arrived in London with timber about twenty are from the river and Gulf of St. Lawrence. But even with these the total arrivals for the week is 12 short of the number of either of the two preceding weeks, and under the circumstances it can hardly be considered an excessive supply. It is however numerically in excess of the corresponding week of last year by nineteen vessels. The difference occurs chiefly in the North American arrivals, only five being in the list o that from Canadian waters.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

Chips.

A STEAM cooperage on the Scotch system has been built at Uddevalla by Swedish capitalists, and the manufacture is superintended hy Scotch coopers. The casks turned out are superior to the hand-made, and, although expensive, are likely to find a good demand.

WORKMEN have discovered a suhterranean forest seven feet helow the surface of the ground near the mouth of Savage river, in Chazy, Clinton county. Many of the trees are declared to be in an admirable state of preservation. One of them is a large oak over 40 feet in length.

MAKING of charcoal is a considerable industry a long the eastern division of the Flint & Pere Marquette railroad, in Michigan. Between East Saginaw and Holly these are a number of kilns. There are a few on the Otter Lake Branch, and between Wayne Junction and Monroe there ahout fifty kilns.

LEWIS PRAY, of Portland,Me., who turns out carriage and sleigh work, makes the statement that hickory can he raised in Maine from the seed in 15 years, to the size required for carriage stock, and believes such culture would be profitable. The older trees are not so fine grained and valuable as the younger ones.

THE quantity of logs cut and floated down the provincial streams during the past season is estimated by a prominent New Brunswick lumherman as 345,000,000 feet. This includes the timber cut in Northern Maine, which floats into New Brunswick River. The amount cut on the Aroostook River is given at 65,000,000 and on the Upper St. John as 45,000,000 feet.

Mr. McAllister's drive of logs on Snake River has heen abandoned owing to the impossibility of getting them through the enormous growth of weeds. The drive consisted of 40,000 logs and some dimension timber, and extends for eight miles along the river. It will prohahly remain there until next spring. Mr, McAllister had accepted several contracts for the supply of lumher, which he will now be unahle to fill.

THE Indianapolis, Ind., Wooden Dish Company has perfected a machine, which takes the veneer from the mill, cuts out the hlank, shapes and scores it, folds it up, makes, drives and clinches the wire staples, and throws the dishes off complete, at the rate of one a second. The company's work's, hurned last March, have been rebuilt, and $12,000 worth of new machinery has been purchased. The works will start up August 15, and have a capacity of 200,000 per day.

THE *Lumberman's Gazette* says :—Opinions of great men sometimes prove no hetter than those of the most ordinary individuals. Twenty-four hours before the break of the great jam of nearly one hundred million feet of logs at Grand Rapids, Mayor Watson was quoted by the press as saying that for one thousand dollars he would insure the safety of the railroad hridge to the extent of twenty-five thousand dollars. That structure, was carried away with others standing in the way of the rushing, roaring flood of logs, and great damage followed.

THE *Mining and Scientific Press* says :—Don't over drive your machinery. The policy of driving our machinery is a losing one. When normal speed is on, and the machinery is running, all is well, but the moment the speed is increased beyond the natural hearing capacity, something must give way. It may not be at once, and the unnatural speeding may go on very well for a term, but the machine is wearing away faster than it should, and some of these days the man who runs it will be reminded of the old deacon's 'one-hoss shay.'

A LOFTY mountain tramway is to he constructed up the famous Pike's Peak in the Rocky Mountains, Colerado, reaching to an altitude of 14,200 feet. It will he divided into three sections, the first worked by an engine at the lower end, the second hy water power utilized on the mountain side through a turhine wheel, and the third by an engine erected on the summit of the Peak. The supports will be made of trees about 24 feet high, on which a thick wire cahle will be fastened. At intervals a large covered arm chair holding two persons, will be suspended about eight feet from the ground.

EPPS'S COCOA

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold in tins and packets only (¼-lb. and lb.) by Grocers labelled thus:

FITS EPILEPSY

OR

FALLING SICKNESS

Permanently Cured—No Humbug—by one Month's usage of Dr. Goulard's Celebrated Infallible Fit Powder. To convince sufferers that these powders will do all we claim for them we will send them by mail, **post paid, a free Trial Box.** As Dr. Goulard is the only physician that has ever made this disease a special study, and as to our knowledge thousands have been **permanently** cured by the use of these **Powders. We will guarantee a permanent** cure in every case **or refund you all money expended.** All sufferers should give these powders an early trial, and be convinced of their curative powers.

Price for large box $3.00, or 4 boxes for $10.00, sent by mail to any part of the United States or Canada on receipt of price, or by express, C. O. D. Address

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co, 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., AUG. 15, 1883.

CHAUNCEY CARPENTER, a saw mill owner in Victoria, B. C., has absconded, leaving liabilities to the amount of $40,000. It is believed that he carried $20,000 away with him.

THE American Lumber Company is building a tug to tow logs up stream, on the Taquamenon river to the company's mill at Dollarville, upper Michigan peninsula.

THE pine forest along the Adriatic at Ravenna, Italy, celebrated by Dante and Byron, and which furnished the shipyards of Rome and Venice, is to be cut down, because an excavation for a railroad has so drained the soil that the trees have died.

BUSH fires have spread over Victoria, B. C., and everywhere flames and smoke reign supreme. The island is similarly affected. The sky is filled with smoke so dense that the sun's rays cannot break through it. There has been no rain for nearly three months.

THE Ottawa *Citizen* of August 4th says:—The American barge Marquis of Lorne took the unusually large load of 240,000 feet of lumber to-day from McClymont & Co.'s millyard, New Edinburgh, to New York. The barge James G. Blaine took a similar load from the same place to Whitehall, N. Y., at the same time.

THE Winnipeg *Commercial* of July 31, says: There has been no change in the lumber market since last week. The mills are busily engaged working up last winter's cut of logs, and the amount of lumber turned out will be very large, more than the demand will require. The old table of rates still holds, but cash customers can get a considerable reduction.

THE Chicago *Lumber Trades Journal* says:—From the reports of our lumber capitalists seeking the Canadian Northwest on speculative tours it is quite presumable that that region of timber lands will experience a boom. Explorations are being made which, from advices, will undoubtedly culminate in very extensive purchases by American buyers; in fact such has been the result in several instances.

SEVERAL cargoes of lumber have lately been shipped from Manistique, Mich., to eastern markets. There is a considerable accumulation of lumber at that point.

WE would call the attention of our readers to the important auction sale of valuable timber limits to be held at Ottawa on August 28th, the particulars of which may be found in our advertising columns.

A SIMPLE device for gauging weather or clap boards has been patented by Mr. J. C. McEwen, of Lochloosa, Fla. The device may be readily set for indicating the inclination and set for the board, and it is readily adjustable for boards of different widths. This implement may be provided with hooks upon which may be hung the various tools used by the workmen, which will thereby be always readily at hand convenient for use.

A PULP mill at Yarmouth, Me., which consumes 10,000 cords of poplar annually, which is equivalent to 1,536,000 feet board measure, is having 1,800 cords furnished by James Irish, of Hartford. The pulp wood was cut on Swift and Ellis rivers, and is peeled before going into the water. The entire lot will be floated down the Androscoggin to Lewiston, where it is taken out at the rate of 50 cords per day, and transported by rail to Yarmouth.

THE *Lumber World* thinks the forestry associations should turn their attention to cyclones, which appear to have joined the ranks of the "denuders." A cyclone in Michigan, recently, leveled acres of timber, making so clean a sweep that hardly a tree was left standing. An excellent idea of the irresistible power of these storms may be gathered from the report from Wisconsin of the trunk of an oak two feet in diameter torn in two, and a hickory twisted into splinters.

THE *Timber Trades Journal* of July 21, says:—As far as the Quebec trade is concerned, although a considerable spring fleet is handy to our shores, we do not think the shipments this season will be very large. The market here offers but little encouragement to shippers, and very few cargoes we believe will be shipped on speculation. Spruce is said to be in somewhat better demand at Quebec, but the stocks of lower port are known to be large, and importers here will be in no hurry to advance on their previous offer as long as they think they have the whip hand.

THE *Railway Review* gives the following statistics as to the annual supply of cross ties required for the railways in the United States: There are about 119,000 miles of railway in operation in that country at the present time, which have an average of 2,816 cross ties per mile of track, making a total of 335,104,000 cross ties now in use. Allowing 160 as the average yield per acre of woodland, the number now in use upon the railways in the United States represents the stumpage of 2,094,400 acres of land, and during the next six years this amount of timber land will be levied upon to renew the existing 335,104,000 cross ties at a cost of $187,552,000."

MR. ERASTUS HIBBARD, of South Barre, N. Y., has recently patented a machine for finishing staves, so that when the barrel or tub is set up and trussed it is ready to receive the head without the use of the usual hand tools for leveling, chamfering, and crozing. Further, the object is to give uniform depth of croze in barrels having staves of varying thickness, instead of making the croze too deep in thin staves and too shallow in thick ones, as is generally the case in hand work. A revolving mandrel carries the tools, and a feed bed with travelling belts carries the staves. The parts are made adjustable and self-adjustiug, according to the thickness of stave.

IRREGULAR DEALS.

To the Editor of the Canada Lumberman.

DEAR SIR,—We notice a great many deals sawn by our circular saw to be ⅛ of an inch thicker one end than the other. The thickest end being where the saw enters the log. Can you or any of your numerous readers give us the reason of it?

Yours truly,

River Ouelle, P. Q. A SUBSCRIBER.

WILL IT PAY TO PRESERVE AND REPLANT OUR FORESTS?

Now that more prominence is being given to the subject of forestry, there is no doubt there will be many asking: Will it pay to preserve and replant our forests?

As this is a practical and pertinent question; is, in fact, the key stone to the solution of what is and what is not the duty of the Provincial Government in the premises, let us briefly state a few of the facts given in Mr. Phipps' recent pamphlet bearing upon this particular point.

In Hanover the Government control 600,000 acres, the maintenance of which costs them about $650,000 annually, while the annual revenue averages about $1,500,000, leaving a profit of about $850,000 per annum, or about $1.50 per acre per annum.

In Prussia there are 20,000,000 acres under forest. One half of this is private property. The remainder is owned by the state, and commercial and ecclesiastical corporations and yields an income of about $14,000,000 yearly against an expenditure of $7,500,000, leaving as net income about 65 cents per acre.

In Saxony there are nearly 400,000 acres worked at an expense of $500,000 per annum, and yielding a revenue of $1,750,000, or a net yearly rental of $3 per acre per annum.

Bavaria has 3,000,000 acres under forest, the returns from which, after paying all expenses (which includes the replanting of 30,000 acres annually), is about $1.50 per acre per annum.

In Austria they have less than 2,000,000 acres of productive forest, and little attention having been paid to the subject in that country until recently, the net income is only a little over twenty-five cents per acre per annum.

These are the only figures given as to forests which have long been under government supervision, and managed with a view to their maintenance and the obtaining of a permanent revenue therefrom, but they certainly must be admitted as going to support the soundness of the views of those who are urging upon the Provincial authorities the propriety of adopting efficient measures for the maintenance and replanting of those public lands, which from their nature and situation are better adapted for the growth of timber than for tillage.

FORESTRY.

Dr. Nelles, of Victoria University, writes thus to the editor of the *Globe*:—

SIR,—I have read with very great satisfaction the pamphlet by Mr. R. W. Phipps, "On the Necessity of Preserving and Replanting Forests." It purports to have been prepared "at the instance of the Government of Ontario," and is full of the most valuable information on the important subject on which it treats, and it is high time that both our Legislature and the people at large were aroused to act with more intelligence and energy in reference to this great public interest. The old adage, "What is everybody's business is nobody's," seems to have been once more illustrated in this matter. Let us hope that a wiser policy is likely to prevail in the future, and that not only the Province of Ontario, but the entire Dominion will seek to remedy as speedily as possible the carelessness and mistakes of the past.

Mr. Phipps has evidently put forth a great deal of research, and has confirmed his own extensive experience by collecting from various recent and trustworthy sources a mass of information such as the general public sorely needs, which it could not otherwise have easily obtained. In fact, it is one of those cases in which it is not only necessary to provide the information, but to enforce its application by Governmental authority. In this matter, as in educational and sanitary measures, we encounter not only gross ignorance, but indolence, apathy, and selfishness, which together make up a stubborn *vis inertia* that only an enlightened and public-spirited Legislature can overcome. As we read Mr. Phipps' well written pages we get a vivid and rather melancholy view of the power of popular stupidity, and feel that there are blunders worse than crimes, or at least equal to crimes in their evil effect. Some persons may consider this strong language to use in speaking about "trees," but the language will not be deemed too strong by those who have carefully weighed the facts and reasonings embodied in this most excellent report. For it is not, as some may imagine, merely a question of firewood and lumber. There are involved as well the important matters of climate, of soil, of comfort, of beauty, and of health, in fact the great agricultural and general interests of the people for centuries to come. Nor let any one foolishly suppose that it is entirely a providential affair which only He who made the forests can control. Those who read the pages of this pamphlet will learn that God has put us in trust with our forests much in the same way as that in which He has given us our cattle, our harvests, and our orchards. We may preserve or destroy, and within limits reproduce, the one as well as the other. And it is not too much to say that the former are almost as indispensable as the latter.

The Hon. S. C. Wood, the late Treasurer Ontario, deserves well of his country for having introduced his timely measure to encourage tree planting. That Act relates, I believe, entirely to ornamental trees, but it is worth considering whether some legislative enactment could not wisely be adopted to encourage the planting of trees in certain districts upon a larger scale. The practice of other countries, as shown by Mr. Phipps, should at least lead to some investigation on the part of our legislators, and the report now published may perhaps be intended as a step in that direction. It is well that so much space is given in the report to this branch of the subject, for, contrary to the popular notion, it does seem possible to rear a harvest of trees, and within such a limited time that he who plants the acorns may himself build a house or a ship with the oaks they produce. But if it be necessary that the father should plant and the children reap, it will only be another example of the great law of life. Numerous extracts from other reports and communications are furnished by Mr. Phipps to show the ease, rapidity, and success with which groves and forests of trees of various kinds have been produced in Canada and elsewhere. I have not space for lengthy quotations here, but will cite one passage, and trust the public journals in noticing this report will make other selections. The following extract is from the pen of Hon. J. Sterling Morton, of Eastern Nebraska:—

"Twenty years ago cordwood sold in Nebraska City for seven or eight and sometimes ten dollars a cord, and that, too, when her population was not one-fifth of what it is now; and, notwithstanding the demand for fuel is at least ten times greater than in 1857, it is a fact that good merchantable wood can be bought in our streets for from $3.50 to $4.00 per cord. The reason of this is simply from the fact that the natural groves have been protected from fire, and the artificial groves are turning out an abundance of good wood, such as the necessities of the country demand for fuel. It will agreeably surprise anyone not acquainted with the fact to know the amount of timber one acre of land will produce in the course of ten years. Mr. Richard Justice, who came here (Otoe county) in 1857, and planted about ten acres of cottonwood in 1859, has one or two outhouses built from hewed logs taken from that grove, and the family have all the fuel they need. Hundreds of such cases might be mentioned throughout the eastern portion of the State, did space permit."

On the whole the Government of Ontario is much to be commended for procuring and publishing the information contained in this document, and both the Government and the general public are to be congratulated on having found so competent a man to write and compile what is here published. The accomplished author I have not the pleasure of knowing, but it is seldom one finds in our "blue books" (as they are called) so much practical experience and scientific knowledge combined with literary taste and excellence of style. I have not attempted to give a minute analysis or extended review of the report, but I am deeply convinced of the importance of the subject which it dis-

cusses, and it is a pleasure to do anything that may help to bring it under public attention, though it be only by penning this hurried and imperfect notice.

S. S. NELLES.

Victoria University, Cobourg, Aug. 6, 1883.

WHAT IS TO BE DONE WITH THE SAW-DUST?

The following note of inquiry was recently sent to one of our regular contributors by one of our readers :

MARBLETOWN, N. Y., May, 1883.

We are running a small steam saw mill, cutting about 10,000 feet of lumber a day. We make plenty of steam by using the slabs made and some sawdust. But we cannot use all the dust and in very dry summer weather are afraid to use it at all, for fear of fire. Consequently it accumulates rapidly and is seriously in the way, requiring the labor of several men to wheel it off and burn it, at a very considerable expense to us. As we know of no consulting engineer in this vicinity, after reading your article in *The Millstone*, we write to you for advice. Please write and tell us what to do. Make your charge and we will pay it, but do not give us any guess work. We want a guaranteed plan, and are willing to pay for it.

Very truly yours,——.

Answer : What to do with the sawdust has bothered more than our inquiring reader. In the large Wisconsin mills the surplus was formerly dumped into the stream near at hand. When that was forbidden by law large brick kilns or furnaces were made, conveyors were run to them and the surplus not needed for steam making was burned up. This, it is believed, is the general custom now. If any better disposition is made of it that any reader of this periodical knows of, he would do a favor by letting the public know through these columns. More sawdust and less slabs may be burned by making a better draft. This can be done by turning the exhaust steam into the smoke-stack, low down, or by increasing the height of the stack. Increased risk by fire by increased draft can be obviated by using a locomotive wire screening over the top of the stack, which should flare out funnel shape. This screen and the moisture from the escaped steam, will avert all danger from flying live sparks, and allow sawdust to be burned at all seasons, no matter how dry the weather may be.

But no other disposition of the surplus sawdust that may accumulate after all, is better than that made by the great mills of the north. A conveyor can carry this surplus a considerable distance from the mill by machinery, and the kiln can be built up close and tight, so a constant fire can be kept up, only requiring a little watching and care by the men employed outside of the mill.—*J. F. Tallant, in Millstone.*

New Zealand Forests.

The forests of New Zealand cover an area of not less than 20,000,000 acres. The forests on the crown lands alone are estimated at 10,000,000 acres ; about 5,000,000 acres are the private property of the white or European population, and the remainder is owned by the Marori or native inhabitants. The kauri pine, found only in the province of Aukland, is on of most valuable trees in the colony. It often grows to a hight of 200 feet and measures 12 to 30 feet in circumference. The annual output of Kauri timber is about 110,000,000 feet. Another valuable tree is the kahikatea, a species of pine. The totara, a hard, close-grained wood, is used a great deal, and lately it has been found to be very serviceable for wharf piles and telegraph poles. There are many other varieties of valuable wood in the colony and the forests are so vast that they must yield enormous wealth to the colony in the futurer

A Plucky Damsel.

A young lady, Miss Kate McDarby, recently ran the Calumet slides and chute on a crib. Only one lady has ever been known to do this before. Not a few river men have also been know to show the white feather at this place. Miss McDarby however was not in the least frightened and after she had passed through it, wanted to run it again.

Saw Mill Burned,

MIDLAND, Aug. 10.—The fine new mill belonging to the British Canadian Lumber Company here was totally destroyed by fire this evening. The yard was full of dry and green lumber, which is at present (9 p.m.) burning, with no hope of saving any. Loss fully $100,000. Particulars of the insurance cannot be ascertained to-night.

ROCK ELM WANTED.

A Few Car Loads of good ROCK ELM, cut into 1½, 2, 2½ and 3 inches thick, 12ft. length prefered.

DUFRESNE & JODOIN,
Lumber Dealers,
6L12 496, St. Joseph Street, Montreal

A RARE CHANCE!

Valuable Steam Saw-Mill

FOR SALE.

The Waba Creek Steam Saw Mills, situated on the Madawaska River, one mile from Arnprior. Capacity of Mill, Fifty Thousand Feet of Lumber per Eleven hours. Capacity of Booming Pond, Thirty Thousand Logs. Has Sidings through piling Grounds connected with main line of Canada Pacific Railway The Mill is in good repair, having only run a short time, and is well found in all appliances required to run it to the above capacity. There is also a good water power connected with it from the Waba Creek, and good stabling, Barn, Boarding House, and other buildings. For information, price and terms, apply to John Robertson, 581, Seigneurs Street, Montreal, or to James McCuan, Arnprior, who will show intending purchasers the whole property, or to

J. T. LAMBERT,
6L11 Lumber Broker, 110 Wellington St., Ottawa.

How Many Miles Do You Drive!

The
ODOMETER
Will Tell.

This instrument is no larger than a watch. It tells the exact number of miles driven to the 1-100th part of a mile ; counts up to 1,000 miles ; water and dust tight ; always in order ; saves horses from being over-driven ; s easily attached to the wheel of a **Buggy, Carriage, Sulky, Waggon, Road Cart, Sulky Plough, Reaper, Mower,** or other vehicle. Invaluable to LIVERYMEN, PLEASURE DRIVERS, PHYSICIANS, FARMERS, SURVEYORS, DRAYMEN, EXPRESSMEN, STAGE OWNERS, &c. Price only **$5.00** each, one-third the price of any other Odometer. When ordering give diameter of the wheel. Sent by mail on receipt of price, post paid. Address

McDONNELL ODOMETER CO.,
2 North La Salle St., Chicago.

SAW MILLS
AND
TIMBER LIMITS
WITH
Logs, Lumber, Store Goods, &c
FOR SALE
In the District of Algoma, Ont.

Eighty-Five Square Miles (54,400 Acres) of Limits, Good Pine, First-Class Water Power, Large New Water Mill, Steam Mill, Store and Dwellings.

☞Canada Pacific Railway now running through part of the property.

For full particulars address :—

WILLIAMS & MURRAY,
L7tf GODERICH, ONT.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy ; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

DIEU ET MON DROIT

Notice to Contractors.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Post Office, Barrie. Ont," will be received at this office until TUESDAY, the 7th of AUGUST next, inclusive, for the erection of

POST OFFICE
—AT—
BARRIE, ONT.

Plans and specifications can be seen at the Department of Public Works, Ottawa, and at the office of Messrs. Kennedy, McVittie & Holland, Architects, Barrie, on and after TUESDAY, the 24th July next.

Persons tendering are notified that tenders will not be considered unless made on the printed forms supplied and signed with their actual signatures.

Each tender must be accompanied by an *accepted* bank cheque, made payable to the order of the Honorable the Minister of Public Works, *equal to five per cent.* of the amount of the tender, which will be forfeited if the party tendering decline to enter into contract when called on to do so, or if he fail to complete the work contracted for. If the tender be not accepted the cheque will be returned.

The department will not be bound to accept the lowest or any tender.

By order,

F. H. ENNIS,
Secretary.

Department of Public Works,
Ottawa, July, 1883.

1L15

FORESTS AND THEIR MANAGEMENT.

We take the following from Mr. R. W. Phipps report to the Ontario Government:

To obtain knowledge on this head, no better source of instruction is available than the extensive report made on the subject by Captain Walker, a gentleman who passed nine months on the continent, by direction of the European Government, for that purpose. I cannot copy his voluminous report, but will give a short review of what refers to each country visited, and anything likely to be useful for our purposes here in Canada. The Captain first visits Hanover, describing the system in which territory to some extent describes all, for he tells us that the system there may be considered as typical. He gives then, the administration there, and a brief statistical record of the others, except in those points where they decidedly differ. Now, as to Hanover.

Hanover.

Its forests under State management amount to 900,000 acres. Some are Government, some Church, some belong to municipalities or communes. Government manages the forests by officers appointed, while the community pay four cents per acre towards the pay of the officers. The method appears to be that of giving the owners as much wood, pasture, or litter for manure, as their original right to the forest entitled them to; but to give it at the hands of Government officials. If the forest is of sufficient extent to employ a special officer, the commune, instead of the four cents, are charged his pay and allowances, as well as other working charges.

The government forests are about 600,000 acres of the above, and the cost of working and all expenses is about $650,000 annually, the receipts being $1,500,000, and the profit therefore $850,000, or, taking the actual figures, about $1.50 per acre per annum. This, of course, takes no account of the value of the land, or what it might rent or sell for if cleared.

Hanover is a province of Prussia. The head office is therefore in Berlin. The forest establishment of Hanover consist of one director and over-forest master, who is also a councillor; twenty forest masters in charge of circles or divisions, forming also a board of management on all forest matters; one hundred and twelve over-foresters in charge of forest districts (*revier*) averaging seven or eight thousand acres each; four hundred and three foresters who assist the over-foresters, and have charge of portions of a district; three hundred and forty-three overseers, under-foresters, etc., employed in watching and protecting the forest, and supervising the work that is executed by hired weekly or daily labor, or on contract under supervision of the fixed establishments. A cash-keeper is attached to each over forester, who receives and disburses all moneys out of the forest cash chest, with which the over-forester has nothing to do, although his accounts should, of course, tally with those of the cash-keeper. For payment of laborers, etc., he gives orders on the cash-keeper, whose books are examined by the forest-master in charge of the division, and accounts rendered to the head office in Hanover, and thence to Berlin.

All the forests have been surveyed, valued, and divided into blocks in this manner:—

Besides those already enumerated, there is, for the sole purpose of measuring, valuing, and framing working plans for the forest, a superintendent, draughtsmen, and clerks, generally practical foresters, and a staff of surveyors and forest valuators, who are generally candidates for the position of over-forester.

When a forest was about to be taken in hand and worked systematically, a surveyor and valuator were despatched to the spot, the former working under the directions of the latter, who placed himself in communication with the local forest officer and the inhabitants interested, and obtained from them all the information in his power. The surveyor first surveyed the whole district, then the different divisions, as pointed out by the valuator, who defined them according to the description of the timber standing, and any conditions affecting the nature of the trees to be grown in future. While the surveyor did this the valuator valued the trees, formed a register of rights with a view to commutation, considered the best plan of working the forest, the roads, in fact, all which enabled him to form a plan for the head office, and a subordinate plan to be handed over to the executive officer as his "standing orders."

The valuator and surveyor return to headquarters, and prepare the maps and plans, which are submitted to the board of forest-masters, the forest director and other councillors of the Finance Department, who are thus prepared to listen to any objections made by communities or individuals, which are very rarely made now, as the people have learned that the action of the officers is not adverse to their interests, and are willing to allow them to settle matters.

The executive officer has thus in his hands maps showing each division of the forest tract in his charge, and instructions—the quantity to be felled yearly, the extent to be planted, the state in which the forest should be ten, twenty or a hundred years after the plans were made, all calculated—so that the over-forester has only to carry out the instructions given him, allowances being made for unavoidable difficulties—failure of seed, occurances of storms, and the like.

The forest-masters have no executive work, but control four to six over-foresters, of whose labor they make frequent reports to the Director (both in forest and office work). The over-foresters give annual report of operations. They spend most of their time in the forest, supervising the felling, planting, sowing, thinning, carting and selling of timber. The laying down of roads is done by a forest officer, but the actual work is carried out by the local officer, who has also much office work, giving grazing licenses, etc., and preparations of returns, but his work is out of doors compared to that of the forest-master, who has more office work; comparing operations and rates in the districts, collecting statistics, settling disputes, and as a member of the forest committee, revising working plans.

The main object aimed at in any scientific forestry is, to convert the natural forest, consisting of trees, young and old, good and bad, too thick and too thin, into blocks of trees of the better description, of the same age, and capable of being worked—that is, thinned out, felled, and reproduced, or replanted, in succession, a block being taken in hand each year. In carrying out such a system, considerations must be attended to, such as the relation of the block to the whole forest system; the needs of the people in timber, firewood, leaves for manure and pasturage; the soil, the situation as regards winds (which must be attended to in felling to lessen damage), and precautions against insects, fire, trespass or theft.

The plans need revising every twenty years, though it is marvellous to notice to what an extent the original scheme has generally answered.

After a forest has (to give some idea of management) by thinning, planting, and so forth, been gradually got into perfect order as described, the system of natural reproduction forms great part of the German method. It is as follows:—

The rotation and periods are fixed in the working plan. For beech "hochwald" it is in Hanover one hundred and twenty years, divided into six period of twenty years each, that is to say, when the forest has been brought into order there should be nearly equal areas under crop of trees in each of the six periods, that is from one year to twenty; from twenty years to forty, and so on. When a block arrives in the last period, felling is commenced by what is called a preparatory clearing, followed by a "clearing for light" in the first year after seed has fallen (the beech seeds every fourth or fifth year) with the object of—1st, preparing the ground for the seed; 2nd, allowing it to germinate; 3rd, affording light to the young seedlings. If there is a good seed-year and sufficient rain, the ground should be covered with seedlings in two or three years after the first clearing; but it is better generally to wait for a second seed year, and aid nature by hand-sowing, transplanting from the patches of many to the barer spots, and turning up the turf to give the seeds a better chance of gerating.

When the ground is well covered the old trees are felled and carefully removed, so as to do as little damage as possible to the new crop, and the block recommences life, so to speak, nothing further being done till the first thinning. The time allowed between the first and final clearings is from eight to fifteen years. But in many provinces they do away with this system, and remove the old trees so gradually that there can hardly be said to be any clearing at all, the new crop of trees being well advanced before the last of the old trees is removed.

In these forests can be seen all the periods of growth—nurseries and schools for seedlings, which are transferred thither, at the age of two to four years, from the seed-beds, and are pruned and transplanted as often as seems required till finally planted out, sometimes not till twelve or fourteen years old. There are many methods of planting adopted here. The steepest and most rocky sides of the hills are covered with forests, which have been created by the labors of the Forest Department. In many such places, where even the few handfuls of soil placed around the young tree had to be carried some distance, it is not contended that the first plantation will yield a pecuniary profit, but the improvement in climate by the retention of the moisture, and reclamation of large tracts formerly barren and unproductive, is taken into account; besides which the dropping of leaves and needles from the trees will ere long create a soil and vegetation, and insure the success of plantations in future years, and conseqnent surplus.

Prussia.

Prusssia has twenty millions of acres of forests, ten millions of which are private, and the remainder, with which we have more to do, state, commercial, and ecclesiastical.

Of these the income is $14,000,000, and the expenses $7,500,000, leaving $6,500,000 clear. This will not show much, in fact not more than 65c. per acre, but there are other returns of more than mere yearly revenue importance. When it is considered that this result is arrived at without trenching upon the capital or stock of timber in the forests, which, on the contrary, is being increased and improved in every province of the kingdom; and that the indirect value to the people of many forest previleges, which they exercise free of charge, must be very great, not to mention the benefit to all in the shape of public recreation grounds and an improved climate, some idea may be arrived at of the enormous value and benefit such a system of state forests must confer on Prussia.

The forests, as already stated concerning Hanover, form part of the Finance Department, and are presided over by an overland-forest-master, and ministerial director, aided by a revenue councillor and joint ministerial director, and a numerous council or board.

There are two forest academies, one near Berlin, and one in Hanover. The overland-forest-master is curator of the academies, and at the head of each is an overland-forest-master, who is aided by a numerous staff of professors and assistant-professors.

There are twelve provinces in Prussia, divided into thirty circles, and to each an over-forest-master, who is appointed to represent the forest department in the council of local administration, and is aided by councillors and by the forest masters as a board, to represent forest interests in the government. Next in order comes the forest-masters, numbering one hundred and eight, in charge of divisions with an average area of sixty thousand acres, and then the executive officers, seven hundred and six over-foresters, to each of whom is 7,000 acres, and to each of whom is attached a cash-keeper, and three thousand six hundred and forty-six foresters, or overseers, with ranges of a thousand to three thousand acres.

At the academy near Berlin are seven professors with assistants. There is an experimental garden attached, with an over-forester in charge of the technical portion, and professors for the meteorological, zoological, and chemical sections. The number of students averages sixty-five. The varied apparatus includes a building where the seed is dried and separated from the cones, large seed-beds of spruce, fir, and willow, full opportunities of transplanting seedlings, and examples of every kind of trees for botanical study.

There is here a museum, rich in specimens of all sorts of birds, animals, and insects found in the forests. In cases where the animal or insect does damage to trees, specimens of the branch, bark, leaf, or cone, in a healty state, and after being attacked, are exhibited close to each, so that the students can see at a glance the nature of the damage, and connect it with the animal which causes it. Thus we have squirrels, rats, beavers, and mice, set up gnawing at the barks, grubbing at the roots, etc. Insects are shown in the several stages of their existence—larvæ, chrysalis, caterpillar, moth, with their ramifications in the stem or branches of the tree. These, with specimen blocks of almost all descriptions of timber, form a most instructive collection. There is a forest district attached, remarkable for the growth of Scotch fir and spruce on a poor sandy soil, and in spite of repeated attacks by insects.

Nothing is more remarkable than the extent of study required from forest candidates, and the number of years they are content to spend in studying or waiting an appointment. The would-be over-forester, which is the lowest of the gazetted appointments, must pass certain terms at a Government school, a year in a district with an over-forester, an examination as forest-pupil, two years at a forest academy, an examination in scientific forestry and land surveying. He is then a forest candidate. Then two years practical study, nine months of it doing duty as an actual forester; then another examination. He is now an over-forester candidate. The first examination tests his theory; the second his practice. Then he will be occasionally employed in the academies, or in charge of a district, only then getting allowances. After five years of this he may look for steady employment.

Thus five years without pay are given in study; five in probation with but meagre pay when employed, and the time is often longer, before regularly installed. Yet so great is the desire for Government—especially forest—service, that there are numerous candidates.

The qualifications for admission into the subordinate grades—forester, sub-forester, overseer—have a military tendency. Candidates, after two years in the forest, enter a jager battalion, and bind themselves for twelve years' service. After three years they obtain leave, and are employed in the forest as huntsmen or game keepers. After eight years they must have passed the forester's test, which consists in six months' charge of a district, and an examination. At the end of twelve years they are discharged with a certificate entitling them to employment in the forest establishments. The appointments are much sought after, and in 1867 there were two hundred and twenty-one applicants for one hundred and forty-five vacancies, but many are absorbed by communal and private forests.

In some provinces the Prussian Government has certain rights concerning the management of even private forests—in others none.

While on the subject of Prussia, it may be well here to insert some extracts from a letter received from Baron Von Steuben, a Prussian nobleman, now Royal Chief Forester of the German Empire, by the Forestry Congress, at Cincinnati, in April of last year. He remarks:—

"There can be no doubt that every country requires a certain quantity of well-stocked woods, not only to supply the demands for building material and fuel, but more especially to secure suitable meteorological conditions, to preserve the fertility of the soil, and out of sanitary considerations. The ratio of the minimum quantity and judicious local distribution of the indispensible forest to the aggregate area cannot be expressed by a universal rule, but the same can only be approximated by scientific investigation. Above all things, it is essential to prevent forest destruction where such would injuriously affect the fertility of the soil. It is important, then, to preserve and to cultivate judiciously those forests which stand at the head-waters and on the banks of the larger streams, because, through their indiscriminate destruction, fluctuations in the stage of water, sand-bars, and inundations of arable lands are

occasioned. It appears also necessary to preserve and properly to cultivate woods in quicksands, or the summits and ridges, as well as on the steep sides of mountains, along the sea coasts, and other exposed localities.

"In Germany, and especially in my more narrow-bounded Fatherland, Prussia, it is regarded as of the greatest importance, not only to preserve the forests already there, but to extend them as much as possible.

"In the National Appropriation Bill large sums are set apart for the purchase of such lands as are unfit for cultivation, and for utilizing the same by planting trees.

"With reference to forests owned by private individuals, they are not restrained in the use of their forests, and may, according to their own judgment, clear the same and till the soil, in short, do what they like, and yet there may be certain restrictions placed upon the free use of the same as soon as danger to the common welfare is feared; these restrictions are prescribed by the law of July 5, 1875, relative to forest protection.

"This law is applicable in cases :—

"1. Where, by reason of the sandy nature of the soil, adjoining lands, or public grounds, natural or artificial courses, are in danger of being covered with sand.

"2. Where, through the washing away of the soil, or through the formation of cascades in open places on the ridges of hill and on hillsides, the arable lands, streets, or buildings living below are in danger of being covered with earth or stone, or of being flooded; or the lands or public grounds, or buildings lying above are in danger of sliding.

"3. Where, through the destruction of forests along the banks of canals or natural streams, riparian lands are in danger of caving, or buildings, hitherto protected by the woods are in danger of iceflows.

"4. Where, through the destruction of forests, rivers are in danger of a diminution of the stage of the water.

"5. Where, through the destruction of forests in open places and near the lakes, neighboring fields are seriously exposed to the detrimental influences of winds.

"In the cases above mentioned, which have been copied verbatim from the statute book, the manner of use as well as the culture of forests may be legally ordered, in order to prevent those dangers where the dangers to be averted are considerably in excess of the damages which would result to the owner by reason of the restrictions,"

Saxony.

The state forests are nearly 400,000 acres, worked at an expense of $500,000, receiving $1,750,000, leaving a clear rental of $3 per acre. The expenditure is planting, draining, roads, improvement of inferior woods, felling, transport, killing insects, etc. About five thousand acres are planted yearly, at an average cost of $7.50 per acre.

The fixed establishment is one inspector, fifteen over-forest-masters, one hundred and twenty district foresters, sixteen cash-keepers, thirteen engineers, twenty-seven foresters, and eighty-three sub-foresters.

There is a forest academy at Tharandt, with a separate staff of professors.

The system of planting now principally experimented on is much the same as that previously described, the young trees being several feet high before the old trees are all removed. One operation is noticeable. It was decided to convert a mixed hardwood forest, patchy and irregular, with impoverished soil, in 1820, into a coniferous forest, and maps were drawn showing what it would be in eighty years. Private intersecting lands have been bought up, and by 1,900 the ideal chart will be actual. Already, in place of a straggling wood, irregularly covered with timber trees of inferior growth, we have now a compact close forest, regularly wooded in sections of different ages, principally spruce and Scotch fir, but containing also fine oak, ash and beech, with straight and clean stems. In many cases the young oaks have been left where pines were planted, and the introduction of the latter has a wonderfully good effect on the oaks.

All private rights were abolished and compensated in these forests by a Bill passed in 1832.

Bavaria.

The state forests are 3,000,000 acres. They return, after paying all expenses, about $1.50 per acre per annum. About 30,000 acres are planted or sown annually, taking 35,000,000 plants and 1,000,000 lbs. seed. Persons found guilty of breach of forest rules have been punished by enforced labor in the woods. Private forest rights are being bought up by the Government.

The system of management is much the same as that previously described. There is a forest academy at Aschaffenburg, with one hundred and sixty-five students.

It will be interesting to notice the injury and process of repair in the fine forests of the Spessart in Bavaria. The deterioration was caused by felling the forest trees as soon as, or before, they were mature, the impoverishment of the soil by the removal of leaves and litter, and the allowing dense underwood to grow unchecked. Inferior trees got the upper hand and prevented the growth of good, while they drained the already impoverished soil and gave nothing in return. Early in the present century the matter attracted attention, and every means have since been adopted to grow oaks, beech, and coniferæ. The result is, though not yet equal to the uniformity of other forests, nowhere can one find finer clumps and individual trees. Inferior trees will soon be rare in the whole forest. In remote portions where the humus had not been destroyed, the growth of beech and oak is truly magnificent, tracts of 120-year old beech and 300-year old oaks being common, the latter with clear trunks running up to 100 feet high. When we compare these with other portions where the crippled and stunted appearance of the trees shows the effect of unregulated grazing and loss of litter, burning of the decayed wood, and forest theft and mischief, or the soil and vegetation, the result is marked. The circumstances, says the Indian Commissioner, are analogous with what has gone on in India for centuries, and is still more or less permitted. The vast extent of forests, which once clothed the hill sides and extended far out on the plains, and the luxuriant growth of the tropics, have hitherto, or until the last two years, prevented the gradual deterioration of our forests being marked or felt, but the subject has now attracted attention, and none too soon. If any have doubts in the matter, let them visit the Spessart, study the history of its forests and judge for themselves.

The forests are sharply protected by law, the average number of prosecutions annually being thirty per thousand acres. The crimes are mischief to wood, pasture, grass, straw, and miscellaneous.

Austria.

Scientific forestry is not so far advanced as in Germany, but officials are busily introducing a reorganization, by means of which, there is no doubt, it will soon be on a par with other states.

The state forests have been largely sold to meet state necessities, but there still remains nearly 2,000,000 productive acres, which yield, however, after expenses are paid, little over 25 cents per acre.

The existing establishments of forestry are not uniform, but there are about twelve hundred employees, of whom twenty-two are forest-masters. Some of these have almost sinecures, while others have six times too much to do, and it is the same with those in the subordinate ranks. The forest academy is at Mariabrunn, near Vienna. There are about thirty-five students.

The collections are fine, possessing specimens of all instruments and appliances made use of in felling, squaring, sawing, carting, and preparing timber, models of saw mills and machinery of all descriptions, plans of river beds improved and embanked for floating, sluices of all sorts, dams and piers for directing rafts in their course and catching firewood, models of rafts, and specimens of home and foreign timber of all kinds. The damage done by animals and insects is also exhibited here comprehensively. There is also a forest garden attached to the academy for the instruction of the students.

The staff of the academy consists of the director, thirteen professors and assistant professors, with subordinates in the account office, laboratory, etc. There is also a forest school at Bruhl, for training young men (of whom eight were there) as practical foresters.

The greater number of those trained here are intended for private and not for Government service, their expenses for board and lodging being paid by noblemen and large proprietors, from whose estates they come, and to whom they return as forest officers and workmen. The state maintains the schools, and pays the professors' salaries, and there are no extra fees. This cannot fail to assist the intelligent management of the private forests of the empire, which are very extensive. The absence of numerous candidates for the government forest service, and preference for private employment is noteworthy, when compared with the opposite state of things in Prussia. The irregular promotion, lack of system, and low salaries in the Austrian forest service are the explanation.

The Austrian crown forests have been neglected; they are patchy with a low and decreasing yield per acre. There has been till now no attempt at rotation of blocks or working in periods. As is found in India, a glance at the outskirts of the forests would lead one to suppose it fairly stocked with timber, but a more careful inspection proves that this is not the case, and that only in the valleys and more remote portions, where the soil is particularly good and the axe has not been so frequent in its inroads, is there a fair and regular crop.

Herr Schuppitch, the present director, is trying hard to change matters, and is changing the hardwood crop, which has exhausted the soil for that class, with pine growths, which besides grow quicker and pay better, He is also dividing into blocks and periods, and planting up many bare or ill-covered tracts, where natural reproduction is impossible owing to the absence of standard trees.

Grand Duchy of Baden.

We shall now notice a private forest, that of the Prince of Furstenburgh, in the Black Forest. The receipts and expenditure are not obtainable, as are the public ones, but we are informed that the forests are economically worked, and that the liberal sums expended in road-making, fitting rivers for floating, housing foresters, &c., were well repaid by the facilities secured, and contentment and zeal of the employees. In the case of this, as of other private forests, it is evident that a private individual is not burdened with considerations of policy aud public good as in a State. The forests are, therefore, worked with the best profit compatible with their retention as capital.

There are about 72,000 acres, in charge of 18 foresters and over-foresters, who of course have many subordinates. The method employed in the slow felling and continual reproduction before mentioned, a block being about forty years in clearing before all the old are replaced by the new trees. Attention and intelligence are necessary, for seed will not grow nor the seedlings flourish without enough light, and the forest officer must watch that they get it; and again much greater care is needed in felling and hauling away when the trees are surrounded by lofty saplings and young trees than when the seedlings of the next crop are not more than a foot or two high. In this the axe-men of the Black Forest are adepts, and the damage very slight to what it would be in other hands.

It may be useful to describe their manner of bringing timber down the rivers. It cannot here be done when the stream is in flood; in fact, the less water in it the better so long as sufficient is stored up above to float the rafts. Reservoirs are made, and the water poured into the river bed when the raft is ready. The streams are often small, of only fifteen or twenty feet in width, and have to be prepared for floating, by being cleared of any large rocks or boulders, and "sleepered," if we may use the expression, by pieces of wood firmly fixed in the bed of the stream every few yards. These prevent the formation of holes in the bed, and serve for the raft to slide on if it touches the bottom, The first impression of the Indian commissioner when he saw the float, composed of stems from twenty to sixty feet in length tied together with withes at the ends, and lying zigzag in the bed of the mountain stream, up and down which they extended sixteen hundred feet, was that it was simply impossible they ever could be floated down the stream, with all its windings, and over the locks and rocks which occurred pretty frequently. It contained 880 stems, eight or ten of which abreast formed as it were a link in the raft. There were thirty links, not fastened laterally, but only at both ends to the next link. The breadth is greatest at about two-thirds from the prow, which is narrow, and consists of only three stems abreast, with in front of all a piece formed of old wood and raised out of water like the bow of a whale-boat, so as to lead the raft and the largest and heaviest stems placed in the broadest part and towards the stern or hinder part, which does not taper at all. There are two or three breaks, by which the speed is slacked or the raft stopped if needed. When all is ready, the water from above is let loose, and the raft, perhaps not now lying in a foot of water, begins to float a little, but is not let go till two-thirds of the water is passed, as it is a curious fact that when let go, if there is much descent, it travels faster than the water, and has to be stopped to let the water get ahead again. The raft has eight or ten men and boys, one or two of whom stand by the master at the chief break, on which the safty of all depends. When let go it is exceedingly curious to see the forward part dart off at the rate of five miles an hour, and the several links which have been lying zigzag and perhaps high and dry uncoil themselves and follow in its wake till the whole dashes along at great speed and apparently uncontrolled. Accidents are rare, as they are well trained (lads of six or eight can be seen going down in miniature floats); but for one not accustomed to it, it is nearly impossible to stay on the raft at all, as it literally springs out of the water on touching a rock, dashes around a rapid turn, or jumps a weir with a fall of several feet. Forty or fifty miles can be got over in a day if stoppages to let the water ahead are not too frequent or the stream is not swollen by rains.

Remarks on Germany.

The Indian commissioner proceeds to remark on the German history of forestry. Perhaps it will be here admissible that I make one myself. Let me say that, when we consider the immense extent and rapid growth of forests in India, the vast amount in Government hands, and yet find that they are so rapidly deteriorating as to necessitate the despatch of commissioners to Europe to learn the methods of preserving the forest, it is likely that Canada has just as much reason to bestir herself in the matter. Let us notice also, by some of the valuable tables Capt. Walker has furnished, that in Germany & Prussia alone that there are nearly two hundred and fifty millions of acres of forests. We will well have already understood, by the foregoing pages, how different the great mass of these forests, with their great reserves of growing and well cared for trees, planned and prepared for many years, so that the forests can be depended on to give its regular and annual yield of valuable timber in perpetuity, are from our Canadian reserves, which are cut without regard to the future, and are fast disappearing before the combined assault of the settler and the lumberman.

On asking, where are we to look for a model or precedent on which to work, he replies "To Germany, where the management of forests by the State has been carried on for hundreds of years. Not the mere planting of a few hundred acres here, or reserving a few thousand acres there, but a general system of forest management, commencing by a careful survey, stock-taking, definition and commutation of all rights and servitudes, careful experiments in the rate of growth, the best soil for each description of tree; in fact, in every branch of the subject, and resulting in what we find to-day, hundreds of thousands of acres mapped, divided into periods and blocks, and worked to the best advantage both with regard to present and future, and the annual yield of which now, and for many years to come, is known and fixed to within a few hundred cubic feet."

(*Continued on page 252.*)

Market Reports.

MONTREAL.

From Our Own Correspondent.

AUG. 9.—Business has been rather slow since the dato of our last report, but at the same time a fair steady local demand has been experienced as the building trade has been very active. Shipping demand has been rather light. Prices in Ottawa are steady, but it is probable there will be a break before the fall. Cherry lumber has advanced in price here, but a further decline is noted in laths which are in fair supply, We quote yard prices as under :

Pine, 1st quality, ℔ M	$35 00@40 00
P ne, 2nd " ℔ M	22 00@24 00
Pine, shipping culls, ℔ M	14 00@16 00

SHIPPING.

Comparatively little lumber has as yet been shipped to South America, but a good deal is expected to go forward from this till the end of the season. Shipments to Great Britain have been active since the date of our last report. The following clearances have been made at the custom house :—To South America, Bk. Peter Crearer, 540,175 ft ; Bk. Wolfe, 807,545 ft ; Bk. Pistaloqua 518,402 ft ; Bk. Tuba, 741,887 ft ; Bk. Wavalench, 445,510 ft ; Bk. Raino, 431,003 feet. To Hartlepool, Bk. Leffler, 461,475 feet. To Glasgow, SS Concordia, 7162 pcs deals ; SS Cynthia, 5,120 pcs deals ; Ship Ardmore, 3,150 pcs deals ; SS Titania, 7,155 pcs deals ; SS Concordia, 3,307 pcs deals. To Liverpool, SS Lake Huron, 2,410 pcs deals ; SS Nipigon, 4,581 pcs deals ; SS Juliet, 15,466 pcs deals ; SS Oregon, 5,472 pcs deals and 15,671 boards ; SS Texas, 4,647 pcs deals ; SS Toronto, 6,023 pcs deals ; SS Milanese, 10,735 pcs deals and 1,956 boards ; SS Manitoba, 4,917 pcs deals ; SS Mississippi, 7,706 pcs deals ; SS Sarnia, 2,224 pcs deals and 5,845 boards ; SS Lake Champlain, 2,499 pcs deals ; SS Montreal, 6,346 pcs deals and 1,818 boards. To Gloucester, Bk Lorna Doon, 290,812 ft white pine deals and ends. To London, Bk Tevit, 312,675 ft deals ; Bk Murie 248 std deals ; Bk Joy, 11,822 pcs deals ; SS Avlona, 3,038 pcs deals ; SS Erl King, 8,095 pcs deals ; Bk Gulfe, 13,254 pcs deals and 35,077 boards ; SS Carmona, 15,813 pcs deals ; Bk Punjaub, 15,078 pcs deals and 892 ends ; Bk Columbus, 16,757 pcs deals ; SS Viking, 10,847 pcs deals ; SS Barcelona, 8,065 pcs deals ; SS Ocean King, 2,903 pcs deals. To Bristol, SS Dorset, 17,998 pcs deals ; Bk Eyra, 112 stad deals ; SS Somerset, 3,237 pcs deals ; Bk Ceres, 282,947 ft lumber ; Bk Georgetown, 7,335 pcs deals. To Grimsby, Bk Gustaff Adolf, 137 std deals. To Barrows, SS Ross-shire, 38,255 pcs deals 2,077 ends, 13,389 pine boards and 4,386 staves.

CORDWOOD.

Prices are decidedly in holders favor, and for some descriptions we advance prices. There is a scarcity of tamarac which is relatively dearer than other kinds of wood. The demand for wood has been slow, stocks in the city are fair, but on the wharf less than usual at this season of the year, although this is not of so much consequence now as in former years as it is procurable in the winter by the railways. We quote prices on the wharf as under :

Long Maple	$ 7 00
Short "	6 50
Long Birch	7 00
Long Beech	6 00
Short "	5 00
Long Tamarack	6 00

TORONTO.

From Our Own Correspondent.

AUG. 9.—Trade from the retail yards is now much better than when I last wroto you, although not at all pushing, and stocks are quite light in all the yards coming under my notice, and there appears a desire on the part of some dealers to purchase dry lots, more especially strips, both 1 in. and 1¼ in. flooring grade. The demand for XXX shingles continues in excess of the supply and prices remain firm. Dimension lumber in 18x20 ft lengths is still hard to procure. This may in part be ascribed to the large demand for car bottom plank of the lengths above named. Shipments by car load to western points is now almost a thing of the past, consequent on the increased tariff of one cent per hundred weight over the Midland and Grand Trunk railroads, nearly all orders will now find their way by the water route to Sarnia and other points, and receive their distribution from the docks there, by rail to the various places required, and will take less time to reach its destination by this route than that usually occupied by the railroads above named.

Business at the docks begins to wear a better aspect. Members of different lumber firms from the American side have put in their appearance during the past week, and lumber is now on the move, and not before it was needed, as it was quite impossible to pile any more on the docks until some stuff was moved to make room, but I think it is generally conceded by all the wholesale dealers that the outlook is much more hopeful than it was two weeks ago, and my own impression is that the remainder of the season will be a fairly active one. Lath by car lots is somewhat lower, prices ranging from $2.20 to 2.25 per M, for A 1 lath. The demand for good basswood is quite active, purchasers for which can be easily found for an unlimited quantity. Black ash is also in good demand and not much coming forward.

BOSTON.

Cotton, Wool and Iron of August 4th, says : General trade is of very restricted proportions, rather more so than is customary at this mid-season period. Buyers are feeling their way along, and are waiting to see how fall business will develop and turn. In fact there is just about the same spirit of conservatism that is prevailing in almost every class of trade. Prices show very little change to note.

CHICAGO.

The *Northwestern Lumberman* of August 4th says :—The total number of lumber and shingle cargoes arrived at this port for the week ended on Wednesday, was 234, as against 217 the week before. The arrivals in port and the offerings on the market continue to show an excess for the last half of July over a corresponding time last year. The fleet was large from Monday to Wednesday, when there was a considerable thinning out, though on Thursday morning there were a number of cargoes offered, the proportion of shingles being excessive.

The market during the week, probably on account of the numerous offerings, was a little slower than that of the weeks preceding, though prices on good average stock did not suffer by the tardy movement. Trades were made slower than formerly, that was all. The wholesale merchants are now having a quiet trade at the yards, so that they feel no urgency to put in stocks beyond keeping their pilers employed, and they had plenty of time to whittle and "gas" on the market. They have hung off about closing bargains just because they could as well as not, and for the reason that a little delay might make the commission men a little nervous and anxious, and that might probably prompt them to offer slight concessions in price or time of payment.

TYNE.

The *Timber Trades Journal* of July 28, says: The past seven days have brought forward a large number of timber-laden vessels, and as several of them are from Quebec, and also one steamer from Hudikswall with an entire cargo of deals, the total importation will be larger than usual. Large as it has been, it is yet a long way short, by about 12,000 loads of the importation to same date last year. So far the arrivals do not appear to have increased the stock on hand, a large proportion finding its way direct into consumption. The American vessels are now coming forward ; some four or five cargoes have already arrived, and a large fleet is daily expected. An entire steamer cargo from Hudikswall, to order of Messrs. Borries, Craig & Co., has arrived. Though by no means so general here as at some other ports, yet it is evident steamers are being sought after for wood cargoes for the Tyne, and will ere long run off the wood ships ; larger arrangements will, however, have to be made for the reception of wood goods by the dock authorities here before merchants will generally see their way to charter steamers as the usual method.

Trade remains fairly good, and although prices are not higher they are well maintained. Contracting too is going on in a fairly average way ; the prospect of work is on the whole, not discouraging.

LONDON.

The *Timber Trades Journal* of July 28, says : The disposition at present noticeable amongst the trade to secure what is offering, if it can be got at a price, cannot be taken otherwise than as a favorable symptom of the market. There are plenty of buyers if the quotations are low enough ; and it is rather regretful that so great a reduction was originally made on the commoner qualities of Swedish redwood, as that was accepted by the trade as indicative of a downward tendency, and has resulted in bringing down the prices of the scarcer and better-classed goods. This, we think, even with a somewhat sluggish sale, might have been partially avoided, or at any rate confined within more reasonable bounds.

We are glad to see the dock deliveries are keeping up, and though still behind last year, the difference is only slight. Including the overside deliveries, we consider the consumption is quite as active this year as it has been for many seasons.

CARDIFF.

The *Timber Trades Journal* of July 28, says : This last week has been a very dull one in the timber trade. Two vessels have arrived from Canada and one from the Baltic with deals, and another from the Baltic with sleepers. One steamer has also come forward with a cargo for three different receivers. This method of doing business is being very carefully watched to see how it works. The trade for the Midlands is very quiet ; only small lots have been sent off, and fresh orders are difficult to obtain. There have been some small purchases from the Baltic, but we can hear of nothing being done from Canada, although importers are open to buy at low prices. Props and mining timber are coming in sparingly ; still prices have not so far materially altered.

GLASGOW.

The *Timber Trades Journal* of July 28, says: The first public sale since the "fair holidays" was held here on the 25th of July. The attendance was pretty good, and transactions were to a fair extent, though of the goods catalogued a considerable proportion was withdrawn. The catalogue consisted largely of spruce deals, of which there is a comparatively heavy stock in this market at present. For spruce of 2nd quality average fair prices are obtainable, as will have been observed. A great part, however, of the stock now in yard is of inferior quality, and brings low prices.

GOOD LUMBER AT A PREMIUM.

IT was appareut to any one who carefully looked over the field last winter and spring that a decline in lumber was inevitable. This paper has been censured in some directions because it forecast the condition, but it did so after the

most thorough conviction that its utterances were those of true prophecy. It needs no argument now to prove that it was correct. It saw the decline so clearly that it felt willing to risk its reputation in asserting what the outcome would be. There is one feature of the lumber business, however, that deserves special consideration. The upper grades, particularly in Michigan and the east, have not sympathized with the lower enes, and the only reason is that good lumber, in proportion to the cut, is not so plentiful as it used to be. Logs from certain streams, which years ago produced twenty-five per cent, uppers, will now hardly produce five. There has been a steady deterioration, In many instances now it is the trees that have been left that are cut. The result is that while there is plenty of lumber, too much in fact, the finer grades are wanting. The same is true in walnut. So much poor stuff has been rushed on the markets that it has been impossible to sell it at anything like former prices, but good walnut has been in demand at good figures. Lumber dealers may as well make up their minds, first as last, that really good lumber, in either soft or hardwood, will be comparatively scarce, and the only conclusion that can be reached is that it will be held at a premium.—*Northwestern Lumberman.*

TREES, LOGS AND LUMBER.

A representative of the New York *Evening Post* furnishes his paper the following graphic description of his view of the Saginaw river.

For 16 miles down to Bay City, near Lake Huron, the stream flows between wooden strands. The eye stretches itself in vain to see beyond the lumber horizon that stretches east and west. The yellow waters, perhaps 200 feet wide, pass first betwecn continuous booms, each enclosing its army of giant logs. These hooms reach far above Saginaw, and if we include the tributaries of the river and count both sides, make up a line of posts seventy-five miles long. Next to the logs and on the bank proper rise, most impressive of all, the tracts of sawn lumber. Pile on pile they rise on either side for sixteen miles up and down the stream, covering acre after acre, until the wooden monotony becomes thinner, only to rise again to more imposing height and width around a new cluster of mills. These mills, often of grand proportions, spring from their lumber heaps as a giant of fairy story looms amid the disintegrated bones of his victims. Their tall chimneys belch black smoke, the rattling saws cut the air with their distant rasp, and the sense of industrial activeness is filled out by the hives of workmen swarming over the lumber hills and loading them, by slow but steady toil, into barges whose hulls rival the capacity of a Cunarder.

RAFTS ARRIVED.

The *Chronicle* gives the following list of rafts, etc., arrived at Quebec:

Aug. 2.—Sundry lots, staves, New London cove.

R. Campbell & Son, white pine, &c., Cap Rouge.

E. L. Kelsey, staves, Dobell's (Sillery).

E. L. Kelsey, staves, Bowen s (Sillery).

A. G. Fraser, white pine, &c,, St. Lawrence Docks.

D. D. Calvin & Co., oak, &c., sundry coves.

Smith & McDougall, white pine, &c., Union cove.

J. R. Booth (2), white pine, &c., Cap Rouge.

J. R. Booth (2), white pine, &c., St. Lawrence Docks.

Barrett & Mackay, white pine, &c., Cap Rouge.

Wm. McKay, white pine, &c., Hadlow cove.

B. Caldwell, white and red pine, &c., St. Lawrence Docks.

Barrett & Mackay, white and red pine, &c., Cap Rouge.

ON THE STILL HUNT,

Chippewa Falls, Wis., July 30.—Some of our lumbermen who thought they were going to "catch on" to a big thing up in Duluth and St. Cloud districts, have returned to the Falls. They found that a few others in the country knew there was some pine in Minnesota, as well as themselves, and also that big things were not very plenty or very cheap. Some of them report that there are at least 2,000 men hunting over pine lands in Minnesota the present summer, and mention one Michigan firm that has 40 crews at work estimating and hunting up pine. I have met one man who has been up in the Duluth country for two months, he says that while there is some good pine on pre-emption land, on the whole the most of the government land of any value for lumbering is already picked up. This gentleman spoke of a suit going on in regard to improvements on the St. Louis, which had the effect of keeping down the price of logs for this year. I see by the *Lumberman* that the suit was decided in favor of the boom company, so that now the prices of logs will scarcely go up this season.—*Northwestern Lumberman.*

The *Timber Trades Journal* says:—The alarming destruction of American forests is the subject of an article that will appear in the August number of *Forestry*, from the pen of Mr. William Little, of Montreal, an authority who has made the subject of American forestry a life study. Mr. Little states that at the present reckless and wanton rate of cutting the United States will be entirely denuded of its merchantable yellow (American white) pine in seven years.

A Foul Murder.

A telegram frnm Guyshoro, N. S., states that a deaf, dumb, and blind coloured girl, named Ada Byard, about twenty years of age, living with her father about a mile outside of Guysboro town, has come to her death under circumstances which leave the impression that she was fouly murdered. It appears on Saturday the girl's father went to town, leaving his wife, who is stepmother of the diseased, with the latter and some younger members of the family. On his return home in the evening he found his wife had also gone to town. The girl Ada was in the house, suffering from terrible wounds, apparently inflicted with an axe, which resulted in her death the following day. The evidence adduced at the coroner's inquest was that a little girl, five years of age, locked herself in the house withdeceased and committed thedeed by striking her with an axe, but the npinion prevails that the child is not the guilty person.

Pirates Unearthed.

An extraordinary number of vessels have been wrecked in the Straits of Kertch, Black sea, the past few years, and in cansequence of many suspicious circumstances, such as the wreck of vessels in calm weather and the fact that some pilots grew rapidly rich, an investigation was made by the English insurance companies, who had paid indemnities amounting to many million roubles. It was learned that a pilot named Francisco was head of a band of English, Italian, Greek and Russian pirates, who made a living by disasters on the coast. They were in collusion with the pilots and charged huge sums for assisting vessels pilots suffered to go ashore. In less than two years fifty stranded vessels had resource to the assistance of the pirate salvors. It is said some Government officials are compromised.

Cows in the Pasture.

Murphy heard cows in his orchard the other night, and slipping out the back way appeared suddenly near the front steps, and yelled:—"He-ah Tige! He-ah Tige! He-ah!" Just then a figure rushed past, cleared two fences and vanished in the gloom. "Take 'im! take 'im!" screamed the old man, but his daughter Miranda, who had unaccountably appeared on the scene, secured the dog by the collar and refused to let go. "What ye doin'?" yelled the old man; "don't ye know them cows has been in here three or four times?" "Oh, pa!" was the answer, "but this was only a calf." The old man was pacified, but Adolphus, who was standing out in the road awaiting developments, wasn't, and Miranda will never understand the coldness that has sprung up between them.

Firemen's Demonstration.

St. Catharines, Aug. 9.—The first day's programme of the Firemen's demonstration was carried out here to-day with great *eclat*. All the hotels, and in fact every place where accommodation can be had, are crowded, all the available cots and shakedowns are being utilized, and your correspondent is congratulating himself on having secured quarters at the Welland house. About fifteen hundred firemen from different parts of the province and New York State and about ten thousand visitors are here to-night, besides large numbers from the surrounding country, who have returned home for the night, but who will return to the city in the morning. The procession was a large and magnificent one. It took two hours to pass a given point.

Remarkable Case of Resuscitation.

Paisley, Aug. 9.—This morning while several children were playing near a cistern, one, a two and a half years old son of John Stark, fell in, and before he was taken out some fifteen minutes had elapsed. His mother, who was sick at the time, became nearly frantic over the affair. Several neighborly women pulled the body, which was quite black, out. They rubbed him well for ten minutes and wrapped him in warm blankets, when signs of life began to appear and vomiting was commenced, and when the doctor appeared he showed more symptoms of recovery. He is now weak, but will likely recover.

Canadian Victory.

In a race on Tuesday for the "Fisher" cups at Chicago, the Atalanta, a yacht built at Belleville, and sailed by Canadians, defeated her opponent, the Cora, by 8 m. 45 sec. The *Mail's* correspondent says:—"No sooner had the judges handed in their report than their services were enlisted for a third match to be sailed on Saturday next. So determined are the amateur seamen here that the "Fisher" cups shall not go to Toronto that you must not be surprised if you should hear, on the Atalanta's winning it again (as is generally expected), that she has been bought by Chicago yachtmen."

BOOK-BINDING.

Our facilities for BOOK-BINDING enables us to execute every description of work as well as it can be done in the cities, and at current CITY PRICES.

Blank Books and Account Books of any size Ruled to any pattern desired, and bound in the most appropriate and durable manner.

Books taken out in parts, Bibles, Works of Art, Illustrated Works, Music Books, Magazines, Perodicals and Newspapers bound in any style desired.

Old Books, Albums, &c. Repaired and Rebound.

Maps, Pictures, &c. Mounted and Varnished.

Names Lettered in Gold Leaf on Presentation Books, Bibles, Purses, &c.

BAXTER'S MANDRAKE BITTERS

THE ONLY VEGETABLE CURE FOR DYSPEPSIA,

Loss of Appetite, Indigestion, Sour Stomach, Habitual Costiveness, Sick Headache and Biliousness.

Price, 25. per bottle. Sold by all Druggists.

"The great difference," says the commissioner, "in climate and local conditions between India and Germany would, doubtless, necessitate important modifications, but I can see no reason why the broad principles of organization and forest management should not be applied with success to our Indian forests, that is, gradually feeling our way as regards the best mode for the forest, and the wishes and interests of the people and the State."

I would here remark that this is still more applicable to Canada, as our climate presents no difference of moment.

"I do not think," he continues, "that we have much to learn from the Germans with regard to the planting and rearing of young trees; but it is with regard to the best method of managing groups or plantations that I consider we may, with advantage, take a leaf out of their book. For instance, I would certainly introduce, in an experimental manner, and on a very small scale, their system of rotation, clearing, and of periods, and endeavor to bring forward a second crop before the first is off the ground, encourage the growth of the better descriptions, and keep down the least valuable, so as gradually to arrive at groups of trees of the same age, description, and class, and eventually at blocks worked in rotation, and containing always a sufficient stock of crop coming on to meet the requirements of future years. To arrive at all this the most careful observations and experiments will have to be made as to the rate of growth and yield per acre of each description of forest, the conditions under which trees grow best and form the most timber, some requiring close and some open planting, some nurses and some not; some, like the oak, requiring a great deal of light, while some, like the beech, do best for many years in the shade. All these points, and many more, demand attention, and till they are settled we shall be merely groping in the dark. In fact, I think it may be taken for granted that all we will do in the way of forestry in the Madras Presidency, during the present century at least, will, after all, be but experimentalizing, which fact, however, need in no way delay the demarkation, survey, and settlement of the forests,"

It may be said here that, if it be necessary to commence at once, in India, it is probably more necessary in Canada, where the process of growth is so much less rapid.

Concerning the capabilities of German foresters, the Captain says:—"An over-forester, and even many of the foresters and overseers, can tell the name, local and botanical, of any tree, shrub and plant, classify it, and state its uses; name and classify every beetle and insect in the forest, and know whether they are harmless or destructive to trees, in what shape they do damage, and what are the best known preventive measures; inform you of the nature of the soil, and to what period the formation belongs; what trees will grow best, and why. All this is known thoroughly, theoretically and practically.

"Then as to the district, the exact yield, rate of growth, and annual increase in value of each block is thoroughly known and can be put down in figures at each moment by the over-forester, who can tell at the commencement of each year how much timber he is going to cut and sell, and from what parts of the forest it is to come, how many acres have to be partially cleared for natural reproduction, how many to be planted, sown, thinned or planted up. The mere details of all this are left, as a rule, entirely to the subordinates, who thoroughly understand them.

"The forest-masters in charge of divisions possess not only the theoretical and scientific knowledge acquired in the forest academy, and the practical experience gained while they were over-foresters in charge of a district, but the more extended knowledge and wider views from their larger field for observation and comparison of causes and results. They are then qualified to decide most points, revise working plans, and supervise operations generally, whilst settling complaints and complications in connection with the forest administrations, advising the local head of the department, and compiling valuable reports and statistical information,"

(To be Continued.)

EXPLORING NEWFOUNDLAND.

Mr. Hall, one of the largest lumber manufacturers in the world, and one of Canada's leading merchants, arrived here, says the St. John, Newfoundland, *Mercury*, on Thursday by the steamship Polino. He brought a party of explorers with him, who departed in the Polino for the purpose of being landed in the bay of Islands, where, should the explorers' reports prove favorable, he proposes to establish a large lumbering manufacturing business. The initiation of the scheme also depends upon the terms upon which the Government will be able to make grants of land; and it is to be hoped that nothing will be left undone to assist in the establishment of an interprise so well calculated to develop a portion of this country. Mr. Hall has also an idea of exploring the Exploits river. He has been looking at our dry-dock, and says that in all his vast experience he has never seen finer timber used in such work—an opinion of great value because of his knowledge of the subect.

Maple Last Blocks.

The Bangor, Me., *Mining and Industrial Journal* has the following: Last blocks are an important article of manufacture in the towns of eastern and northern Maine. Blanchard, Lagrange, Alton and Katahdin Iron Works, will each ship about 25 carloads this season over the Bangor & Piscataquis railroad. Large numbers are also cut on the line of the Eastern & North American division of the Maine Central, and also in the towns to the eastward of Bangor. The blocks are cut from rock maple, and the work of getting them out gives quite remunerative employment to the farmers and their sons during the long winter months. A million and a half of these blocks, valued at about $36,000, were shipped from Bangor last year, principally to Western Maine, New Hampshire and Massachusetts shoe towns. This, however, by no means includes all the last block business of this section, as large quantities are shipped each season by way of Calais.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. It cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle,

Convincing Proof.

Having suffered from rheumatism for a long time I was induced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to buisness, thanks to your wonderful medicine.

I am yours truly,
W. H. Dickison,
218 St. Constant St., Montreal.

To Henry, Johnsons & Lord, Montreal.

Arnica and Oil Liniment is sold by all Druggists.

A Cure for Cholera Morbus.—A positive cure for this dangerous complaint, and for all acute or chronic forms of Bowel Complaint incident to Summer and Fall, is found in Dr. Fowler's Extract of Wild Strawberry; to he procured from any druggist.

"When all other remedies fail," for Bowel Complaint, Colic, Cramps, Dysentery, etc., "then Dr. Fowler's Extract of Wild Strawberry comes to the rescue." Thus writes W. H. Crooker, druggist, Waterdown, and adds that "its sales are large and increasing."

It is now in season to warn our readers against the sudden attacks of Cholera, Cramp Colic, and the various Bowel Complaints incident to the season of ripe fruit, vegetables, etc. Dr. Fowler's Extract of Wild Strawberry is the grand specific for those troubles.

A Valuable Discovery.—One of the most valuable discoveries in the medical science, for the benefit of mankind, was made when Burdock Blood Bitters were invented. This medicine positively cures all diseases of the Liver, Kidneys, Stomach, Skin and Blood. 25,000 bottles have been sold during the last three months.

86 and 88 Market Street, Chicago, Ill.

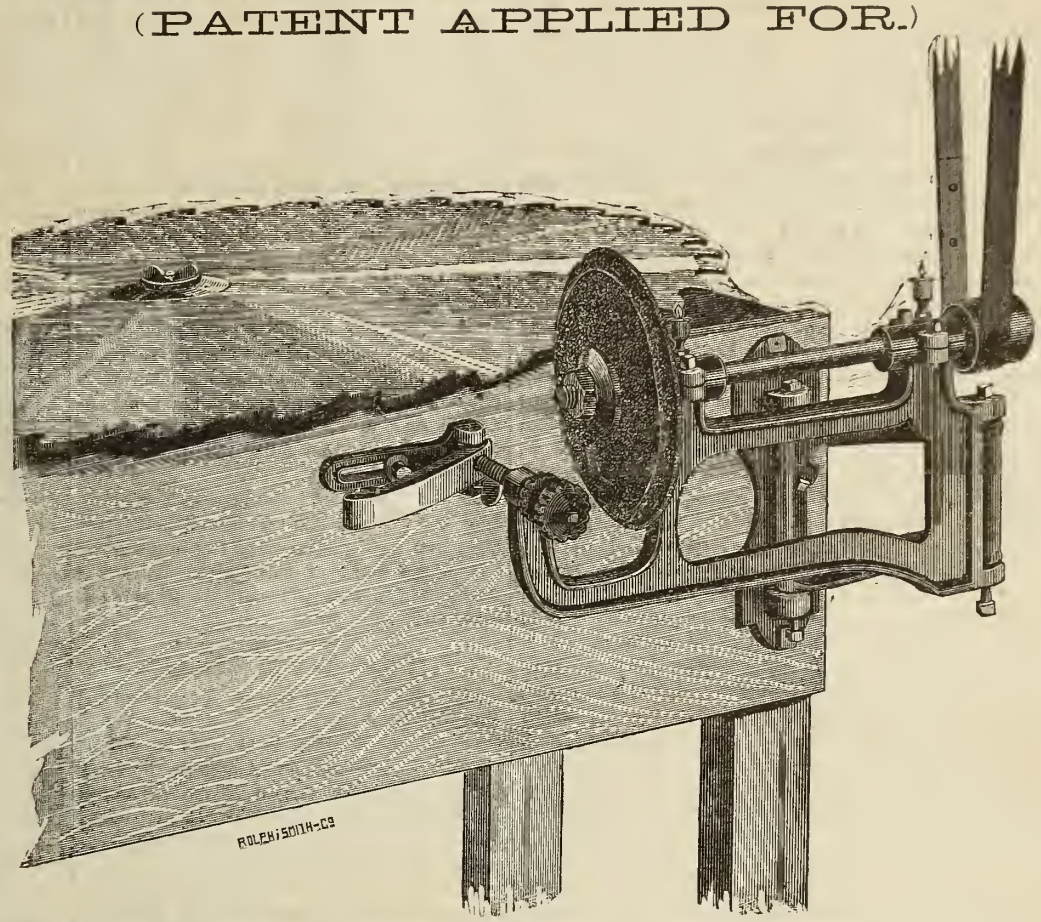
ROGERS' SAW GUMMER

(PATENT APPLIED FOR.)

No Heating!

Quick!

Simple!



Exact Work!

Cheap!

Complete!

POSITIVE STOPS! ADJUSTABLE GUIDE! Every Tooth made exactly alike!

JUST WHAT IS WANTED in every Saw-mill in Canada!

A REVOLUTION IN GUMMING SAWS WILL BE EFFECTED WHEREVER

ROGERS' SAW GUMMER

Is Introduced to replace Burr Gummers, or Grindstones, or where Emery Wheels have been run in the usual way. Every Machine Guaranteed to work as represented or No Sale. *It works EASILY; is so SIMPLE and COMPLETE that Sawyers can keep their Saws CONSTANTLY in FIRST-CLASS ORDER and thus LARGELY INCREASE the DAILY OUT-PUT.*

Price Complete, with Countershaft - - $40.00.

HART EMERY WHEEL COMPANY, Limited

HAMILTON, CANADA.

☞ Manufacturers of **HART'S PATENT EMERY** and **CORUNDUM WHEELS.**

BLYTHE MILLS.

Instead of grumbling about the price of wheat being always too high, and milling heing a ruined business, Mr. George Hilliard, M. P., set himself to work to find out how it was that he could not buy and grind wbeat and make something out of the operation, as well as some others were evidently doing, inasmuch as no man can or will long continue at a business in which the balance is always on the wrong side.

The investigations thus hrought about were not long in convincing Mr. Hilliard that the old system of grinding could not compete with the new roller process, which has recently heen introduced into Canada, either in the quantity or quality of flour producable from a bushel of wheat. He accordingly determined to have his mill refitted with the latest and most improved machinery for making flour hy the roller or gradual reduction process, and to this end entered into a contract with the Consolidated Purifier Company, of Toronto, who have secured control of all the most recent improvements in the flour line, for the refitting of his mill, and this contract has just been completed, and the new system put into operation hy that company.

As a result of this change three of the four run of stones recently contained in the Blythe mill (the fourth being retained for chopping purposes only) have been discarded, and in their stead there has been introduced six sets of brakes, three purifiers, a bran roll, and a germ roll, which gives a capacity of one hundred barrels per twenty-four hours. As most of our readers, no douht, are aware the great difference which exists hetween the old and new processes is that while hy the former the grinding is all done at one, or at most at two operations, by the latter it is accomplished only after from four to five separate grindings. While any attempt at a detailed description of all the operations involved and machinery required in this process, from the time the wheat leaves the bin until it is ready for market, would be tedious to the general reader, yet we think a brief description of how the best, or patent flour is ohtained will at once be interesting and give the ordinary reader some idea of the new process. The wheat, after being cleaned as formerly, is passed through three successive brakes, or sets of chilled iron rollers, each crushing the grain finer than its predecessor. As the orushed grain or meal leaves each of these brakes it passes over perforated zinc which allows all that has heen reduced to a certain stage of fineness to pass through and be conveyed to a real covered with fine bolting cloth. In this way there is gradually separated from the whole product of the wheat the best part of it, with the least possible quantity of bran, before it enters the real we have just mentioned, and in passing through which there is separated that portion which has been over-ground or killed. From this real the meal is passed through a purifier, from whence it passes through a brake with stone rollers and in which it receives its final grinding, and passes to the bolts, where it is bolted as in the old process, and the "Patent" flour is ready for the market. From this hrief statement of the *modus operandi* any one in any measure familiar with flouring operations will at once see that the patent article can hardly fail to he the very hest that the wheat can produce, owing to the system of "creaming" which has been adopted in its production. But were we to stop here many might be disposed to think that the improved quality had been obtained at a too great sacrifice of quantity. In this, however, they would be mistaken. Of course the bran, or rather meal, which has not fallen through the perforated zinc over which it has passed after leaving the first three brakes still contains a good deal of flour. This, however, is conveyed from the last brake to the "hran roll," which separates the pure hran (and those who huy it for feed will think it pure enough) from the rest which is then passed through a purifier, and a stone roller brake, thon through a set of holts which extract therefrom a second quality of flour, while that which still remains has the same process of purifying, grinding and holting again repeated to extract from it a third quality of flour. And when all this has been judiciously done it is needless to say that the "remainder" does not contain much which, by itself, will make four footed animals grow fat.

Besides the improvements directly required in connection with the manifacture of patent flour Mr. Hilliard has introduced two new packers which are easily adjusted to the packing of anything from a barrel down to a twenty-five pound paper sack.

As the more wheat ground at home the better for all of us, we trust Mr. Hilliard will not only have no reason to ever regret the large outlay which these improvements have necessarily involved, but that they will prove as profitable to himself as their success will nndouhtedly prove heneficial to farmers marketing their wheat in Peterhorough.—*Peterborough Review.*

THE MIDLAND R. R. WORKSHOPS.

From an article in the Port Hope *Guide* in reference to the Midland Workshops, we take some particulars. In the machine shops great alterations and additions have taken place. The moving of the Belleville and Lindsay shops to this place has also been accomplished, and though the appearance previously indicated that there was hut little room for much more machinery, under the new arrangements there is ample room for all that has reached here from the two shops, and apparently room for more yet. In place of lathes, planers, drills, &c., heing scattered about, they are now classified and placed in rotation according to size, quality and kind, therehy not only heing more easily reached, hut are so situated as to the very best advantage meet the demands of work. The shop has also been divided into departments, every one having a duty to perform; each of these having a leading man, and to him on the dissection of an engine is sent the work to be repaired to he done hy his men. To illustrate:—When an engine comes into the repair shop the stripping gang immediately commences its duties. After uncoupling the engine, taking out wheels, &c., &c., the different parts are cleaned. They are then distributed to the respective departments where the requisite amount of repairs are made, which on completion, the pieces are returned to the erecting shops where fitters again take hold of it, and reerect the engine. As a consequence of the hringing of the shops mentioned to Port Hope, there are now employed in the machine shops more men than heretofore. While the interests of the Company have heen effectually looked after, the comfort and health of the employees has not been forgotten, and additional windows, a new floor, and a good drainage are things of recent date. The ventilation has also heen made much better by the removal of the cumbrous partition which formerly existed. Its removal has increased the room likewise.

The blacksmith shop presents a much more cleanly appearance from a new coat of whitewash and a general renovation. The number of hands here are about the same as when Mr. Patterson came.

Business is again lively in the carpenter shop. The twelve flat cars, the order for which was countermanded some time ago, has been again given; in fact some of them are completed and others are approaching completion. Fifteen to twenty hands are now employed here.

The round house is a bee-hive of industry, as the employees are required on an engine coming in to thoroughly wipe it, take out the fires, and wash them out once a week. Twenty-five engines now come in and out for use on the Midland division alone. Each engine receives a fresh supply of coal and water before coming into the round house, and is at once ready to be "fired up" when required for a new journey.

Mr. Patterson has made another revolution in the system of government, time-keeping, &c., and while the plan is very simple, it is one whereby the most complete accuracy can be ohtained.

As we were coming away, an engine, the repairs on which had just been finished, was leaving the shop on her trial trip. As to the engines sent to Montreal, the repairs required were of such a nature as to demand larger machinery than is here to economically perform the work.

Mr. J. Storer, of Uxhridge, we understand, is to succeed Mr. Patterson as general foreman in the Midland shops, and as the last named gentlman leaves for Montreal on Satnrday, no douht the new officer will arrive by that date,

TAMARAC AND JUNIPER.

The *Northwestern Lumberman* says:—The terms tamarack, hackmatack and juniper appear to be more or less confounded, being regarded by some persons as identical. Juniper differs considerably from tamarac, but the hotanical classification groups tamarac, hackmatack, American larch and black larch under the head of *Larix Americana.* Juniper is of different classification, and manifestly of different character. *Juniperus Californica* is called a small shruh, or tree, sometimes 20 to 30 feet in height. A sub species (*Utahensis*) growing in central Nevada, and south to southern Utah is only 10 to 20 feet in height and up to two feet in diameter, frequenting elevations from 5,000 to 8,000 feet. Another species grows to a large size in Oregon, and is smaller in California, or often reduced to shrub. A suh-species growing in western Texas forms forests, and is an important timber tree, though not as large or so easily worked as the *Juniperus Virginiana*, or red cedar of the plains of eastern Texas. Tamarac, instead of habiting plains and eminences, is common to low, swampy ground, and moist uplands. As is well known, it has a commercial valuc principally for ship's knees, posts, ties, etc., while juniper has little commercial value except for fuel. In Labrador and Newfoundland the tamarac is a tree from 80 to 100 feet high, and from two to three feet in diameter, hut in the limits of the United States it is smaller and less valuable, and always grows in cold, damp swamps.

FORESTRY CONGRESS.

The following letter appears in the Montreal *Herald*:

POINTE PLATON, P. Q., July 30, 1883.

MY DEAR SIR,—The American Forestry Congress meets at St. Paul, Minnesota, on the 8th August. A number of Canadian gentlemen, from every part of the Dominion, are members of that Association.

All those among us who take an interest in forestry have felt grateful to the American Forestry Congress for having chosen Montreal as their place of meeting last summer, and the results of that meeting have been most encouraging, both in awakening puhlic interest and in stimulating private enterprise.

We, Canadians, owe it to our American friends to return their courteous visit; and we owe it our own country to join heartily in their efforts for the preservation and renovation of the forests of this continent in which we are so deeply interested. I know that some of our Provincial Governments intend to be represented at the Congress and hope the Dominion Government will not be behind them, there is so much work for the forester on our western prairies, which are now hare of timber. It has been established heyoud a doubt that timber can he successfully grown there, and we shall see on our way to St. Paul what has already been done under similar circumstances hy railway and private enterprise in the creation of new forests.

May I hope that you will exert your powerful influence in order to encourage a good attendance of Canadian members to the Cougress, and that the other leading organs of public opinion in the Dominion will join you iu that useful work.

All the American railways have been most liberal in affording travelling facilities to the members of the Congress on their way to St. Paul and back, and I feel confident that the Grand Trunk and Canadian Pacific railways will be equally liberal.

Believe me,
Yours truly,
H. G. JOLY.

Vice-Pres. American Forestry Cougress.

New Patent Wood Pavement.

Mr. Edward Hughes, of Liverpool, England, has patented a method of laying wood pavement on concrete, the chief feature of which is that a rebate is cut in the bottom edges of each block, so that when they are placed side by side the two rebates form a single dovetail Th dovetail thus formed becomes entirely filled with the material in which the hlocks are laid, forming with the bedding material one compact hard mass, from which it is impossible for any block to loosen itself. It is claimed that by this method the joints may be made perfectly close, there being no necessity for any grouting. —*Timber Trades Journal.*

Do not attempt to remain over night without a bottle of Dr. Fowler's Extract of Wild Strawherry near at hand. This is the season for Bowel Complaints, Colic, Cholera Morbus, etc., and the remedy above named is the nnfailing specific.

THERE is no excnse for snffering from Headache, Constipation and all the wearying train of symptoms of a disordered liver, when Burdock Blood Bitters is an unfailing remedy, and only costs One Dollar a bottle. Why snffer on without a trial? 25,000 bottles sold during the last three months, with almost universal satisfaction.

Health is Wealth.

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, a guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain, resulting in Insanity and leading to misery decay and death, Premature Old Age, and Spermatorrhœa, caused hy over-exertion of the brain, self-abuses or over-indulgence. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by use for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by ORMOND & WALSH, sole authorized Agents for Peterborough, Ont. JOHN C. WEST & CO., Sole Prorpietors, Toronto

FOR THE

Canada Lumberman

FOR THE FOLLOWING REASONS:

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☛TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw mill men and lumber and timber dealers of the Dominion.

AMERICAN WOODENWARE IN NEW ZEALAND.

REPORT BY U. S. CONSUL GRIFFIN, OF AUCKLAND.

Nearly all the woodenware imported into New Zealand is of American manufacture, and it is gratifying to me to be able to state that about three-fourths of it is brought here direct.

The value of the imports of woodenware into the colony of New Zealand for the year 1881 was $45.075 against $25.045 for the year 1880, an increase of $30,030. This of course, is exclusive of certain articles of ironmongery combined with wood, doors, window-sash, and all kinds of office and household furniture, such as chairs, writing desks, tables, &c. If the latter articles were included in the imports the amount would be increased to about $620,000. The woodware trade proper embraces such articles as tubs, pails, buckets, washboards, oars, axe handles, brush and broom handles, shoe-pegs, wooden screws, clothes-pins, rolling pins, butter churns, cheese molds, step ladders, bread boards, trays, platters, mallets, croquet and lawn tennis sets, chessmen, checkers, checker-boards, shafts, oak rings, felloes, poles, shade and blind rollers, &c. It is now very generally admitted by dealers and importers that, with few exceptions, all these articles can be manufactured much cheaper in the United States than anywhere else. The choicest wood for such purposes can be obtained in America at very low prices, and there is no other country in the world that has so many ingenious machines for the manufacture of all kinds of woodenware. There are several firms in the United States that have extended their trade here with very little effort.

All the adjustable wooden shades used in Auckland are of American manufacture. Hartshorn's patent shade roller has been introduced in every city and town in the colony.

GERMAN AND ENGLISH WOODENWARE.

The small fracture of woodenware imported from England and Germany into New Zealand consists of bread platters, butter prints, egg cups, forks, spoons, wooden faucets, knife cleaners (cylindrical and board), cricket and lawn tennis bats, ninepins, chessmen, checkers, checker-boards, pepper grinders, &c. Of the articles named above the chessmen, checkers, and boards come from Germany, the rest are of English manufacture. The chief characteristic of English and German woodenware is that they indicate a maximum of labour with a minimum of material, which, of course, is just the reverse of those made in the United States.

PRICES OF WOODENWARE.

The cost of freight, customs duties, and other charges make the price of woodenware here much higher than in the United States. The duty, however, on woodenware, is only 15 per cent ad valorem, and some articles, such as brush, woodware, buggy shafts, bent wheel rims, carriage shafts, spokes, felloes and naves, saddle trees, butter churns, axles, axle arms and boxes, ship's blocks, &c., are admitted free. There is no demand here for wooden buckets; galvanized iron ones are used instead.

NEW ZEALAND WOODWARE.

New Zealand has developed the largest timber industry in the southern hemisphere. The immense forests of kauri, kahikatea, puiri, and rimu, in the Province of Auckland, are fully appreciated by her enterprising inhabitants. The annual output of sawn timber in this province alone is about 70,000,000 feet in addition to 2,000,000,000 feet of planed timber, 6,500 doors, and about $75,000 worth of other products. Of the different kinds of timber for manufacturing purposes, the kauri pine is the most valuable. The kauri forests of the province of Auckland, cover over 200.000 acres, exclusive of the land still in the possession of the Maoris or natives. The kauri tree, as I have mentioned in former reports, is not found outside of the province of Auckland.

The are 43 saw mills in the province of Auckland, and about 250 in the colony. The valuo of the lands and buildings in connection with these mills and factories is set down in the last government returns at $1,885, 420. Over 8,000 persons are employed in connection with the timber industry of the colony.

The kauri pine, of which the chief products are made, is more apt to shrink than the pine imported from America. The factories excel in the manufacture of doors, window sash, and various kinds of household furniture, but make only limited quantities and to special order what is known to the trade as woodenware. Their articles of coopery are worthy of praise, especially their butter kegs, which are made of kauri, totara, and pariri (the last is known as New Zealand oak). Amongst the native woods suitable for the manufacture of woodenware may be mentioned tawa (Larus tawa,) used like ash, taraire (Lauras taraire,) white birch, rewarewa, honeysuckle (Kingthtia excelsa). These goods are used in considerable quantities for axe-handles and small cabinet work. Agricultural implements and oars are sometimes made of mangiai, but these articles are not as good as those imported from America. Mapau is another excellent New Zealand wood; it is very tough, and is occasionally used in the manufacture of carpenters' tools.

The great disadvantage the wood manufacturers experience in New Zealand is the high price of labor, and the duties charged on American pine and other timbers.

AMERICAN WOODWORKING MACHINERY.

American woodwooking machinery is employed to a greater or less extent in all the principal timber and wooden factories in New Zealand. The Auckland timber company uses by far the largest number of American machines in the colony. It would require a good size volume to enumerate all the various kinds of American machinery used in these establishments.—*Lumberman's Gazette.*

ANCIENT PLEA FOR THE FORESTS.

The *Lumberman's Gazette* of Aug. 8, says:—In the sixteenth century we find a note warning against the evil consequences likely to follow the wasteful destruction of the forests "An Historical Description of the Island of Britain, by Mr. Hamsen," given in Hollinshed's Chronicles—of which a reprint appeared in 1807. In a curious chapter on Woods and Marshes, the author complains of the rapid decrease of the forests, and adds:

"Howheit thus much I dare affirme, that if woods go so fast to decaie in the next hundred yeere of grace, as they haue doone and are like to doo in this, * * * it is to be feared that the ennie bote, broome, turfe gall, heath, firze,, brakes, whinnes, ling, dies, hassacks, flags straw, sedge, reed, rush and also seacole will be good merchandise euen in the citie London, whereunto some of them euen now haue gotten readie passage, and vp their innes in the greatest merchants' parlours. * * * I would wish that I might liue no longer than to see foure things in this land reformed, that is: Tho want of disipline in the church; the couctous dealings of some of our merchants in the preferment of the commodities of other countries, and hindrance of owne; the holding of fairs and markets vpon the sundaie to be obolished and referred to the wednesdaies; and that euery man in whatsoeuer part of the champaine soile enioieth fortie acres of land, and vpwards, after that rate either by free deed, copie held or fee farme, might plaut one acre of wood, or sowe the same in oke mast, hasell, heech, and sufficient prouision be made that it may be cherished and kept. But I feare me that I should liue too long, and so long, that I should either be wearie of the world, or the world of me.

Again, in the time of Charles II., the improtance of conserving and replenishing the woodlands in the forests, as a means of saving timber for the navy, was perceived, and were adopted accordingly. And in 1664 was published the first edition of Evelyn's Silva, a work which contributed much to the extension of arboriculture in England.

Hitherto it was chiefly the demand for wood for naval purposes which excited the anxiety of statesmen; but several authors in the 16th century expressed fear of serious evils following the wasteful destruction of woods for domestic fuel, and meanwhile there was gradually manifesting itself a new source of danger. In the forest of Dean and elsewhere, mines of iron ore were being exploited with more and more energy. For the smelting of the ore fuel was at hand, and trees were recklessly felled for the work. Coal had been found, but coal fires were not found propriate to the purpose, and the consequent destruction of the woods threatened to bring the country into a condition not unlike what is now the case in many districts of the Ural mountains in Russia—what were richly wooded lands being devasted.—[Brown's "*Forest of England.*"

ENGLISH LUMBERMEN IN FLORIDA.

The new company just promoted, says the London Timber Trades Journal, under the title of the "East Florida Land and Produce company (limited)," to acquire land in that profitable region of the great American continent, in their prospectus dwell on the large resources of timber. The property they are about to acquire contains yellow pine, cypress, orange, and other valuable wood being distributed over its surface. The swamps so intimately connected with Florida are stated to be absent from this property, which lies in the northern part of the state, the swamps being in the southern portion. The cypress is said to be very valuable for railway timber, sleepers, ties, &c., and the so-called yellow (pitch) pine, from the nature of the soil, presents a fine color. That the resources of the southern timber lands are comparatively in their infancy we have plenty of evidence of, and a contemporary, writing about Texas, says; "The timber lands of Northern Texas will be, in the course of a few years, the most valuable of any lands in the state. Lumber can be bought, delivered at our doors for $1.50 per 100 feet, while in the western counties the same will bring from $4 to $6. Thus far little timber has been culled beside the pine and walnut, while the thousand of acres of white oak ash, hickory, bois d'arc, sweet gum, etc., remain in their virginity, not a stump showing that the destroying hand of man has ever been lifted aganst them. As the state develops it is believed that these forests will necessarily be drawn upon to supply a demand for building purposes, railroad ties, etc., which the timber of the north would be totally unable to meet."

An $80.000 Fire.

RAT PORTAGE, Aug. 20.—The Rainy Lake Company's mill here was destroyed by fire on Saturday midnight. It was caused by fire working through the brickwork of the boiler-room into the sawdust. The watchman must have been asleep, as he got burned getting out. A fire caught in the same place before. Loss, $80,000; insurance, $30,000

In Olympia, Washington territory, the nights are made lurid on nearly every side by the roaring forest fires now raging in that immediate vicinity. The atmosphere is so loaded with smoke that the sun at noonday is shorn of its glare, and assumes the appearance of a great ruby in the sky. As a law has been passed whereby parties who carelessly or otherwise set fire to government timber may be punished, wouldn't an example or two cause a decrease in the frequency of forest fires?

ANNUAL MEETING OF THE AMERICAN FORESTRY CONGRESS.

ST. PAUL, Aug. 8.—The annual meeting of the American Forestry Congress commenced to-day in the capitol building, President George B. Loring in the chair. The Congress was welcomed to the state by George L. Becker, president of the State Forestry Association, and Governor Hubbard.

President Loring, in his annual address treated of the State Forestry in the United States. He stated that clearings in the old settled parts of the country were being filled up with trees, so that in Ohio, Maine, New York, and other states, the acreage of forest was constantly growing. In other states where the subject of forestry gained some attention it is also gaining. In states where an Arbor Day has been established the number of trees planted increases yearly. There is need of further encouragement of this enterprise.

Concerning the extent of forestry in the United States at present the president said the forest acreage was less than one-fourth of the total surface, a less proportion than in east, west and north Europe.

The address treated of the decrease of pino timber, showing that the supply would be exhausted in the northern states in a few years at the present rate of cutting, so that much would depend in the near future upon the pine forests of the Gulf States for lumber.

Much remains to be done for the care of forests. Much timber was being wasted for want of care in burning and cutting. Public minds should be aroused to the importance of the subject. The president indorsed the suggestion of the land commissioner in his report for 1882, in which he speaks of the difficulty of suppressing the unlawful cutting of timber, and asks for some general and comprehensive law regulating who may cut timber on Government lands, for what purpose it may be cut, and providing a penalty for unlawfully destroying forests. He pointed out the effect of the forests on the rainfall, and closed by saying the United States, which had been so busily engaged in lumbering for the last 40 years, should devote itself now to forestry.

The following officers were elected :

PRESIDENT—George B. Loring, of Massachusetts.

VICE-PRESIDENTS—H. G. Joly, Quebec ; George L Becker, St. Paul.

RECORDING SECRETARY—N. H. Eggleston, Washington.

CORRESPONDING SECRETARY—B. E. Fernon, Pennsylvania.

TREASURER—Charles Mahe, Alabama.

EXECUTIVE COMMITTEE—B. G. Northrup, Connecticut ; Marion Higby, Ohio ; J. G. Knapp, Florida ; J. S. Hicks, New York ; J. L. Budd, Iowa.

At the evening session Mr. Burson, of Topeka, Ka , read a paper on the profit of planting forest trees. He gave an example of a man investing $5,000 in 400 acres of land, the trees on which in 16 years bring a profit of 800 per cent on the sale of the trees alone.

The rest of the evening was consumed in considering the subject of education in forestry. Members spoke warmly endorsing the Ohio plan of establishing experimental stations, and having forestry as a science admitted into the common schools, and especially the agricultural colleges.

AUG. 9.—This morning the Committee on Forest Experimental Stations reported, commenting on the decrease of State forests for want of trained foresters. None were in existence. There were no forest academies, and comparatively little importance was attached to experiments in forestry. The committee recommended that members from the respective states urge the necessity of establishing forestry experimental stations ; that this congress memorialize the legislatures of the different states, urging upon them the practicability of establishing these stations ; that the Ohio plan is recommended as the most suited to our circumstances. The report also recommends experimental stations in agriculture, and that a committee on forestry experimental stations be appointed. The report was adopted.

The committee on memorializing State Legislatures upon the establishment of a State forestry commission reported a memorial calling attention to the importance of giving early attention to measures for the maintenance of forest supplies, and to the relations existing between the woodlands and the agricultural welfare of the country, water supply, etc. In view of the fact that most of the settled portions of the country are owned by individuals, the report says that the most effective way of promoting tree culture is the diffusion of correct ideas among owners of land. This end can best be achieved by the appointment of a State commission to introduce a new variety of trees, keep the people informed of the best methods of tree culture, establish nurseries and experimental stations, and holding meetings.

The Committee on Forestry Education reported that the business openings for trained foresters were not such as to encourage sufficient numbers of students to support schools in this study. They should be taught, however, in schools for the promotion of agriculture. It might be desirable for State institutions to employ lecturers and co-operate with local societies in their work. The report was adopted in connection with the following resolution, offered by Mr. Minier, of Illinois :—

Resolved,—That the Forestry Congress earnestly urge all our Industrial colleges and Normal schools to begin at once testing tree planting, and as soon as possible the introduction of both the science and art of forestry in the public schools.

The congress discussed forestry legislation. Congressman Dunnell, of Minnesota, stated that people generally did not appreciate the alarming rapidity with which the forests were being destroyed.

In the afternoon the congress discussed the importance of planting and maintaining groves of trees, and accepted an invitation from the Northern Pacific to take an excursion over the road. In the evening a committee was appointed to report at the next meeting the form of a memorial to Congress on the subject of establishing forestry experimental stations.

The discussion was continued on the need of forestry education in agricultural colleges. Also a paper was read by Professor Saunders, of London, Ontario, on insects injurious to white pine.

A resolution was adopted recommending the establishment of Arbor Day in all the States of the United States and Provinces of Canada.

Committees on Forestry Experimental stations and on Forestry Schools were appointed, and the congress adjourned.

THE CANADIAN PACIFIC RAILWAY.

A special correspondent of the Montreal *Star* writes as follows :—

The C. P. R. own two steamers which run between the "Depot" on the Spanish River and Algoma mills. One is an ordinary small tug and the other a handsome river steamer with good accommodation for short trips. Both are used to bring supplies from Algoma Mills to the head of navigation on the Spanish River, whence they are taken by teams to the various camps on the construction line. Lumber, provisions, clothes, fodder, cattle, horses, carts, picks, shovels, wheelbarrows, powder, and all that is necessary for building the line are landed at the spacious stores there to await transportation inland to various points of destination on the way. The rapids which cross the barriers of the stream a little higher up are about as large as one of the chutes at the Sturgeon, and they bar navigation to everything except bark or Peterborough canoes. The "Depot" is thus made the distributing point for the coustruction line all the way to Sudbury Junction or rather now to the Vermillion crossing, where the jurisdiction of Mr. Abbott ends and that of Mr. Worthington begins. Westward, however, there are more facilities for bringing up supplies. Here the line runs parallel to the Spanish River, and small depots have been established at intervals all along the water side. At these depots the two steamers laud their cargoes, and it is but a short distance from the different landiugs to the construction line. This is considered a great advantage by railway men, many of whom think the question of feeding the men and carrying in the supplies sometimes more serious than spanning a river or bridging a chasm. The navigation is easy, the river being free from shoals and snags, while green timber lines it, on both sides to the water's edge. Along the margin of the stream there are at places, ranges of irregular rocks, conical, table and undulating, and it is to avoid these that the railway line is laid at a little distance from the shore. There are I think between 1,500 and 2,000 men working on Mr. Abbott's portion of the C. P. R. Unlike the men at the other end of the line they all boarded by the company, and those in authority appear to think that this system secures better food and better accommodation for all. Contentment, that parent of delight, appears to be general, and it is only fair to add that the men speak in terms of generous praise of the gentleman who is entrusted with authority. But the land through which the railway runs is poor. It is nearly all marsh or rock. I only walked over a small part of it, but no attempt is made to conceal the barren nature of the soil, all along the way. It is a wilderness of boulders, turf and evergreens. Close to the margin of the river, however, I saw some fair land. Alluvial deposits have mixed with the sand, and at places give evidence of nutriment and warmth. There is, too, a flourishing settlement on the north side of the stream, and I saw potatoes well advanced and other crops healthy. On the south side we passed an Indian reserve where "Yellow Thunder" lords it over his swarthy tribe. I saw some of them at one of the landings.

LITTLE DETROIT AND WINDSOR.

We soon left the Indian reserve and the river widened into the north channel of the Georgian Bay where we were soon ploughing through a gentle swell which rocked us in the cradle of deeper and more picturesque waters. I then heard that we were to stop at Little Detroit, and we headed for some narrows where even so small a steamer as the Eclipse could hardly turn with safety. On one side of the narrows there was a store and I think a shanty—that was Little Detroit ; on the other side there was a shanty and no store and that was Windsor. People say that there are 90 fathoms of water in that narrow gut, which we soon left and stopped at the Spanish Mills a little further on. Here barges flying English and American flags attracted our attention and I was told that the mills belonged to an American firm whose timber we saw scattered over the river higher up the stream. There was a dock made out of refuse boards from the mill and which appeared to be loosely piled on each other, but which had withstood the wind and weather of the bay for many a year. Returning through the narrow channel we once more passed Little Detroit and Windsor, and we were soon treading our way through the rocky groups of the North Channel. Except an odd gull there was not a bird to be seen, and all the way from the "Depot" to Algoma Mills we only passed one boat with an Indian doctress and a sick child on board. Rocks of all sizes and all shapes stand firm, cold and weird looking, out of the water, and the spray dashed up their slippery sides and frothed and foamed in caves which they had eaten with their fury. The wind rose a little and the Eclipse rocked while the waves leaping at her weather bow made her rise with each succeeding wash and dash off the sea like a boxer warding off a blow ; and still wriggle through the islands which here are as thick as plums in a pudding.

IN THE NORTH CHANNEL.

The North Channel is the Thousand Islands on a larger scale, and while it loses some of the charms which comes from a close inspection yet it gains in magnitude and depth and greater volume. More than 27,000 islands, large and small, dot the waters of the bay between Collingwood and Sault Ste. Marie, and at places where they narrow, there is a variety and beauty of outline equal to the most attractive spots on the far famed islands of the St. Lawrence. At some places there are sharp pinnacles like the aigulets of the Alps, and at others denudation has broken the granular rock into "tors" such as may be seen on the coast of Cornwall or Devon. The rounded hills are scantily clad with vegetation, and a close inspection of the stone shows where the quartz has filled up the space between the crystals of feldspar and of mud and left impressions of these minerals on the stone. Beautiful fossils are found embedded in a limestone quarry which has been discovered on an island in the bay. They are found in masses as at Saarbuck, and some interesting remains may be dug from the stone. To our left the great Manitoulin Island looms through a somewhat misty atmosphere, and at 5 o'clock that evening we saw Algoma Mills ahead.

ALGOMA MILLS.

This is town in these parts. There are eight or ten houses, including stores, a handsome cottage for the use of Mr. Abbott, a C.P.R. workshop, a dock and wharf, and a railroad track. We are now at the other end of the iron. This is to be the present terminus of the branch line of the C.P.R. There are two docks to be built, a large hotel and a grain elevator put up, and these will give Algoma Mills an importance not possessed by any place in the region. Whether the C.P.R. will be continued to the Sault or not, no one appears to know. The company own 600 acres about the Mills, and the iron is laid about 26 or thirty miles along the road from here to Sudbury Junction. There is yet about 100 miles of iron to lay before the branch to Algoma is completed, and it is confidently expected that all that will be done and the boats running from Algoma Mills to Thunder Bay in May next. A walk along the track showed how well the ballasting had been done, when suddenly snakes ran across my path and made me experience the horrors of which De Quincy spoke when recording the visions of his opiated dreams. But the reptile is harmless. There are no rattlers here, and there is no evidence of anyone ever having been poisoned by a bite from a serpent. They are numerous but harmless. After a while one can even come to like to see them gracefully raise the body into arches and glide over the ground. The thing is as incapable of doing harm as an eel. I can understand a man skipping about when he sees a Naja in India, a crotalus in Carolina, or hears a rattler on the plains, but these little things out here are as harmless as worms. Returning to town, I see the men lounging on the wharf, and learn that some are coming to and some are going from the woods. A band of Italians headed by a bagpiper who was droning out something with no melody and but little of the harmony of art. They have come from the States and are going up the line. Not one of them can speak a word of English and they gesticulate widly as they pass along. Meanwhile the shadows grow longer, while flies get troublesome, and rather than to apply more tar to keep them off I seek my room, smoke a pipe and think of—to-morrow.

MIDLAND.

MIDLAND, Ont., Aug. 11.—The estimated loss given this morning on the British Canadian Lumber Co's mill fire is $130,000. The mill machinery and eight dwellings and about five and a half million of lumber were totally destroyed. Two hundred hands are thrown out of employment by the burning of the British Canadian Company's new mill. This was one of the most complete in the world, and had a capacity of 75,000 feet per day. The total amount of insurance is $53,000, of which the Commercial Union hold $30,000.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

Do not delay, if suffering any form of Bowel Complaint, however mild apparently may be the attack, but use Dr. Fowler's Extract of Wild Strawberry. It is the old reliable cure for all forms of Summer Complaint that require prompt treatment. Ask your druggist and all dealers in patent medicines.

THERE is no excuse for suffering from Headache, Constipation and all the wearying train of symptoms of a disordered liver, when Burdock Blood Bitters is an unfailing remedy, and only costs One Dollar a bottle. Why suffer on without a trial? 25,000 bottles sold during the last three months, with almost universal satisfaction.

EDDY'S ENTERPRISE.

Since last November, building operations have been carried on with great energy at Mr. E. B. Eddy's mills in Hull, but till very recently the whole plan of buildings had not been decided on. Hearing that the plan for all the establishments had been settled, a FREE PRESS reporter went over there yesterday and got the full particulars about every establishment. As is well known, the match and pail factories are in the same buildings as before the fire, with some improvements made since then. With the match factory Mr. Eddy says that he can supply three Dominions, and glut the market too. The building now occupied as a machine shop will be occupied by the pail factory and the machine shop transferred to the building just west of that now occupied as a planing mill, which is 50 by 60 feet. As has been stated before, the new large mill is 120 by 140 feet, and is fitted up with two slabbers, two gangs, twin circular, two splitters, three edgers and three butting tables. The water power used in this mill is 1,300 horse power, and the capaciity is 250,000 feet every 12 hours. In arrangement this is the most complete mill in every way in the world, the logs entering the mill being turned out graded and sized, and all the old pieces are turned to the best advantage, and sent by shoots to the proper places, where they are carted away. Not a cart of any kind enters the mill, all lumber being carried out by a perfect system of rollers. Mr. Eddy is having a system of waterworks arranged by which the whole mill can be flooded by the chief watchman, if necessary, in three minutes. There are now five very powerful fire pumps, run by water, and with these, the premises always being well watched, it seems impossibe for a fire to gain any headway. Immediately north of the large mill, the planing mill and the box shop have been under way for some time, and are so far advanced that it is thought they will be ready for occupation in two weeks. This building, as all the others, is of stone, and is 185 feet in length by 60 in width, two storeys in height and covered by an arched roof which has not a pillar to support it, the immense arched trusses resting on the wall being all that hold it. On the south side the building is three storeys high, and well lighted in the lower one, a flume being on the north. The small mill to the south of the large one is 60 by 70 feet, and will be used for filling and splitting. The blacksmith's shop will remain in the building where it now is, which was constructed specially for the purpose. The foundry will be where the planing mill now is. At the west end of the machine shop is the office, under the same roof and on the site of the old office. It will be entered from Maine street and be 24 feet front by 74 deep. In this is a brick covered vault, seven by nine feet and about twelve high ; the inside of which is of half inch boiler plate iron. There will be double doors with fire and burglar proof comination locks. The vault is on a solid foundation of stone built up from the solid rock, and will be able to withstand any heat it might be subjected to. In rear of the office is a long fire proof heater, by which the offices, machine shops, and store room 110 by 60 feet above both will be heated. The store room will be used for storing the goods made by the firm. The office building, as before indicated, is two storeys in height, and will be surmounted by a mansard roof. The power used by the various departments besides the mills, is as follows ; Wooden mill. 350 horse power ; machine, 100 ; match factory, 100 ; box shop, 200 ; pail factory, 100, and small stone mill about 100. The capacity of the small wooden mill is 150,000 feet per day. With the immense establishments already erected, one would imagine there was nothing wanting, but Mr Eddy thinks differently and will commence shortly the erection of a sash, door and blind factory, 60 by 60 feet, two storeys high, at the south west corner of Bridge and Maine streets, or just the blacksmith shops.

All the above buildings are, or will be, covered by arched roofs of galvanized iron, which is more lasting, strong and better able to resist the fire than any other known. The buildings will all likely be finished by fall and will then present a great contrast, as Mr. Eddy said, to the appearance of their site on the 3rd of November last.—*Ottawa Free Press.*

FIRE AT RAT PORTAGE.

RAT PORTAGE, Ont., Aug. 20.—The new mill of the Rainy Lake Lumber Company was entirely destroyed by fire early this morning. Whether the result of accident or design cannot now be determined, but circumstances point to incendiarism as the cause. The watchman about three in the morning noticed fire in the conveyor for carrying the sawdust from the mill to the yards, and says that the fire was in the sawdust at the opening of the conveyor in the well of the boiler-house, and that on going inside he found the roof of the boiler-house in flames, rapidly extending to the mill proper, which in a few minutes became a sheet of fire. He gave the alarm to the foreman and another man who sleeps in the mill, and they had barely time to escape with their lives. The foreman rushed for the cord which blows the whistle, but found it was not there, having apparently been cut off. This gives color to the suspicion of foul play. The hose, which had been thoroughly tested and found efficient the night before, was burnt away, and was useless. No human aid could now avail to save the mill, and in an hour it was burnt the to ground. The morning was calm, and tho lumber, which was piled across a swamp at a distance, was saved. It required, however, great exertions later in the day to save it, as a storm came on and the wind was at times like a hurricane. The mill was the finest in the North-West. It had been two months in operation, and was fitted up with most approved American and Canadian machinery. Its capacity was 200,000 feet per day of twenty-four hours. The company had made over 20,000,000 logs, only a small quantity of which had been sawed into lumber. The shareholders are Hugh Sutherland, M. P., Simon J. Dawson, M. P., Wm. Buckingham, John Ross, (contractor) and James Corcoran, Stratford. The loss will be a severe one to them, as the property destroyed is not half covered by insurance, and their operations are at an end for the season. The companies who carried the risk are Imperial, Commercial Union, London, Liverpool, London & Globe, Citizens', Phœnix, of London, Queen's, Western, and British America, each $2,000 ; the Phœnix of Brooklyn and Northern each $4,000 ; City of London, $6,000. Total $30,000. The occurence is a severe blow to this place, as it stops the principal industry in Rat Portage. It throws out of employment from one hundred to two hundred men.

REVIEWS.

FORESTRY.—We have before us the August number of *Forestry*, a monthly magazine edited by Mr. F. G. Heath and published by Wm. Rider & Son, 14 Bartholomew Close, London, England. One of the contributions is by Mr. Wm. Little, of Montreal, on the subject of "The Alarming destruction of American Forests." There are many other papers on forest lore, one of the most valuable and interesting being that on "Re-afforesting of Ireland." It is a periodical that should be read by all who take an interest in forestry.

RAFTS ARRIVED.

The *Chronicle* gives the following list of rafts, etc., arrived at Quebec :—

AUG 9.—Jos. Bolduc, deals, Bay St. Lawrence and Beauce.

E. C. Baker, timber, Woodfield Cove.

A. & J. White, white pine, etc., St. Lawrence Docks.

Perley & Pattee, white pine, etc., Hadlow Cove.

R. & A. Conroy, white pine, etc., Cap Rouge.

A. & J White, white pine, etc., St. Lawrence Docks.

J. & G. Bryson, white pine, etc., Cap Rouge.

Ancient Circular Saws.

That the hard basalt and granite used in Eyptian buildings of some 4,000 years ago, were cut by circular saws of some sort, is proved by recently examined specimens with the tool marks fresh upon them. The circular marks are as distinct on these imperishable stones as on a fresh pine plank. The proof of the existence of ancient circulars is curious, for that form of saw has been believed to be of modern invention.—*The Wood-Worker.*

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

NORMAN'S ELECTRO CURATIVE APPLIANCES

RELEIVE AND CURE

Spinal Complaints, General and Nervous Debility, Nervousness, Rheumatism, Gout, Liver, Kidney, Lung, Throat and Chest Complaints, Neuralgia, Bronchitis, Incipient Paralysis, Asthma, Sciatica, Sprains, Consumption, Sleeplessness, Colds and Indigestion.

Ask for NORMAN'S ELECTRIC BELTS and you will be safe against imposition, for they will do their work well and are cheap at any price.

A. NORMAN, ESQ.—Dear Sir,—Please send me a waist belt. Enclosed find price. Head band I got for my wife has almost cured her of neuralgia. Yours truly,
C. L. TILLEY, WATERVILLE, N.B.

Numerous of such testimonials can be seen at my office, proving that they are doing a good work and worthy the attention of all sufferers. Circulars free. No charge for consultation.

A. NORMAN, 4 Queen Street East, Toronto.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1m7

FORESTS AND THEIR MANAGEMENT.

We continue our extracts from Mr. R. W. Phipps' report to the Ontario Government:—

FORESTS OF LUSS AND THE HARZ.

Another gentleman, M. Gustav Mann, Conservator of forests in Bengal, has proceeded to Germany for the same purpose as Capt. Walker, and gives some further important information relative to the German forests.

In the plain of North Germany the Scotch fir is the principal forest tree, and better suited for deep, loose, sandy, than for heavy loaming soil.

The great "Luneberg Heath" is mentioned as having been covered with wood, but the indifference of the inhabitants to the existence of forests, originating in the common belief that they will continue to exist, no matter how recklessly treated, the desire of the villagers to get grazing ground for their cattle by burning the forests, the indiscriminate usage of the wood and method of felling in vogue, have destroyed hundreds of miles of forest, and have left the greater part of the Luneberg Heath barren, covered almost exclusively with heather, and of little use to any one. Now the evils are seen, and with a view of restoring these forests large sums of money, and much skill and labor, are being expended.

I will quote here a short description of the method used in planting the Scotch fir in such localities. The land is first ploughed, after which a man proceeds along the bed, making holes at distances three feet by five, with a wedge spade (one quite straight, made all of wood except the edge, which is shod some inches high with iron, and is two inches thick at the top of the blade). This he forces into the ground, withdraws it, and passes on, while two women follow him, who plant by holding the seedling against one side of the hole, while with their foot they press the opposite earth against the plant. The material for planting consists of one-year old seedlings of Scotch fir, and occasionally a two-year old seedling of spruce, which are raised in the ordinary way by sowing in furrows. The Scotch fir requires more light and air than any other, and does not thrive at all in the shade of other forest trees. For the same reason natural reproduction (in forests) is very difficult, and not attempted here. As a tree affording some shade to other trees which require it the Scotch fir is well suited. If sown or planted very close, early attention to thinning out also is necessary, as plants early stunted never fully recover their strength. The soil not being rich, the trees are not allowed to grow older than sixty to eighty years, this being the age at which the comparative yield of wood is best. Spruce is planted in small numbers with the Scotch fir, and even where the soil is not good enough for it to grow up into large trees with the fir, it becomes beneficial by the cover of its dense foliage, which facilitates decomposition of the soil, and keeps it moister and cooler than the fir alone could do.

It will, perhaps, be as well here to give Mr. Mann's very lucid description of beech culture:—

Seed beds for beech are prepared in the ordinary way, and the seed is sown in autumn as well as in spring. If the former time is preferred, care has to be taken that the seed does not germinate too early, so as to be exposed to spring frosts. This is prevented by covering over the beds after the surface gets slightly frozen, and by removing the covering in spring so late that the young seedlings have nothing more to fear from the frost. If sown in spring, the seed has to be carefully stored during the winter. Steaming, as well as excessive drying, must be guarded against. The first is avoided by turning over the seed or even keeping it spread out; the second by slightly watering it and turning it over afterwards, so as to distribute the moisture equally. A cool, moist room on the ground floor is preferable to a warm dry one.

From the seed beds the plants are either removed at once into the forest, or into other nurseries for transplanting and keeping until they reach a height of three or four feet. If they are to be planted in open ground, without the protection of old trees, they are sometimes kept in the nursery until they reach a height of ten or twelve feet, which however is a very expensive measure. In this care is taken that the young shoots are not removed from the stem, as the bark of the beech is very easily burnt by the sun, and otherwise apt to be damaged by the weather. Unnecessary exposure of the roots of the young beech is carefully avoided, as they are sensitive, and demand special care during the removal of the plants. Where it can be done some of the soil is left on the roots for the same reason.

Ordinarily the beech forest trees get re established by natural production, *i. e.*, the shedding of seed from old trees. When the beech gets mixed with other kinds, as in the coppice with standard, its regeneration is furthered or checked according to circumstances, but planting is seldom resorted to.

In the pure, high forests of beech the natural reproduction is brought about by gradual and well considered fellings, which tend to effect this as completely as possible. In hilly or mountainous localities fellings are commenced at the top of the hill. These fellings take place when the trees have reached maturity, and are three to four in number, and distinguished according to the immediate effect they are intended to have on the forest.

The first felling called in Germany the preparatory cutting, is intended to facilitate the decomposition of the dry leaves and branches which cover the surface, and thus prepare it for the reception of the seed, which latter, without this precaution, frequently germinates without being able to penetrate with its roots the comparatively hard and leathery leaves lying on the surface, and often dies in consequence, while weeds and scrub easily get up in it, and cover the surface soon, thus adding to the difficulties to be overcome by the young plants. It is commenced several years before the intended regeneration, and carried out gradually; but where the air and light thus admitted are not sufficient to render the surface fit for the reception of the seed, a timely permission to villagers to remove some of the dead leaves is resorted to. Besides the preparing of the soil, this opening out of the forest induces the tree to flower and bear seed more frequently than when standing very close.

The second felling—the so-called seed-cutting—is carried out as soon as the bearing of the seed becomes probable, which can be judged of beforehand by the appearance and shape of the buds during the preceding winter. An abundant seed-bearing season generally occurs with the seed after longer or shorter intervals, but sufficient seed for the regeneration of the forests may be reckoned on every second or third year. Precaution is used not to remove too many trees at once, as in the case of the flowers being destroyed by spring frosts or other causes, the restocking of the ground with young plants does not succeed. Too much light would dry up the surface of the soil, and induce the weeds to overrun the ground, both circumstances seriously interfering with the germination of the seed at a future season. Where at this time the suitability of the soil remains doubtful, a timely loosening and preparing of it in stripes and patches is resorted to to insure success.

When the expected seeding of the trees turns out a failure, further clearing is carefully avoided, to prevent the deterioration of the soil or overgrowing with weeds. If, however, the season is a favorable one, and produces sufficient seed, and the young plants germinate, this felling is soon extended to a greater number of trees to admit more light and dew to strengthen the young plants.

For the purpose of getting the seed worked into the ground, herds of swine, cattle, etc., are often driven through the forest with good effect.

Seed beds are sometimes established in the neighborhood of a forest at the same time, to furnish young plants for the filling up of vacancies, which, however, are also obtained nearly as good out of the forest itself from places where the plants stand thick enough. Although the aiding of the natural reproduction by artificial means, either sowing or planting, is at the present time generally resorted to at once, as such measures always lead to a more satisfactory accomplishment of the desired regeneration, and save time.

The third felling is called cutting for light, as its chief purpose is to admit light and air in greater abundance as the young plants require it. This is generally commenced when the seedlings are two years old. It is also regulated very much by circumstances, and while in the one case the forest trees may be required longer on account of the spring frosts, so very injurious to the young beech, in others their early removal is necessary, even if an increase in size be sacrificed, for the establishment of the young trees. Neither do partial failures prevent the removal of the old trees, but are resorted to at once by sowing or planting as the safest and quickest mode of securing the establishment of the young forest.

After the third or light felling follows the gradual removal of the old trees, or final clearing, which is regulated in the first instance also by the requirements of the young trees, and after this by the fixed yearly out-turn, as laid down in the working plan. As a general rule, all these fellings are carried out gradually, without causing sudden changes in the forests. The aiding of natural reproduction is either accomplished by sowing, if failures are perceptible early, such as non-germination of the seed or death of the seedlings; or by planting, if the seedlings get destroyed later by spring frosts or are choked by weeds. The sowing is carried out in the forest in strips two feet wide, in furrows, or in patches two to three feet square, prepared by hoeing for the purpose, and by loosening and levelling of the soil; while planting is done by seedlings two to three feet in height taken from adjoining nursery beds, or from spots in the forest where there are more than are necessary.

"It is evident," says Mr. Mann, "that if, with all this care and attention to aid natural reproduction, still occasional failures occur, how unreasonable it is to expect forests in India to keep in an equally rich and thriving condition when left to themselves, or worked only with a view of extracting the timber from them." I would also apply the remark to Canada, and observe also that Captain Clarke respecting India, and the Hon M. Joly concerning Canada, make precisely the same statement, to the effect that the forests in both countries, cut over and carelessly managed, are often, so far as any available supply of good timber is concerned, only in appearance.

It may be noticed that the beech of all other trees, is said to improve the land, forming a rich vegetable mould, to gain the benefit of which other trees—oak, ash, maple, larch. Scotch fir—are planted among the beeches and do well. I may notice here that in Canada, while clearing the forest this did not appear to me. I generally found the maple on the richest land, and where beech were intermixed a lighter loam.

One description of forest much used in Germany is called "Middle Forest. It contains a number of high trees cut at long intervals for timber, and below them a coppice (smaller trees growing from roots of previously existing trees, and which will themselves, when cut, be succeeded by similar ones) cut at much shorter periods for firewood. In cutting the coppice, young trees are left to replace the tall ones when cut.

A method of planting used here should be noticed. A small spade of solid iron, about 20 pounds in weight, 14 inches long, seven inches broad at top, five at bottom, with a handle four inches long, is driven in the ground and bent to all sides then drawn out. The plant, three or four years old, of beech, spruce, or oak, etc., is dipped into a thin mixture of loam and water, which adheres easily. In this state it is pushed with its roots into the hole as far as possible, and with continual shaking, by which the roots get straight right down into the hole, drawn up to the level at which the plant should stand. Here it is held by one man, while another drives in the spade a second time, about three inches from the first hole and parallel with it, and first presses with its point towards the first hole, and then with the broader part, by which means the plant gets very firmly pressed into the soil. If necessary the spade is driven in a third time, to close up the second hole slightly. The soil is then beaten firm with a mallet all around the plant, but not striking closer than three inches. This mode is very successful; it is carried on without preparing the soil, and answers in stony ground, on account of the strength of the spade.

On the Harz Mountains (the scene of many a supernatural legend) are vast forests of spruce, kept with much care. One remarkable point in the management is the Government seed-drying kiln at Westerhof, for getting the spruce seed out of the cones and cleaning it of wings, which is carried on here extensively, the spruce being plentiful, of excellent growth, and producing exceptionally good seed. The cones are collected by contract work, and varies according to the seasons, if plentiful or otherwise, and generally enables the workmen to earn 50 cents to 75 cents per day. After all the Government stores are filled, private persons are allowed to collect, for which the person has to pay a small sum per season. In the cones the seed remains good from seven to eight years. The Government kiln turns out about 180 cwt. per season, while private parties in good seasons have turned out as much as 1,600 cwts. besides. The cones, when first brought in, are stored in large rooms, with perforated walls, so as to admit a free current of air through them.

The kiln itself consists of three rooms, the centre one of which is heated by means of a large oven, from which large iron pipes, six inches in diameter, pass twice through the room before they enter the chimney. This room is separated by walls, in which there are holes of nine inches, from the two outer rooms, in which the cones are being dried. By means of these holes, which can be closed at pleasure, the temperature in the drying room is regulated, and kept between 122 and 128 Fahrenheit. The drying is done in large wire dums, out of which the seed falls on the floor of the room. There are twelve in each room, and are turned from the outside of the room, where it is cooler. They are filled in the evening, the temperature got up, and so left for the night. The next morning the fire is lit again, and the drums being turned every half hour, by night the cones are empty. Half the cones are used to heat the kiln; the rest sold for fuel. It costs the Government about six cents per pound. What is not needed is sold at nine.

It is noticeable that the spruce wood, among other uses, is ground up into pulp for paper manufacture, several mills in the Harz Mountains being employed in this manner. It might be worth consideration whether, under an improved system of forestry, the waste wood left in such quantities in hewing and score-hacking could be, in our great Canadian spruce forests, so employed.

It will be well to give an account of the method of reproducing and caring for spruce forests, both because our own forests will soon need replanting, and to give some idea of the care taken in maintaining woodland property in foreign lands.

Natural reproduction of the spruce is seldom attempted, as too slow and uncertain; but if there are thriving naturally some clumps of any extent, they are kept up. Almost all spruce forests are regulated high forests, with complete clearings, either re-sown, which is still preferred by some, or planted, which is by far the most general mode of establishing or re-establishing spruce forests. If sown, lines about two feet in width are prepared by clearing the weeds, etc., off the ground, and placing this at edge of the lines to prevent the wind blowing among the seed, or rain washing them off. The soil on these strips is sometimes loosened and left as it is if the seed is to be sown broadcast. If the seed is sown in rows, small furrows are made. Between the strips, ground twice as wide is left. For plantations, the seed is sown in seed-beds, which are good, even, and sheltered pieces of land, about half an acre in size, and well dug up, afterwards levelled and occasionally slightly manured by the ashes of the weeds, remains of wood, etc., collected on the surface, brought together and burned, and afterwards mixed with the soil. These seed-beds are usually in the immediate neighborhood of the ground to be planted, and have to be fenced in. If the seedlings, after they are three or four years old, have to be removed from here at once to the spot where they are to remain, the seed-beds have to be larger, especially if the young plants are to be planted out in numbers,

i. e., three or four in one hole. In the latter case the seed is sown generally in furrows, one foot apart, as being more convenient, and requiring here in the hills about seventy five pounds of seed for half an acre, which is sufficient to plant fifty acres of forest. The better plan, however, is to have the plants from seedbeds, after they are two years old, transplanted singly in a nursery at about seven inches distance, where they remain until they are four or five years old; this, however, requires as much space again for the nursery as for the seed camp. Not unfrequently four to six year old seedlings are taken from the adjoining forest, where they are generally so close as to permit of the removal of many of them; and this is the most inexpensive way of procuring seedlings in limited numbers. Where there is a demand for thinnings, the planting of three or four plants in one hole recommends itself. If it is likely that the ground get run over rapidly with weeds, or the soil dried up by the sun, the replanting is done as soon after the removal of the old forest as possible, whilst where the danger from insects, especially the small beetle, is great, the ground is let lie two or three years first. Planting is done in autumn as well as in spring, but the latter is preferred. Spruce is planted four or five feet apart.

To protect the spruce forest against damage from insects the forester has to be constantly on the alert, as they are many, and if not checked in time, great damage is done by them. The most destructive noticed was the ordinary spruce bark beetle, which attacks the bark of living trees, and had, in some of the localities visited by the commissioner, destroyed so many trees that, when the diseased were removed the forest had become so open that the wind would soon have removed the rest had they not been felled. Experienced men are told off to guard against this danger, by going through the forest to search for the trees attacked by the beetle, and fell and bark them to prevent the spreading of the insects. In most cases, they are quite able to hold the insects in check. These generally attack trees loosened in the roots by wind, known after the beetle gets in by their foliage turning yellow. In spring, when they are worst, healthy living trees are felled at the southern margin of the forest in sunny spots, for the purpose of attracting the beetle. Such trees are often full of them three or four days after being felled. The trees attacked are barked, which destroys the larvæ if not too far advanced; if so, the bark is burned. To prevent any escaping while barking, a cloth is spread under the stem. The timber beetle, which attacks new felled trees, going deep into the wood, is also common there, and is watched for closely. For the young plantation of spruce the first mentioned is the most dangerous, as it eats off the bark above the roots, and kills the tree. Fresh pieces of bark a foot square, inner side down, are laid around before or after planting. The beetles go under, and are caught and killed. The bark is examined every morning.

To be Continued.

TRADE IN PREPARED LUMBER.

There is a boom in the lumber trade of Goderich, and dockage facilities are greatly in demand. Are our lumbermen making a bid for the new trade in prepared flooring that has sprung up in England? It is the custom there to saw out a bill of lumber to order from the raw material in the shape of deals. Recently a sample cargo of prepared flooring was received in London, and bought by some merchants of a speculative turn. At present this trade, should the English dealers tackle kindly to it, gives a prospect of being chiefly controlled by the Swedish and Bothnian dealers. In this connection, the question arises as to how Canadian dressed and matched flooring would fare overthere. Such exports are already proposed among American dealers. How many obstacles there are in the way has not yet developed, but if the cost of yellow pine flooring, dressed and matched, is not excessive, when laid down across the water, it ought to compare favorably in quality and service with the foreign prepared article, since in what the preparation consists is a rather obscure proposition. The question of superior manufacture is an important one in this country, and doutless is in England. Canadians are already exporting ready made dwellings, doors and sashes; some going to Manitoba and others to the West Indies. Should there arise a trade with Great Britain in prepared lumber, in this country, it might be the means of adding largely to an already great and profitable industry.

THE REVIVAL OF CHERRY.

Those to whom fifty years is a memory readily recall the cherrywood tables, bureaus, drawer chests, that were then in fashion, when the more gaudy and more costly mahogany had but lately come in. It is an evidence of a return to good taste that the cherry tree is again in favor, not only as it exists in old furniture, but in its new requirements. It is largely used in cases for musical instuments—melodeons and organs—and in furniture—chairs and tables—after being "ebonized," or blackened by acids and dyes. But it is also coming again into use in its natural color. One of the finest banking houses in the Eastern States is finished entirely in cherry and it is beautiful. The wood, filled and not varnished, has a soft glow not possessed by any other, and has none of those distortions of grain that are so unpleasant in mahogany.

The timber is chosen from the wild cherry, which in New England and the North generally does not usually grow to a girth of more than twenty inches, but in some of the Western States and in the South frequently attains a diameter of twenty-four inches. The domestic fruit cherry gives some good specimens of small timber, but as the tree is rarely sacrificed until it is past bearing and is decayed, this source of supply is precarious. Like all close grained timber, the best specimens are those which grow singly in exposed situations and not in a dense forest. The facility with which cherry can be worked makes it a favorite with the cabinet maker.

A NEW INDUSTRY.

Under this heading the St John *Globe* reminds its readers that there is an extensive demand in theMediterranean for hardwood box shooks, birch and maple. and a large and growing trade is being done by Bangor in them, that city ships over $60,000 worth a year. The shooks shipped from that port are manufactured in the northern part of Maine, and this is an iudustry to which some New Brunswick people might turn with advantage. The supply of suitable lumber is abundant enough. Indeed, every year, says the *Globe*, thousands of dollars worth of hard wood, fit to be made up into shooks, is burned up in the process of the clearing land. "If mills were erected in the interior of the Province for the manufacture of shooks and other articles of commerce from hardwood, a great impetus would be given to the settlement of new land, as one of the obstacles at present is the disposal of the hardwood trees, in any other way except by burning them. During the time the iron mines of Carleton county were in operation the demand for charcoal led to the clearing of immense areas of new land, and gave Jacksontown and the adjacent districts an impetus, which made their agricultural progress very remarkable. A similar effect would be produced, though, perhaps, in a less degree, by the erection of mills for the utilization of the different varieties of hardwood

---

THE fine forest along the Adriatic at Ravenna, Italy, celebrated by Dante and Byron, and which furnished the shipyards of Rome and Venice, are to be cut down, because an excavation for a railroad has so drained the soil that the trees have died.

IF you would escape the ravages of that scourge of the summer season, Cholera Morbus, keep Dr. Fowler's Extract of Wild Strawberry at hand for use. In that and all other forms of Bowel Complaint it is infallible.

READER, if you suffer from any disorder of the Liver, Stomach, Bowels, Kidneys, Skin or Blood, try Burdock Blood Bitters, Nature's specific medicine for acting on those organs for the outlet of disease. 25,000 bottles sold in the last three months.

W. A. EDGARS, of Frankville, was cured of Liver and Kidney Complaint after life was dispaired of. He had remained from ten to fifteen days without an action of the bowels. Burdock Blood Bitters cured him, and he writes that he is a better man than he has been for twenty years past.

FITS EPILEPSY
OR
FALLING SICKNESS
Permanently Cured—No Humbug—by one Month's usage of Dr. Goulard's Celebrated Infallible Fit Powder. To convince sufferers that these powders will do all we claim for them we will send them by mail, **post paid, a free Trial Box.** As Dr. Goulard is the only physician that has ever made this disease a special study, and as to our knowledge thousands have been **permanently** cured by the use of these **Powders. We will guarantee a permanent** cure in every case **or refund you all money expended.** All sufferers should give these powders an early trial, and be convinced of their curative powers.
Price for large box $3.00, or 4 boxes for $10.00, sent by mail to any part of the United States or Canada on receipt of price, or by express, C. O. D. Address
ASH & ROBBINS,
20L24 360 Fulton Street, Brooklyn, N. Y.

CONSUMPTION
POSITIVELY CURED.
All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humbug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**
We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.
Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address

CRATEFUL—COMFORTING.
EPPS'S COCOA
BREAKFAST.
"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctors' bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack whereever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*
Made simply with boiling water or milk. Sold in tins and packets only (½-lb. and lb.) by Grocers labelled thus:
JAMES EPPS & Co., Homœopathic Chemists,

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co, 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., SEPT. 1, 1883.

IT is estimated that 58,000,000 trees have been planted in Nebraska, which cover 100,000 acres of land.

H. HOWARD & Co., Port Huron, Michigan, are filling a large order for sawed timber to be used in the locks of the Welland canal.

SEVERAL million feet of logs belonging to Thomas Nester are hung up on Baraga stroam, in Baraga county, upper peninsula, Michigan.

LUMBERMEN in Ottawa are all extending their piling grounds. Trade is very dull, but they want to cut the winter's log harvest and require more storing room.

A 7,000 000 drive from Otter Tail Lake, Minn., has arrived for Messrs. J. R. Sutherland & Co.'s mill, St Boniface. This, it is believed, is the largest drive that has ever arrived there.

A 7,000,000 drive of lumber from Otter Tail Lake, Minn., has arrived for Messrs. J. R. Sutherland & Co.'s mill, St. Boniface. This, it is believed, is the largest drive that has ever arrived here.

RAT PORTAGE council has passed a by-law bonusing the Rainy Lake Lumber company $15,000 towards erecting a new mill. The company promises a better mill than the one recently destroyed.

A LARGE toothpick factory is to be started at Harbor Springs, Michigan, that will consume the poplar and birch that grows in Emmett county. Eight or ten men, and 15 to 20 boys and girls will be employed.

A KINGSTON gentleman thoroughly conversant with the subject gives the following estimate of the value of the timber production in this district, which has been developed by the local railway:—Square timber, $50,000; sawn lumber, $75,000; other products, such as wood, ties, telegraph poles, saw logs, shipped to other places, etc., $25,000. Total, $150,000. This is nearly all shipped to Kingston, and has been added to the trade of the city during the last two years.

In a list of the rich men of Eau Claire, Wis., appear the names of W. A. Rust, $450,000; J. S. Owens, $150,000; three Rust brothers, $300,000. These are all lumbermen. The Rust brothers and J. S. Owen formerly resided in East Saginaw.

THE Selkirk correspondent of the Winnipeg *Commercial* of Aug. 21st, says:—The North-West Lumbering Company are sending large quantities of lumber to Winnipeg. One day last week they shipped twenty cars over the new railway.

MR. HERMAN COOK, of Quebec, has sold to Mr. A. T. Townhouse about 350,000 feet Michigan board timber, 22 inches average, at something over 38 cents. A lot of Chaudiere pine deals has been sold at $106, $32 and $25, 75 per cent. regular and 25 per cent. under size.

S. J. MURPHY, of Detroit, has just consummated the purchase of 40, 000 acres of timbered lands on the eastern slopes of the White Mountains. The price paid is said to be about $1 per acre. The timber is largely spruce, inferior to pine, but available as the latter becomes scarce.

A SHIPMENT of 300 bushels of red oak acorns has been made to Germany for planting on untillable lands and hillsides. This tree has been found to do well in Europe, and its wood is thoro considered to be very valuable. The acorns for shipment were gathered in Missouri at an average cost of $1 a bushel.

THE *Canadian Manufacturer* says:—The supply of standing timber on the Pacific coast is large, and soon supplies for the Prairie country will be carried east, in Canada as well as in the United States. The product is now ten million dollars worth annually, of which British Columbia may want perhaps half a million's worth.

THE destructive tornado that swept over the country in the vicinity of Rochester, Minn., August, 21, demolished John M. Cole's large planing mill at Zumbrota. Mr. Cole, the proprietor, was passing from the mill to his residence, when he was caught by the wind, carried several rods, and dashed to the earth a mangled corpse.

WILLIAMS BROS., Manton, Wexford county, Michigan, manufacture harness hames out of tree stumps, the crook of the roots forming a natural crook of the hames. The stumps are cut just above the ground, including the crook, but avoiding the grit of the ground. The enterprise is said to be profitable both to the manufacturers and stump owners.

THE Minuedosa correspondent of the Winnipeg *Commercial* of Aug. 21, says:—Jermyn & Bolton's saw logs are now all down, and their sawmills will be run night and day for the remainder of the season. In anticipation of the introduction of pine lumber as soon as the railway is completed, the lumbermen here have arranged a new schedule of prices averaging about $6 per M less than the one hitherto in force.

IN a white oak log over 3ft in diameter, which was sawed up lately in Sauer & Baird Bros. saw mill, Plattsville, a two inch oak pin was found, and that pinned to the tree again with a § pin, the whole had again been overgrown with solid wood five inches. It must have been put in a good many years ago. The hole was bored with a pot augur, the point showing very plain yet. The tree was cut on the farm of Thomas Bond, of Brantford.

THE *Northwestern Lumberman* says:—Hardwood flooring is being used in Massachusetts factories instead of southern pine. In the Flint mill, at Fall river, 300,000 feet has been used, and in an addition to the Pacific mills at Lawrence, Mass., as much more is being put in. Hardwood, like stone, for building purposes to which it is adapted, will always hold its own against all rivalry, and the owners of good hard wood in the tree should remember this and withhold the axe and firebrand.

THE *Northwestern Lumberman* says:—They tell a joke on a tug captain at Cheboygan, Michigan. He wanted to tow a boom of logs down the river during the night. The boom boys objected to the night work, and when the captain insisted and handed the crew the towline, they fastened it around a solid spile instead of to the movable boom. The tug pulled and puffed all night without budging an inch. A captain that would tug at a fixed post all night like that must have "spiled" considerable bad whisky.

THE *Canadian Manufacturer* says:—It is rightly pointed out by several of our contemporaries that Canada, a large exporter of lumber, exports far too much of it in a condition nearly approaching the natural one. Much of what we send over to England in the shape of deals and square timber ought to go as planed flooring and boards; and no small quantity should go as doors, sashes, and frames. The men and the machinery for this business we have in plenty, but the necessary money and enterprise appear to be holding back.

THE Ludington *Appeal* says that the largest logging contract ever made in those parts was consummated last week between the Danaher & Melendy Lumber Company on the one side and J. S. Stearns and John Dolan on the other. By the terms of the contract Messrs. Stearns & Dolan agree to put into the north branch of Pere Marquette river during the next three consecutive years 30,000,000 feet of logs, from a tract of land owned by the D. & M. Co. on sections 16 and 17 t. 17 n., r. 14, in Lake county. The consideration for performing the work is in the neighborhood of $20,000.

THE *Northwestern Lumberman* says that Henry Gamble, at Grand Marais, Schoolcraft county, upper Michigan peninsula, has dug a canal two miles long, as an outlet for Gravel river logs. He formed the canal by first dredging the channel, after which piles were driven 10 feet apart to a depth of eight feet. Brush was then laid between the piling and bank, slanting a little down stream, on which an embankment of earth was thrown. Boom sticks were chained along at the side, in a manner to permit them to rise and fall with the water, for the purpose of keeping the logs on the way down from sticking and impairing the embankments. The canal will hold from six to eight feet of water. The logs from Gravel river are flooded out through this canal into the bay for boomage.

MR. HUTCHINS, of Montreal, is now at Bolton Centre, examining facilities and supplies which may exist in the line of birch, maple, basswood, and some other woods for the purpose of manufacturing barrels, kegs, etc., also of veneering, for which purpose a company has been formed, who are making a preliminary examination of the material and facilities, as well as inducements to be had at the different sections in the township. Roxton Falls has offered the company exemption, from taxation for ten years, three acres of land to build on and possibly other good things, but unfortunately the best kind of timber is not to be had there although the other facilities are acceptable. The central point appears to rest between Bolton Centre and Eastman. Mr. Hutchins states that when his machinery is in full operation it will cut about one million feet of lumber per annum, which is to be manufactured into barrel kegs and veneering of various kinds and patterns for the Canadian market.

THE LUMBER TARIFF.

Elsewhere we make room for a lengthy letter, addressed to Sir John Macdonald, on the subject of protection to the lumber trade, which will no doubt be read with interest, even by those who, like ourselves, cannot indorse all the views of the writer.

TREE PLANTING.

The following letter appears in the Toronto *Mail*:—

SIR,—As farmers and others owning large tracts of land are beginning to seriously consider the necessity of planting trees for timber, the first thing to consider is what to plant, and therefore I wish to show the merits of the European larch. The larch is a cone bearing tree, belonging to the pine family, but differing from that genus in the annual shedding of its leaves. It is a native of Switzerland, growing principally in the Alps and Appenines. We have two natives in Canada, larch microcarpa and black larch (*L. Pandula*), commonly called tamarack or hackmatack, growing mostly in swamps, and for this reason they are not so suitable as the European larch. I will give some idea of its value as a tree for timber. The larch was first introduced into Scotland in the year 1738, when eleven plants were given to the then Duke of Athol, who was so pleased by the rapidity of their growth and the quality of their timber that he afterwards planted thousands of acres. In the year 1744 a small plantation, of some twenty trees were made at Blair, and in the year 1804, sixty years after, their average girth at 3 feet from the ground was from eight to ten feet. The total measurement of this lot of twenty-two trees was 2,645 feet, which, if placed at the moderate value of fifty cents per foot, would give $1,174. If from four to five hundred could be grown to the acre, then the timber would be worth from $16,000 to $20,000 in 60 years. It must be remembered that the larch can be grown on the poorest land, in fact on land that would not grow enough pasture to feed a sheep. Being a close observer of the merits of the different varieties of trees or timber, I think I am safe in saying that there is no tree that grows equal to the larch for quick growth and durability of the timber. While the heart wood is not formed at all in the other resinous trees till they have lived some years, the larch, on the contrary, begins to make it as soon as planted. To prove the durability of the larch as timber, several experiments were made on the banks of the River Thames, posts of equal thickness, some larch, others oak, being driven down, where they were alternately dry and covered with water by the effects of the tide, a most trying test for timber. The oak posts decayed, and had to be renewed twice in the course of a few years, while those made of larch remained altogether unchanged. Larch is largely used in ship-building; in fact, it is the principal timber used in both naval and mercantile dockyards in Scotland. Larch is propagated by seed, which the trees furnish in great abundance.

Should the Government wish to encourage tree-planting, perhaps the best means that could be employed would be to get seed and establish nurseries to raise the stock for planting. It takes about three years to raise plants from seed large enough for transplanting. It takes about three years to raise plants from seed large enough for transplanting, hundreds of thousands of forest trees are annually sent out from the Grant Edinburgh nurseries, and I do not suppose there could be got enough suitable plants in all the Canadian nurseries to plant a five-acre patch.

Yours, &c.,

ALEX. ROBERTSON,
679 Yonge stree.

Toronto, Aug. 22, 1883.

THE OUTLOOK AT PHILADELPHIA.

A very encouraging outlook is presented to lumber dealers by the increasing number of building permits taken out in the city for buildings, large and small, dwelling houses and shops. The industries are expanding, and a large volume of business will be transacted, in spite of much talk to the contrary.

The railroads are making heavy improvements, all the way from bridge building to station houses. Large contracts have been made lately for Virginia oak ties, which are in special request in this section. A few parties have invested in timber lands along the lines of Virginia railroads, with a view to an early rapid development to meet the enlarging southern and northern Atlantic coast demand. Two or three of our larger firms are now making heavy deliveries to New York roads, and some specifications are coming to hand for next spring delivery on account of Pennsylvania and Maryland railroads.

Railroad companies are likely to be as large buyers next spring as they were last year,

Vanderbilt has 400 miles of road under construction, practically. Garrett is about placing grading contracts for his proposed Baltimore & Philadelphia road. Besides this, between 400 and 500 miles of road are projected. Ship timber is under heavy contract for fall work, and deliveries this month are larger than usual. Houses are wanted everywhere. Contractors are busy, but yardmen are making bitter complaints against the former, who buy from first hands. A good deal of building is being hastened to completion in Chester, Norristown, Reading, Pottstown, Coatesville, Camden and in a dozen smaller towns.

Some large transactions have just been closed in yellow pine. Freight rates are from $6 to $6.50. There is more enquiry, and heavy consumptive requirements are in sight. Prices are stationary. Oak is strong, and good qualities in active demand for August, but some sales show sellers ready to sacrifice for cash.

Walnut is scarce. Some parties who have large tracts will not cut until prices are better. Kentucky shipments are light. Some buyers are prowling around through Indiana. Some parties here needing money are selling walnut cheap—cheaper, in fact, than it can be replaced, according to all indications.

Mahogany is a coming wood among the furniture men. The leading dealer reports sales in one month now to exceed those in six months a few years ago. Mexican mahogany is coming in in larger quantities, and some large orders have been recently secured for winter and spring deliveries. Stocks are increasing.

The scarcity of good cherry is still spoken of. Nothing new is to be said as to poplar, ash and hemlock. Williamsport white pine men are holding for good prices. Hemlock shipments will be large during September. Several yard men are rearranging to accommodate larger supplies. Lath are active and scarce—Spruce is quiet. There is on all sides a confidence in an active fall.—*Northwestern Lumberman.*

ALPENA ALLOTMENT.

A correspondent from Alpena, to a Saginaw newspaper, states that the mill men there, as well as at Tawas and Au Sable, have determined to hold their Norway logs for the present, as they are dissatisfied with prevailing prices. It has been observed all the season that more than the usual Huron shore Norway was being offered on the Chicago market, and latterly it has moved off rather slowly at slight concessions, since shippers to the West prefer white pine dimension to Norway, on account of the difference in weight. It is stated that the mills at Alpena have, as a rule, sold close up to the cut, so that the determination to hold the logs is for the purpose of avoiding cross piling, as would be necessary if the mills were kept running on Norway logs. The Prentiss Lumber Company has this season sold 5,900,000 feet of lumber ahead of the cut. The entire cut of the season by W. H. & E. K. Potter's mill has been sold and is being shipped as fast as cut, 5,000,000 feet having already been shipped. Fletcher, Pack & Co., last week sold to Ohio parties 400,000 feet of Norway strips at $11 a thousand. W. L. & H. D. Churchill lately sold to Chicago parties 2,000,000 feet of white pine at private terms. The Minor Lumber Company last week sold to Chicago parties 1,000,000 feet of bill stuff, 18 and 20 feet long, at $9 and $9.50 a thousand, kind of timber not stated. The Prentiss Lumber Company lately sold to Ohio parties 700,000 feet of Norway at $9, 650,000 feet of common stock white pine, at $7.50, $15 and $35, and 500,000 selected stock, at $25 a thousand.—*Northwestern Lumberman.*

A MAINE WOOD INDUSTRY.

Ranger Brothers, of East Wilton, are carrying on a kind of wood manufacture which is thus described by a local journal. It is the process of stripping lumber for veneering sleigh-backs and dashers, picture-frame backs, etc. The wood used by them is principally basswood, and is prepared for stripping by sawing the logs into the length required. These are stowed into the steaming room, which will contain 2,000 feet of lumber. The logs are steamed about 13 hours, and it is a very particular job, as the lumber must neither be steamed too much nor too little. The logs are now turned out perfectly round and then placed in the cutter, the log being held as in a turning lathe and the knife held down upon the revolving log by means of a long lever purchase. The wooden sheets, as they are cut, pass along upon a table, until the log is used up. Out of a log two feet in diameter they will average about 112 square feet, three-eights of an inch in thickness—a strip 28 feet long and four feet wide. The sheets are cut into squares and dried in the sun. If the weather is favorable, it will take about eight days to dry and prepare the sheets for market. The Ranger Brothers now employ five men, and think of enlarging in the fall. They have not taken an order for two years, and still have on hand more old orders than they can easily fill this year, and yet they will do double the work of any previous year—using some 100,000 feet of lumber. They have orders from Germany and from all parts of America.—*Northwestern Lumberman.*

LAKE HURON LUMBER FREIGHTS.

The Alpena, Mich., *Argus* says in reference to lumber freights from that port: "The freight on lumber from Alpena to Ohio ports is $1.25 per thousand, but there is prospect of an advance to $1.50. At the former rate vessels could not pay expenses. The rate to Chicago, Tonawanda and Buffalo is $1.75 per thousand, and on timber to the two latter places the freight is $2. At these figures vessel men do not get rich. A lumber barge has to give one-third of her freight to the steam barge that does the towing, and the longshoremen at Tonawanda demand 30 cents per thousand feet as remuneration for their services in unloading. This leaves the vessel owner about 87 cents per thousand to pay all his other expenses—such as harbor tow bills, clearances, cost of loading, wages and board of crew, and repairs, and it is no wonder that vessels are often tied up for debt. The prospect is not very glorious for owners of lumber barges."

ANCIENT FOREST LAWS.

The first forestry laws were enacted not at all for the preservation of the timber but only to prevent the destruction of woods in which wild beasts might find shelter—that is, they were, strictly speaking, game laws, rather than forestry. The earliest law of this sort of which we have any record is that promulgated by King Canute, of England, in the year 1016. One of its provisions is as follows: "Let no one cut any of our wood, or underwood, without leave of the chiefs of the forest; which, if any one do, he shall be adjudged guilty of an infringement of the royal chase. But if any one cut down an oak *(ilicem)* or any tree that furnishes food for the beasts of the forest, beside infringement of the royal chase, he shall pay to the king twenty shillings." Not until the reign of Henry VIII did laws looking towards the preservation of timber begin to be enacted. One passed in the thirty-fifth year of his reign begins as follows: "The king, our sovereign, perceiving and right well knowing the great decay of timber and wood universally within the realm of England, and that, unless a speedy remedy in that behalf be provided, there is great and manifest likelihood of scarcity and lack, as well for houses and ships, as for fire-wood, etc."—*Lumber World.*

ALASKA TIMBER.

The rapid destruction of American forests is a subject which is attracting the attention of our economists. Some startling figures upon this subject were submitted to the people in the recent discussion of the tariff bill in Congress. All authorities agree that Alaska could furnish timber for the world. Norway pine, spruce, hemlock and cedar predominate. Possibly the eyes of our great lumber barons will be turned to Alaska when the forests of the north-west and the Rockies shall have disappeared before the rapidly advancing and ruthless axe of the pioneer.

The most valuable wood of the coast is the yellow cedar peculiar to that country. It closely resembles hickory. It is recommended for ship-building, and the forests of Maine and the south will soon be denuded of their ship timber. This wood is also susceptible of a high polish, and is adapted to fine furniture. William H Seward was so much impressed with it that he had book-cases made of it and his library panelled with it. Moths are said to shun it more than they do camphor. These vast tracts of timber lands are not in the market. They are part of the public domain of the United States which has not yet been surveyed. The Public Lands Commission recommended that the government make a survey by competent persons, and considered that the timber resources of Alaska would be likely to prove a source of great wealth.

Alaska has an area of 577,390 square miles, estimated to be 369,529,600 acres. This is all subject to the control of Congress, except certain grants made by the Russian government. The land laws of the United States have not yet extended over Alaska, nor have any of the lands been surveyed. Probably one of the next steps of the speculators will be to urge upon Congress that these lands may be surveyed. Undoubtedly there are great fortunes for those who first obtain a valid title to the vast tracts of timber which are immediately accessible to the ocean. Navigation to San Francisco, or to the western terminus of the Northern Pacific road, is easy. Land costs only one and nineteen-twentieth cents per acre.—*Lumber World.*

New Hampshire Timber Purchase.

The Saginaw *Courier* says concerning a purchase of a tract of timber land in New Hampshire by S. J. Murphy, of Detroit: "The tract embraces 47,000 acres, S. J. Murphy, of Detroit, and C. E. Dole, of Bangor, Me., being the purchasers. The land is estimated to cut 250,000,000 feet, about one-half of which is pine the balance is spruce. The price paid was about twenty-five cents stumpage, and the low figure paid is owing to the rough region in which the timber is located, it having been considered almost inaccessible by the usual methods of lumbering in that section. T. E. Dorr, of this city (East Saginaw), business partner of Mr. Murphy, and an experienced lumberman, recently visited the tract for the purpose of determining the improvements necessary to get the timber out, and the probable expense. The understanding here is the purchasers have made a fairly good investment."—*Northwestern Lumberman.*

Utilizing Sawdust.

Numerous methods have been devised to utilize sawdust, thousands of cords of which are annually consigned to the flames for the purpose of getting rid of it. Compressing machines have been invented to press it into solid substances for use as fuel, and for other purposes, and the inventive genius of the country is still engaged in the attempted solution of the problem, "what shall be done with the sawdust?" A new idea has lately materialized, according to an exchange, which says: Pine sawdust, highly compressed, has been successfully used to make up center frames of carriage wheels. It is said to be so solid that it will bear a pressure equal to 23 tons per square inch. As sawdust has also been used for partition and bricks, its application to the production of complex carvings and mouldings does not seem to be far off. This opens up quite a new market for sawdust, which has hitherto been a comparatively waste product.

MANAGER.

Wanted Engagement to Manage a Lumbering Business in the woods. Large experience in Logs and Square Timber. Refers to Sixteen Years Service with late Employers. Address

MANAGER,

How Many Miles Do You Drive!

The

ODOMETER

Will Tell.

This instrument is no larger than a watch. It tells the exact number of miles driven to the 1-100th part of a mile; counts up to 1,000 miles; water and dust tight; always in order; saves horses from being over-driven; is easily attached to the wheel of a **Buggy, Carriage, Sulky, Waggon, Road Cart, Sulky Plough, Reaper, Mower,** or other vehicle. Invaluable to LIVERYMEN, PLEASURE DRIVERS, PHYSICIANS, FARMERS, SURVEYORS, DRAYMEN, EXPRESSMEN, STAGE OWNERS, &c. Price only **$5.00** each, one-third the price of any other Odometer. When ordering give diameter of the wheel. Sent by mail on receipt of price, post paid. Address

McDONNELL ODOMETER CO.,

SAW MILLS

AND

TIMBER LIMITS

WITH

Logs, Lumber, Store Goods, &c

FOR SALE

In the District of Algoma, Ont.

Eighty-Five Square Miles (54,400 Acres) of Limits, Good Pine, First-Class Water Power, Large New Water Mill, Steam Mill, Store and Dwellings.

Canada Pacific Railway now running through part of the property.

For full particulars address:—

WILLIAMS & MURRAY,
L7tf GODERICH, ONT.

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily and honorably. Address TRUE & Co., Augusta, Maine.

THE LUMBER TARIFF.

The Honorable Sir John A. Macdonald, K. C. M. G., Minister of the Interior, Ottawa, Canada.

HON. SIR,—In the interests of the lumbering industry, I respectfully beg leave to bring to your notice and to that of your colleagues, the anomaly and injustice of the National Policy tariff, in the way in which it is at present constituted; that while all other branches of industrial establishments and interests in Canada have received the thoughtful consideration, and the fostering and quickening influence of the Government, through the tariff, the lumbering industry has never received any material benefit more than that which it received under the tariff of 1878,

Under the present tariff, everything used and consumed in the mills, and in the forest, necessary to the prosecution of this most important Canadian industry have increased in price, thereby causing its products to cost more when ready for delivery, and at the places of shipment, than when under the old tariff.

The following comparative statement will show the exaction of the tariff as bearing on the lumbering interest, for the years of 1878 and 1883, respectively, on articles of prime necessity, and which are imperatively necessary to the efficient prosecution of the industry, viz.—Pevies (canting bars), pick hand-spikes, steel and iron shod sleds, boom and binding chains, haruess, oats, hay and cornmeal, boots, woolleu clothing, duck jumpers and over-alls, flour, pork, beef, beans, dried apples, lard, butter, molasses and tea, steam engines and boilers, machinery, water-wheels, axes, mill saws and files and machinery oil.

Articles.	*Revenue Tariff, 1878.*	*Protective Tariff 1883.*
Steam Engines and Boilers	17½ per cent.	25 per cent.
Machinery and Water-wheels		
Millsaws and Files		
Machinery Oil		5 per cent.
Chains	Free.	$5 00 per ton.
Steel, for shoeing sleds, for Hand-spikes and Pevies	Free.	25 per cent.
Harness and Boots	17½ per cent.	20 per cent.
Hay	10 per cent.	10 c. per yd. and 25% Adv.
Woollen, Clothing	17½ per cent.	2c. per yd. and 15% Adv.
Duck, for jumper and over-alls	17½ per cent.	30 per cent.
Duck jumpers	17½ per cent.	1c. per lb.
Pork and Beef	1c. per lb.	10c per bushel.
Oats	Free.	40c. per bbl.
Cornmeal	Free.	50c. per bbl.
Flour	Free.	15c. per bushel
Beans	Free.	4c. per lb.
Butter	4c. per lb.	2c. per lb.
Lard	1c. per lb.	30 per cent.
Axes	17½ per cent.	

It will be seen on an examination of the foregoing comparativo statement, that the present customs tariff (excepting on tea and molasses) is excessive, and must, therefore, bear more heavily on the lumbering industry than the previous tariff.

It is a contradiction of the meaning and spirit of the National Policy, as the people have been educated in understanding it, to admit woods of foreign countries free of duty into Canada in competition with those of our forests—of which injustice the following paragraphs, copied from the customs tariff now in force, will serve to show:

"Lumber and timber, plank and boards, not shaped or otherwise manufactured, of boxwood, cherry, chestnut and hickory, mahogany, oak, pitch pine, rose-wood and sandal-wood, Spauish cedar, walnut and white-wood.

"Woods not further manufactured than sawn or split, viz.—Africau teak, blackheart, ebony, lignum-vitæ, red cedar and satiu wood."

The admitting of the woods of foreign countries into Canada free of duty, in competition with the produce of our forests—excepting those which cannot be done without in the manufacturing of ships' blocks—is opposed to the general interests of advancing the prosperity of the country, and is decidedly coutradictory to fosteruug aud encouraging the lumber iudustry. We have in our forests an abundance of valuable and most beautiful woods, suitable for the finest of manufactures for which wood is used. We have walnut and white-wood, oak and most beautiful varieties of maple and birch and ash, elm and hickory; this being the fact, all woods should be on the duty list.

The American Government and people are not as generous nor as partial to our lumbering interests as we are to theirs. While we admit their timber into Canada, duty free, and give them the privilege of using our market as well as their own, they exact a heavy tax on the value of our woods on entering their territory.

From a careful perusal of the following paragraphs, which were copied from that portion of the American customs tariff particularly dealing with the importation of foreign woods, it will be observed that the statesmen in the Government of the United States have recognized in an eminent degree the policy of protecting its lumbering interests:

"Timber hewn and sawed, and timber used for spars and in building wharves, 20 per cent. advalorem.

"Timber squared or sided, not specially enumerated or provided for by this Act, one cent. per cubic foot.

"Sawed boards, plank, deals and other lumber of hemlock, whitewood, sycamore and basswood, one dollar per thousand feet, board measure. All other articles of sawn lumber, two dollars per thousand feet, board measure. But when lumber of any sort is planod or finished, in addition to the rate herein provided, thero shall bo levied and paid for each side so planed or finished fifty cents per one thousand feet, board measure.

"And if planed on one side, and tongued and grooved, one dollar per thousand feet, board measure.

"And if planed on two sides, and tongued and grooved, one dollar per 1,000 feet, board measure.

"Staves of wood of all kinds, 10 per cent. advalorem.

"Pickets and palings, 20 per cent. advalorem.

"Laths, 15 cents por one thousand pieces.

"Pino clapboards, two dollars per one thousand.

"Spruce clapboards, ono dollar and fifty cents per one thousand.

"Wood, unmanufactured, not specially provided for in this Act, 20 per cent. advalorem.'

In addition to the many disadvantages existing against the profitable prosecution of the lumbering industry I may mentiou the export duty—on shingle bolts, ono dollar per cord of 128 cubic feet; and on spruce and pine logs, one dollar per thousand feet. If there was a scarcity or an insufficiency of timber in our forests in supplying the wants of our people, this tax then might be considered excusable. No such argument, however, can be successfully advanced in favor of its continuance, as we have an inexhaustiblo supply of timber in the forest, sufficient for the wants of tho couutry for all time to come.

All other iudustries iu Canada, without exception, are protected and fostered, and are in various ways encouraged, and receive full privilege under the tariff, without let or hindrance, to export their products where they please; and why, therefore, the lumbering industry should be singled out to be restricted and hampered in its export, I must confess that I cannot understand.

In support of the statement that all industries (excepting lumbering) in Canada are protected and fostered, and otherwise receive the benign influeuce of the Government, through the tariff, I respectfully beg leave to mention the iron industry. My reasons for singling out this trade to make a comparison is that it more recently received the generosity of the Government than others. Iu addition to the generous manner in which this industry was considered in the past, when framing the new tariff your colleagues were pleased, during the last session of Parliament, in further protecting it, by placing the duty on steel at five dollars per ton, and in making an appropriation of a sum, presumably in the estimates, sufficieut iu giving this highly favored industry a cash bonus of one dollar and fifty ceuts per ton on all the ore that would thereafter be extracted from the soil.

The following statement will show the number of tons of iron ore raised from the pits in the year ending April, 1881, and respectively by Provinces:—

Provinces.	*Tons.*
Ontario	91,877
Quebec	74,242
Nova Scotia	53,878
British Columbia	2,560
New Brunswick	500
Total tons	223,057

The number of tons of ore, as shown in the foregoing statement, was the out put of the iron mines in Canada for one year. The bonus will, no doubt, have the effect of largely stimulating this industry, and it is possible the present year may record the output to be 500,000 tons. If this figure is reached, it will mean that this industry will receive from out of the treasury ($750,000) seven hundred and fifty thousand dollars.

In the Province of Nova Scotia there was raised from the pits 53,878 tons, and of this quantity 38 tons was for Cape Breton County, and the balance, 53,840 tons, was the output of mines in the County of Colchester, which are owned and worked by the Londonderry Iron Works Company and others. This bonus, theu, would mean for the proprietors of these mines the recciving of a sum, annually, of, at the least, eighty thousand dollars. An amount sufficient in paying the interest at four per cent on a capital sum of two million of dollars,—which is a larger sum than that which is at present invested in the iron industry there.

It is not for me to say that this princely generosity of the Governmcnt should not be continued towards encouraging a larger development of the iron industry—not at all—but merely to give an idea to the representatives aud thinking people of Canada of the great difference there is in encouragement given to this and other industries as contrasted with lumbering interests.

From all these circumstances it must be admitted that the lumbering industry suffers under great disadvantages compared with other industries, and never received that measure of consideration and encouragement from the Government to which, from its great importance as a labor-giving industry, it is justly entitled.

To give you an idea of its present proportions, and its great importance as a source of national wealth, I beg to direct your attention to the perusal and close examination of tho subjoined statistical statements which were made up from the report of the census of 1881, and from the trade and other returns of Canada which were available, and must, therefore, be reliable.

The gross value of the produce of the forest for the year ending the 4th April, 1881, was $38,541,752. This amount was credited among the various Provinces as follows:

Ontario	$ 16,601,175
Quebec	10,542,649
New Brunswick	6,532,826
Nova Scotia	3,094,132
Manitoba	885,173
P. E. Island	240,153
Territories	95,318
	$38,541,752

The value of the product of this industry for 1881, if divided among the people, the population now being 4,344,810, would give nearly niue dollars to each iuhabitant.

The following statement will show on examination the number of saw mills, large and small, inclusive, engaged in maunfacturing in the various Provinces in 1881, and, besides, the number of stave and shingle mills in operation, and also the number of hauds employed.

Provinces.	*Lumber Mills.*	*Shingle Mills.*	*Stave Mills.*	*Men.*
Ontario	1761	204	27	18,010
Quebec	1729	377	1	13,312
New Brunswick	478	85	....	7,494
Nova Scotia	1190	114	3	4,435
Manitoba	37	...	....	582
P. E. Island	165	16	....	459
British Columbia	27	5	....	404
Territories	3	...	...	44
Grand total	5390	801	31	44,740

It will be seen in the foregoing statement that 44,740 persons were directly employed in 1881 in the mills manufacturing the produce of the forests into deals, inch and other lumber, shingles, staves, &c. This number does not include the lumbermen in the woods nor the log drivers on the rivers and streams, if they were enumerated and added, it would be found that the number of hands directly employed through the lumbering industry in the mills and in the forest, and on the rivers and streams in that year was not less than 100,000 people. The census returns show that for 1881, there were 812,136 distinct families in the Dominion, and the population numbered 4,324,810 souls, which makes the average number of persons in each household to be five and a fraction. It is therefore reasonable to infer that, taking each family, including the wage-earner, to be composed of five persons (man and wife and three children), the lumbering interest, as one industry, has been equivalent in 1881 to the giving of a livelihood to about 500,000 of our people—being about one-ninth of our whole population.

The amount of capital invested in the industry, including mills, machinery, &c., was estimated at $25,059,680, and credited respectively to the Provinces as in the following:—

Provinces.	*Capital.*
Ontario	$11,397,889
Quebec	7,673,608
New Brunswick	3,058,436
Nova Scotia	1,704,133
Manitoba	609,350
British Columbia	344,350
P. E. Island	217,919
Territories	64,000
Total capital	$25,059,680

In the following statement will be seen the total value of the export of the produce of the forest, manufactured and otherwise, for the year ending 30th June, 1883, and respectively by Provinces:—

Provinces.	*Export.*
Quebec	$ 9,280,233
Ontario	8,015,485
New Brunswick	4,724,422
Nova Scotia	1,587,041
British Columbia	362,871
P. E. Island	20,098
Total export	$23,991,053

When it is considered that the total sum of capital invested in 1881 in all of the industrial establishments in the country was $165,302,622, and of this great sum the lumbering interests shared $25,059,680, and that its produce exported in this last year, 1883, ending 30th June, reached twenty-five per cent. of the sum total of all Canadian produce exported to foreign countries, it must therefore be conceded, without cavil or doubt, that the lumbering industry is, in extent and in value, the greatest and most important of our industries.

The foregoing comparative statements give but a faint idea of the immeuse wealth that can be gleaned from our forests.

The Dominion has in its unexplored forests an iuexhaustible supply of various kinds of wood, and which is in extent and in quantity sufficient, when developed, of giving a livelihood to more than a million of our population; and I have no hesitation in stating that this much to be desired result can be arrived at within the next decade by the Government eucouraging the industry.

The encouraging of the lumbering industry, with a view of facilitating its greater development, is a broad question and worthy of the gravest consideration of the Government. It is a national question of the first importance. It not only affects one Province, but all the Provinces, and if the Dominiou is ever to become rich and powerful, and to rank and be respected as one of the great nations, it must in a large measure be through the opening up of our vast resources, which cau be doue by a judicious encouragemeut beiug given to our industries—to utilize and work up, in mauufacturing and otherwise, the resources of the soil.

This question of fostering aud facilitating a greater developmeut of the lumbering industry is not a new subject; it was the one great plank in the platform of argument made by candidates seeking Parliamentary honors in 1878, and by the press favoring the (so-called) National Policy, that so soon as that policy would be confirmed by the people the first caucus of the Governmeut—its promoters—

would be the consideration of developing our industries.

It is now five years since the inauguration of that policy, and particularly now, that nearly all of the industries of Canada have in various ways received marks of encouragement from the Government, it must be admitted, therefore, that it is about time the promises made to those interested in lumbering in this connection were fulfilled.

There is no class of people in the Dominion of Canada who has greater claims or deserves more encouragement of the Government than the lumbermen. It is a fact that their interests have been ignored and neglected, never receiving but small recognition from any of the Governments in the past nor under the present regime, notwithstanding they pay tribute, as it were, to every home industry, and, besides, paying as much, if not more, revenue into the treasury per capita, than of that received from those prosecuting other industries.

It is a difficult problem to figure out, or to state with any great degree of reliability, as to how much more revenue is paid by one class of our population than another, as there are no statistics at present to be found in the blue-books of the Parliament treating on such a subject. But, if we carefully examine the revenue statistics of Nova Scotia for the year 1866, it being largely a non-producing Province, some information may be gleaned on the question which may serve to arrive at, fairly, a correct conclusion.

The Province of Nova Scotia previous to Confederation, was not an agricultural nor a manufacturing country, to any extent. The occupations of the people consisted principally in mining, fishing, shipbuilding, and in lumbering, and hence their imports were larger than Provinces in which the people earned a livelihood though other avocations. The average of the customs tariff of this province at that time was small, not exceeding ten per cent., still the *per capita* tax of the people on this average reached ($3.76) three dollars and seventy-six cents (*vide* the Auditor-General's Report to Sir John Rose, the then Finance Minister, on the letter of Hon. A. W. McLellan, dated September 17th, 1878, asking, that Nova Scotia receive better terms). The present Dominion tariff, when figured to make a general average, will be found to equal an advalorem duty of twenty-five per cent. Now, if we apply this average of our tariff to the imports of Nova Scotia for 1866, it will be found that they would be paying under such a tariff, a *per capita* tax of at least nine dollars and forty cents; the same rule applies to the lumbering industry as to Nova Scotia.

It may, therefore, be safely estimated that under the National Policy tariff, the lumbering population of Canada, numbering about 500,000 people, pay nearly five millions of dollars in customs and excise towards providing for the expenditures of the country, and in giving protection and bonuses to the various industries, It is therefore unreasonable to expect that the lumbermen will be satisfied any longer in being thus treated, without receiving, in some measure, a countervailing benefit.

In this connection, and with a view of assisting the Government in devising a scheme for the better development of the lumbering industry, I beg respectfully to offer for your consideration some ideas that have presented themselves to my mind. which are as follows:

The repeal of the export dues on Canadian spruce and pine logs, and from off shingle and stave bolts; the removal from the free list to the duty list of all foreign woods, excepting those kinds which are imperatively necessary and cannot be done without in the manufacture of ships' blocks; the exporter or shipper of deals or other lumber, whether of pine or spruce, when being exported to foreign countries (to offset, in some measure, their import duties), to be paid an export bounty or bonus, per standard on deals, and per thousand feet on boards.

The policy of encouragement as foreshadowed in the foregoing suggestions, if acted upon by the Government, would, in my humble opinion, work beneficially, causing a larger development of the industry. It is a question in which the people of the country from Cape Breton on the Atlantic to British Columbia on the Pacific, are largely interested. The Government, however, might think it better to refer the matter to a commission, composed of gentlemen from the several provinces having a knowledge of the subject, who would give their most earnest consideration to the question, and report on a policy which could be acted upon by your colleagues.

It is unnecessary for me to tell you that there are certain duties developing on and expected from the Government under the National Policy, and that the principal one of which is to legislate and so frame the tariff that it will foster and build up uniformly the various industries. The majority of the people declared in favor of that policy on two occasions (1878 and 1882), believing the principles on which it is based to be sound, and best suited to advance the industrial and other interests of the country, and they expect it to be applied and carried in its entirety.

Trusting that this great question of the lumbering industry will receive the earliest and most earnest consideration of yourself and colleagues, and hoping that the result arrived at will be the placing of it in the rank of equality to which, from its great importance as a labor-giving industry, it is entitled, with other Canadian industries.

I have the honor to remain, Sir,
Your obedient servant,
JOHN A. MACKASEY.

Halifax, N. S., July 23, 1883.

TIMBER LOSSES FROM FIRES.

To the Editor of the Monetary Times.

DEAR SIR,—My attention has been called to an article in your paper of the 27th July, entitled "Our Forest Wealth," in which you say "we would hesitate to accept as accurate the statement of Mr. Thistle at a Forestry convention—on which Mr. Phipps bases some caculation that fire destroyed ten times as much timas the axe." As my name has been given as the maker of this somewhat sweeping assertion—unsupported by any data—an explanation as to how the error may have occurred in connecting it with my name, if in the report of the Forestry convention, is necessary. The opinion I expressed then, and of which I was satisfied from extensive explorations when practising as a land surveyor, and since in connection with my lumbering business, was "that the amount of timber so destroyed was far in excess of that manufactured." The same day on which I saw your article, meeting Mr. Peter White, M.P.P., for North Renfrew, an extensive and observant lumberman, who had taken an active part in the discussion mentioned, I asked him if he remembered it, and how such a mistake could have arisen. He informed me that the Hon. Geo. Bryson, also a very experienced lumber merchant, in the course of the debate had expressed it as his opinion that in the valley of the Ottawa, in the country that had come under his observation, the proportion of pine destroyed by fire would be about ten to one manufactured.

The very large fires that have burnt over the country extending from Lake Nipissing and Sturgeon River, to the meridian of the Sault St. Marie, and also from the head waters of the northern tributaries of the Ottawa to the watershed of the Hudsons Bay, which fires took place long prior to the commencement of timber manufacturing, would impress one, when included with more recent fires in our pine, arising from settlers' carelessness in clearing lands, and from hunters and river drivers, that the estimate given by Mr. Bryson from his own observations, may be generally nearer correct than one likes to suppose. It must be borne in mind that a country once burnt over is destroyed from the seedling up—while in manufacturing, as the operator is always seeking for the best article his limit will produce, the thinning out tends to the more active growth of younger timber. And if fire could be avoided the natural seeding and growth would, in my opinion, support a very considerable manufacture.

In this connection I am satisfied that any efforts to draw public attention and educate the people to the importance of protecting the forests will be thoroughly appreciated by the lumbering interests. And so highly do the license holders regard the necessity for caution that very few would take the risk of clearing up new lumber farms, or increasing old ones, if they are at all near their pine forests. I think it is safe to say that bush fires are becoming much less frequent, and that the efforts of the various governments towards establishing some system of forest fire police in connection with the present staff of forest rangers will be productive of further benefit, more especially when aided by the better information of the public in such matters, that must result from their discussion in the press.

I am truly yours,
WM. R. THISTLE.

August 1st, 1883.

Great Sale of Timber Limits.

MONTREAL, Aug., 16.—It is stated that Mr. Senecal has made another grand coup of half a million by selling the timber limits of Hull estate to his new colonization company at the meeting in Quebec yesterday for two millions and a half, leaving him master of a considerable portion of the property, the whole of which cost him about a couple of months ago exactly two millions. The purchase includes the mills, wharves, and houses. It covers an area of 2,700 square miles of land. The timber wharves at Montmorenci extend eight miles, and are reported to be the finest on the continent. An English expert who examined the property estimates the annual production of timber at eighty millions of feet. The stock books of the new company, which were only opened here at the beginning of the present month, contain subscribers, it is reported, for $1,500,000. This looks as if there are lots of capital in the province for investment.—*Mail.*

Cause of Boiler Explosions.

A fruitful source of damage done to boilers, and one which has ruined thousands, is the practice of blowing a bsiler off, and immediately refilling it with cold water, while the brickwork is red hot. The *Age of Steel* believes that nothing will tear a boiler to pieces quicker than this. Boilers bave exploded with disastrous effect from this cause after the fire had been drawn. Probably most persons not familiar with the matter would be surprised to know the pertinacity with which cold water will cling to the lowest point of a boilor under these circumstances. Local contraction of such severity is thus enduced that nothing can withstand its effects, and a few repetitions are generally sufficient to ruin any boiler.

Big Blaze in Chicago.

CHICAGO, Aug. 15.—The United States Rolling Stock Co.'s buildings were burned last night. The fire began in the planing mill. The loss will reach half a million. The stock destroyed included 60 complete cars, valued at $500 each, and a million feet of lumber. The company employed 500 hands.

COTTONWOOD lumber seems to be coming into large use, and for dry goods cases, starch boxes, and similar purposes it is said to be well adapted. One establishment in Ohio, it is said, works into boxes as many as two million feet of lumber annually. For building purposes it is not well adapted, as it apt to swell and shrink with the condition of the atmosphere.

Market Reports.

TORONTO.

From Our Own Correspondent.

AUG. 23.—There is a fair amount of trade being done by all the retail yards here at present. Nothing rushing and still little to complain of. The stocks at nearly all the yards is extremely light, most of the dealers preferring, whenever possible, to fill orders direct from the rail. This method saves long hauls to their yards, and in a majority of cases amounts to a saving of 50 cents per M, which in itself gives a living profit in cases where prompt payment is made. Dealers are enabled to adopt this course at the present time owing to the large quantity of lumber owned by wholesale dealers piled off the cars alongside the rails. On enquiry I find there is some disposition on the part of retailers to cut down on figures previously quoted you, but mainly in cases where direct delivery can be made from the rail, and to good men. Laths have receded in price and may now be quoted at $2 per M in car load lots, and $2.50 per M from the yards. Shingles remain firm at previous quotations, choice lots of clear and picks have been sold during the past week at $35.00 by car load lots. Shipments from our docks move off slowly, something like 3,000,000 feet having left here since my last letter, but it would look more cheerful had 10,000,000 feet passed off in the same time, which could have easily been done had there been the demand for it. Choice lots will sell readily enough, it is the coarse common that accumulates on our hands, and when we take into account the fact that only few stocks will pan out more than 10%, clear and picks, you will be able to form some idea of the large amount of common that accumulates, unless it can be worked off at paying figures, owners of large stocks must come out behind at the close of the season. Allowing only 100,000,000 feet of mill run lumber as likely to find its way to this market for tho season of 1883, we have eighty to ninety millions of coarser grades to got rid of by some means, and with a limited local market, this means a glut. It must be borne in mind that the above is a low computation, and, in placing it thus low, I do so believing that by reason of the present slack demand a larger amount will be held over at the mills during the coming winter than for some years past. In consequence of the late starting up of the mills this was at any rate a foregone conclusion, and the present condition of the market will tend to make the quantity to be wintered over still larger than was anticipated. We have only a little over two months on which to depend for safe navigation and I fear there is no chance to crowd a good season's work into so short a space.

MONTREAL.

From Our Own Correspondent

AUG. 25.—We have little or no change to note in our lumber market. Prices keep steady and unchanged for seasoned lumber, but there is an easier feeling for new cut stuff, and a decline is said to have taken place in Ottawa for that description, but no concessions will be made as yet for dry. The enquiry for ash and cherry on American account is well maintained, and holders are firm. Shipping demand for deals has been good and a considerable quantity are being shipped. Local demand for building purposes is fairly active. We continue to quote dry lumber ex yard as under.

FREIGHTS AND SHIPPING.

Since the date of our last report only two vessels have been loading for South America and no clearances as yet reported. Another vessel was taken up to-day for the River Platte at $15.50. A considerable quantity has been shipped to the United Kingdom at rates averaging from 65s. to 67s. 6d., and there is a still fair demand for room on board outgoing steamers. The shipments since the date of our last report recorded at the custom house are as follows:—To London, SS New York City, 19,286 pcs deals: SS Avlona, 9,055 pcs deals; SS Erl Ling, 4,391 deals and 761 ends; Brig Mathilda, 7,829 deals and 129 ends. To Liverpool, SS Lake Huron, 5,225 pcs deals, SS Anjer Head, 297⅞ std. deals and 45 std. boards; SS Ontario 10,875 pcs boards and 6,932 pcs deals; SS Circassian 4,068 pcs deals; SS Hanoverian, 6,037 deals; SS Lake Nipigon 2,519 pcs deals; SS Oregon, 2,886 pcs deals and 21,779 deal ends; SS Lake Winnipeg, 6,073 boards; SS Texas, 9,760 boards and 4,778 ends. To Glasgow, brig Limpio, 4,164 pcs deals; SS Lucerne, 189 pcs boards. To Gloucester, Bk. Spencer, 8,053 pcs deals and 300 ends; Bk Hero, 8,630 white pine deals and 880 deal ends. To Bristol, SS Dorsot, 5,738 pcs deals.

CORDWOOD.

There have been fair arrivals and the stock on the wharf is ample for all requirements as the demand at present is not very active. Maple is a little dearer, and we advance quotations half a dollar. We quote on the wharf ex cartage as follows:—

BOSTON.

Cotton, Wool and Iron of August 17, says:—There is a quiet demand, but trade is about as good as is usual at this midsummer stage. Stocks in the yards are quite moderate, but there is a disposition to proceed in a very cautious and limited manner. Eastern lumber has arrived quite liberally, with hemlock steady, pine boards in fair request, spruce lower, and laths scarce, firm and in good demand. Western pine is rather dull, with light arrivals, but ample stocks to supply the present limited demand. Southern pine is quiet, with few orders on the market for timber. Flooring and steps are steady with a moderate supply.

Hard woods are moving fairly. Walnut of good grades is in fair demand. Cherry of choice descriptions is in good request. Whitewood is dull, with an overstock, especially of second quality and culls. Ash and oak are quiet and in moderate demand at about previous prices.

CHICAGO.

The *Northwestern Lumberman* of Aug. 25, says:—The past week has been one of the dullest of the season. Arrivals have been meagre compared with the two previous weeks and at that cargoes have stuck to the market with surprising pertinacity considering the fewness of the offerings. The total of arrivals at this port for the week ended on Wednesday were 187 as compared to 240 for the week before. Of all coming, a regular proportion go to the yard docks without stopping at the market, whether the total of arrivals is great or small; so in case there is a meagre total there is a smaller than usual proportion of offerings on the market. This has been the condition for the past week. The wind has blown a gale from the west and southwest a large part of the time, thus preventing the fleet from reaching port, and it is probable that this adverse condition will be succeeded by one directly opposite, and that by the time this report is in print the river will be blockaded by loaded vessels. In fact, at this writing the wind has veered to the northwest, and frequenters of the market are looking for a big squadron of luggers.

It might have been supposed that since the arrivals were few the inquiry would have been urgent and prices a little better than when the market was crowded. But such has not been the case. The market has been sluggish all the week, and trading has been done at the recent decline in values. The wholesale dealers continue to go slow about purchasing.

Receipts of lumber, shingles, etc., for the week ending Aug. 23, as reported by the Lumberman's Exchange:—

ABERDEEN.

The *Timber Trades Journal* of August 11, says:—Imports here and along the coast have been comparatively light during the past month, while the spurt in the building trade is quieter.

At Messrs. Milne & Co.'s sale last week of waney pine deals and hardwoods there was a good attendance of buyers, and prices on the whole were pretty good. These sales, however, of American goods are felt to be a necessity in the north, and are generally well patronized, and value given for the goods exposed; with manufactured stuff this cannot be said. Waney pine fetched from 2s. 3d. to 3s., according to girth; deals, 3s. 2d. to 3s. 6d.; elm, 2s. to 2s. 4d.; birch, 2s. to 2s. 2d.; hickory also sold well.

CARDIFF.

The *Timber Trades Journal* of August 11, says:—This week has been a very dull one here; only one steamer cargo of about 400 standards has come to hand from the Baltic, and a sailer from Wyborg, and one from Miramichi.

Respecting engagements of tonnage the market has been exceedingly inanimate. Canadian goods, we hear, are pretty stiff, and a rising tendency is apparent both in prices and rates of freight. Buyers, as a rule are not pushing matters, but it is reported that some c.i.f. transactions have been effected by Liverpool and London merchants. There is no doubt that Canadian goods are considerably firmer than they were some weeks ago, which is more than can be said about Baltic material.

Mining timber and props remain in much the same condition. We have seen a slight rise in French props, but Norwegian mining timber has not advanced equivalently, although buyers ought to pay more than is the case at present.

GLASGOW.

The *Timber Trades Journal* of Aug. 11 says:—The imports of wood to the Clyde for the past week include five cargoes of Quebec timber and deals at Greenock, the tonnage of the vessels employed in conveyance aggregating 9,900; and at Glasgow the imports of Quebec deals have been about 1,800 loads. Imports at Grange-

mouth are represented by a carrying tonnage of 2,041 tons.

In the meantime the market is fairly furnished with all the ordinary useful descriptions of wood ; but as yet it is quite safe to say there is no appearance of a glut in the market. The Quebec arrivals have been comparatively moderate. Of lower port birch there has been rather a sparing supply at Glasgow this year, the yards at present being quite bare. There is an opening also for Tabasco mahogany, with prospect of fair prices being realized.

Imports of pitch pine have been considerable, but not up to last year's total at date ; tonnage employed, say 1882, 33,000 ; 1883, 28,000 tons.

The amount of work on hand specially in shipbuilding is very large. Although housebuilding is still quiet with us, 1st quality Canadian deals of good dimensions would be a safe import, as the stock on hand is moderate, and the demand by machine makers and millwrights considerable, besides what is required by builders and for general joiner work.

LEITH.

The *Timber Trades Journal* of August 11, says :—The import list for the past week only contains four cargoes deals and battens two of which are from Archangel) and consignments of wainscot and walnut. Other four of the Quebec fleet came into the Roads on Tuesday, but their cargoes are not passed at the Custom House at the time of writing.

On Tuesday last Messrs. Ferguson, Davidson & Co. offered for public competition their cargo of American goods ex Garibaldi. For the waney pine not a single bid was forthcoming, notwithstanding its undoubtedly superior quality. This, taken in conjunction with the very few lots sold by Messrs. Wm. Thomson & Co., at their sale on the previous Tuesday, does not seem to give a very bright outlook in face of the unusually heavy shipments from Quebec to this port. Only 14d. was offered for the 3rd yellow pine deals, a price which the auctioneer did not deem fit to accept, although fully 1d. per foot above the same stuff bought on the previous Tuesday. A good portion of the deals, which are of very fine quality, were sold privately at the close of the sale at a substantial advance on the price offered at the sale.

On Tuesday first Messrs. Mitchell, Somerville & Co. will offer an assortment of prime deals and battens for public competition, while the following week Messrs. A. Garland & Roger will expose their Quebec cargo.

LONDON.

The *Timber Trades Journal* of Aug. 11, says : Among the 66 timber and partly timber-laden ships reported in London between the 2nd and the 8th instant inclusive, 14 were from our North American colonies, a rather large importation thence in a single week ; hut there were 21 from Russia and Russian Finland. There were 31 steamships in the list, several with small parcels of staves, &c., and upon the whole the supply was varied and ample for the state of the demand. The abundance of steam vessels at present seeking employment is thought likely to keep freights for the chief timber depots from rising this year so early as they did last summer, but small handy sailing vessels, from 100 to 140 standards, are likely to be in demand for the outports,and will probably obtain some advance on the first open-water rates ere the present month expires.

LIVERPOOL.

The following appears in the *Timber Trades Journal* of August 11 :—Since the auction sales held during the latter part of last week there has been little of moment to remark upon, as the import has still continued light, and the consumption has naturally been interfered with by the intervention of the holidays. We may, however, look forward for several arrivals, as a strong southwest breeze has sprung up, which will bring up many vessels now due, not only from Quebec but from other ports in the Dominion. Freights in St. John, N. B., fluctuate but little, and with a continuance of the low prices obtained for spruce deals on this side there is no disposition to charter ; in fact, it is reported that several mills have shut down rather than continue cutting at the prices now going at the ports in the United Kingdom.

On Thursday, the 2nd instant, Messrs. A. F. & D. Mackay held one of their periodcal auction sales of deals and whitewood. The catalogue was, however, somewhat more limited and unattractive than usual and owing to these causes, and probably to the influence of the holidays, neither the attendance of buyers, nor the competition for the goods submitted for sale, was equal to what was expected. About 3,500 pieces of the St. John, N. B., cargo were withdrawn, as the prices hid were not up to the brokers' limits ; the other goods sold realized the following prices :—

THE COMING TIMBER.

There seems to be no denial of the statement that hemlock will succeed pine lumber in the early future, and the Muskegon mill men should keep their eyes on the hemlock timbers on the Muskegon rivers and tributaries. Throughout most portions of the North-west hemlock is abundant. It can be bought for a song almost. The price of hemlock at ten cents a thousand is nothing, when compared with pine that will produce nothing but coarse lumber at $3 per thousand, and plenty of it has been sold at that. There are a very few manufacturers in Michigan who mix their hemlock with their pine dimension, and get the same price for it. Others make $1 per 1,000 difference. Hemlock dimension is certainly as good as Norway, and the latter sells on the cargo market here at not more than 50 cents less than white pine, and often not so much difference as that is made. Hemlock, at present prices, is a good investment, much better than pine, the way they have been booming the latter in certain sections.—*Muskegon News.*

CENSUS FIGURES.

The following comparison of forest products in Ontario, Quebec, Nova Scotia and New Brunswick, is taken from the Dominion census return :—

	1881.	*1871.*
	Cubic Feet.	
Square white pine	17,358,245	55,236,921
Square red pine	2,571,328	1,954,372
Square oak	5,734,042	3,302,643
Tamarac	4,585,563	5,695,963
Birch and maple	4,294,916	1,939,357
Elm	3,092,224	1,832,654
Walnut	808,350	220,570
Hickory	336,426	197,827
All other timber	47,045,450	20,290,264
Total	88,876,457	69,670,471

Of logs the output was, in the two years —:

	1881.	1871.
Pine logs	21,501,128	12,416,408
Other logs	23,055,706	9,314,557
Masts, spars, &c.	191,078	121,685
Tanbark, cords	398,239	162,521
Firewood, cords	10,493,155	8,713,083

Increased Speed Between New York and Liverpool.

After many sleepy years of slow boat employment the Cunard Company now begins to show hopeful signs of wakefulness to enterprise and appreciation of the public wants. During the past year it has put into service two new and splended steamers, the Servia and Aurania, which are almost equal in speed to some of the fast boats long used on rival lines. The company has now made a contract with Messrs. John Elder & Company, of Glasglow, for the building of two additional steamers of a character and power far in excess of anything that hitherto been devised for the Atlantic mail and passeger service.

They are to be vessels of 8,000 tons burden, and are to have engines of 13,000 horse power indicated, their dimensions being 500 feet long by 75 feet in breadth of heam, by 40 feet in depth of hold ; and what is perhaps the most striking fact of all is, that they are to be guaranteed to steam at the rate of nineteen knot per hour, thus crossing the Atlantic, between Liverpool and New York, in less than six days. These two ships are to cost three millions of dollars.—*Scientific American.*

QUEBEC CULLERS' OFFICE.

JAMES PATTON,
Supervisor of Cullers.

Quebec, Aug. 10.

LAKE WINNIPEGUSIS.

Mr. McLean, of Toronto, a capitalist widely known in financial circles, has heen prospecting among the timber limits at the northwest end of Lake Winnipegosis during the past month. He helieves that the timber on the slopes of the Porcupine hills is unequalled in any other part of the Northwest, and is not surpassed on the whole continent. There is an abundance of trees measuring from 4 to 8 feet in circumference, and some of them measure 18 or 20 feet. The scenery in some parts is spoken very highly of by Mr. McLean. He was particularly charmed with the portion of the Red Deer river between Red Deer Lake and Lake Winnipegosis. The river is about two hundred yards wide and studded with small islands, which Mr. McLean describes as perfectly fairy-like. Salt springs are to be found here and there, marked by the peculiar greenness and luxuriance of the surrounding vegetation. At the mouth of the Red Deer river there are some springs from which Mr. McLean manufactured a quantity of excellent salt. He mentioned the vicinity of Deep Rock river and Salt river as other places where he had found salt springs. Ducks, geese, and gulls, as well as pelicans, abound on Lake Winnipegosis at its northwest end. What particularly struck Mr. McLean was the immense size of the pelicans. Some of them, he says, measured nine feet hetween the extremities of the wings, while others would not have been less than nineteen feet.—*Winnipeg Sun.*

Manufacturing Spools.

The spool factory at Piccadilly, eight miles from Sussex, N. B., employs fifty hands. Twelve cords of wood per day are used, and spools of all sizes are made. The factory is turning out now about 10 000 gross per month, but it is equal to 17,000 gross per month, if necessary. Clark & Co., of Paisley, and other English thread manufacturers, are supplied.

DESTRUCTION OF THE B. C. CO'S MILL AT MIDLAND.

On Friday evening the 10th inst, the inhabitants of this prosperous village were thrown into a state of intense excitement when it became known that the new mill was on fire. About half-past six many persons in different parts of the village noticed a small blaze as if some rubbish was on fire in the mill yard. In a few miuutes, however, it proved to be the engine house on fire. From there it spread rapidly to the fine mill, which soon disappeared. Few expected when the mill was burning to see the lumber go also, but by ten o'clock the last pile of 6,500,000 feet was enveloped in the flames. Several attempts were made to make a break in the immense rows of lumber, but the fire raged so fiercely that the workers were driven back each time without accomplishing much. When the fire burned fiercest the illumination was so great that many at a distance supposed the whole village was on fire, and a great number hitched up their teams and drove into the village. The reflection of the fire was seen over thirty miles away. Had there been a north-west wind at the time the greatest portion of Midland would have disappeared as rapidly as did the immense piles of lumber. The mill property, after the fire, was visited by hundreds who felt keenly the loss of so great an enterprise. The scene of the fire is a desolate spot, the fire having swept over four acres and in its course consumed seven dwellings with the mill and lumber.

At present it is not known that the mill will be rebuilt, as the board of directors in the Old Country will have to be consulted. In the meantime, however, the men who were employed in the new mill will not be long out of employment, for as soon as the electric lights can be got ready the old mill will be kept running day and night. This will take place about Monday next, and then the whole of tho men will be employed. It is hardly possiblo to estimate what the loss will be to the village.

The loss on the mill, trams, &c., is estimated at $60,000, and the lumber in the yard at the time of the fire was valued at another $60,000. On the mill there is an insurance of something like $30,000, and on the lumber about $45,000. We understand that the dry lumber in the yard belonged to Messrs J. & F. N. Tennant, of Toronto, but we have not been able to ascertain the exact amount of their loss.

The fire it is supposed was caused by a spark from the boiler house.

THE GAME LAW.

The game laws have been so mixed and muddled by the Legislature that but few laymen can understand them. The following complitation of their provisions, however, may be relied upon, as it has been prepared by a lawyer of eminence, who is a keen sportsman as well:

The only season during which the following game may be hunted, taken, or killed, is as follows:

Deer—1st October to 15th December, inclusive.

Partridges—1st September to 1st January.

Quail—1st October to 1st January.

Woodcock—1st August to 1st January.

Snipe—14th August to 1st January.

Grey, black and wood ducks—15th August to 1st January.

Other ducks and geese—15th August to 1st May.

Hare—1st September to 1st March.

These may be exposed for sale for twenty days after expiration of time for killing. No eggs taken or destroyed at any time. No traps, nets, or snares, baited lines, or similar contrivances to be used. These may be destroyed by any person without liability. No contrivances described or known as batteries, swivel guns, sunken punts, or night lines to be used for killing wild fowl.

Fur-bearing animals may be only taken, hunted or killed as follows:

Beaver, muskrat, sable, marten, otter or fisher—1st November to 1st May. Nor shall any snare or other contrivance be set outside this season. Nor shall any muskrat house be cut, broken, or destroyed at any time. Any person may destroy such traps, suares, etc., so set, without any liability.

N. B.—No poison to be used in killing the animals named, and no poisoned bait to be exposed in any locality where dogs or cattle may have access to the same.

No deer dog to run at large from the 1st November until the 1st Octoter.

FINES AND PENALTIES.

Deer—$10 to $50 each offence.

Fur animals—$5 to $25.

Birds or eggs—$5 to $25 each bird or egg.

Any other breach of this Act—$5 to $25.

No fine can be less than the minimum fines above. The whole fine goes to the informer.

Insectivorous Birds Act, R. S. Ontario, page 2,009, and amendment 1878, page 82:

These acts do not apply to birds mentioned in the game act, or to birds commonly known as poultry.

It shall not be lawful to shoot, destroy, wound or injure, or attempt to do so, any bird whatsoever, except eagles, falcons, hawks, owls, wild pigeons, kingfishers, jays, crows, ravens, plovers, and blackbirds, but rails may be shot between 1st Septembee and 1st January. Nor shall the birds protected by these acts be taken, captured, bought or sold, or exposed for sale, or had in possession, nor shall any trap or snare be set for them, nor shall it be lawful to take, injure, destroy, or have in possession, any nest, young, or egg of the same. Any person may seize on view any such bird unlawfully possessed, and take the same before a magistrate.

For violation of any provision of these acts a fine of $1 to $20 is imposed, the whole going to the informer, and on nonpayment, imprisonment of from 2 to 20 days.

These acts do not apply to anyone having a written permission from the Commissioner of Agriculture authorizing him to obtain such birds or eggs for *bona fide scientific purposes* only.

1881. Page 284. Act to amend, etc.

Any person may, during the fruit season, for the purpose of protecting his fruit from the attacks of such birds, shoot or destroy on his own premies the birds known as the robin and cherry bird without being liable to any penalty under the act.—*Belleville Intelligencer.*

Noah's Ark Discovered.

A Constantinople correspondent announces the discovery of Noah's Ark. Turkish commissioners appointed to investigate the avalanches on Mount Ararat, suddenly came upon a gigantic structure. The Ark was in a good state of preservation. An Englishman saw that it was made of gopher wood which only grows on the Euphrates. The interior was divided into partitions. Into three of these only could they get, the others being full of ice, and how far the Ark extended they could not say. Says the *Pall Mall Gazette*, an American was soon on the spot, and negotiations have been entered into with the local Pasha for its transfer to the United States.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relievo the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

Convincing Proof.

Having suffered from rheumatism for a long time I was induced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to buisness, thanks to your wonderful medicine.

I am yours truly,
W. H. DICKISON,
218 St. Constant St., Montreal.

To Henry, Johnsons & Lord, Montreal.

Arnica and Oil Liniment is sold by all Druggists.

"LEAVES have their time to fall," says the poet, but Wild Strawberry leaves are on the rise just now, being utilized in such enormous quantities in making Dr. Fowler's Extract of Wild Strawberry—the infallible remedy for Cholera Morbus, Diarrhœa and other Summer Complaints.

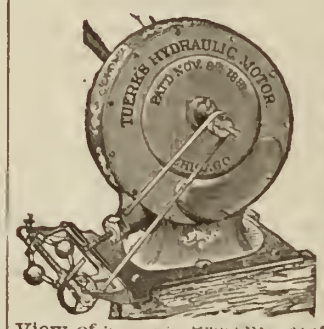
TUERK'S

WATER MOTOR.

Patented November 8th, 1881.



View of Tuerk's Pressure Motor, with Tuerk's Improved Governor Attachment.

For running Sewing Machines for families or for manufactories; also, for running Dental Lathes and Engines, Telephone Generators, Coffee Mills and Roasters, House and Church Organs; also for running one Printing Press or six, at the same time. Paper Cutters, Sausage Machines of any make or size; GRAIN, FREIGHT OR PASSENGER ELEVATORS, Straw Cutters, and all kinds of Machinery by Water Power.

HYDRANT PRESSURE.

Cheaper, Quicker and Safer than Steam.

Over Fifty Motors of other makes have been taken out and replaced with the TUERK MOTOR; among the list are the Backus, the Sabin, the Little Giant, the Hayward, Clark's Piston Engine, and others.

Names of a few who have taken out Backus Motors and put in the Tuerk Motor in their place:

C. W. Meikel, Indianapolis, Ind.
Columbus Telephone Co., Columbus, Ohio.
James Egan, Chicago, Ill.
H. C. Hawkins, Cleveland, Ohio.
Printing Office, Hannibal, Mo.
A. Solmens, Hat Manufactory, So. Norwalk, Ct.
Lake Shore & Mich. So. R.R. Shops, Elyria, O.
Index Printing Office, Evanston, Ill.
Republican, Johnstown, N. Y.
Tribune, Salt Lake, Utah.
Alton Printing Co., Alton, Ill.
A. F. Worthington & Co., Cincinnati, Ohio.
Lemon & Co., Waverly, N. Y.
Braun & Jones, Cedar Rapids, Iowa.
Gates, Douglas & Co., Cedar Rapids, Iowa.
Village of Rutland, Rutland, Vt.
W. L. Randall, Chicago, Ill.
A. J. Stoll, Sandusky, Ohio.
Killits & Wayland, Chillicothe, Ohio.
S. A. Morrow, Springfield, Ohio.
R. Putnam, Chillicothe, Ohio.
N. Shelton, Omaha, Neb.
H. J. Lewelling, St. Helena, Cal., and others.

Do not fool your time away trying other Motors, but send for the Tuerk Motor, which is warranted to do better work with less water than any other Motor or Water Engine made.

Send for Catalogue, and state what you want to run,—give full particulars and Water Pressure per square inch.

TUERK BROS. & JOHNSTON,

86 and 88 Market Street, Chicago, Ill.

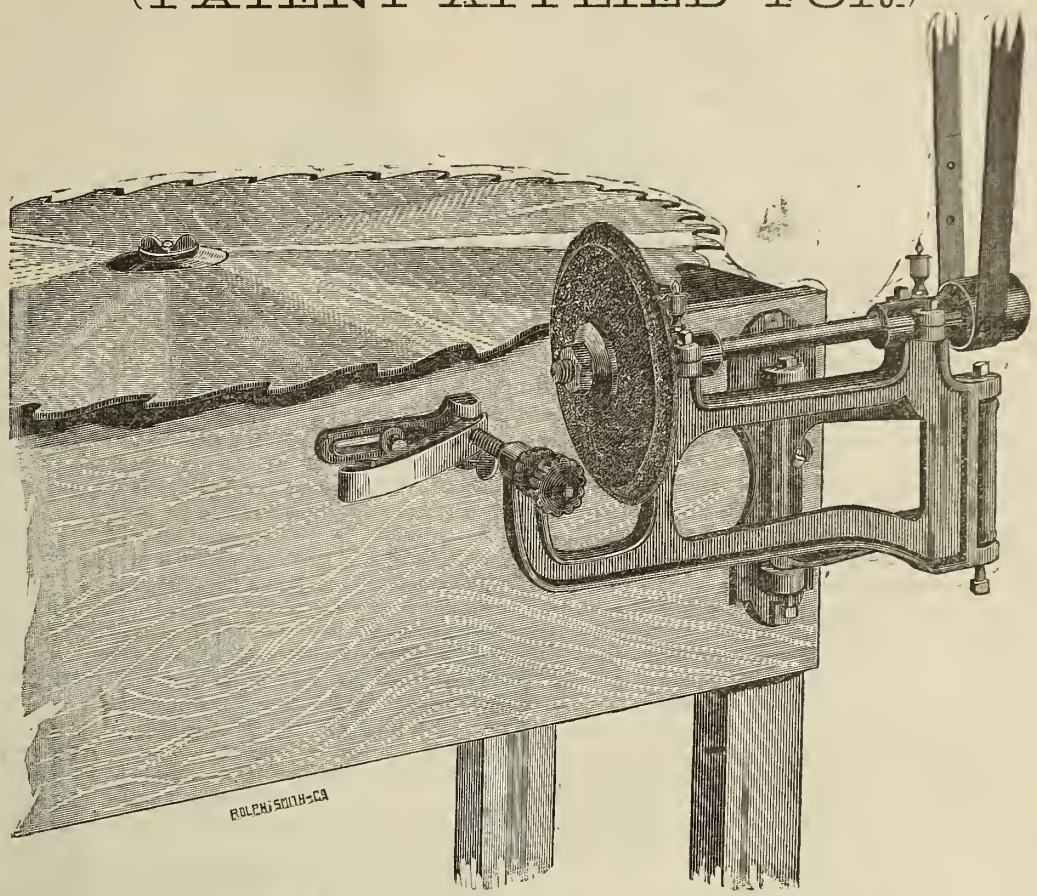
ROGERS' SAW GUMMER

(PATENT APPLIED FOR.)

No Heating!

Quick!

Simple!



Exact Work!

Cheap!

Complete!

POSITIVE STOPS! ADJUSTABLE GUIDE! Every Tooth made exactly alike!

JUST WHAT IS WANTED in every Saw-mill in Canada!

A REVOLUTION IN GUMMING SAWS WILL BE EFFECTED WHEREVER

ROGERS' SAW GUMMER

Is Introduced to replace Burr Gummers, or Grindstones, or where Emery Wheels have been run in the usual way. Every Machine Guaranteed to work as represented or No Sale. *It works EASILY; is so SIMPLE and COMPLETE that Sawyers can keep their Saws CONSTANTLY in FIRST-CLASS ORDER and thus LARGELY INCREASE the DAILY OUT-PUT.*

Price Complete, with Countershaft - - $40.00.

HART EMERY WHEEL COMPANY, Limited

HAMILTON, CANADA.

AXE AND AXEMEN.

The axe is the emblem of pioneership, and the precursor of settlement and development. It builds the cabin and levels the forest, making way for the plow, the farm and the city. Its antiquity is untraceable. It was known to our primal ancestors of the stone and bronze ages in the form which comes unchanged to us. Though the progress of mechanics and metal working has brought many advantages in the process of making, it is yet the axe that our great grandfathers hammered out at the anvil, with only the hammer marks ground out and a polish added. Contrary to the general supposition, the axe is an instrument of skill, and the expert axeman looks as closely to the fitness of the bevel of his blade, the form of his helve, the length and shape of blade and pole and the weight of his axe for the purpose contemplated, as the fencer to his foil. The weight of the axe is arbitrary and dependent upon the choice of the axeman for the purpose intended. If the object to be cut is small timber which may be severed at from one to half a dozen blows, an axe with a long, thin blade and as little bevel as is compatible with strength is chosen, and at every stroke the blade is buried to the helve. If the purpose be to fell large trees or cut heavy timbers, and this same axe is used, it bites deeply in its strokes, but the chip remains in the timber after the incisions and many more blows are required to dislodge it than were necessary to its formation ; therefore, for this purpose an axe having a thick, heavy bevel and cutting much less deeply is selected. The bevel, now acting as a wedge, forces out the chip at the same stroke by which the incision is made.

Many manufacturers ignoring the full value of this principle, have attempted to make an axe for general purposes with an average bevel. This, as well as the introduction of double-bitted axes, is a doubtful improvement. Experience teaches that the poll is not only useful in itself, but the essential in giving the proper force and direction to the blade.

The most important essential to a good axe is the helve, which, by its proper form and flexibility, not only seconds skill, but adds materially to the ease and endurance of the workman. In general, machine-made handles do not possess the qualities requisite to good helves.

The axe, like its cousin german, the sword, has fallen from its high estate, and no more is borne as the emblem of power and unity, dangles, formidable, at the saddle-bow of chivalry, or rushlessly crushes through crested helm and cap of steel. The saw, too, has robbed the broad axe of its glory, and the hewers are fast becoming things of old. But even yet a reverence is paid their skill, and when some great timbers which must be true in every line and straight in form and grain are wanted, some one of these, now always an old man, is hunted up, and his skill, his truth of eye and hand, and the long, thin shavings that fall from the broad edge of his axe as from a plane, are themes of wonder to the younger generations of artisans.

Observation develops the fact that large men are as a rule are inferior to small ones as axemen, and it is no unusual thing to find the address of the latter accomplishing feats which baffle the more powerful efforts of the former. A true eye and the ability to strike each alternate blow in precisely the same place are the highest qualifications, and, with a moderate amount of strength and great endurance, make in the end the chopper's skill—an acquirement which happily bids fair to possess an active market value in our country for generations to come.—*C. G. T. in Industrial world.*

A SAW LOG'S STORY.

A correspondent of a New York paper has evidently been going the rounds of a Saginaw saw mill. He thus describes what he saw :—Up the Saginaw in a wide region reached either by the river or its tributaries, the great pine saw log, often three feet in diameter, has its birth. Pine forests, now rapidly thinning out, once covered several thousand square miles around the head-waters. Entering that lumber region in the late autumn, the lumbermen establish camps, 'round which during the whole winter long the axes resound, the tall trunks fall, and in sections are rolled to the adjacent streams for the spring floods to bear away. Floating down the main river, the "boom men" pick out each owner's logs, as identified by the brand, and gather them inside the booms, which may be curtly described as long tree-trunks chained together at the ends, often enclosing a smooth water surface of several acres. The coves of the Saginaw—called locally "bayons," a term borrowed from the lower Mississippi—are especially adapted for the gathering and organization of these log armies. The military metaphor, indeed, has peculiar fitness here, for the logs are mustered, side by side in companies, held together by a rope fastened to each log by a devise not unlike the domestic clothespin. As these logs down the stream are worked up by the tireless mills, these upper booms are dawn upon for more, until the freezing river finds them quite empty, and another winter comes on to yield its fresh supply.

But the saw log's story becomes most dramatic as it nears the mill and, loosed from the restraining rope, is steered into the glade of open water that leads up to the wooden slide. Enter now the great lumber mill, and we shall be in at the saw log's death. Down the slide on a wooden railroad runs a heavy truck, fitted with two cross lines of heavy iron teeth. With a plunge it dashes below the water, still holding its place on the rails. Then three giant logs are floated above it. At a signal the steam is let on, the machinery reversed, the strong chain holding the truck tightens, and the truck itself begins to ascend. The sharp teeth catch the logs, which in a trice, are lifted dripping from the water, whisked up like twigs 100 feet to the mill, and rolled off opposite the first set of saws. These saws are two in number ; one set below is of the buzz variety, perhaps six feet in diameter, and cutting, therefore, through a three-foot log ; but as this semi diameter is often insufficient for a big log, a second and a smaller "buzz," placed above and in front of the first, cuts the slice which otherwise might still hold fast the slab. One of the largest logs weighs a number of tons, and human strength alone would never suffice to turn it after one of its sides has been "slabbed."

Just here comes in a beautiful piece of powerful mechanism. At the touch of a lever a stout beam, armed with iron teeth, rises by the forest Titan's side. It snatches the wood, and in less time than words can tell it the log is tumbled over, and the framework rushing back and forth with amazing speed, has driven the edges of the tree athwart the saws, until the once rough stick stands forth a symmetrical square. Then, in another instant it is shifted before the "gang," a set of ordinary upright saws placed an inch apart, and often with 30 or even 35 blades. Below an ordinary circular planer revolves in front of the gang and smoothes the lower edges of the boards. The immense piece of timber is run through in a few moments, and what was five minutes before a rough tree trunk is transformed into the inch boards of commerce. Nor does the work end here ; for the slabs are passed to a new machine which grasps them with almost human intelligence, and whatever part of them can be made so become laths. Other machines take the harder woods, ash, elm, or oak, and convert them with equal speed into staves, barrel heads and shingles ; and finally the otherwise useless debris passes to the furnace to feed the fires of the engine. There is seen little or no sawdust around the Saginaw lumber mills for the reason that it is all used for the furnace flames ; and, in general, the cycle of utilities by which one brauch of the great industry is made to feed or supplement another seems as rounded as human ingenuity can make it.

Sometimes, particularly in the more modern mills, the routine as described is varied by lifting the logs from the river on an endless chain ; and a number of minor mechanisms fill out the devices by which the lumber is cut and distributed. One ingenous machine working double emery wheels, sharpens the buzz saws on both sides of the teeth during a single revolution, and requires no attention beyond simply the the fastening of the saw upon it and unfastening after the work is doue. Another flattens out, by a clever mechauical expedient, the teeth of the saw, so as to cut a wider rent and prevent clogging as the cut becomes deeper ; finally, a system of elevated railroads takes the lumber-laden trucks and distributes the boards at the points in the yard or on the wharf whence they are to be shipped. Some additional conception of the size and importance of the industry may be derived from the fact that the Michigan Central railway company takes away from one station here one hundred car loads of lumber for each day of the working season, to say nothing of the large quantities shipped from the river by the Flint & Pere Marquette Railroad line, and even large shipments by the lake barges.—*The Wood-worker.*

HARDWOOD FLOORING.

The use of beech, birch, and maple has been restricted to a few specific purposes, but the example of the builders of the new Flint Mill at Fall River, in flooring with these woods, will probably be followed by others. The narrow Southern pine planks that have been so long and extensively employed for flooring require to be culled with great care to insure an even floor. They must be staight grained, or they will bend and splay by use, splintering into short slivers dangerous to the feet, and collective of all the fluff and fibrous dirt with which they come in contract. The heart of the pine is especially open to this objection. But a beech or maple floor will wear evenly and smoothly, and has greater endurance for heavy rolling weights than that of the Southern pine. It is more cleanly, and is not so readily inflammable.

The birch when properly seasoned under cover, or kilu dried at a heat not sufficient to vaporize its contained oil, makes a durable and evenly wearing floor. This cheaply estimated wood is really elegant also for furniture purposes. It shows well in cabinet work alternated maple or apple, and it is fully as valuable for drawers and chests in defending the contents from moths as is the red cedar. The best qualities of birch timber come from the black birch or the yellow birch, the white birch wood being too open or porous for fine finish or durability ; and the yellow and black birch grows also to a larger size generally.

The New York *Evening Post* says that the new building of the Pacific Mills at St. Lawrence, Mass., is to be floored with hard wood, some 300,000 feet to be used, and that other mills throughout Massachusetts, Rhode Island, and Connecticut, have also ordered this hard wood flooring, and it is very evident that Southern pine flooring will find a serious competitor. A good hard pine mill floor board, free of sap and coarse knots, will cost about $28 per thousand feet in large lots, according to the quality, while hard wood flooring will cost from $30 to $32 per thousand feet all dressed and delivered.—*Scientific American.*

THE POWER OF WATER.

The properties of water are only partially understood by those who have never seen it under high pressure. The Virginia City Water Company get their supply from Marlette Lake on the Tahoe side of the mountain. They get it through by a long tunnel, and are then on the crest of a high mountain opposite Mounte Davidson, with Washoe Valley between. To cross this valley by a flume would be almost impossible, so the water is carried down the mountain side to the bottom, and crosses under the V. & T. Railroad tract, on the divide between Washoe and Eagle valleys, then up again to the required height in iron pipes. The depression created in the line of carriage is 1,720 feet, and the pressure on the pipes is 800 pounds to the square inch. One pipe is 11 inches in diameter, and is quarter inch iron lap welded, and 18 feet long, with screw joints. There is little trouble from it, but the other, which is twelve inches diameter, and is riveted pipe, makes more or less trouble all the time. The pipe is laid with the seam down, and whenever a crack is made by the frost or sun warping it, or from any other cause, the stream pours forth with tremendous force. If the joint is broken open, of course the whole stream is loose and goes tearing down the mountain, but usually the escape is very small. The break last week was less than five-eights of an inch in diameter, and yet the water in the flume was lowered an inch and a half by it, and the pressure went down fifteen or twenty pounds. Captain Overton says that fifty inches of water went through it. It has been probably a year in cutting out, and was made by a little stream hardly visibly to the naked eye, that escaped through a joint and struck the pipe two or three feet off, eating away the iron until the pressure inside broke it through. When such a break occurs the noise can be heard for half a mile, and the earth shakes for hundreds of feet around. A break the size of a knitting needle will cut a hole in the pipe in half an hour. Such breaks are repaired by putting a band around the pipe, pouring in melted lead, and tamping it in. Such a stream bores through rock like a sand blast. The flying water is as hard as iron, and feels rough like a file to the touch. It is impossible to turn it with the hand, as it tears the flesh off the bones, and if fingers are stuck into the stream, with the point up, the nails are instantly turned back, and sometimes torn loose from the flesh.—*Reno Gazette.*

G. B. HALL & Co., Quebec, have sent out a member of the firm to explore the island of Newfoundland with the view of ascertaining the extent of its timber wealth, and its adaptability for utilization.

$500 Reward !

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C. WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. ORMOND & WALSH, sole authorized Agents for Peterborough Ont. w46111L92

Health is Wealth.

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, a guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain, resulting in Insanity and leading to misery decay and death, Premature Old Age, and Spermatorrhœa, caused by over-exertion of the brain, self-abuses or over-indulgence. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars ; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by use for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by ORMOND & WALSH, sole authorized Agents for Peterborough, Ont. JOHN C. WEST & CO., Sole Proprietors, Toronto

HILL'S
English Extract of
BUCHU,
One of the Best
KIDNEY
INVESTICATORS IN USE.

It is a specific in the cure of all diseases of the Kidneys, Bladder, Prostatic Portion of the Urinary Organs, Irritation of the Neck of the Bladder, Burning Urine, Gleet, Gonorrhœa in all its stages, Mucous Discharges, Congestion of the Kidneys, Brick-dust Deposit, Diabetes, Inflammation of the Kidneys and Bladder, Dropsy of the kidneys, Acid Urine, Bloody Urine, Pain in the Region of the Bladder, PAIN IN THE BACK, Urinary Calculus, Renal Calculus, Renal Colic, Retention of Urine, Frequent Urination, Gravel in all its forms. Inability to retain the Water, particularly in persons advanced in life. IT IS A KIDNEY INVESTIGATOR that restores the Urine to its natural color, removes the acid and burning, and the effect of the excessive use of intoxicating drink.

PRICE, $1 : or, Six Bottles for $5.

W. JOHNSTON & CO.,
161 Jefferson Ave., DETROIT, MICH.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy ; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

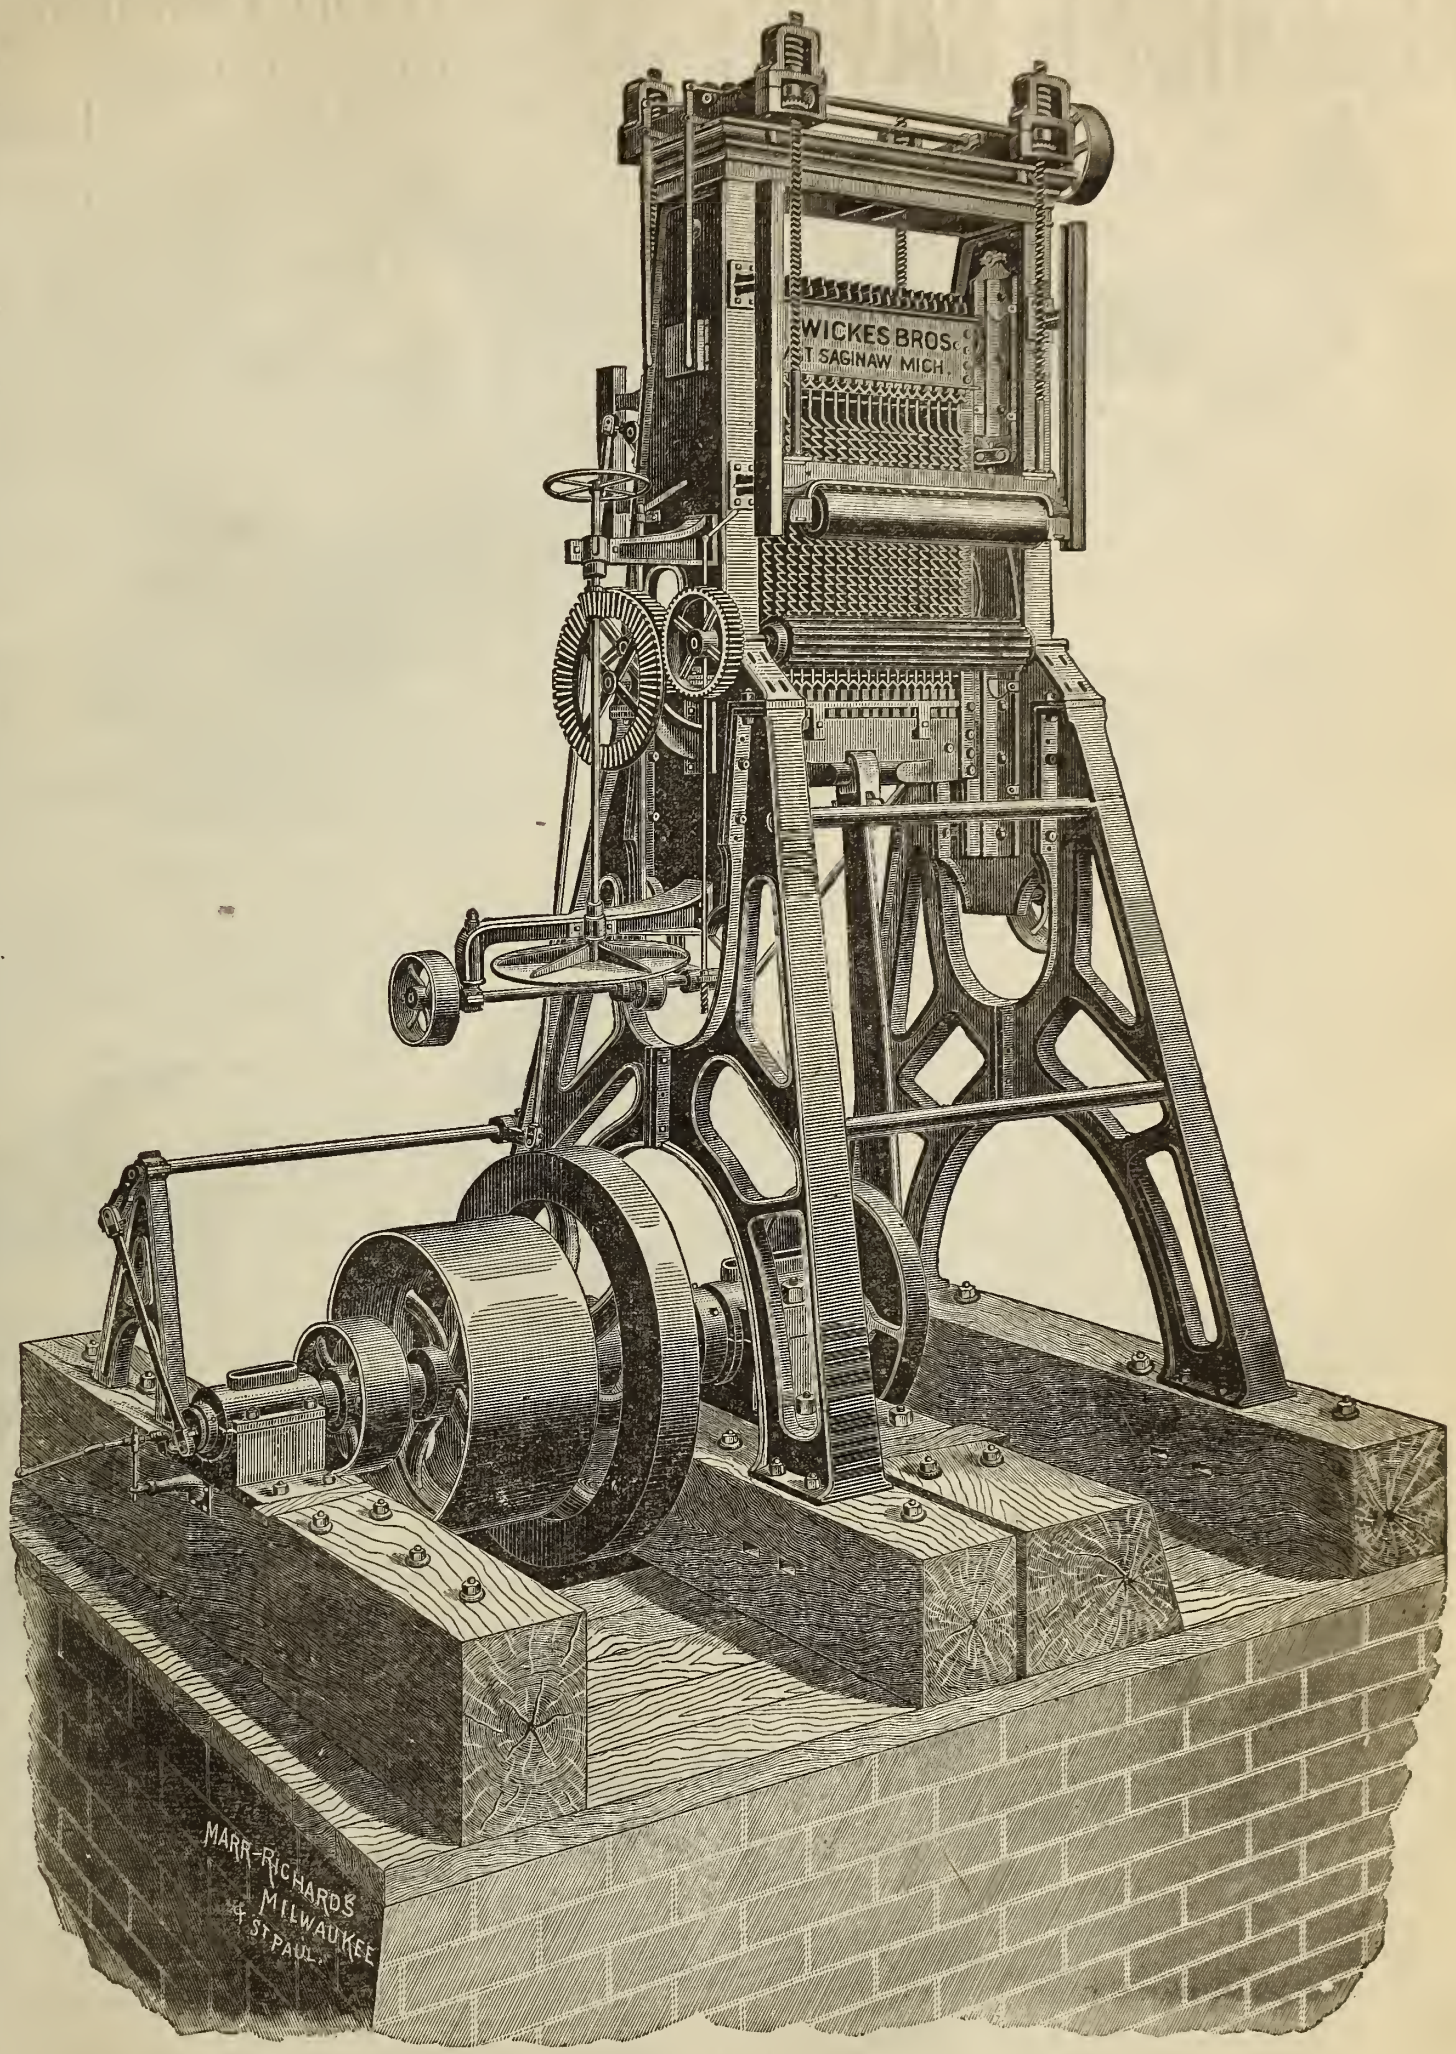
IRON FRAME GANG MILLS.

The gang mill is regarded as possessing material advantages in the rapid and economical manufacture of lumber. Among the recent improvements tending to perfect such mills, those which are shown in the iron frame Stock Gang manufactured by Wickes Bros., East Saginaw, Mich., are eminently valuable. Our large and elegant engraving represents one of these mills, constructed to be driven by belt, friction or direct engine, as may be desired. The important requisite in this class of mills is such design and proportion of parts as will insure durability and continued movement at the highest speed, safely increasing the quantity and improving the quality of work done at a lesser feed, and admitting the use of thinner saws than is practical in the slower moving sash. These are among the advantages gained in the iron frame machine, overcoming the necessity of an expensive mill frame, saving time and expense in setting up, and avoiding the liability of decay or change of position.

Many improvements have been made in the mechanism of oscillation, and from these the builders of this mill have adopted what is known as the Wilkin movement, which oscillates the top and bottom slides. The top slides are pivoted at the top end, and the bottom ones from the bottom end, both being operated by one rock shaft from the centre. This movement when properly adjusted gives an easy clearance and the easiest cut yet obtained. It adds no extra weight to the sash, and avoids the cumbrous rock shaft and its attendant joints, usually weighing from three to five hundred pounds, which have been found so objectionable in many other movements. The feed is continuous, and is made variable from ¼ to 1¼ in. to each stroke, controllable by the sawyer. Power is applied to the press rolls in the double screw form with pivot point, also operated by the same hand. A special feature of this machine is the spreading of the lower frame so that its base rests upon an independent portion of the foundation from the main pillow block or crank shaft. The solidity of the structure is thus increased, both by the increased width at the base and the prevention of connecting vibrations, which necessarily communicate when resting upon the same part, as in other forms of such machines heretofore in use.

The mill shown is one of 26 saws, 4½ feet long, sash 38 inches wide in the clear, and stroke 20 inches, capable of making 230 strokes per minute. The crank shaft is 9 inches in diameter, of the best forged iron. The main pillow block has a base 6½ feet long by 21 inches bearing, weighing 2,800 pounds. The cap is secured by two forged bolts, 3½ inches in diameter, and by this arrangement no unequal strain upon the cap is possible. A disk crank is used with suitable counterbalance, expressly adapted to the weight and speed of sash; a hammered steel wrist pin 5 inches in diameter, and a forged pitman of the most approved pattern, with best composition boxes. The iron drive pulley is 4 to 4½ feet in diameter and 24 inches face; the fly-wheel, 6 feet in diameter, weighing 4,700 pounds, turned off at rim. When a wider and heavier sash is required, a proportionate increase is made in all these parts.

In the construction of the sash the stiles are made of steel; the lower girt and upper heads are made in one solid piece, without rivets, giving greatest strength possible, with the least weight. The outfit also includes eight iron rollers for the floor, 8½ inches in diameter, with iron stands, and geared as live rolls when desired, a full set of Lippencott's steel saw hangings, and gauges for one-inch lumber. The weight of the machine here shown is 18½ tons. They are, however, built in larger or smaller sizes, adapted to any locality, quality or quantity of work desired.



IRON FRAME GANG MILL.

A Ship Canal

The bill for a ship canal to Manchester, England, has passed the House of Commons, burdened however with conditions which will make it a very uncertain enterprise. The promoters are required before commencing work to go to Parliament for a fresh bill showing exactly what work they intend to carry out in the estuary of the Mersey, they are also forbidden to do anything at the canal proper or to deviate any railways until they have progressed so far with the works in the estuary as to show what the effect on the regime of the channel and the approach to the Liverpool docks is likely to be and these works are to be so constructed that they can be removed if any detrimental effects are likely to be produced. The House of Lords will probably pass the bill in this form, but it will, we should think, be difficult to raise the large capital required, under such burdensome conditions.

A Half Million Fire.

WILLIAMSPORT, Pa., Aug. 27—A fire started this evening in the sawmill of Finley, Young & Co., and destroyed it. The flames spread to the lumber yards of Merriman & Son and others, burning over a square and destroying a large quantity of lumber. At midnight it was still burning, but with prospects of being subdued. Several dwellings and barns were burned. Twenty-five to thirty million feet of lumber were destroyed. The loss is estimated at half a million.

THIN

SOLID SAWS

☞SAVE YOUR TIMBER

By using THIN Saws.

McLAUGHLIN Bros., Arnprior, run two 66-in. Brooke Bit Saws, 800 revolutions per minute, on 6 to 10-inch feed.

They use Steam Feed

THE BROOKE BIT-TOOTH SAW

With this Saw you have either a Bit Tooth Saw or ordinary Inserted Tooth Saw, with teeth two-and-a-half inches long, both fit same socket and are interchangeable in a few minutes. These Bits require no gumming, and very little filing; are so firmly held that they will stand all necessary swaging, and can be worn down to dotted line shown in cut; they rest on lugs, saving the strain on the rim of the saw. For these reasons they will cut more and better timber at less cost than any other tooth. EXTRA BITS (per 100) No. 1. $9; No. 2, $8.— (per 1000), No. 1, $80, No. 2, $70.

Two sets No. 1 Bits have cut 500 m. feet pine, in 60-inch saw, running 800 revolutions per minute, on 6-inch feed. E. E. PARSONS, Arnprior.

We run 60-inch to 72-inch Solid Saws, as thin at center as 10 guage at rim—saving, over a 7 guage saw—1000 feet of lumber in every 25,000 cut.

McLAUGHLIN BROS., Arnprior, run two 66-in. Hoe Saws, on 6 to 10-in. feed, 800 revolutions per minute.

☞Write them.

EMERSON'S EXTRA THIN SOLID SAWS

Having special facilities for the manufacture of extra thin saws for board mills, we are prepared to receive orders for Circular Saws as follows:—54 inches in diameter, as thin as 12 guage at rim and 11 at center, 54 to 56; 11 guage at rim, 10 at center, 66 to 72; 10 at rim, 9 at centre. Our unparelleled success with thin saws during past few years has induced us to recommend them to our customers. Our superior facilities are:—1st, Evenness of Temper; 2nd, Perfect Accuracy in Thickness, Saw balances perfectly; 3rd, Properly Hammered, to have equal strain in all its parts and at same time run true. This department is under the special supervision of J. E. Emerson, who has had 30 years experience and is without doubt the most successful circular saw maker in the world.

VOL. 3. PETERBOROUGH, ONT., SEPTEMBER 15, 1883. NO. 18.

A TOW 1,200 FEET LONG.

The large sea-going towboats, Cyclops, Captain Lounsbury, and the Bertram T. Haviland, Captain Gully, from St. John, N. B., were this morning off Chatham Light, Cape Cod. The raft which they are towing to this city was reported to be intact, and they were making an average speed of sixty miles a day. They expect to arrive in New York early next week. On Saturday last the towboats encountered a severe northeast gale off Cape Elizabeth, and the hawser with which they were towing the raft parted. This necessitated about four hours' delay, until they could pick up the parted hawser, and pass to the tow two hawsers, one leading to each steamer. That day the boats put into Portland, owing to the heavy weather, but on the day following they resumed the voyage. From that time until last night nothing was heard of the tow, and fears were entertained that the raft had been lost or cast adrift by the towboats.

The great danger to be feared was the probability of a heavy sea being encountered. The raft itself is about twelve hundred feet long and thirty feet wide. It draws nearly eight feet of water. It is divided into sections of about 70 feet in length. The sections are cribs, into which, when they were made at St. John, the logs [about 65 feet long by 16 inches in diameter at the butts] were rolled and stowed. Then over and around the cribs strong chains were fastened. Between each crib there is a ten-foot space to permit free working of the raft in a heavy sea, for, in the length of 1,200 feet which the raft covers, during a storm there may be ten or twelve different large waves, and, were the raft all of one piece, there was every probability that before they had gone 100 miles it would become a wreck.

In the raft are twenty-four cargoes of 250 tons each. Were the contractor who owns it to have the spiling, of which the raft is composed, brought to New York by a sailing vessel it would have cost in the neighborhood of $26,000, as the vessels that are engaged in this kind of business demanded, on account of the enormous length of the logs, extra compensation, they not being able to take as much as a full cargo. This the contractor, Mr. James Murray, of Burling slip and Front street, refused to accede to and chartered the tugs Haviland and Cyclops. The tug Haviland belongs to Mr. W. H. Tebó, corner of South street and Coenties slip; the Cyclops belongs to Captain C. C. Ellis, of No. 60 South street. Mr. Murray, when asked for information concerning the venture refused to have anything to say, stating that he had rather wait till the boats arrived in New York before making any statement. Mr. J. C. Ellis, son of Captain J. C. Ellis, of the Cyclops, said this morning that in the event of the undertaking proving successful, there would be a revolution in the coastwise timber trade, between New York and ports east of Boston. "By the mode of bringing this raft here which Mr. Murray had adopted." Mr. Ellis said, "there is a saving of some $8,000 or $10,000. The charter price of the tugs I am not at liberty to state, but they are hired by the day, and, of course, no matter how long it takes to bring the rafts here we will lose nothing. The tow left St. John on the 7th inst. and will be here Monday. Captain Bragg, of the Portland Line steamer Eleapora, which arrived this morning, reports that he met the raft about 30 miles northeast of Cape Cod; that at that time they were getting along splendidly. They laid their course straight across from Cape Elizabeth to Cape Cod, and the greatest fear of Captains Gully and Lounsbury was that they might be caught by an easterly gale and be carried down into Cape Cod Bay, where there were ten chances to one that tugs, rafts and all would be lost. But everything is propitious for us now and there is no doubt that the raft will be anchored safe and intact in New York harbor within seventy-two hours.

"If the thing proves a success," said one of the most prominent towboat owners in the city, "within six months you will see the finest fleet of towboats in the world ready for service between the ports east of Boston and New York. In New [Brunswick, of which St. John is the principal port, there is not one tug that can at all compare with our large ocean tugs, and it will be out of the question for them to attempt to compete with us. There is, of course, a considerable amount of shingles, laths, &c., that come by sailing vessels, and these undoubtedly will be left to the coasters, but the majority of the trade is done in spiling, of which, in a short while I hope we shall be the masters. St. John is about 800 miles, by water, from New York."

NORWEGIAN TIMBER HOUSES.

Mr. J. C. Wilcocks, of Plymouth, writing to the *Field*, says: "Since information on this subject was asked for I happened to meet the owner of the house mentioned, and some time since visited there. It is a most comodious country residence, having side walls reaching 6ft, above the level of the ground, with capacious cellarage beneath. The whole of the superstructure is of timber, excepting the partitions through which the flues of the stoves (also Norwegian) pass. These partitions are of brick. The walls and ceilings and doors are all of varnished wood, and the decoration consists of the stem and fruit of the wild strawberry plant, the effect of which is very good indeed, and much more opposite than any decoration of more elaborate character. The stoves are very much like in appearance to church towers in miniature, and stand off about 2 ft. from the brick flue walls; they are of cast open ironwork, allowing thus the heat to pass off into the room with the greatest facility, and an elbow flue carries of the products of combustion into the chimney, and peat and wood are the chief kinds of fuel used. The entire absence of draughts and facilitics for warming the building are both remarkable. The cost, I am informed by the owner, has amounted to about a third of that of an English-built residence of the same dimensions and accommodation. Fire insurance about 1s. per cent. extra. Externally the house is twice painted annually, owing to our extremely uncertain climate, combined with an exposed position to south and west winds. The interior ceilings and hall being entirely varnished, no dust or dirt adheres to this smooth surfice, nor is there any paper to soil or spoil. There is not a sign of damp in the house. Labour being cheaper in Norway than England, I imagine it cheaper to import a house from Norway than to prepare material in England."

Old Building Material.

The *Scientific American* says that an extensive trade in second-hand building material has been carried on uninterruptedly in New York city for fifty years, and is largely supported by build ers and joiners. The stone and brick of an old building is used in the construction of a new one, the lime-whitened bricks making the inside of the outer walls and the partitions, and the stone going into the foundations. But it is generally known that the inside woodwork is used again, frequently without radical alternation. Many builders prefer this old timber because it is thoroughly seasoned, having been defended from the weather and been subjected to the influences of a measurable even temperature for years. The richer woods which are admired for their color mellower tones by age and become more valuale as the years pass. Everybody knows that furniture of mahogany and rosewood that has outlived several generations is much handsomer than that made from new wood. But it has an added value as mere material. An article made from the old wood will remain its integrity in all its joints; its shrinking days are over. For the same reason the timbering, wainscotting and flooring of old buildings has an added value, although its selling price is less than that of new material.

New Method for Drying Timber.

Although steam-pipes are largely used in drying timber, hot air circulation is being introduced, and several improvements have been made in America in this mode of treatment. Professor Carvalho's method is described as follows: "A continuous volume of heated air is forced over the timber by means of a fan-blower, the temperature of which is gradually increased, until the boiling point of water is reached; then the water in the albumen or other substance is converted into steam. This degree of heat also coagulates the albumen, and the pores of the inner cells of the timber become filled up with the solid coagulum." The hot air is made to enter at the bottom of room, which is air-tight, and after circulating round the timber, and through the wood, is discharged through another pipe at the opposite end of the room. It is asserted that this method of drying does not discolour the wood, and is a preservative againt dry rot.

A Wooden Costume.

A very unique costume was made for the Oiympian Club carnival, Boston the entire outfit of dress, boots, mask, wig, and parasol being of wood. The chief garment was a princess dress made of various kinds of Spurr's papered veneers. It had a brocaded front and basqne and trimmings of knife-plaiting, fichus and loops of wood ribbon, and was ornamented with rosettes and leaves in wood of various shades in their natural colours. At the sides there was a substitute for embroidery in inlaid work of fancy designs. The sleeves were of cord paper, trimed to imitate puffing, and at the bottom was a deep border of black walnut knife-plaiting. The boots and gloves were of birch bark, and the mask of matched woods with a fringe of plaiting. The wig was composed of abont ten curls, consisting of white pine shavings artistically prouped. The parasol, of Chinese pattern, was covered with various coloured veneers, and similar lined. This attempt was thoroughly sucessful, the effect of the different kinds and colours of wood in the combination being very striking and artistic. The veneers were so thin that the costume was not very heavy, and so flexible that it was not liable to injury.

Cottonwood.

Cottonwood, it is said, will make four rails in seven to nine years, and maple the same in from eight to ten years. Cottonwood, soft maple and California redwood are regarded by many as the best trees for forest planting when quickness of growth is desired, and also when shelter belts around orchards, gardens, barns and stock yards are necessary. Many farmers have learned from sad experience that by cutting down their forests indiscriminately they have made the way clear for chilling, biting winds and frost to nip their growing fruit.

Another Trail.

A man in Washingtou, who, it is stated, has failed in business exactly 85 times, has now started to retrieve the last break in his fortune by engaging extensively in the lumber business in Florida. He has rented a dock in New York, and although 65 years of age is said to be pushing his new venture with the energy of a young man.

THE tug Alice M. Campbell towed 4,000,000 feet of logs for 40 miles on Lake Superior for the Oneota Lumber Company, without losing a log.

DISEASE AMONG SPRUCE TREES.

Tho following letter appears in the Montreal *Witness*:

SIR,—Mr. Vennor, in your number of the 18th, gives rather a novel cure by introducing woodpeckers and other tree creepers. Will he kindly let us know where these birds can be caught, and how caught? He can scarcely be sincere in proposing such a cure. Woodpeckers could never be trapped, and if he introduced a million in a grove of spruce, in a few hours there would be very few left in the grove, as they are continually on the wing, and the woodpecker is miles away in the evening from where he took his morning meal. Having some knowledge of the Maine timber lands and these localities, I may say the disease alluded to among the spruce trees arises from the fact that all the first and second quality spruce deals have been cut down all through Maine, and what has been left standing by the lumberman, were the faulty trees, culls and dead standing timber, which of course will be the favorite localities for the wood borer, of which there is a numerous family. One of the most destructive is the *Monohammus Confusor*, it is remarkable for the length of its antennæ, or horns, which sometimes are twice the length of its body, the latter being an inch and a half long. It is produced from a grub of a whitish color with a large broad head and very powerful jaws, with which it cuts into the trees. It attacks all newly cut timber with the bark left on and all injured timber, blown down, burnt and sickly trees. I had an opportunity of demonstrating the facts after a forest fire had passed through a considerable grove of mixed timber. The beetles in question made their appearance in large numbers and attacked all the fallen trees, depositing eggs in every crack and crevice or knot hole. The damage done by this beetle is in some instances enormous. I had one season several thousand pine and spruce logs which stuck on the drive. The waters getting so low they remained stranded on the rocks and beach till the following spring, and every log was attacked by them and bored from one to two inches inwards, which caused a loss of several thousand dollars on the value of the logs. The *Monnohammus Scutellatus* is another borer and more numerous than the one I have described, but the habits of both are similar. The *Chalcophora Liberta* and *Virginica* are also wood borers. I never knew the Coddling moth or worm to attack the forest trees. It is known to be most destructive to the apple, as it makes its attack upon the fruit. The insect deposits its eggs in the apple blossom, the eggs are soon hatched and penetrate into the growing fruit. Every apple grower knows something of its ravages. I made an extensive exploration through the Canadian forests bordering on Maine and found the spruce trees, both scattered and in groves, in a perfectly healthy state and did not see any signs of the disease referred to. Mr. Vennor's cure by woodpeckers would only be making the evil worse and the trees less valuable, as the woodpecker makes a considerable hole in the tree before he can reach the grub with his speared tongue. The prevention must be with the beetle, not with the grub. In May the beetle comes out of the grub in immense numbers. The crow is the only bird that devours them. Hens and turkeys eat them also. I have seen them in the new settlements, where the slash has been made during the winter, running and flying from tree to tree devouring the beetle most vigorously.

CHARLES HUGHES.

Montreal, 25th August, 1883.

FORESTRY IN AUSTRALIA.

The colonies of Australia are awakening to the importance of forest conservation and restoration, and South Australia is the first to establish a system of forestry, that promises good results. Legislation upon this subject, was begun in 1871, when Mr. Krichauff, M. P., called for a return, eliciting information from persons resident in the different districts of the colony, in regard to the supply, preservation, and culture of forests. The answers were prepared by Dr. Schomburgk, director of the Botanical Gardens at Adelaide. In 1873 he introduced a bill, and secured its passage. It was entitled "An Act to Encourage the Planting of Forest Trees," and provided for the payment of £2 per acre for every acre planted by a land-owner in certain districts of the colony, upon certain conditions specified. A report on Forest Reserves was submitted during the same session, prepared for the Hon. the Commissioner of Crown Lands, by G. W. Goyder, Esq., the Surveyor-General, in which it was suggested, that certain portions of the country should be set apart by proclamation as Forest Reserves, and the subject of the formation of a department of forests, was discussed at length.

In 1875, a bill was brought in by Mr. Krichauff, and passed, entitled "An Act to make Provision for the Appointment of a Forest Board, and for other Purposes." It defined the districts pointed out as proper for forest reserves, in the previous report of Mr. Goyder, and specified the duties of the Board. It did not, however, survive long enough to test its merits, and was superceded, in October, 1878, by the "Forest Trees Act," and this again by "The Woods and Forests Act of 1882," which has been passed during the current year.

A cumbersome arrangement under the Forest Board having failed to meet the requirements, the three non-official members resigned; upon which the Government, considering that the operations of the system could be better conducted by the Conservator of Forests, placed directly under the Honorable Commissioner of Crown Lands and Forests, this mode of management is now in operation.

The principal fault of the system appears to consist in the smallness of means provided, amounting we believe, to about £5,000 per annum. This, when applied to the expenses of office management, and to the care of something like 240,000 acres, of which two-thirds are timberless, or covered with a useless growth of dwarf Eucalypti, Acacias, and the like, should not raise great expectations of grand results.

From the official report for 1881-2, it appears that there were then 19 Forest Reserves, containing 239,336 acres, which, with the exception of the Travelling Stock Reserves, were all leased for pasturage purposes at rates ranging from ½d, to 2s. 8d. per acre. There were four well established nurseries, having together an area of about 20 acres. Planting, and other forest conservancy operations, were being conducted upon eight reserves. The force consisted of three foresters and four nurserymen, with an average force of 25 laborers. About 4,043 acres had been enclosed and set apart for planting and other forest operations. The average income from the Forest Reserves, in the last six years, had been £5,581, and the expenditures of the board, £5,787. About 440,000 young trees were doing well, from the results of the board's planting; some 300,000 saplings and seedlings of natural growth had been pruned, in connection with the system of encouragement for the renovation of the indigenous forests, and about fifty thousand seedlings of natural growth had been reared in the Natural Regeneration inclosures.

The following extract from regulations, dated January 13th, 1879, and applicable to the Wirrabara Reserve, will prove of interest to our readers:

1. All standing trees disposed of by the Forest Board in this reserve, by private contract or otherwise, must be previously marked by the Conservator or officer in charge.

2. The official mark will consist of a longitudinal chip taken off two opposite sides of the tree and stamped F. B. in distinct characters.

3. Each tree must be cut off from its base at a height not greater than two feet from the ground.

4. In cutting down trees, care must always be taken to fell them in such a manner that they will not interfere with or injure any of the other trees, saplings, or seedlings, left standing on the ground; and should any damage arise in this way from the carelessness of the workmen, the officer in charge of the reserve (whose decision on such matters shall be final) is empowered to value such damage at a rate equal to the deterioration effected, and collect the amount from the party to whom the tree felled has been sold.

5. Any party or parties found felling trees which have not been marked and sold to them, will incur a penalty of not more than five pounds, in addition to the value of the material.

6. No purchaser shall be permitted, on any pretense whatever, to light fires within the forest, except on such sites and for such special purposes as shall be defined by written permission from the conservator.

7. The purchaser of any tree must remove the whole of the same that is convertible into a marketable commodity, and pile together all refuse ready for burning, to the satisfaction of the forest officer. Any breach of the two last regulations, will incur dismissal from the forest.

8. Purchasers will be allowed sufficient time for the removal of their timber from the forest. This time will in all cases be specified and entered in the forest sales book. Should any purchaser fail in having it removed within the period stated, then it will be optional for the officer in charge to declare it forfeited or give an extension of time for its removal.

9. Splitters applying for timber, on satisfying the Conservator of their respectability, and on giving a guarantee that they will not attempt to evade the regulations, will be allowed to erect temporary huts on such sites as the Conservator shall deem expedient; but they will not be allowed to keep stock of any kind in the forest further than may be necessary at certain times for the removal of their timber to market—this to be decided by the Conservator, whose decision shall be final.

10. All standing timber will be sold per cubic foot, or in lots by valuation, to suit purchasers.

11. As soon as the trees are marked and sold, they will be at the entire risk of the purchaser; but the purchaser will not be allowed to cut or ring trees bought, until a proper settlement for the same be made to the satisfaction of the forest officer.

12. All sales amounting to less than £2 to be paid for in full before the timber is interfered with; and all sales realizing more than that amount, the purchaser shall pay half such sum in advance, the remainder before any of the timber is removed from the ground.

13. Sites for the erection of saw mills will be granted on payment of a nominal charge per annum, and licenses given for materials, sinking wells, erection of huts, and stabling for accommodation of horses used in the haulage of timber. Special arrangements for the purchase of timber will be entered into with parties erecting saw mills.

14. Sites for the erection of saw-pits will be granted free of charge, with liberty to erect temporary camps and depasture working bullocks actually employed in the hauling of timber, etc.; all subject to approval of the Conservator.

15. Licenses to split posts and rails from dead wood in localities named in body of licenses, will be granted at 20s. per annum each, with an additional fee of 10s. per 100 for all posts and rails removed from the forest.

16. Licenses to procure straining or corner posts of dead timber from localities to be named in license, will be granted at 1s. for each post.

17. Licenses to remove firewood from the dead timber lying upon the ground from localities to be named in body of the license, will be granted at the following rates:—

8s., for one horse load;

1s. 6d., for load of two horses or bullucks;

2., for load of four horses or bullock;

4s., per load where more than four horses or bullocks are used.

STONE, SAND AND GRAVEL.

18. Licenses to remove stone, sand and gravel, will be granted at 20s. per month each.

19. Splitters will be allowed to erect temporary huts only in the forest, and only on such sites as may be approved by the Conservator.

New regulations dated March 20, 1883, and received too late for further notice in this number, have been issued under the Woods and Forests Act of 1882. They vest in the Conservator of forests, their immediate control and management, the sale of timber, employment of laborers, etc., but subject to the approval of the commissioner of forest lands.

These regulations forbid the lighting of fires for any occasion during the summer months (May to October), and provide for the sale of licenses for various purposes, besides the cutting of timber.

LAKE ST. JOHN VALLEY.

In an account of the Lake St. John Valley a special correspondent of the Toronto *Globe* says:—

"The forests around Lake St. John contain pine, elm, tamarac, ash, spruce, cedar, basswood, fir, white poplar, birch, and some hard maple. This, says Michaux, is the most northerly region where white spruce and cedar have been observed. White pine is found in abundance, and hemlock literally fills the forest. Poplar sometimes attains a height of 80 feet and a diameter of three feet. Mr. Robert Bell in 1858, reported that acorns were found on the shore of Lake St. John, showing that oak must exist on some of the rivers.

In his description of the town of Chicontimi the same writer says:—

"The Government pier, at which the steamboat lands, is at the end of a cross street, half a mile from the Court house, and a mile east of the old Hudson Bay post. This pier was commenced in 1873, by the St. Lawrence Tow-boat Company, and completed by the Dominion Government, by whom it is now maintained. The total Government expenditure upon this work to date has been $17,017. The depth of water at the end of the pier was originally ten feet, but it has since been reduced to seven feet by slabs and sawdust from the mills above. The tide rises for some distance above Chicoutimi, and sea-going vessels can ascend with a draught of ten feet during low water, and with a draught of 18 feet during half tide. The Marine Hospital, a two-story brick structure 35x45, will be finished this year. It is situated on the top of the hill in the rear of the College, and is opposite the stone monument erected to the memory of the late William Price. In consequence of the depositing of slabs and other refuse in the Saguenay, it has been found necessary to take steps to clear the channel. The total expenditure by the Dominion Government upon the improvement of this channel up to 1882 was $13,559. No less than from twenty-seven to forty-five ocean vessels, besides many schooners, have come to load lumber at Chicontimi every year since 1872, and at the smaller ports lower down quite a number also obtain cargoes."

EXTENSIVE PLANTING.

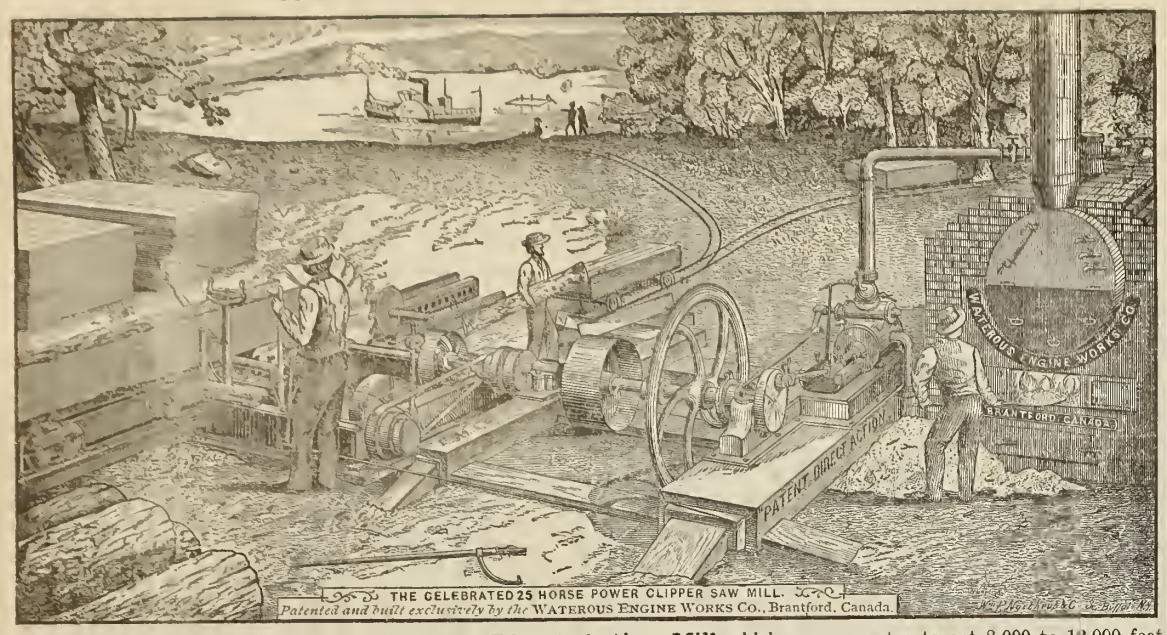
The *Lumberman's Gazette* says:—Nebraska believes in forestry, and demonstrates the strength of her belief by practical results. On the last arbor day 500,000 trees were planted within her territorial domain, which, if they arrive at maturity, will not only furnish lumber for building purposes in the future, but will be of inestimable value to the people in the cooling shade they afford and the protection against the biting blasts of winter, but their climatic effects possibly will never be measured. As much attention to this question in all the states and territories as in Nebraska would very much tend to relieve that great source of an anxiety,—the denudation of the American forests. Kansas last year also came to the front nobly in this connection by planting 93,000 acres with timber. The constant agitation which has been so persistently maintained in the class of journals of the country is thus bearing excellent fruit.

The Pacific Coast.

The lumber industry, says the San Francisco *Journal of Commerce*, is going to be *par excellence* one of the great industries of our Pacific coast future. There is no region on earth except tropical South America that possesses anything like the forest that clothes the great mountain chain whose principal summits rear above the deserts of Arizona. These are fully 700 miles of mountains covered with virgin forests, which it would seem as if the whole world could not exhaust. The estimated quantity of lumber contained in these forest is not less than 4,032,000,000, or 4,000,000,000 feet, worth in log, at a very low estimate, $25,000,000,000. California itself has 12,000,000 acres of woodlands, the annual production being about 500,000,000 feet. The total average product of the coast is estimated as follows:—California, 500,000,000 feet: Washington, 300,000,000; Oregon, 2000,000,000: British Columbia, 50,000,000: other sections, 60,000,000—total, 1,110,000,000 feet. The value of this for export is about $10,000,000.

Semi-Portable and Portable Direct Action and Belted Saw Mills!

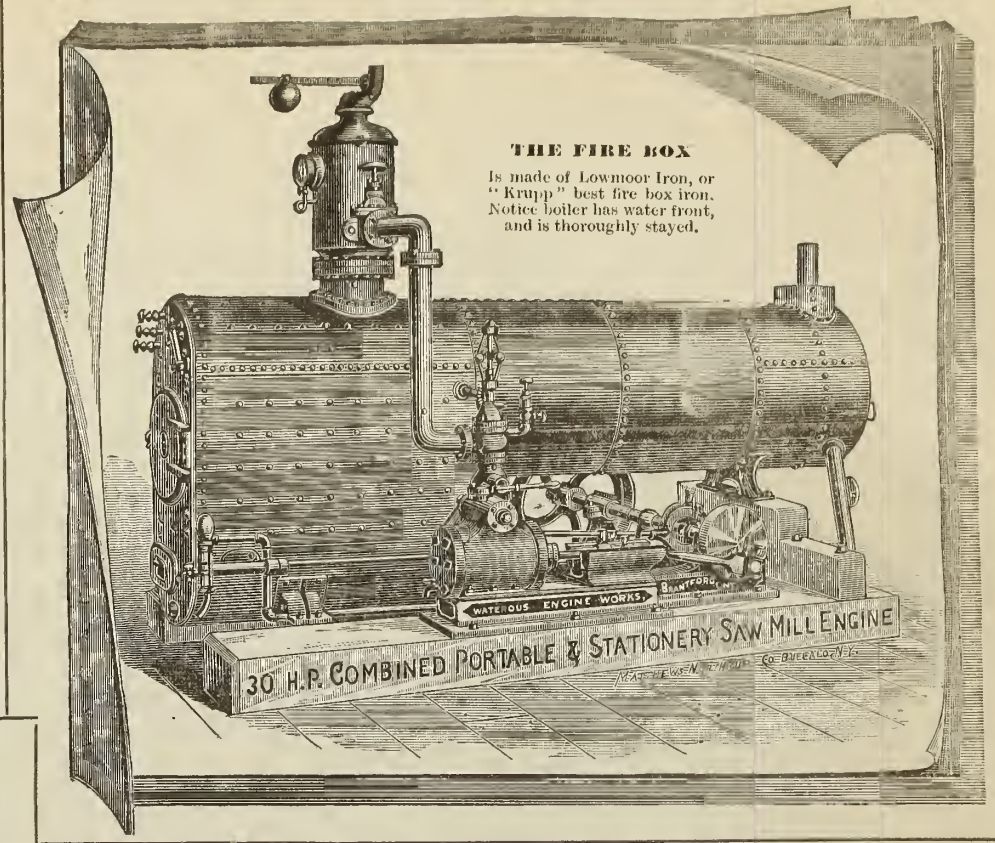
TEN DIFFERENT SIZES.



THE CELEBRATED 25 HORSE POWER CLIPPER SAW MILL.
Patented and built exclusively by the WATEROUS ENGINE WORKS Co., Brantford, Canada.

Above cut represents **Our 25 H. P. Patent Direct Action Mill** which we guarantee to cut 8,000 to 12,000 feet of lumber per day of ten hours, and to be the most efficient, economical and durable mill built in America, and will saw lumber cheaper per thousand than heavy large size belted or gang mills. For over a quarter of a century the leading pioneer mill of Canadian settlers. ☞Specially constructed for hard work.

☞This Cut represents the Engine furnished with Nos 8, 12, 16 and 18 Saw Mills.

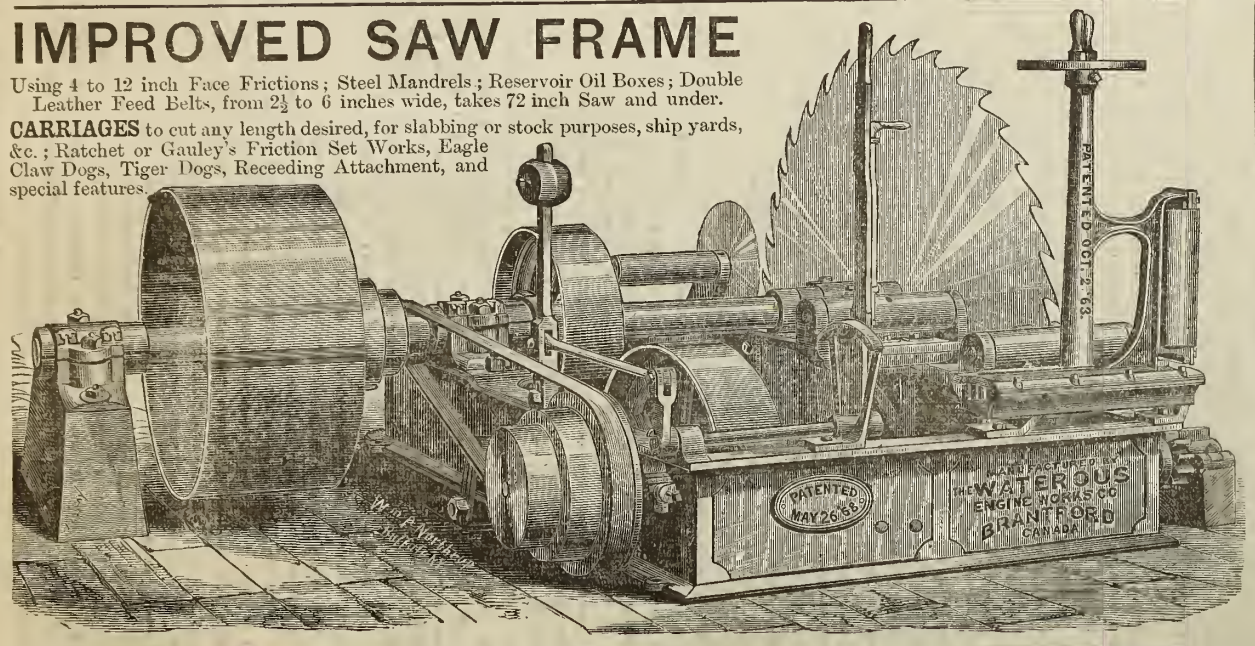


A. & P. White, Pembroke, have one of these 30 H. P. mills at Deux Rivieres, C. P. R. R.
G. C. V. Hall, Quebec, has one of these 30 H. P. mills at St. Agnes, Quebec.
Also, W. & R. Wallace, Gardner's Creek, N.B., with 60 foot Ship Yard Carriage.

IMPROVED SAW FRAME

Using 4 to 12 inch Face Frictions; Steel Mandrels; Reservoir Oil Boxes; Double Leather Feed Belts, from 2½ to 6 inches wide, takes 72 inch Saw and under.

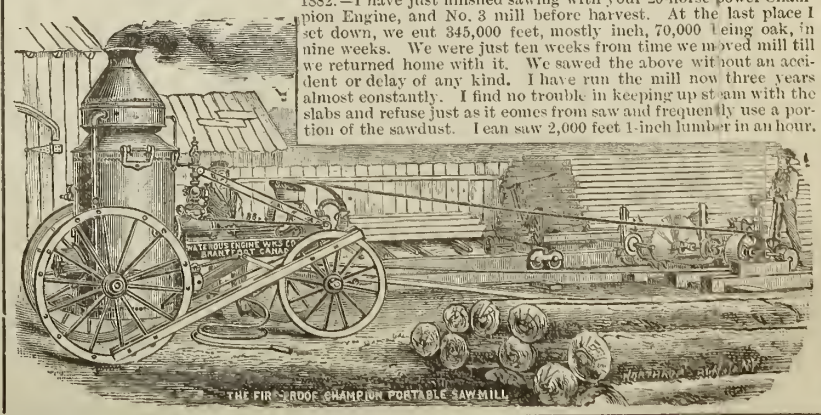
CARRIAGES to cut any length desired, for slabbing or stock purposes, ship yards, &c.; Ratchet or Gauley's Friction Set Works, Eagle Claw Dogs, Tiger Dogs, Receeding Attachment, and special features.



Champion Portable Saw Mills

12, 16, and 20 H. P.

GEORGE BOOK writes as follows:—"ST. ANNS, ONT., July 27th, 1882.—I have just finished sawing with your 20-horse power Champion Engine, and No. 3 mill before harvest. At the last place I set down, we cut 345,000 feet, mostly inch, 70,000 being oak, in nine weeks. We were just ten weeks from time we moved mill till we returned home with it. We sawed the above without an accident or delay of any kind. I have run the mill now three years almost constantly. I find no trouble in keeping up steam with the slabs and refuse just as it comes from saw and frequently use a portion of the sawdust. I can saw 2,000 feet 1-inch lumber in an hour.



The following are a few who have bought these mills:—

Canada Pacific R. R. Co.
G. B. Hall & Co., Que. (2)
Dominion Land & C. Co, Sherbrooke, Que. (2)
Sorel R. R. Co., Que. (2)
Cochrane Ranche Co. Bow River, N.W.T.
Nor.-West Milling and Mining Co., Bow River, N.W.T.
Toronto and Nor.-West Colonization Co., Near Brandon.
Morton Dairy & Farming Co., Turtle Mountain.
Allan Grant, Ottawa.
Geo. Perley, Ottawa.
Michipicoten Native Copper Co.,
W. W. Stewart, Montreal

Double Edgers, 2, 3 and 4 saws; Automatic Lumber Trimmers, 5 to 9 saws each; Log Turners, Slash Tables, Log Jacks or Haul-up of all Capacities, Endless and Single Chain; Automatic Log Rollers, Transfers, Live Rolls, Shingle Machines, Drag Saws, Knee Bolters or Block Splitters, Shingle Packers, Gang Lath Mills, Stave Machines, Automatic Sawdust Feeders for Gangs of Boilers, Sawdust, Slab and Refuse Conveyors, Elevators, Pickering Governors, Worthington and Blake Steam Pumps, American Planing and Matching Machines, American Saws, Solid and Inserted Tooth, Extra Thin Circular Board Saws a specialty, Swages, Gummers, Emery Wheels, and all kinds of Saw Mill Furnishings kept in stock.

☞WATEROUS ENGINE WORKS CO., Brantford, Canada.

Send for New Price List and Illustrated Circular, of special interest to saw-mill men. ☞Mention this Paper.

FORESTS OF NORTH AMERICA.

It is only within the last few years that public attention has been directed to the subject of the preservation of the forests and that efforts have been made to stay the wholesale destruction of trees, which threatened before long to denude the country almost entirely of its woods.

The mere utilitarian will regard the matter of consequence only from his industrial standpoint, and will regret the destruction of trees from a consideration of their marketable values, relegating to the scientist the more abstruse and less tangible reflection of the climatic and other effects of such denudation. That the latter consideration is not the least important is becoming now evident, when it is almost too late to remedy the evil. Whole sections of the country have been divested of their natural summer vesture of foliage, except in isolated patches, and the consequence has been a decreasing rainfall, a more dry and less fertile soil, while it is also generally admitted that in such sections the climate is less salubrious than previous to the clearance of the forests. Æsthetic considerations, it is presumable, ought to weigh less in the public estimation, still to many it is a subject of sincere regret that the charming variety and beauty of wooded hills and valleys have wholly disappeared in large areas all over the country, and that cool shade and summer foliage may be found frequently more readily in the environs and parks of cities than in the country. The sameness of aspect and absence of scenic effect resulting from the disappearance of the forests has seriously marred the beauty of the country, and in the level sections the uniform, dull monotony of the landscape is only relieved by an occasional orchard surrounding the farm houses from an unvarying uniformity totally destructive of beauty.

GEOGRAPHICAL DISTRIBUTION OF TREES.

The Continent of North America possesses a great variety of forest trees, so many as 340 different species being known to exist. Of this number about 100 species exist in Canada, its less varied climatic conditions precluding such a general diffusion of arborescent growth. Some species of trees are not only widely diffused but are persistent over great areas, being found almost everywhere within the limits of their distribution, while others although having an extensive range are nowhere very common and are sometimes absent for considerable intervals. Other species are confined to comparatively small tracks, or appear in detached sections, where the nature of the soil and the locality is favorable to their growth.

As a general rule the more northern species occupy the greatest extent of country, while the southern ones are more and more restricted as we proceed south. This is owing to the great difference existing in climatic conditions in going from the east to the west in the more southern latitudes. Along the northern borders of the forests of the continent the elevation of the land above the sea level is more uniform and comparatively slight, and other physical conditions are tolerably regular. As a consequence of this we find the most northern group of trees extending from Newfoundland to Alaska—a distance of 4,000 miles.

The study of the distribution of the various forest trees possesses an interest even to the geologist, as bearing upon questions in regard to the condition of the continent in later geological times. The outlines of the areas occupied by the different species and other circumstances connected with their characters and distribution may throw some light on their dissemination from certain centres or lines, or possibly in some cases their contraction from wider limits, or it may be found that some of them still have a tendency to retire or to advance.

FORESTS IN CANADA.

The correctness of the Frenchman's prevision, of the time of Jacques Cartier, would no doubt be questioned who would predict within even centuries the disappearance of the apparently interminable forests extending in almost unbroken solitude from the Atlantic to the Pacific Ocean. The continuity of the vast canopy of foliage was only occasionally broken by meadow marshes, and the small clearances of underwood surrounding the wigwams of the aborigines. In other sections the vegetation was so luxurious that only an occasional gleam of sunlight could dart through the interspaces of the thick mantle of green to the ground below. Then, as now, the vast prairies in the centre of the continent were destitute of trees, but to the Frenchman first landing in Canada, and his progeny for more than two centuries, these regions were a *terra incognita*, far removed from the range of vision and observation. So far as he had penetrated during over two hundred years the vast sea of foliage, extending everywhere, swayed and quivered in the sunlight, or changed from the light green of early summer to the darker shades as the season progressed, finally ending in the vermillion, carnation and the thousand various tints that still throw a glamour of glory peculiarly their own over Canadian forests preceding the fall of the leaf. Into those sublime and gloomy solitudes, undisturbed save by the whoop of the savages, the howl of the beast of prey, or the moan of the wind through the needles of the pine, the Trappist Fathers penetrated, and, far removed from the verge of civilization, acted as the pioneers of progress in sacrificing the comforts of life, and frequently life itself, in their noble efforts to Christianize the heathen.

Habits of self denial incalculated by their order, and a gloomy asceticism which had nursed religious ideas until they became a second nature, peculiarly fitted them for such a work. Social ties they had few or none, and the dominating idea or object of their mission became so all absorbing as to render a life long residence in those profound and gloomy forest shades the only phase of existence they could really desire. Their day has long since gone by, but the historian who would fail to credit them as the pioneers of the now existing age of progress would be guilty of an act of injustice as well as of falsifying the records of the past.

At the period of the conquest of Canada by the British in 1759, the forest had been cleared only from detached sections of the country adjacent to the St. Lawrence, but in no instance had the labor of the colonists extended to any considerable distance from the river toward the interior. At that time Upper Canada was an unbroken wilderness, the few settlement that existed being restricted to the banks of the St. Lawrence and the shores of Lake Ontario and Erie.

WOODS OF ONTARIO.

So late as 1850 the Western peninsula of Upper Canada (now Ontario) was a tree covered expanse, the settlements being confined to the shores of Lake Huron, Simcoe and the Georgian Bay. Since then, however, the progress of the settlement has proceeded with such rapidity that but few sections remain now unoccupied. As the trees formed the primary and chief obstacle to cultivation it was but natural that the squatter would regard the forests with no favor, and that he would in consequence direct all his energies to the speedy clearing of the land and the destruction of what involved years of the hardest labor before he could expect any but the most meagre returns for his toil. All that he cared for was to leave enough of the timber for fuel and for rails, and such was and is the existing dislike to trees that the spontaneous growths of such along the fences and boundaries of farms were and are ruthlessly destroyed. So much is this the case that in large areas in Ontario some of the farms are entirely destitute of timber, even pasture fields being unprovided by a solitary tree to shade the cattle from the glare of the noon day sun.

A reaction, however, has set in and the idea has dawned upon the public mind quite recently that the wholesale destruction of the woods is a great evil, and efforts are now being made to retard the process as much as possible where it is now in progress, or to partially remedy the evil where it has gone too far.

This spring a number of advanced thinkers inaugurated a movement looking to a partial restoration of the destroyed forests, and an "arbor day" in all the large cities of the Dominion, and towns and villages, will doubtless result in not only making tree planting fashionable, but will, before long succeed in enhancing the beauty and salubrity of the country.

In the uncleared portions of Ontario the forests present a remarkable richness in the number of species to be found growing together. In some localities as many as fifty different kinds are to be found on one farm. Maples, elms, beeches, basswood, with a proportion of evergreens, the hemlock and balsam being the most common, except where the pine flourishes. The underwood is usually of the same species as the larger trees, unless on low ground, where other varieties peculiar to such localities prevail. In isolated places, where the nature of the soil is suitable, groups of wild cherry, butternut, oak, white and black ash, birch and many other trees grow luxuriantly and attain great dimensions. The forests of Ontario are, however, now but shadows of what they were, and the glory of their foliage and the mysterious depths of their dim umbrageous spaces have disappeared before the woodman's axe and firebrand, and like other vanished things, good and bad, have been consigned to the region of the past. The pioneer now recalls, with visible pride and a sigh for his departed strength, the time forty years ago, when he carried the flour for the sustenance of his family a distance of forty miles through an almost trackless expanse of wood to his steading on the shores of the Georgian Bay or Lake Huron. He recalls also with regret that early period when life, even with all its hardships, was happy and free from care, and primitive wants, few in number, were almost entirely supplied from the virgin soil, and he and his family, if possessing fewer luxuries, had fewer desires, and the free and exhilarating air of the forest, a simple diet and constant occupation precluded those enervating influences so frequently accompanying the more complex and luxurious modern style of living.

LUMBER SUPPLIES.

Commercially considered the most valuable products of the Canadian forests are the pines which have now been very effectually culled from the settled portions of Ontario and other parts of the Dominion. With the exception of detached clumps scattered over the inhabited part of the country, the lumberman must now seek his supply in the region of the Upper Ottawa, in the Nipissing and Muskoka districts, and in the occasional patches existing on the north shores of Lake Huron and Superior, British Columbia, Quebec and New Brunswick. The dense pine forests in the latter provinces have virtually disappeared, while the supply from Quebec, never large, is now less than ever before.

Still, the quantity of lumber now exported is larger than a number of years ago, which is doubtless owing to higher prices, more vigorous prosecution of the trade in lumber, and the extension of the labour of the lumberman to newer and more distant forests, which now, instead of supplementing the ordinary production, are almost the sole sources of supply. That the limit of the production of pine has now been reached in Canada is generally conceded by experienced dealers, and they contemplate with anything but a feeling of satisfaction the approach of the time, by no means distant, when the most difficult problem presented to them for solution will be that of supplying the market demand for lumber when the sources of supply have become exhausted. That this exhaustion is now taking place at a rate that seriously threatens the complete extinction of this valuable tree at no distant date it is needless to deny, and it is quite as undeniable that the geueration now living, the present process of destruction continuing unabated, will witness the supply so seriously impaired as to make pine lumber too valuable to be applied to many of the uses for which it is now considered indispensable.

The same destructive influences are at work in our own country, and the day is probably not far distant when the principal sources of pine in Maine, North Carolina, Michigan, Oregon and other sections, shall have become exhausted, and the builders will be confronted with the difficult question of supplying the place of boards by other materials combiniug their advantages of lightness and ease of workmanship with cheapuess.

Next to pine, hemlock is the most valuable tree to the builder, for the rougher sorts of lumber. It existed in conuection with hard wood over a more uuiform and extended range of country, but never like the pine in separate sections, to the almost entire exclusion of other species of wood. It has now become almost as scarce as pine in many sections, and on farms where thousands of trees were destroyed the owner would now find it impossible, unless in rare instances, to secure sufficient hemlock to furnish lumber for the erection of a barn. Maple, one of the most valuable and most plentiful of Canadian trees, is also rapidly disappearing, the vast quantities used for fuel and firing purposes on trains, added to the quantities destroyed in clearing the bush lands, having reduced this most useful and beautiful of trees to straggling and narrow limits.

TREES OF BRITISH COLUMBIA.

The most valuable trees in British Columbia are the Douglas spruce, yellow and red pine, which extend from the Pacific to the Rocky Mountains. The other varieties of trees are the western larch, found in the Rocky Mountains and the valley of the Selkirk and Gold ranges; hemlock and vine and other maples, and western scrub pine, which forms dense groves in the interior of the province.

Douglas spruce, commercially known as Oregon pine, is the most important timber tree of British Columbia, and is the only one of which the wood has yet become an article of export on a large scale. It is found in all parts of Vancouver's Island, with the exception of the exposed Western coast. On the mainland, near the 49th parallel, it extends from the sea to the Rocky Mountains, being found even growing at an altitude of 6,000 feet in a stunted form. In the dry southern portions of the interior it is confined to the higher uplands between the various river valleys, coming down northward to the general level of the country. The best grown specimens are to be found near the coast in proximity to the numerous bays and inlets by which it is indented.

In those places it forms prodigious and dark forests, the foliage being so dense as to be impervious to sunlight. The trees here attain very large dimensions, many of them being over ten feet in diameter and two hundred to over three hundred feet high.

REGION NORTH OF THE LAKES.

The region north of Lake Huron is generally timbered with beech, maple, pine and cedar, where the land is fertile, but as a great extent of this section is sandy and rocky, the area of timber is rather detached and restricted. At some distance from the shores of Lake Superior and extending from Sault St. Marie to Fort William, a large portion of good rolling land, occasionally broken by trap rock, and heavily timbered exists. On approaching the lake the country becomes mountainous and barren, varied at intervals with richly wooded fertile acres.

The Nepigon River, the largest to the north of Lake Superior, takes its rise in Lake Nepigon, and flowing through several smaller lakes empties itself through a wide, deep channel into Nepigon Bay. Adjacent to its banks are many fine white and Norway pine and other varities of trees. The river swarms with tront, weighing from one to twelve pounds each, and in it and the surrounding lakes and rivers the most enthusiastic disciple of Isaak Walton would find ample means for enjoying his favorite sport.

Lake Nepigon, 120 miles long by 60 wide, is dotted with beautiful islands, some of which are very large and heavily timbered. The coast of the lake is generally mountainous and barren and but sparsely wooded.

Black Sturgeon River, connecting Lake Nepigon with Lake Superior, flows through a valley about six miles wide, which contains excellent soil, composed of disintegrated trap rock, ot which the surrounding hills are composed. The adjoining country is wooded with large birch, elm, poplar, spruce and balsam trees.

The Kamanistiquia, the only river on the Canadian side of Lake Superior that is navigable for vessels for any distance from the mouth, flows into Thunder Bay at Fort William. For the latter part of its course it winds through a rich valley of alluvial soil, between banks varying from five to forty feet in height. The valley is covered with a profuse growth of elm, ash, poplar, birch, spruce, pine and a thick underbrush of flowering shrubs.

This region of couutry is the sportsman's paradise, and is becoming yearly more fashion-

able as a favorite retreat in which to spend the warmest period of summer. Tourists from New York, Boston and Philadelphia, as well as from the principal Canadian cities, have discovered it to be an excellent fishing and hunting ground, and are high in their praises of the coolness and salubrity of the climate and the unparalleled facilities for fishing and shooting.

THE WOODS OF MANITOBA.

The largest portion of the area of the Province of Manitoba is entirely destitute of timber, and in sections where trees do exist they are crowded together along the margins of the rivers and lakes.

The principal tree in the woods is the poplar, the next in importance is the oak, and near the rivers will be noticed large elms. One of the most beautiful trees of this locality is the ash leaf maple, its fresh, green leaves opening out quite early in the spring. It is a most vigorous grower, bears transplanting well, and were its qualities better known would be valued as an ornamental shade tree in any northern country. In the spring the ash leaf maple yields a sweet sap from which superior sugar and syrup are made, but, as the flooding of the river occurs at this season of the year, the trees are difficult to reach in order to secure the sap. On the shores of the streams which enter the Red River, and especially near their mouths, basswood grows in great abundance, and ironwood of a large size can be met with. Commercially, the trees of Manitoba are of but inconsiderable value, and even used for fuel are but indifferent substitutes for the maple and hard woods of Ontario.

HUDSON BAY AND OTHER SECTIONS.

It is not generally known that valuable forests of white, red and pitch pine, black and white spruce, balsam, larch, white cedar and birch exist along the banks of the rivers emptying into James Bay, one of the arms of Hudson Bay. That these woods will be utilized in the near future is not at all doubtful. The head of Hudson Bay is nearer the fertile country of the northwest by 1,500 miles than Quebec, and already the project of connecting the interior of the continent by rail with Hudson Bay is mentioned, and will become no doubt an accomplished fact before long. Recently Dr. Robert Bell, the well known geologist and veteran explorer, made a survey of a large portion of the coast of the bay, and in his opinion, based upon observations then and upon information gathered at various times during his explorations in the North, is that the bay and straits are perfectly navigable for a large part of the year, and that the passage is probably open both winter and summer.

Other well wooded localities are the Manatoulin Islands and the Nipissing and Muskoka districts. These sections, however, merit no special mention as the extent of timber is but limited.

The reference made to the woods of Ontario would apply with but slight modification to those of Quebec, New Brunswick and other portions of the Dominion which have not been noticed in detail.

The same destructive influences have likewise been at work in those places, and the country has been rapidly denuded of its timber. Forests have been swept away until scarcely a trace of them is left, and now complaints are made of a scarcity of wood for fuel and lumber, where, not so long ago, the ground was completely covered by the thick leafage of the overshadowing woods.—*Brooklyn Eagle.*

An Old Forester.

The Brantford *Courier* says :—"The present alarm which is being manifested throughout the country with reference to the consequences likely to accrue upon the wholesale destruction of Forests, had its key note struck as far back as the sixteenth century by a Mr. Hamsen, who, in an "Historical description of the Island of Britain" devotes a curious chapter on Wood and Marshes, after referring to the general decay of the forests in the land he goes on to say : I would wish that I might liue no longer than to see foure things in this land reformed, that is : The want of displine in the church ; the couetous dealings of some of our merchants in the preferment of the commodities of other countries, and hindrance of owne the holding of fairs and markets vpon the sundaie to be abolish and refer to the wednesdaies ; and that euery man in whatsoever part of the champaine soil enoieth forty acres of lands, and vpwards, after that rate either by free deed, copie held or fee farme, might plant one acre of wood, or sowe the same in oke mast, hasell, beech, and sufficient provision be made that may be cherished and kept. Mr. Hamsen was evidently a philosophical old gentleman, for he ends his reflection thus : 'But I feare me that I should liue too long, and so long that I should be wearie of the world or the world of me."

Second Growth of Timber.

The *Northwestern Lumberman* says :—From a pamphlet by the board of trade, Bangor, Me., we learn that the value of the products turned out in 1882 from the wood-working establishments of that city, omitting ship-building and the furniture and carriage business, is placed at $3,552,425, or something over half of the value of the entire products of all the mills and factories of the city. It is also estimated that the amount of lumber cut on the Penobscos from 1816 to the close of 1882 was, in round figures, 4,843,000,000 feet, 1,277,000,000 of it being pine, 3,026,000,000 spruce, and the balance, 440,000,000, hemlock and other woods. Notwithstanding this drain on tho timber tributary to the river the compiler of the report says :

The trade in lumber, which in the past has been the leading industry and the chief source of income to the inhabitants, is still in the flourishing condition, and the timber supply shows no sign of exhaustion. The quantity now standing is likely to last for generations to come, and meanwhile new forests are springing up and growing with marvellous rapidity. It is said by competent judges that there is more standing timber in Hancock county to-day than 20 years ago, and the same may be truthfully said of other sections of the state. Furthermore the system of cutting only the larger trees and carefully protecting the remainder prevails in northern Maine, and allows the forests to be profitable work over at state intervals, thus insuring their permanence. It is true the immense pine logs of former years are no longer seen floating down our rivers to the mills, but the numberless new and important uses which have been found for the smaller and cheaper woods, all of which are of rapid growth, have more than supplied the deficiency caused by the diminished size of the pine and spruce.

Their Value Appreciated.

The *Northwestern Lumberman* says :—"A treeless country is never a pleasant one, and no one fully appreciates the value of trees until he is once set down where they do not grow. Many of the people who have settled in Dakota complain more about the absence of timber than all other disadvantages combined. One gentleman in a letter say : "A tree, next to the faces of my best friends, is what I long to see most." This gentleman migrated from Wisconsin, and used the think, he says, that his native state was so productive of trees that they were a nuisance, but now he believes he would prefer a home "in the woods" rather than on the treeless plains of Dakota. The fact that for miles and miles there is not a tree for fuel, shade or wind-break renders a man who is used to seeing, and being benefited by trees, a little lonesome up there."

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

If you would escape the ravages of that scourge of the summer season, Cholera Morbus, keep Dr. Fowler's Extract of Wild Strawberry at hand for use. In that and all other forms of Bowel Complaint it is infallible.

FITS EPILEPSY
OR
FALLING SICKNESS
Permanently Cured—No Humbug—by one Month's usage of Dr. Goulard's Celebrated Infallible Fit Powder. To convince sufferers that these powders will do all we claim for them we will send them by mail, post paid, a free Trial Box. As Dr. Goulard is the only physician that has ever made this disease a special study, and as to our knowledge thousands have been permanently cured by the use of these Powders. We will guarantee a permanent cure in every case or refund you all money expended. All sufferers should give these powders an early trial, and be convinced of their curative powers.
Price for large box $3.00, or 4 boxes for $10.00, sent by mail to any part of the United States or Canada on receipt of price, or by express, C. O. D. Address

CONSUMPTION
POSITIVELY CURED.
All sufferers from this disease that are anxious to be cured should try Dr. Kissner's Celebrated Consumption Powders. These powders are the only preparation known that will cure consumption and all diseases of the Throat and Lungs—indeed, so strong is our faith in them, and also to convince you that they are no humbug, we will forward to every sufferer, by mail, post paid, a Free Trial Box.
We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these Powders a trial, as they will surely cure you.
Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., SEPT. 15, 1883.

LARGE shipments of telegraph poles are being made from Duluth westward for the Northern Pacific roads.

THE Winnipeg *Commercial* says that a Forestry and Horticultural Society has been organized in Winnipeg.

AN application for letters patent has been made by the Pigeon River Log Driving Association and Improvement Company.

THE electric light was started in connection with Mr. Booth's saw mill at Ottawa on the evening of August 27th. The test was satisfactory. There were in all twenty lamps.

A MICHIGAN farmer of Northfield recently sold for $5,000 clean money, 100 black walnut trees from his 120 acres of land. The Saginaw *Courier* says that they will "scale a total of 9,000 cubic feet,' and are to be shipped to Europe by way of Quebec.

THE *Dominion Mechanical and Milling News* says:—The history of wood-working machinery, as we understand that term, dates back a little over one hundred years, and England has the credit of being its birthplace. Daniel Bentham, Inspector General of the Naval Works, in 1779, invented the first machine for planing wood.

Ingoldsby says:—

"There are three social duties, the whole of the swarm
In this great human hive of ours ought to perform,
And that, too, as soon as conveniently may be:
The first of the three is the planting a Tree,
The next the producing a Book—then a Baby."

ABOUT the end of last month the lumbermen at Duluth were fervently supplicating for rain to bring down the hung up logs on the St. Louis & Nemadji. It was said that twenty-four hours of steady rain would bring down as many as 35,000,000 feet into the Fond du Lac boom, and also a large number down the Nemadji. Duncan, Gauble & Co. were making a determined effort to get some of their logs over the Dalles by a process of flooding, with some success.

OWNERS of steamers running between Stillwater, Minn., and Taylor's Falls have begun action against the St. Croix Boom Corporation for damages for interrupting navigation during a log jam that lasted several weeks. They claim several thousands of dollars.

THE Winnipeg *Commercial* says that Messrs. Walkley, Burrows & Bradley, who recently sold out their interest in the Northwest Lumbering Company, have been succeeded in the directorate by Messrs. Renwick, Boxer and J. B. McArthur. Mr. McArthur has been elected vice-president, and Mr. F. H. Cameron, sec-treasurer.

THE Ottawa *Free Press* of September 6th says:—There are seventy barges lying at the Chaudiere docks awaiting loads. This is a good indication of the unusual dullness in the lumber market. There is a large stock on hand, and very few sales made. Quotations keep the same. The output of logs in the limits next season will be full twenty per cent less than last winter. Wages are decreasing.

MESSRS. W. C. Edwards & Co. of Rockland (on the Lower Ottawa), who have hitherto confined their milling operations to the manufacture of boards and deals, have decided to commence the manufacture of shingles in their new mill. This branch of their business will, it is estimated, give employment to about 100 hands. The firm at present employs about 400 hands at Rockland.

THE Winnipeg *Times* says:—The news comes from Milwaukee that suit has been begun by the Milwaukee road against the Omaha, involving some 200,000 acres of valuable pine land in Douglas county, Wis., besides other properties and franchises. The matter grows out of an arrangement made last year between the two roads regarding the contest over the old St. Croix land grant to the Chicago, Superior & Pacific Air line.

ON Ottawa despatch of Sept. 10th says that Mr. David Moore has sold his square timber for 36 cents per foot. It was a splendid average. The price is somewhat lower than last year's quotations. Lumbermen generally complain of an unusual dulness in the timber market. Already large gangs of raftsmen are leaving daily for the shanties on the Ottawa and its tributaries. Operations will be greatly curtailed this season, and it is thought that the cut will be reduced 25 per cent.

ON THE MIDLAND R. R.

ON that portion of the Midland Railway known as the Coboconk branch a large business is being done by Messrs. McKenzie Brothers and Campbell, of Kirkfield, in telegraph poles. Their shipment this season will foot up about 30,000 poles, all of which has been sold to the Western Union Telegraph Company, delivered at various points in the States. As the guage on the Coboconk branch had not been widened, all these poles had to be transhiped at Lorneville Junction, which added unnecessarily to the cost of transporting them to their destination. The Coboconk branch has now been widened to the same guage as the rest of the line. There has also been a quantity of cedar taken from this section for the harbor works at Toronto.

There was a movement on foot some time ago at Orillia to have a canal dug between Lakes St. John and Couchiching at the portage, so as to enable Messrs. R. & G. Strickland who have bought Thompson, Smith & Son's mill at Bradford, and who own large limits on waters whose outlet is by way of Lake St. John, to move the Bradford mill to Orillia, and manufacture their lumber there instead of at some other point, but a survey revealed the fact that at the average height of these lakes, Lake St. John is the lowest and as a consequence the project has had to be abandoned.

At Foxmeade is to be found about the only log railway in Ontario. It is the property of Mr. James Maddon and runs from his mill a distance of about two miles into the bush. This mill has been chiefly engaged clearing some limits for the British Canadian Lumber Co., but after this season it will cut from a limit owned by the proprietor.

From Coldwater a branch of about nine miles has been built by the Midland to reach the Medonte Lumber Co.'s mill. The Medonte Company have been at work about four seasons, but as yet have shipped none of their stock, which amounts to between four and five million feet. They are in a section where there is a large quantity of fine grey oak.

The North River Lumber Company have erected a new mill at Fesserton. They have a contract with the British Canadian Company to clear certain lands for them. The B. C. Co. guarentees them 4,000,000 a year for six years. The cut to vary according to the times. Bushy & Wood have also erected a mill here, having a capacity of about a million and half and have some good limits to stock it from.

Mr. R. Power, of Victoria Harbor, has entered into partnership with Mr. Misscampbell, formerly manager for the British Canadian Co.—the firm to be known as R. Power & Co., and Mr. Misscampbell is to take the management of the business. This year's stock will be about ten million feet of lumber and twenty million shingles, which latter have been purchased by Messrs. Christie, Kerr & Co., of Toronto. This is about the largest individual stock of shingles in this section of the country. The season has been a bad one for towing, and this firm lost their first tow, owing to the stormy weather.

Business at Midland City seems to be very good. Two vessels cleared last week with lumber, one for Amherstburg and the other for Courtwright. The cut of the B. C. L. Co. this year was expected to be about 30,000,000 at their two mills, but the destruction of one of their mills by fire will prevent this anticipation being realized. Rathbun & Son, of Deseronto, are operating here too. Their inspector Mr. McCallum, is here shipping ties which have been delivered from various points on the Bay. They will ship about 30,000 ties and 10,000 posts from here this season. The lumber for the elevator at Fort William has been shipped from here by the propeller Argylo. It was brought here from Waubanshene and dressed by Mr. Garnet at his planing mill before being shipped. Mr. Garnet is very busy, having quite as much work as he can attend to, and therefore does not think he shall have any reason to complain of having located at this point.

The general feeling seems to be that the out get of logs next season will not be so large as it has been during the last two seasons.

TREE PLANTING AND PRESERVATION.

Mr. Phipps is sending out the following circular, and would be glad if any of our readers could send him information, so as to further his work in a matter of so great public importance:

SIR,—Having been instructed by the Ontario Government to make certain inquiries relative to the desirability of tree planting and forest preservation, I should be much obliged if you would send me word if any plantations of forest trees have been established in your neighborhood, whether only a few trees or many, as even the experiment of a solitary tree is valuable. Also, if you happen to know or can readily ascertain, when such were planted, what varieties have been found to thrive best, and on what soils, and what method of planting has been used. I may be passing your way, and would be glad to see and inquire personally into any improvements of the sort; but circumstances may forbid this, and a line from you would be valuable in the meantime. At the same time, I would gladly know whether, in your neighborhood, any change in rainfall, or drying up of creeks or rivers, seems to have followed the clearing of the forest. An early answer will greatly assist.

Yours truly,
R. W. PHIPPS,
Clerk of Preservation of Forests, Ontario.
233 Richmond Street west, Toronto,
Sept. 3rd, 1883

THE EFFECTS OF LIGHTNING ON TREES.

Our Geneva correspondent writes:—"The frequency of thunder storms in Switzerland this summer (we have on an average two a week) has afforded Prof. Colladon, of Geneva, a great authority on electricity and meteorology, ample opportunity of continuing his observations on the effect of lightning on trees and vegetation generally. He has ascertained that when lightning strikes a tree it leaves very few marks of its passage on the upper part and middle of the trunk, a peculiarity which he ascribes to the fact of those parts being more impregnated with sugar, a good conductor, than the lower part. As the electric fluid descends to the neighborhood of the heavier branches, where there is less saccharine matter, it tears open the bark and in many instances shivers the tree. It is no uncommon thing to find the lower part of a tree literally cut by the lightning, while the upper portion and the higher branches seem to have suffered hardly at all. Oaks, however, would appear to present an exception to this rule, or they are often found with tops quite blasted and the passage of the lightning lower down marked by a gouge-like furrow. These furrows sometimes go completely around the tree like a screw, the reason of which, says Prof. Colladon, is that the lightning follows the cells of which the bark is composed lengthwise, and in certain sorts of wood these cells are disposed spirally. A curious effect of lightning on vines is that it invariably strikes a great many vine stocks at the same time over a space, for the most part circular, from 8 metres to 25 metres in diameter, and containing, therefore, several hundred vines. Thd plants most effected are those in the centre of the circle, and the number of burned and yellowed leaves diminished in proportion to their distance from that point. In July two vineyards in this canton were struck by lightning, and the first idea of their proprietors, on seeing their shrivelled vines, was that a still more dreaded foe, phylloxera, had been at work, but when the Professor was called in he speedily enlightened them as to the cause of the mischief, and, in proof of his diagnosis, pointed out that the ground in the centre of the circle was strewn with torn leaves and freshly broken twigs."—*London (England) Times.*

CANADA WHITE PINE.

Dr. Bell, Assistant Director of the Geological Survey of Canada, says respecting the white pine: "This and the next species have so nearly the same limit throughout the greater part of their northward range, that they are represented on the map both by one line. The red pine, however, does not extend so far east as the white, so that in this direction the line represents only the boundary of the latter. Contrary to popular belief, the white pine is confined to a comparatively small part of the dominion, as will be observed by an inspection of the map. Its northern limit in Canada extends east as far as Mingan, while to the west it does not reach Lake Winnipeg, or Red River. It reaches its lowest latitude opposite to Ottawa City, about 48½°, and its highest about 52°, in the Lonely Lake Region. It occurs in favorable situations throughout the greater part of Newfoundland, but it is of best quality and most abundant along the Cander and Exploit rivers on the north, and the Humber on the west side of the island. On the last named stream, I have cut into the centres of several good sized trees, and found the wood of excellent quality. In the country immediately north of Lake St. John, the Messrs. Price have cut large quantities of fine white pine timber for export. When coming from Lake Mistassini to Ottawa, by way of the Gatinean river, Mr. Richardson, of the Geological Survey, first met this species at 230 miles north of that city. It occurs of fair size on the head waters of all the principal branches of the Moose River, and in former times is said to have extended considerably further north along these streams: but having been entirely destroyed by extensive forest fires, it has been replaced by other trees. Owing to these fires it is now very scarce in most of the region north of Lake Superior, but small groves of it have been observed as far north as represented."

RAFTS ON THE OTTAWA.

The Ottawa *Free Press* of Sept. 10th, says: The lumber trade is the staple industry of Ottawa, and consequently the citizens take a deep interest in the same, as anything injuriously affecting the business would prove hurtful to

tbe community. The market during the present season has been rather quiet, lumbermen holding back for better prices while purchasers have been waiting until later on in the fall before buying. As a consequence the shipment of lumber so far has been very small when compared with past years. This fact can easily be seen when it is noticed that the lumbermen in this district have considerable difficulty in finding piling ground for their output. Some mill-owners are engaged in taking their lumber some distance down the Ottawa on barges and piling it there. The expenses of handling the lumber so often before shipment must be quite an item, but this season it is observed that Messrs. Bronson & Weston bave introduced a rather simple, but, nevertheless, excellent and cheap plan for saving labor while engaged in this work. The lumber is placed on the barges in lots or tiers consisting of quite a number of pieces, and is trans-hipped with a crane at the wharf, afterwards being placed on lorries and run back on rails to the piling ground. This system saves the lumber being handled piece by piece, and the expense of paying for labor in performing tbis work is greatly lessened when compared with the old system. The other day a *Free Press* representative had a conversation with Mr. B. Grier, of the firm of J. & B. Grier, Lachine, who was in the city looking after one of his rafts which arrived from the Kippewa. The reporter and Mr. Grier visited the raft togetber and found that the timber, which consisted of square and waney, was of excellent quality. Indeed for size, straigbtness and appearance it can be said with all truth that tbe ratt was the best down the Ottawa this season. Some of the pieces of timber contained no less than 200 feet, and it took some trouble before Mr. Grier and the reporter could find a piece with a bend in it, which of course detracts from the value of timber. The quality of the Kippewa timber excels that of Michigan, and is almost as good as that of the St. Lawrence. To give the uninitiated an idea of the time it takes to bring a raft from Kippewa it may be stated that the one in question left in April, when navigation opened, thus taking upwards of four months to reach Ottawa.

Speaking of the outlook of the timber market Mr. Grier stated that wbile it was comparatively dull during the season, still prices were fair and the outlook was tbat in a very short time, as purchasers were not supplied, and as lumbermen were holding on to their output, the market would be good and a good figure the result. A splendid raft that was alongside of the Messrs. Grier's, and belonged to Mr. Latour was also visited, and the timber, too, was of good quality, although not nearly so heavy as the first mentioned. This one also, which consisted of square timber, came from the Kippewa. While referring to the lumber trade in the Ottawa district it might be interesting to give some statistics in regard to the trade generally. There are engaged in the getting out and manufacture of lumber in Canada about 100,000 men, who support families forming a grand total of half a million, or about one-ninth the population of the Dominion. In all the industrial establishments of Canada, $165,000,000 of capital is invested ; in saw mills and machinery over $25,000,000, is placed. The amount invested in lands and lumbering outfits is about $50,000,000 in all, or more than one-third the amount invested in all other industrial establishments. The total product of lumber in 1881 was $38,541,752, or nine dollars for each inhabitant of the country, of which enough was sold to bring into the country $23,991,052. As a revenue paying class the lumbermen take a high place, the half million persons who are supported by this industry paying five millions of dollars into the revenue of the country.

The lumber trade is far from being on the decrease and forms to-day, next to agriculture, the most important industry of our people.

THE WINNIPEG TRADE.

The Winnipeg *Times* has been publishing a series of interviews with business men from which we take the following :—Mr. James Sutherland said that business during the summer had been good, although there had been a considerable fall in prices. This decline commenced in the spring and continued until it represented a fall of about twenty-five per cent. ; but he thinks that prices have now touched bottom, and expects a rise in the fall. There has been a very fair demand for lumber all summer, but on the other hand there has been a greater competition, owing to the overflow of trade from Minnesota and from the Georgian Bay district, in both of which business has been somewhat dull. The opinion is, however, that the Minneapolis and Georgian Bay dealers are now pretty well out of the trade, finding that they cannot bring in lumber and make a profit at the prices at which the home manufacturers are able to sell. Altogether the sales have been nearly as large as last year. There is a prospect of a very fair fall trade. Messrs. S. R. Sutherland & Co. will have a large stock of dry lumber, something which the manufacturers have never been able to supply before. Heretofore the quantity of lumber sawn has always been so small that the manufacturers have been able to sell it almost direct from the saw. This year Messrs. Sutherland will go into the winter with ten million feet on hand, of white pine floated down the Red River from Minnesota. Mr. Sutherland believes that the bome manufacturers will now be able to supply all the wants of the country. Payments are being made fairly net.

SAW MILL IDEAS.

In some mills the driving pulley is so farf rom the husk that the belt is nearly horizontal. This will be the case where there are very long belts coming from below, or where the husk is not upon the floor above the engine or the counter shaft. In such cases the highly desirable arbor belt gig cannot be used ; but the same arrangement of the rag shaft and the pulley shaft, and the frictions can be used, the gig friction shaft having an extension with a bearing on the pulley outside the husk, and the cross belt making the connection with the engine or the counter shaft. As this cross belt extends beyond the arbor and will be so long as to be more durable than cross belts generally are, this independent gig may be driven either by belts direct from the engine on the same level, or from a counter shaft above . The belt should be as long as possible, to relieve the cross belt from excessive friction and wear ; and in tbis case it will gig as promptly and saw as fast as though the direct arbor belt gig were employed.

Although the cross belts have more wrap and hence more driving power than open ones, it is best to avoid them where it is possible. If the land be dry; there may be a pit dug about 6 ft. deep, and then the arbor belt gig can be applied. Depth of pit may be saved by raising the track about 4 feet, and drawing the sawdust away from the pit to the boiler by an endless cbain or rubber belt conveyor. It is best to have the logs taken from ground a few feet higher than at the mill, then there will be no power needed to draw the logs in. In those cases where the ground is level, the log may be drawn in by a light rope or chain, with spool and friction wheels.

In order to have the engine and boiler out of the way of the logs, they may be at the rear of the carriage ; a counter shaft passing under the track, in the pit, to belt to the arbor. Where there is a pit the front side of the carriage is open, so that the lumber need not to be carried a long way to the edgers, slab-cutters, lath machines, etc., these being right near.

The advantages of the double saw need not be here rehearsed. There are cases where single mills have no provision for altering to double, by attaching the frame of an upper saw to the husk. In this case the top saw may be hung from an inverted hanger ; the arbor beam being raised and lowered by screws, and held to the hangers by large turned bolts, wide apart. The upper arbor may be driven either from the lower one, or by a belt coming through the floor from the counter shaft below.—*Mechanical and Milling News.*

MAKING CIGAR BOXES.

The *Canadian Manufacturer* in a description of the industries of Galt says :—A little room breathing the incense of natural woods and occupied by a courteous gentleman, is the office of Wm. Beck & Co., who are engaged in making cigar boxes from domestic and imported woods, Canadian elm, and Spanish and Mexican cedar. The machinery used consists of small saws, planers and an exact machine that nails the scented boards together. The boxes are made to order, and the sizes are greatly diversified. Then they make whole and half-boxes, or those holding 100 and 50 cigars respectively. Twenty employees make 900 boxes each day. Upstairs, in a cheery, bright room, six girls were finishing and decorating the boxes with strips of paper, trade marks and vignettes. The girls were tastefully dressed and looked so happy that we asked them if they enjoyed their work. They assured us that they did enjoy it ; that it was not from necessity that they were engaged in it, as their parents are comfortable people owning their own homes. But the girls are proud to earn their independent pocket money, from which fund they draw for dainty dresses, fees to instructors of music, drawing, and the purchaso of books and pictures. Here is the beginning of the disappearance of the clinging vine idea about these young women, refreshing as a breeze from the ocean on a hot day. It speaks of a healthy moral vigor and a sturdy spirit of self helpfulness amongst these young people that insures the strength that is the pride of any country.

Peterborough, Ont.

The lumbering season has commenced. Messrs. Ul'yott & Sadler sent a number of men north to their limits last week, and a further force on Friday. Their timber limits are in the townships of Burleigh and Anstruther, Peterborough County, and Anson, Victoria County. The first week in September is about the usual time the work in the woods is commenced. It is expected that the total cut this year will be smaller than last year. It will probab'y not amount to over two-thirds of last year's cut. Mr. Irwin has also sent men north to his limits.

THE people of Brooklyn, Conn., deem their old oak the most beautiful tree in New England. A hundred years ago its top was cut off to use in bushing in hay seed, and the young tree then put off many branches near the ground. Some of these have grown to a length of 50 feet, and are very large. The trunk is 15½ feet in circumference.

And MANUFACTURERS,

☞Dealers in WALNUT, BUTTERNUT, CHERRY, CHESTNUT, ASH, OAK, WHITEWOOD, and all kinds of Hardwood and Pine Lumber. PICTURE BACKING, HOLLY, EBONY, LIGNUM-VITÆ, RED CEDAR, &c. American and French VENEERS.

Orders for Lumber and all kinds of Factory Work promptly attended to. Lumber Kiln dried to order.

Yard : Cor. Wellington & Strachan Aves.
FACTORY : Corner Soho and Phœbe Streets.
OFFICE : 39 Adelaide Street East, (First Floor, nearly opposite the Post Office.

L5 TORONTO, ONT. 1y

WATER POWER
TO LEASE.

THE UNDERSIGNED having largely extended their raceway at Lakefield, are desirous of corresponding with parties who wish to go into manufacturing, and they are prepared to sell or lease water power on the most favorable terms, or would erect buildings of any size suitable for factories.

R. & G. STRICKLAND
1d86 LAKEFIELD, ONT. w15t9

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business. No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily and honorably. Address TRUE & Co., Augusta, Maine.

THE FORESTS AND THEIR MANAGEMENT.

We take the following from Mr. R. W. Phipps' report to the Ontario Government:

SILVER FIR AND SPRUCE IN THE BLACK FOREST.

The Black Forest mountains are the home of the silver fir. The winters are severe—five to eight feet of snow on the hills from November till April; three feet in the valley from December till March. They are partly regulated forest, in which, however, a gradual felling for their reproduction is carried on over one-third or one-fourth of the whole area at once, from which every year during thirty or forty years the largest trees are removed, while the rest are allowed to grow larger during the remaining years. This is done, as the price these large trees fetch is much higher in proportion than that of the smaller ones, and all are felled and removed in one piece if possible. Natural reproduction is chiefly resorted to in these forests, which, in consequence of the young plant growing well in the shade of the old trees, is very easily accomplished, even though it is extended over such a long period as thirty or forty years. To be able to keep as many trees as possible growing on the lands on which the regeneration of the forest is going on, the branches up to one or two-thirds of the height of the tree are sawn off to admit air and light to the young plants below, which does no harm to the silver fir, but, on the contrary, is said to aid the more rapid increase of the trunk, while the branches are used for litter. This sawing off of the branches is commenced from above by men who earn about forty-five cents a day. Regular seed-bearing seasons occur at longer or shorter intervals, but nearly every year there is sufficient seed to increase the number of young plants where it is wanted, Moss cover is very favorable for the germination of the seed, whilst in such places as get covered with grass or weeds, or where for other reasons the seed does not germinate freely, the soil is at once prepared, by clearing and slightly loosening it in strips and patches for the reception of the seed, the germination of which is thus facilitated. If the open space in the forest is so large that the seed from the old trees does not reach the whole of it, sowing by hand is resorted to early, so as to let the young plants be as nearly as possible of the same age. If, by the time the old trees are nearly all removed, there are still some parts not covered with young trees, planting is resorted to. For the better growth of such planted trees the existing groups are somewhat rounded off, to avoid the young trees planted having to struggle with the others, perhaps already twenty to thirty years old; and where, on incompletely stocked spaces, which have to be filled up by planting, there are single trees of some twenty or thirty years, they are cut down altogether; or, if they are standing in numbers, and are not quite so large, some of the lower branches are lopped off the outer ones, so as not to interfere with those planted. These plants are either taken from nurseries or out of the forest, if the latter have not grown in too deep shade, which would render them liable to suffer on being removed to open places.

The seed is collected with some risk from the trees in October, before the cones open and it falls out. As the seeds are very oily, they are best kept in the cones or sown at once. The sowing is done in prepared beds in rows four inches apart, and after germination the ground is covered with moss to keep in the moisture. The seedlings one year old are transplanted into rows six or seven inches apart, and three inches between the plants in the rows, after which the soil between them is covered with moss. Here they remain for two or three years before they are fit for transplanting. Shade from the side is very beneficial for the seed beds as well as for the nursery. Plants from the nursery are preferable to those out of the forest; and the latter, when used, are as a rule removed with some of the soil adhering to the roots. Planting is better done in spring than in autumn, and in the usual way, the roots of the young plants being cut as may be necessary. They have to be sheltered as far as possible against sun, dryness, or spring frosts, and the plants as a rule thrive better on the cool northerly and easterly slopes of the mountains than anywhere else. The silver fir grows very slowly at first, and does not get much higher than six inches in the first four or five years. At the age of twenty-five years it begins to grow very fast, and increases most between the ages of eighty and a hundred and twenty years. It likes best a deep, cool, moist and loamy soil with a covering of moss, and sends its roots deeper than the spruce, in consequence of which it suffers less from wind and storm than the latter. There are many spruce intermixed, used when natural reproduction of the silver fir fails. Thinnings are necessary in the thirtieth year, and have then to be repeated every tenth year, till the gradual felling of the largest trees commences. These fellings are regulated by the needs of the young seedlings, and are carried out only sufficiently to admit light to the young plants, leaving as many of the old trees to stand as can be permitted.

Moorpan.—In Hanover and elsewhere, where the Government are breaking up thousands of acres of heath for the purpose of planting forests, great difficulty is found in penetrating and converting into good soil a hard layer called "moorpan." This is broken by plough and pick-axe, and Scotch firs planted, whose deep tap-root passes down into the layer of better soil below. The Government pay about $11 an acre for the land.

ITALY.

Soon after the present Kingdom of Italy was established, a central forest school was organized near Florence, under the direction of A. di Berenger, formerly in the Austrian forest service of Venezia, and author of an excellent work on the history of forest management in Italy. The school is located in the splendid silver fir forest of Vallombrosa. We all remember

"Thick as autumnal leaves that strew the brooks,
In Vallombrosa,"

This is below the crest of the Appenines, on their western slope, about twenty miles east of Florence. In winter it is transferred to a lower station at Paterno, in the region of the olive. Italian forest literature of direct practical application is comparatively modern, but of late the publications of the Ministry of Agriculture, to which sylviculture is entrusted, contain much that is valuable. The two most important of these give the statistics of forests and the forest law of Italy. There are over five million acres of communal forests, over six million of private forests, and only half a million acres of State forests. One-fifth of the land is in forest. This is scant enough, apparently, or the nominal forests have been culled to depreciation, for we are told that—

"Projects of a general forest law for the whole of Italy have been repeatedly submitted to the Italian Parliament. The evil effects of denudation have been severely felt in many parts of the country, and the aim of these proposed legislative enactments has hitherto been to guard against further mischief by determining beforehand which lands shall, in the public interest, be clothed with forest or kept under forest, and then to place the whole of these lands under the supervision or control of the public forest officers without distinction, whether they belonged to state, village, commune, or private persons. From a report with which the Minister of Agriculture submitted the project of a general forest law in 1870, it appears that the financial exigencies of the country had rendered imperative the alienation of the greater part of the forests at the disposal of the State, and that it was only intended to retain a limited area of state forests, mainly with the view of supplying the timber required by the navy, and the forests required for this purpose the bill proposed to declare inalienable.

"Thus, with regard to forest matters," says Captain Walker, "it seems probable that Italy will pursue a policy different from that which has of late years been initiated in most provinces of India. In those provinces we acknowledge the necessity of maintaining certain areas under forest, or of clothing them with forest when they are bare; but we do not expect any satisfactory success in those attempts, unless the forests to be thus maintained or created are under the entire control of the State, and we entertain no serious hopes of effecting any real good by the supervision of private forests, or by any general kind of control over communal forests, unless the administration or management of such communal forests can be vested entirely in the hands of the public forest officers.

"In those provinces, therefore, of the Indian Empire, to which I now refer, our principal aim is, in the first place to consolidate the State forests wherever the State has suitable forest lands at its disposal; and we hope that eventually, when the majority of public forest officers shall have acquired that professional knowledge, skill, and experience which is necessary for a satisfactory management of forest land, that they may be found competent not only to manage the state forests intrusted to their charge, but also to induce large landed proprietors to follow their example in the management of their own estates, and, if such should ever be found necessary and expedient, to exercise an efficient supervision over private and communal forest lands; but we think that any attempt to exercise supervision and control over private and communal forest lands through the agency of forest officers who have not actually charge of public forests entirely under their own control, and who cannot point to the management of their own forests as an example to be followed in the management of the private or communal forests, would lead to unsatisfactory results. The further development of the general forest policy in Italy will doubtless be followed with great interest by Indian foresters, and on this account it appeared to me right to add the present remarks."

It may be valuable here to notice that in this, as in other points, the practical ideas of the Indian commissioner might well be applied in Canada. There is good reason to fear over-denudation here; there is also reason to believe that we shall have an interval in which to take measures for avoiding the evil. In that interval the course stated by the commissioner as likely to be followed in India might, it appears to me, profitably be pursued here, namely, the taking in hand by Government of any amount of forest fit for the purpose, and which could be spared from the operation of the system at present pursued, and preserving them on the European plan. This will further on be more fully treated.

(To be Continued.)

TIMBER AND DEALS IN GREAT BRITAIN.

Reports from the principal timber markets of Great Britain up to the 20th Aug., show a slightly improved tendency in prices. At the Baltic sale rooms in London on the 15th a parcel of pine sold well, the wide stuff bringing £26 15s., a better price than has been obtained for weeks. But wide stuff has been and still is scarce, and this price is out of proportion to regulars, which sold at under £22, while 9 inch went under £18. The reserve price for waney board was under £5. Quebec spruce, ex Electric, sold at £8 for regulars, "a non-paying price."

At Liverpool, a large fleet of vessels arrived during the week ending the 18th of August, including a considerable part of the Quebec spring fleet, and a number of spruce deal-laden vessels from the lower ports, which temporarily weakened the market for spruce deals. The timber trade, like other kinds of business was dull at that point, but an inquiry sent out for the Mersey docks and Harbor Board, for about 100,000 cubic feet of timber, of various descriptions, principally pitch pine, infused a little animation. At a sale of Alfred Dobell & Co. on the 10th, Dalhousie spruce deals, 3x11, 9 to 24 ft. brought $7 7s. 6d.; 3x9 brought £7 2s. 6d. and 2x6 brought £6 12s. 6d.

On the Tyne, trade continued very good up to 16th, and prices for all wood goods were firm. At Sundorland, imports were light, the Baltic oak trade fairly brisk. At Cardiff, the iron-workers' strike being over, the week was the busiest in timber for a long time, arrivals being numerous from Canada, Florida, the Baltic and the White Sea.

Arrivals of Quebec timber to Clyde ports were heavy during the week, over 11,000 tons being reported. Messrs. Edmiston & Mitchells held a sale on the 15th; there were offered parcels of States black walnut and Quebec birch, ash, and pine timber, and a few lots of deals, when shipbuilders were well represented and the following sales by auction were made: States black walnut, a parcel of 33 logs, averaging square (string measure) about 18 in., sold at 4s. to 6s. 3d., averaging 5s. 0½d. per cubic foot; Quebec birch, 14 in. to 15in. average square, sold at 1s. 8d. per cubic foot.

The imports of hewn and sawn wood into the United Kingdom for the seven months ended with July last were 1,021,727 loads hewn and 1,718,583 loads sawn, as compared with 1,045,876 of hewn and 1,879,574 sawn in a like period of 1882. The total was thus 185,150 loads or six per cent less. London shows an increase, but other leading points a decrease from last year. The export of deals from St. John for these seven months was smaller than for any similar period since 1879, being 105,253,000 feet, as compared with 117,679,000 feet same time 1882 and 114,978,000 feet 1881. Shipments from that port to Scotland, Wales and Ireland were larger this year than last, but to Liverpool, Bristol and the continent they were decidedly lessened.—*Monetary Times.*

WIDE DIMENSION PINE.

The London *Timber Trades Journal* of Aug. 18, says:—The pine parcel, ex Eugenie, sold well, the wide stuff going at £26 15s., a value that has not been recorded in the public sales for a long while, and which cannot be other than satisfactory. Regulars, however, went under £22, which is not a whit better than similar descriptions have been realizing for some time past, and the 9 in. under £18 were also plain evidence that there was no actual improvement as yet in the market. That values of broad pine are so disproportionate to that of other dimensions is entirely due to its present scarcity, but with such an apparent demand the inquiry for board timber, in the ordinary course, may be expected to take an active turn. Dealers now are so accustomed to everything ready sawn that they are disinclined to press business in what we may term the raw material, as leading them into deep water.

It is one thing to pay a good price for an article ready to hand, but another thing altogether to buy the material in its rough state to convert to the sizes required. In the one, the question is merely that of what you pay and what you receive, the other has lots of things hanging to it that may leave a wrong balance unless closely watched. For those that have plenty of saw machinery under their own control we should think just now at the present price of pine timber a profitable trade could be done in manufacturing board pine into saleable sizes. The reserve price on waney board was under £5, which, with the cheap rates sawing is now done at, on paper leaves a wide margin for contingencies. Why the stuff is not converted on the other side it is not easy to conjecture; the quantity of best quality each log would supply is the problem which would first have to be solved, and possibly this might give a different colouring to the calculation altogether.

That wide dimensions are obtainable at other shipping ports of the St. Lawrence as well as Quebec we have plenty of evidence of by the quotations supplied in the journals at the timber localities of the United States, which now and again appear in a tabulated form. Not that alone, but the sizes of the logs shipped in the partly rough state to this side are also given. We doubt if the high prices now obtainable could be depended on were the market better supplied with wide deals, and it probably suits the mills to keep more to the regular sizes, even if they get proportionately less money for them.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

THERE is no excuse for suffering from Headache, Constipation and all the wearying train of symptoms of a disordered liver, when Burdock Blood Bitters is an unfailing remedy, and only costs One Dollar a bottle. Why suffer on without a trial? 25,000 bottles sold during the last three months, with almost universal satisfaction.

Chips.

THE Paris Municipal Council have voted 480,000f. for the erection of wooden buildings in the bastions of the fortifications to serve as hospitals in view of an outbreak of cholera.

THE factory of John McGregor, at South Lincoln, Me., turns out from 30,000 to 40,000 gross of spools per month, and consumes annually from 2,000 to 3,000 cords of birch. Fifty hands are employed.

THE Quebec *Chronicle* of Aug. 31st says:—Messrs. John Sharples, Sons & Co. have purchased a raft of white pine from Mr. Barrett, of Renfrew, of about 45 feet average, at 19½ cents per foot.

Freyberg Bros., of Washington island, mouth of Green bay, Wis., recently lost 150,000 feet of pine logs, as they were being towed in raft from point Aux Bark to Washington island. A heavy sea broke up the raft.

G. W. Frost & Co., at Saco, Me., have a large new box factory, the bnilding being 80x125 feet on the ground. The consume 5,000,000 feet of pine a year in packing-boxes of all kinds. They employ 40 to 50 hands.

DURING July two vessels with lumber left Puget Sound mills for Honolulu, Sandwich Islands, two for Sydney, Australia, one for Callao, and one for Guaymas. The cargoes aggregated 4,500,000 feet, and a value of $60,000.

A PARTY of Wisconsin loggers recently put in an appearance at Olympia, W. T., and were dumbfoundered at the size of the fir and cedar of Puget Sound, as compared with the pine timber to which they were accustomed.

THE Minnedosa correspondent of the Winnipeg *Commercial* says:—Messrs. Sword & Moore, of Brandon, are bringing in a large stock of sash, doors and fine lumber, and have opened business in Barker's block on Tilson street.

THE Parcels Post, on the second day of its coming into operation, brought to the House of Commons a small tree addressed to Mr. Gladstone. In the absence of other explanation it is supposed that this was a joke, and had some reference to the right hon. gentleman's well known skill in the use of the axe.

THE Winnipeg *Commercial* of Aug. 28 says:—There has been a more active movement in lumber during the past ten days than for some time. Considerable building operations in the city, and also at different points out west. have caused quite a demand. The mills are busy and it will keep them fully employed to cut all the logs on hand between now and winter.

The Winnipeg *Times* says:—The sawmill at Fort Alexander has been rented to Mr. Schneider, of Winnipeg, who will run it for the remainder of the season. It is understood that Mr. Schneider intends erecting a first-class steam sawmill on Winnipeg River, a few miles above the Fort, this coming fall.

THE *Lumberman's Gazette* says:—Many people suppose the United States has the heaviest percentage of woodland of any country in the world and are inclined to treat all that may be said in reference to the destruction of our forests with utter indifference. But the fact is, we have only one fourth of our territory covered with wood, which is a smaller area relatively than eastern, western and northern Europe. Pine timber is being rapidly denuded and ere many years shall have passed into history, the southern states will be the only source of supply for pine lumber.

THE *Timber Trades Journal* says:—A list of 62 arrivals of timber laden vessels in London, in the seven days ending the 15th of August, is a pretty considerable contribution to the stocks on hand, but not so heavy an importation as some preceding weeks have shown. About a third of them are from Canadian ports, and we seem to be getting more than usual from the St. Lawrence shores. Steamers are less plentiful in the list than they have latterly been, two-thirds of the whole number being sailing vessels. We should judge from the features of this week's importation that the scale of supply is rather abating. The comparatively few steamers in this week's report suggests that they, or many of them, have found other employment which suits them better.

EVEN sawdust is being utilized in heretofore unheard of ways: Pine sawdust, highly compressed, has been successfully used to make up centre frames of carriage wheels. It is said to be so solid that it will bear a pressure equal to 33 tons per square inch. As sawdust has also been used for partitions and bricks, its application to the production of complex carvings and mouldings does not seem to be far off.

THE Winnipeg *Times* says:—A new departure in the lumber trade has been inaugurated by Mr. D. Ross, of Whitemouth, who intends to hold periodical auction sales in bulk of lumber at the mills, thus allowing the buyers to fix the current market of the stuff. From the known quality of the product of Mr. Ross' mills it will be a fair test of what good quality and grade of lumber is worth in open market. Mr. Wolf has been selected to wield the hammer on this important occasion.

THE *Northwestern Lumberman* says:—The statement made by our Ashland, Neb., correspondent that Tennessee poplar is being used in that state for finishing purposes is a significant one. It is one illustration of what this paper has claimed for some time, that the kinds of lumber used in the different sections will be more varied year after year. It was not long ago that white pine was about the only wood called for or expected to be had for building purposes in the Northwest. This was largely because the other woods were not well known.

PUGET SOUND.

The Lumber industry of Puget Sound, says the *Post-Intelligencer*, has reached a point of development which must command attention. There will be cut in Washington Territory during the present year 500,000,000 feet of lumber. This product is distributed, as nearly as can be estimated as follows:—

Export to California	250,000,000
Export to foreign ports	80,000,000
Home consumption	170,000,000

This vast product represents in round numbers a value on the wharves ready for shipment, or at local mills ready for delivery, of $12 per thousand, or an aggregate of $6,000,000, which is net revenue to the territory from this one industry. The 330,000,000 feet exported requires the service of a goodly number of vessels. Taking all classes of craft on which lumber is exported, the average cargo is about 500,000 feet, which would make necessary the shipment of 660 cargoes. Another and the most notable feature, one which more than others evidences the rapid settlement of the territory adjacent to Puget Sound, and the cities and villages situated thereon, is the item of home consumption. The lumber for export is mainly cut by seven large mills on the Sound. That for home consumption employs as many as 40 smaller ones, with a daily output of from 2,500 to 75,000 feet each, and an average of about 12,000 feet. These mills are constantly crowded with orders. Builders are forced to wait their turn, and there is no evidence of a falling off in the demand. The amount of improvement this large quantity of lumber represents in buildings of various classes, wharves, sidewalks, railway ties, etc., etc., is an evidence of prosperity conclusive and incontrovertible. Within the city limits of Seattle there is being cut at this writing an average of 160,000 feet per day, and within 30 days this capacity will be increased to 200,000 feet per day. All this lumber is used here, and the demand is still greatly in advance of the supply. The prospective magnitude of the lumber interest of northwestern Washington is as yet hardly realized. It is to be the most potent factor in the growth and production of permanent wealth to our people. From Puget Sound ten years hence the exports of lumber direct to foreign ports will exceed those of the balance of the Pacific coast. We shall ship to every known port, and the flags of every nation will be seen floating at mast head in our harbors. The interior will also demand attention and our home consumption should and will double every year. We shall be prepared and will furnish our brethren east of the Cascades and on the line of the Northern Pacific railroad, as far east as the demand may reach, houses made of the finest of pine, cedar and fir, framed, fitted and ready for immediate erection, put up in packages and shipped to destination for less money and of better class than they can be built upon the ground, saving freight, wastage and time to our eastern customers and creating for ourselves an industry of illimitable extent and undoubted stability.

COMPRESSING SAWDUST.

To the Editor of the Canada Lumberman.

DEAR SIR,—I was reading lately an article in your paper of the 1st Aug., about compressing sawdust into fuel. I have large mills here turning out about 250,000 sup. ft., per day, of spruce deals three inches in thickness, and, consequently, there is much sawdust. If you feel satisfied that the machine will work spruce sawdust, please hand this letter to the patentee. If he can fit it up at any reasonable price I would like him to communicate with me, as I would feel inclined to embark in the enterprise.

Yours truly,

J. B. SNOWBALL.

Chatham, Miramichi, N. B., Aug. 28, 1883.

The Port of Quebec.

From a comparative statement printed in a recent issue of the *Quebec Chronicle*, showing the number of sailing vessels and steamers entered inwards and outwards at the port of Quebec from the opening of navigation to June, 30th, 1882 and 1883, we find that 311 vessels arrived this year, against 239 vessels in same period of 1882, showing a good increase on 1883. Of this number there were this year 193 vessels under the British flag, and 223 arriving from the United Kingdom, against 150 and 176 vessels respectively last year. The outward vessels this years numbered 198, in total of which 121 were British, and 176 for this country, against 165 vessels, 115 Britissh, and 141 for the United Kingdom last year. This likewise shows an increase for the present year. Another statement gives the following return of vessels inwards and outwards for the fiscal years ending June 30th, 1882 and 1883:—Inwards, 1883, 682 vessels, British 447, steamers 152, sailing vessels 530, from United Kingdom 516. 1882, 642 vessels, steamers 148, sailers 494, British 412, from United Kingdom 499. Outwards, 1883, 653 vessels, steamers 111, sailers 542, British 417, to United Kingdom 550. 1882, 680 vessels, 146 steamers, 534 sailers, 460 British, and 568 to United Kingdom. As will be seen, there was an increase of forty vessels inward this year, but a decrease of twenty-seven leaving the port.

Looking for Timber.

The Winnipeg *Times* of Aug. 28 says:—Mr. Alex. McKay, of Ottawa, accompanied by a friend, a gentleman also belonging to that city, have returned to Winnipeg after quite a lengthy trip to Lake Winnipeg and vicinity.

In reply to a question by a TIMES representative one of the gentlemen said:

"We spent considerable time looking over the Lake Winnipeg and Bearings rivers district."

"With what result?"

"Well, we are satisfied that there is considerable spruce there. We were dissapointed in not seeing any pine. There is none of any size."

"What do you think of the Bearings River?"

"It is pretty rough and the rapids are numerous. I think, however, that there should be no trouble in driving logs on it."

"Have you a limit in the districts you visited?"

"Mr. McKay has a 50 mile limit at Bearings River. I have no interest."

"What will be the outcome of your trip?"

"That we cannot say as yet. The cost of handling the logs will be considerable, but all considered lumbering there may be made to pay."

W. A. EDGARS, of Frankville, was cured of Liver and Kidney Complaint after life was dispaired of. He had remained from ten to fifteen days without an action of the bowels. Burdock Blood Bitters cured him, and he writes that he is a better man than he has been for twenty years past.

Do not delay, if suffering any form of Bowel Complaint, however mild apparently may be the attack, but use Dr. Fowler's Extract of Wild Strawberry. It is the old reliable cure for all forms of Summer Complaint that require prompt treatment. Ask your druggist and all dealers in patent medicines.

Convincing Proof.

Having suffered from rheumatism for a long time I was induced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to buisness, thanks to your wonderful medicine.

I am yours truly,

W. H. DICKISON,

218 St. Constant St., Montreal.

To Henry, Johnsons & Lord, Montreal.

Arnica and Oil Liniment is sold by all Druggists.

READER, if you suffer from any disorder of the Liver, Stomach, Bowels, Kidneys, Skin or Blood, try Burdock Blood Bitters, Nature's specific medicine for acting on those organs for the outlet of disease. 25,000 bottles sold in the last three months.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

$500 Reward!

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C. WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. ORMOND & WALSH, sole authorized Agents for Peterborough Ont. w&d1121z22

Health is Wealth.

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, a guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain, resulting in Insanity and leading to misery decay and death, Premature Old Age, and Spermatorrhœa, caused by over-exertion of the brain, self-abuses or over-indulgence. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by use for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by ORMOND & WALSH, sole authorized Agents for Peterborough, Ont. JOHN C. WEST & CO., Sole Prorpietors, Toronto

BAXTER'S MANDRAKE BITTERS

THE ONLY VEGETABLE CURE FOR DYSPEPSIA,

Loss of Appetite, Indigestion, Sour Stomach, Habitual Costiveness, Sick Headache and Biliousness.

Price, 25. per bottle. Sold by all Druggists.

Burdock BLOOD BITTERS

Market Reports.

TORONTO.

From Our Own Correspondent.

SEPT. 10.—The retail trade in this city at the present time is fairly good ; on making inquiries at the various yards I received the same replies, —doing all we can conveniently handle, but keen competition leads to a cutting in prices to some extent. In bill stuff this cannot be done, unless the dealer is able to make it up on some other portions of the order. Mill men hold firm to former figures for all classes of dimension timber, and, as long as this is the case, prices cannot be cut unless the dealer makes it up on the coarser grades of boards and plank. There are no private tenders taken by builders from dealers in this city. The usual course adopted is something like the following : A builder enters the office of a dealer and opens out his list of stuff required for a building, or buildings, and modestly asks for figures for his bill delivered on the ground. After he has received this he proceeds to visit another dealer and obtains figures from him, if said figures are below those already obtained he at once travels on to another, but if above the first figures obtained he opens out the offer received from dealer No. 1 for the inspection of dealer No. 2, and in nine cases out of ten the latter is ready to come down a few dollars for the privilege of supplying the order ; the builder, however, is not quite ready to leave his order just at present, he has the offer made in writing and goes on his way quietly to visit dealer No. 3, and if the offer received there is not lower than the offer made by dealer No. 2, why, of course, he shows number No. 3 the tender made by No. 2, taking care to keep the offer made by No. 1 in his pocket, and in this way he will go the rounds of six or eight dealers and then take the lowest tender. I presume it is useless to point out through the journal how this suicidal policy on the part of dealers can be brought to an end. I have urged time and again, both by word of mouth and use of pen, the true remedy, but many dealers seem to consider that the bulk of business done by them is the only road to prosperity, ignoring entirely the plain fact that it would be much better to sell 1,000,000 feet of lumber and obtain a profit of $1,000 than to sell 2,000,000 and only make the same, and only half the risk by bad debts incurred, and if dealers cannot be made to see this why then to use a homely Scotch saying they must "gang their ain gait."

Shipments over our docks to American ports have somewhat improved, but most of that being sent forward is on consignment, direct sales being few and far between, although dealers affirm that returns so far made on consignments have been fully up to expectatious.

MONTREAL.

From Our Own Correspondent

SEPT. 11.—Business for the past two weeks has been quiet, but stocks are sold assorted. Coarse lumber has been somewhat shaded in price this summer, but the price of a good article continues high, and it is in good demand. The enquiry for hardwood has been fair, for ash and cherry in particular. Laths are still held for our quotation. Prospects are that the output of logs this season will be considerably under that of last year. There appears to be an over-production of sawn lumber, as millers seem to manufacture as much lumber when the demand is light as when it is brisk, thus keeping the market overstocked, and for low prices they have only themselves to blame. Quotations ex yard are unchanged as under:

Pine, 1st quality, ⅌ M	$35 00@40 00
Pine, 2nd " ⅌ M	22 00@24 00
Pine, shipping culls, ⅌ M	14 00@16 00

CORDWOOD.

The late cold weather has helped to give an impetus to the demand, and although we do not alter quotations, for large lots they would probably be shaded. Imports are keeping pace with all requirements and the stocks on the wharves are pretty full. We quote prices ex cartage as follows :—

Long Maple	$ 7 50
Short "	6 50
Long Birch	7 00
Long Beech	6 00
Short "	5 00
Long Tamarack	6 00

WINNIPEG.

The Winnipeg *Commercial* of Sept. 4, says : There has been a better demand for lumber lately than for some time past, and business will likely be fairly good during the balance of the season. The mills are actively at work, and the cut between now and winter will be heavy. The supply will no doubt be largely in excess of the demand. Quotations are as follows, but they are by no means fixed :—Pine lumber, 1st, common boards dressed, $26.50 ; 2nd do. dressed, $25.50 ; 1st do. rough, $26.50 ; 2nd do. $25.50 ; sheathing, rough, $25 ; timber 16 feet and under, $24 ; do. over 16 feet, for each additional 2 feet, $1 ; dimension and joists 16 feet and under, $24 ; do. over 16 feet for each, $1 ; fencing, $25 ; 2 and 3 inch battens, $30 ; A stock boards, all widths, $50 ; B do $45 ; C do. $40 ; D. do. $35 ; 1st clear, 1, 1¼, 1½, and 2 inch, $60 ; 2nd do. $56 ; window and door casings, $50 ; base boards, dressed, $50 ; 1st pine flooring, siding and ceiling, $40 ; 2nd do. $35 ; 3rd do. $32 ; ½ inch split siding, dressed, $30. Spruce lumber—timber 16 feet and under, $23 ; do., over 16 feet for each additional 2 feet, $1 ; dimensions and joists, 16 feet and under, $23 ; do., over 16 feet for each additional 2 feet, $1; boards, $23 ; 1st flooring, siding and ceiling, $32 ; XX shingles, $5.50 ; Star A shingles, $5.50 ; X shingles, $5.50 ; A do. $5 ; lath $4.50.

ALBANY.

BOSTON.

Cotton, Wool and Iron of Sept. 8th, says :— Eastern lumber is arriving moderately, with prices about as of late. Hemlock is rather quiet and easy. Spruce is moving well and steadily. Southern pine is in only limited request. Western pine is moving in a moderate way at about previous prices. As to hardwoods, there is quite a good trade in desirable grades of walnut, especially from the furniture manufacturers and prices are steady. Oak is having a a fair request. Cherry of good grades finds a good demand. Whitewood is in large supply and fair movement at low prices.

CHICAGO.

The *Northwestern Lumberman* of Sept. 8th, says :—There are indications clear and pronounced that lumber is beginning to move in larger volume than during the summer months. This increase is more noticeable in the prairie states than elsewhere. There is a decided change for the better in this city, both on the cargo market and at the yards. The interior begins to call for lumber more urgently. Yard dealers throughout the country have been going slow and cautiously all summer. In the majority of instances they have let their stocks run down. Everybody has been waiting to see the crop outcome. The average agricultural result has been good this year, and a large sale of lumber must be the consequence. The fact that assorted stocks are nowhere excessive, and in many yards are really short, points to a demand this fall that will be unusual. Buyers everywhere have laid in stocks cautiously this season. Reports from New England and New York mention the same conservative feature. The rising of a powerful demand would soon make the lack of stocks in the yards felt.

The number of cargo arrivals at this port for the week ending Wednesday was not quite as large as the week previous, it standing 218 this week to 260 last week. The wind was favorable during Saturday and over Sunday, so that on Saturday, Sunday and Mouday 120 vessels had put in an appearance. On Monday and Tuesday the market was crowded with loads, the wind continuing favorable, but it was noticeable that the fleet was rapidly thinned out, indicating greater activity than characterized the weeks before. The revival of demand at the yards was beginuing to be felt on the market, and it is safe to repeat that the week has been a fairly active one. Cargoes have been taken more quickly, with less preliminary talking, aud there has been less disagreement about prices. While values cannot be quoted higher, they are stiffer, and buyers have not questioned them as much as formerly. It may be said that the sag below quotations that has all along been noticed has been restored to a straight line. It is even claimed by some brokers that prices are a little higher, though they do not demand that quotations be raised.

Quotations are as follows :—

Short dimension, green	$ 9 00@ 9 50

LONDON.

The *Timber Trades Journal* of Aug. 25 says :— The prices of wood have as yet apparently made no upward movement, although there is an evident disposition on the part of those who hold stock to keep it out of the market rather than accept the low values now obtainable. Of course what turn the market will take during the dead season depends greatly on the shape the fall stocks will assume. If these, contrary to expectations, are of a heavy character, it is quite possible the recovery of values will be delayed till well into the following spring. On the other hand, should the closing shipments of the year be on a moderate scale, an advance in the market may be expected to speedily follow.

We had some years since begun to recognise the fact that the forest yield in timber producing countries was gradually lessening, and the trees themselves by becoming scarcer were intrinsically rising in value ; but, from whatever cause it may arise, we seem now to have an overplus of the commodity, and that too in the teeth of the greatly extended area of consumption which the magnified proportions of the trade have led up to. If this immense exhaustion is going on daily, surely prices might not unnaturally be supposed to feel its effects.

Several thousands of standards have been taken out of consumption this season by fires at the yards both in Sweden and Russia ; but this has had no appreciable influence on the market. So with the pine stocks here, which, though still confined to moderate proportions, have not helped prices to advance, because large quantities that stood over from last year are known to be available, and may come forward yet before the shipping season terminates. We have no faith in these rumours of heavy fall supplies, especially from the Quebec side, the rise in freights probably checking any tendency to ship heavily on speculation.

LIVERPOOL.

The *Timber Trades Journal* of Aug. 25, says : Apart from the order for about 100,000 cubic feet of timber from the Mersey Docks and Harbor Board, which is now in process of being delivered, there is also a good and steady demand from the country, induced, no doubt, by the low prices now ruling, especially for pitch pine and spruce deals. The latter have come forward far too freely for the wants of the market, and with the dull condition of trade in the manufacturing districts, there is no likelihood of any advance iu the present price, unless the shipments are materially curtailed.

Advices from St. John, N. B., state that several of the largest mill have shut down, and will remain so until prices on this side improve, and that the stocks held there have advanced nearly five shillings per standard. All this may be perfectly true, but at the same time this market is well supplied already, and there is a

good stock in the manufacturing districts in the hands of the consumers, who are therefore reluctant buyers at any price. On the other hand, it must be admitted that some cargoes are now being stored on account of the shippers, who have faith in the future, but whose hopes may not be fulfilled if imports continue to come forward as they have done recently.

On Friday last, the 17th August, Messrs. A. F. & D. Mackay offered one cargo each of St. John, N. B., Shediac, N. B., and Pictou, N. S., spruce deals, birch timber, &c., together with other woods. Although there was a good attendance of buyers, not only from the country but from the local trade, there was but little spirit of competition shown, and evidently a large portion of the audience were there as spectators only :—

The cargo of St. John, N. B., spruce deals sold as under :—

	£ s. d.		£ s. d.
16 to 26 ft. 3×11	7 7 6		
12 " 15 " 3×11	7 5 0		
9 " 11 " 3×11	7 2 6		
16 " 24 " 3×9	7 2 6	to 7	5 0
12 " 15 " 3×9	7 0 0		
9 " 11 " 3×9	6 17 6		
16 " 27 " 3×7	6 17 6		
12 " 15 " 3×7	6 15 0	" 6	17 6
9 " 11 " 3×7	6 17 6		
9 " 26 " 2½×7	7 2 6		
9 " 20 " 3×15 to 19	7 2 6		
9 " 23 " 3×14	7 2 6		
9 " 24 " 3×13	7 0 0		
9 " 26 " 3×10	6 17 6		
16 " 24 " 3×8	6 17 6	" 7	0 9
9 " 15 " 3×8	6 15 0		

The bidding for the cargo of Shediac was very slow, and apparently this class of goods was not wanted, about one-third of the cargo being withdrawn.

About 1,130 logs of Pictou birch were offered, but of these about 382 logs were withdrawn ; hese were all of the larger sizes, say 17 to 20 deep, but the remainder was sold 12 to 16½ in. at an average of about 16½d. per foot.

On Wednesday Messrs. James Smith & Co. sold by auction a cargo of Bathurst spruce, and pine deals, &c., and "to arrive" about fifty standards red pine deals.

HULL.

The *Timber Trades Journal* of Aug. 25, says : The import of wood goods into Hull during the past week is again a full average, amounting to 19,343 loads, of which the following are the particulars :—

Quebec.....3,699 lds		Kramfors....1,055 lds.	
Riga .....3,255 "		Soderhamn .. 955 "	
Cronstadt....2,186 "		Pensacola.... 767 "	
Uleaborg.... 1,710 "		Porsgrund... 644 "	
Wyborg.....1,452 "		Gothenburg.. 427 "	
Archangel ...1,323 "		Demerara.... 317 "	
Nyhamn.....1,190 "		Stettin ..... 229 "	

Other ports, 132 loads.

The Quebec goods are timely arrivals, and come to replenish a very bare market, for there are but few deals held here, and none in Grimsby, except it be a small cargo passing through for a Lincoln firm. Quebec goods are falling out of use on this coast, no doubt owing to their high price, a detail that must be attributed to their in some degree becoming a scarce article. The trade is very active here, the new arrivals and the old stocks having largely passed into consumption.

LEITH.

The *Timber Trades Journal* of Aug. 25, says : The import list for the past week is heavy for deals and battens, some large cargoes having arrived, amongst which may be noted two large shipments per steamer from Riga and Cronstadt, for Messrs. Ferguson, Davidson & Co.

On Tuesday last Messrs. A. Garland & Roger exposed for sale by public auction their spring shipment of American goods. The weather was everything that could be desired, and a large company turned out, including many well-known purchasers. At previous sales this summer buyers have held back, apparently laboring under the impression that, owing to the heavy spring importations of American stuffs to this port, prices will decline considerably. On Tuesday, however, there seemed to be a greater tendency to come forward, although the prices were not altogether satisfactory in some cases. A considerable portion of the waney yellow pine was sold at from 2s. 8½d. for the large timber down to 2s. 5½d. for the small. American walnut found a few buyers at 5s. per cubic foot, while birch went away pretty well, though, to be sure, the price was very low indeed. Yellow pine deals did not seem to be in great demand, only a few lots being sold. After the American goods had been exposed, the usual variety of deals and battens, flooring, etc., were offered, and a good few lots found purchasers. The following is a note of the principal prices realized :—

American birch	1s. 9d. to 2s.	per cub. ft.
Waney yellow pine	2s. 5½d. to 2s. 8½d.	"
Walnut	5s.	"
1st yellow pine deals	2s. 5d.	"
2nd " " "	2s.	"

GLASGOW.

The *Timber Trades Journal* of Aug. 25, says : During the past week the imports of wood goods to Clyde have been heavy—in all about 5,600 loads, chiefly log timber ; and at Grangemouth the arrivals, consisting principally of battens, amount to about the same quantity.

An auction sale of timber and deals was held at Greenock on 16th inst., and one here on 21st inst. At the former sale a large quantity of wood changed hands, there being a good attendance, and prices on the whole compare favorably with recent rates,

The sale here on the 21st inst. was pretty well attended, and a number of lots of deals were disposed of ; but a large proportion of catalogue was withdrawn, prices offered not being satisfactory to the broker.

On 16th inst., at Greenock, Messrs. Edmiston & Mitchells, brokers. The following are some of the sales :—

Quebec waney boardwood		Per cub. ft.
45 c. ft. av per log	2s. 3d.	"
Do square do.—		
52 c. ft. av. per log	2s. 2d.	"
Do. yellow pine.—		
40 to 50 c. ft. av. per log	1s. 5½d. to 1s. 7d.	"
Do. do. deck plank—		
70 c. ft. av. per log	2s. 2½d.	"
Quebec 3rd yellow pine deals—		
10 to 13 ft. 12/23×3	1s. 2½d.	"
12 " 16 " 11×3	1s. 0½d.	"

CARDIFF.

The *Timber Trades Journal* of Aug. 25 says :—We have not had this week such heavy arrivals as recorded in our last report. A cargo of pitch pine has come to hand from Mobile ; the first, so far as we can learn, imported here from that place. There have also arrived two steamer cargoes and a couple of sailing cargoes from the Baltic, and several Canadian shipments. There is, likewise, expected in a day or two a steamer from Finland, with about 700 standards, which will be the largest cargo ever brought to Cardiff in one bottom, and it will be interesting to see whether the despatch the dock authorities will be able to give will be such as to tempt owners to repeat the chartering for this place.

QUEBEC CULLERS' OFFICE.

The following is a comparative statement of Timber, Masts, Bowsprits, Spars, Staves, &c. measured and culled to Aug. 31 :—

JAMES PATTON,
Quebec, Aug. 31. Supervisor of Cullers.

SWEDEN.

Consul Drummond Hay, in his report on the trade of Stockholm and the eastern coast of Sweden for 1882, says :—The prospects of trade were far from favourable in the commencement of last year, owing to the prejudicial effects of the bad harvest of 1881, the consequence being a fall in exports and a rise in imports. In the summer, however, the crops throughout the country were most promising ; business thereupon became brisker, especially in the wood and iron markets, and the exceptionally fine harvest which followed gave a decided impulse to commerce generally.

The exportation of wood goods at Stockholm in 1881 amounted to 22,564 cubic metres. and in 1882 to 24,800 cubic metres, of which, 13,475 cubic metres were shipped to Great Britain.

The figures must, however, not be taken as an example of the general condition of the timber trade in Sweden. According to the annual report of the Saw mills and Timber Association for 1882, it appears that the value of the timber trade was about 15,000,000 kronors higher than the preceding year.

Favoured by extrarodinary facilities for floating timber during the whole of the season, the transport to the sawmills was unusually large, and consequently the timber, which, under ordinary circumstances forms a reserve for the following year, has already floated down to the coast.

The association are further of opinion that there will only be small consignments this year, as nearly all the goods have been sold for delivery in this country.

The stored wood goods ready for exportation at the opening of the ports north of Stockholm in 1883 are as follows :—Gefle, 55,000 standards : Soderhamn,, 74,000 ; Hudikswall, 26,300 ; Sundswall, 110,000 ; Hernosand, 57,000 ; Ornskoldsvik, 19,382 ; Umea, 14,000 ; Skelleftea, 8,616 ; Pitea, 15,560 ; Lulea, 23,846 ; total, 404,704 standards ; against 356, 253 standards in 1881.

In the trade and commerce of the principal Vice-Consulates on the east coast of Sweden, Vice-Consul Koperitz reports as follows on the commerce and navigation of Gefle :—The year under review opened with stocks of sawn wood in Great Britain and on the Continent, causing a great demand up to the end of July, and most of the first open-water supply was bought up at remunerative prices. As it was apparent, about the begining of August, that the production would be unprecedentedly large, by reason of the favourable floating season, prices began gradually to recede from the comparatively high figures obtained for spring delivery, and this depression continued up the close of the navigation. At the present time the timber trade of the district is more depressed than it has been for the three previous seasons.—*Timber Trades Journal.*

A Bushel of Coal.

In consequence of the practice of peddlers of coal in Boston of selling by means of short measure, getting retail price for three pecks of coal for a nominal bushel, a law has been passed specifying that in the sale by measure of coal in quantities less than five hundred pounds, the baskets or measures used shall be of a cylinrical form, of the following dimensiou : nineteen inches in diameter in every part, and nine inches in depth, measured from the highest part of the bottom, each of which shall be deemed to be of the capacity of one bushel ; or nineteen inches in diameter in every part, and four and one-half in depth, measured from the highest part of the bottom, each of which shall be deemed to be of the capacity of one-half bushel. Such measures, in selling, shall be filled level full, and shall be sealed by a seal of the city or town in which the person using the same usually resides or does business.

RAFTS ARRIVED.

The *Chronicle* gives the following list of rafts, etc., arrived at Quebec :—

Aug. 30.—J. J. Calvin & Co., oak, &c., sundry coves.

J. R. Booth, white pine, &c., St. Lawrence Docks.

John McAllister, walnut, Roche's cove.

Thos. Buck, elm, &c., Wolfe and Ottawa coves.

Sept. 6.—J. J. Calvin & Co., oak, &c., sundry coves.

J. R. Booth, white pine, &c., St. Lawrence Docks.

John McAllister, walnut, Roche's cove.

Plamondon & Auger, tamarac, Archer & Co's. wharf.

Frs Burk, elm, &c., Wolfe and Ottawa coves.

R. & G. Stricklaud, white pine, &c., Cap Rouge.

F. & W. Murray, white pine, &c., St., Michael's cove.

Thompson & Son, white pine, Woodfield.

D. Moore, white and red pine, Cap Rouge.

Steel Nails.

At first the extra cost of steels nails was one and a half cents per pound, or $1.50 per keg, but it has now beeu reduced to $1. The great advantage of the steel nails is that they can be driven into hardwood as easily as an iron nail will go into a pine board. Steel nails have been driven into a white oak knot without bending. Nothing else is now used in laying hardwood floors, as they require uo boring, but are driven readily. For all kinds of finish they are especially adapted, and as so much hard finish is now employed, their use must be on the increase. They are also used largely by builders, and box makers are increasing their demand for them. Box makers have been using the better grades of iron nails, as they desire those that can be drawn and redriven.

Journalistic.

A new organ of our manufacturing industries has just appeared under the name of *The Dominion Mechanical and Milling News.* It is published in Toronto by the Beaver Publishing Company, and its first number gives promise of a valuable addition to our periodical literature. It is full of news and technical information of interest to the class it addresses, and both the letter press and illustration are very clearly printed on excelleut paper, so that its appearance is as interesting as its contents are useful. Such a periodical is another evidence of the progress of Canada as a manufacturing country.

DRY ROT.

This is a disease in timber, which occasions the destruction of its fibres, and reduces it evontually to a mass of dry dust. It occurs most frequently in a warm, moist, stagnant atmosphere; while wet rot is the result of exposure of wood to repeated changes of climatic conditions. In both diseases, however, spontaneous combustion or decomposition goes on in the wood; water, carbonic acid gas, and probably carburetted hydrogen are evolved, and a pulverulent substance or humus remains. Although the appearance of fungi accelerates the process of dry rot, its true origin is in the incipient decomposition of the sap in wood.

The commonest precaution against the occurrence of the disease in wood is to expose it to the air, or, in other words, season it.

Charring, steaming and bolling have been resorted to as a means of dessecation. Mr. Lukin, at Woolwich dockyard in England, experimented on green oak logs, with pulverized charcoal heated and applied as a coating to the timber. This process had the effect to lighten the wood, but disintegrated the fibre, thus rendering it useless. He then attempted to replace moisture in these heated logs with a distillation of pitch pine and sawdust, but failed to accomplish any favorable results. Since then, other processes have been perfected, by which wood is exposed to currents of rapidly moving hot air, and in kilns; these have been used successfully for years, and many of our large saw-mill manufactories have dryers attached to them whereby to put seasoned lumber on market in the shortest space of time possible. The ancients understood the advantages of felling trees when the sap was out of them. As early as the reign of King James, of England, a statute was enacted prohibiting tho felling of oak trees, except from April 1st to June 30th, even for the King's use, except to repair his majesty's ships of war. In 1771, Mr. Barnard, of Deptford, England, stated in the House of Commons that timber should be barked in the spring, but not felled until the winter time.

In France, the timber cutting season was from the 1st of October to the 15th of April, until Napoleon I.'s reign, when the limited period was fixed from November to March, and then only on the decline of the moon, on account of the supposed rapid decay of wood from fermentation of the sap when cut at any other period.

Submerging timber in water has for centuries been considered a prevention from dry rot, and certain it is that by that process the disease has been arrested. The frigate, "Resistance," whose timbers were badly affected, was rendered sound by sinking her for one month in the harbor at Malta. The "Eden," similarly affected, and sunk in the harbor at Plymouth (England) was raised in a perfectly sound condition after 18 months' submersion, and was once more a seaworthy craft.

Salt has been found an efficacious preventive of the disease. though it has the objectionable quality of attracting too much moisture. The subject of preserving wood has been one of constant interest to builders, naval architects, and in fact, to every one it is a question worthy of constant thought; hence scientists have devoted much time and study to discovering substances for preserving it. In 1832, corrosive sublimate was tested, this was soon followed by zinc chloride, and copperas, followed by sodium carbonate. It was in 1838 that Bethel introduced the the treatment of wood by crude creosote and oil of coal tar. This discovery has been found the most valuable of any, and when the wood is injected with coal tar, in a cylinder at a temperature of 120 deg. Fahreinheit, and a pressure of 150 pounds to the square inch, ordinary soft wood will absorb about ten pounds of the material per square foot, and afterwards become almost indestructible.—*Lumberman's Gazzete.*

Aged Timber.

A few miles from San Francisco a tree was recently felled which, as American writers think, is one of the oldest, if not the oldest tree in the world. It was one of the *Wellingtonia* species, and, according to the rings which were counted, its age was no less than 4,340 years. It was partly hollow, and within the bark three hundred persons could find standing-room. It was only with reluctance that this ancient giant of the forest was cut down, but its removal was imperative, as it threatened to come down of itself during the first violent gale. Another ancient tree which was recently destroyed was a cypress tree near Sparta. It is stated that this was the very tree spoken of more than two thousand years ago by the ancient Greek writer Pausanias, and wae then very old. It was accidentally destroyed by fire, a band of gipsies having lit a fire under it to cook their food and incautiously allowed the flames to reach it.

VALUABLE SOUTH AMERICA TREES

Some investigations by M. Thanneur, eays *Engineering*, show that South America is rich in woods for engineering purposes. The yandubay is exceedingly hard and durable; the couroupay is also very hard and rich in tannin. The quebracho is, however, more interesting than any, and grows abundantly in the forests of La Plata and Brazil. It resembles oak in the trunk, and is used for railway sleepers, telegraph poles, piles, and so on. It is heavier than water, its specific gravity varying between 1.203 and 1.333. Its colour at first is reddish, like mahogany, but grows darker with time. Being rich in tannin, it is employed for tanning leather in Brazil and has recently been introduced for that purpose in France. A mixture of one-third of powdered quebracho and two-thirds of ordinary tan gives gooods results.

Proposed New Ship Canal in England.

A ship canal is projected from Bristol Channel across the peninsula of Somerset and Devon to the English Channel. The length of the canal will be 62 miles; the waterway will be 125 feet wide at the surface, 36 feet at the bottom, and 21 feet deep, the dimensions being similar to the grand ship canal of Holland from Amsterdam to the Helder. Such a canal will accommodate ships of 1,500 tons drawing 18 feet. The cost of the now canal is estimated at about fifteen millions of dollars; and twelve per cent annual dividonds on this cost aro expected.

Elm Tree.

A large tree growing at Norwich, Conn., is over soventeen years old, and the limbs are 30 ft. from the ground. It stands alongside a house, tho chimney of which has been swept away by the overhanging branches, while the tree has raised and moved the house one foot by the force of its growth, A similar instance has occurred at Nassau, New Providence, one of the Bahama Islands, A cotton silk tree growing there has attained such mammoth proportions that it has actually lifted a large Government building.

Saw-Mill Boys.

Saw-mills, and places where steam and circular saws are used, employ a large number of boys. If yon were to give a tea-party to saw-mill boys the thing that would astonish you would be the difficulty of finding half a dozen of your guests with the proper number of fingers. I know ono little lad who is employed at pulling out the planks which have been pushed through tho machine by men, and he has one hand now on which only the thumb is left. (!) "How the poor Live," by G. R. Sims, *Pictorial World.*

THE MISSING LUDWIG.

Hope for the SS. Ludwig appears now to have been abandoned alike by the owners and agents, the friends and relatives of those on board and the public generally. She is sixty days out from Antwerp to-day, and her longest antecedent time for making the passage being from fourteen to twenty days, little doubt can be entertained as to her fate. The more hopeful refer to the fact that the Dominion steamship Quebeo was fifty-two days in making her voyage from Liverpool to our port last spring and was forty days without being sighted or epoken; but she was sighted and frequently spoken subseqnently. Of the Ludwig no vestige has been discovered. Theories as to her fate are various, but the most feasible and the one indeed given oxpression to by thoss more directly interested in the ship is, that she has struck an iceberg or heen run into by eome other vessel during the night, breaking in two or more of her compartments and einking almost inetantly. Under such circumstances no time would be left to get out the boats or arouse the paseengers.

The Messre. Steinmann & Ludwig, founders and owners of the "White Cross" line of eteamere, the line to which the ill-fated ehip belongs, are among the moet substantial and enterprising promoters of Atlantic transport service in Europe. Their line consiste of eight first-class steamships, six of which run between Antwerp and New York, and the remaining two, the Helvetia and the Ludwig between Antwerp and this port. The line was established about forty years ago, and the Messrs. Steinnman and Ludwig may be considered in the fullest eenee the pioneers of naval commerce between Antwerp and Montreal. For msny years they used eailing ehips, but more recently exchanged them for steamers, trade having expanded and they having entered into contract with the Dominion Government. The Company have chartered the SS. Surrey, in Antwerp to take the place of the eupposed lost ship Ludwig, but they intend to build a first-class vessel at once to fill up the gap in their line. The Surrey sails for Montreal on September 5th.

The proprietors have lost only two vessels since the establishment of the line, these being on the New York route. Their voyages to and from Montreal have been singularly successful, the Ludwig, if lost, being the only disaster worthy of the name. This is saying much when the perils of the sea, especially from ice in the straits of Belle Isle, are considered. In connection with this matter, a glance at some statistics regarding British ehipping in general for some years past may be interesting. Taking the year 1882 as an example, we find in Lloyds' *Register* that no less than 996 vessels sailing under British colors, were returned as lost, broken up or not heard from. The aggregate tonnage of these vessels was 373,700 tons. The number of ships built during that time was 878; an aggregate of 928,369 tons, showing that there were 118 more ships lost belonging to the United Kingdom than were built there and registered. The aggregate tonnage of thoee built exceeded those lost by 554,664 tone. During the year four ships a day were lost.

The present season appears to have been unusually prolific of disasters such as that which has probably befallen the Ludwig; the number of steamships, in all waters taken together, during the first eix months of the year, which sailed from their ports and have never eince been heard of, being no less than 27.

A THRILLING SCENE.

Recently at Perranporth, near Truro, England, the driver of a waggonette party wandering on the beach found his retreat cut off by the tide. He essayed to climb the cliffs, but when half-way up he found progress impossible and descent certainly fatal. The ledge on which he was supported would only give space for one foot, and the ground to which he clung above was loose and crumbling. For some hours he endured his suspense, when the visitors descried him from above. The news spread and a crowd congregated, but none dared venture along the slight ledge by which alone the man could be approached. To have thrown a rope would have been useless, for the effort to catch it would certainly have caused the poor fellow to fall.

A coastguardsman, named Regan, volunteered to be let down 100 feet over the face of the cliff, and while he descended the excitement was quickened tenfold. The man below could only hold ont a little longer, and the least disturbance of the earth around him would inevitably cause his distruction. In breathless eagerness the spectators saw the one man near the other.

By a sudden effort the coastguardsman clasped the man he had endeavored to save with a sudden and strong grip, and they swung off the ledge together. Even then danger was not at an end; but a descent was safely affected to a ledge below, when access to the summit was gradually gained.

The spectators were too overcome to cheer, but they did what was better—collected a good round sum for the gallant coastguardsman.

TERRIBLE STORM.

ST. PIERRE, Sept. 4.—Thursday's storm exceeded in violence the cyclone of the previous Sunday. The damage to shipping is incalculable. A large proportion of the fishing fleet is disabled. Some fifty vessels have already arrived completely stripped. The lose of life is appaling. Jacquet's banker lost six men, Hardy's vessel eix, Vincent's eix, Leoni Coste's four, Demalvillain's two, and almost all one or two men. Louis Jourdan's vessel foundered after the storm subsided. The crew were saved. Over thirty vessels are missing, Not the slightest intimation of the approach of the storm was given, except a rising of a dense black cloud on the eastern sky with loud peals of thunder. Before half an hour elapsed the wind was at its height and the sea mountains high.

"LEAVES have their time to fall," says the poet, but Wild Strawberry leaves are on the rise just now, being utilized in such enormous quantities in making Dr. Fowler's Extract of Wild Strawberry—the infallible remedy for Cholera Morbus, Diarrhœa and other Summer Complaints.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

HILL'S
English Extract of
BUCHU,
One of the Best
KIDNEY
INVESTICATORS IN USE.

It is a specific in the cure of all diseases of the Kidneys, Bladder, Prostatic Portion of the Urinary Organs, Irritation of the Neck of the Bladder, Burning Urine, Gleet, Gonorrhea in all its stages, Mucous Discharges, Congestion of the Kidneys, Brick-dust Deposit, Diabetes, Inflammation of the Kidneys and Bladder, Dropsy of the Kidneys, Acid Urine, Bloody Urine, Pain in the Region of the Bladder, PAIN IN THE BACK, Urinary Calculus, Renal Calculus, Renal Colic, Retention of Urine, Frequent Urination, Gravel in all its forms, Inability to retain the Water, particularly in persons advanced in life. IT IS A KIDNEY INVESTIGATOR that restores the Urine to its natural color, removes the acid and burning, and the effect of the excessive use of intoxicating drink.

PRICE, $1; or, Six Bottles for $5.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

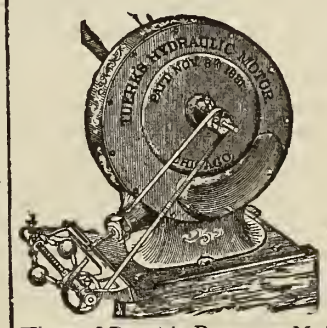
TUERK'S

WATER MOTOR.

Patented November 8th, 1881.



View of Tuerk's Pressure Motor, with Tuerk's Improved Governor Attachment.

For running Sewing Machines for families or for manufactories; also, for running Dental Lathes and Engines, Telephone Generators, Coffee Mills and Roasters, House and Church Organs; also for running one Printing Press or six, at the same time. Paper Cutters, Sausage Machines of any make or size; GRAIN, FREIGHT OR PASSENGER ELEVATORS, Straw Cutters, and all kinds of Machinery by Water Power.

HYDRANT PRESSURE.

☞Cheaper, Quicker and Safer than Steam.

Over Fifty Motors of other makes have been taken out and replaced with the TUERK MOTOR; among the list are the Backus, the Sabin, the Little Giant, the Hayward, Clark's Piston Engine, and others.

Names of a few who have taken out Backus Motors and put in the Tuerk Motor in their place:

C. W. Meikel, Indianapolis, Ind.
Columbus Telephone Co., Columbus, Ohio.
James Egan, Chicago, Ill.
H. C. Hawkins, Cleveland, Ohio.
Printing Office, Hannibal, Mo.
A. Solmens, Hat Manufactory, So. Norwalk, Ct.

Index Printing Office, Evanston, Ill.
Republican, Johnstown, N. Y.
Tribune, Salt Lake, Utah.
Alton Printing Co., Alton, Ill.
A. F. Worthington & Co., Cincinnati, Ohio.
Lemon & Co., Waverly, N. Y.
Braun & Jones, Cedar Rapids, Iowa.
Gates, Douglas & Co., Cedar Rapids, Iowa.
Village of Rutland, Rutland, Vt.
W. L. Randall, Chicago, Ill.
A. J. Stoll, Sandusky, Ohio.
Killits & Wayland, Chillicothe, Ohio.
S. A. Morrow, Springfield, Ohio.
R. Putnam, Chillicothe, Ohio.
N. Shelton, Omaha, Neb.
H. J. Lewelling, St. Helena, Cal., and others.

☞Do not fool your time away trying other Motors, but send for the Tuerk Motor, which is warranted to do better work with less water than any other Motor or Water Engine made.

Send for Catalogue, and state what you want to run,—give full particulars and Water Pressure per square inch.

TUERK BROS. & JOHNSTON,

86 and 88 Market Street, Chicago, Ill.

DEVICE FOR DISCHARGING WATER FROM VESSELS.

Last week a successful practical trial was made in this harbor of Keating's improved device for discharging water from ships without pumping. The invention consists of a valved tube which passes through the hull of the vessel, at or about midships. The tube is arranged to be pushed down outside of the hull when in use, and withdrawn even with hull when not in use. The tube carries a valve, by opening which communication between the inside of the hull and the water outside may be established. The extremity of the tube, looking toward the stern of the vessel, has an orifice, but the front portion of the tube is solid. When the tube is pushed down through the ship's bottom, the forward motion of the vessel will produce a suction in the tube, and if the valve is opened the water in the hull will be drawn out.

The inventor expects that sailing and steam vessels may be kept dry and prevented from sinking by simply adjusting the tube and valve as above indicated. On the recent trail here the valve was applied to an old scow sixty feet long, towed by a tug. The valve was open and water was ollowed to flow in and fill the scow until it was almost ready to sink; the tug was then started, and under a speed of three miles an hour the scow was in ten minutes relieved of its water in the manner discribed. A similar trail was lately made at Buffalo, N. Y., with equal success. The invention has realized in practice all that the inventor claims, as far as it has been tried. How it will work on deep draught vessels, where the water pressure against the bottom of the hull is increased, has yet to be shown. The Keating Company, No 86 Duane Street, New York, is now ready to furnish and attach this novel appliance to vessels of all descriptions.

Brooklyn Bridge Traction Cable.

Splicing the endless cable that is to be used in propelling cars over the New York and Brooklyn Suspension Bridge was a work requiring unusual skill, as it was an unusual task. The rope is a compound of a hemp core or center and an envelope of steel wire. It is 11.600 feet long, or about two miles. Its weight is 3.1 pounds per foot, which gives it 35,900 pounds for a total weight. The diameter is 1½ inches, and it has a breaking strength of 50 net tons. The splice is 160 feet long. It would be useless to our readers to attempt a description of the method of splicing, which, however, is similar to that of hemp or Manila rope splicing so far as that is applicable to this composition cable. The skill particularly required in this work is the union of the steel wire envelope. And this work is so exactly completed that to designate the splice from the other portions of the cable it has been painted white. It is probable the longest rope splice ever made.

Timber and Eathquakes.

Consul Denius, in his annual report, says: Wood for the construction of houses is an important item among the imports of Smyrna, as the houses of the lower orders are built entirely of wood; and those of the better class, which outwardly appear to be solid construction, have skeletons of wood merely faced with stone—a system adopted to lessen the danger arising from earthquhuakes. Both timber planks come chiefly from Austria, Russia, Roumania, and European Turkey. In 1877 the import was confined to planks, which accounts for the small import for that year, amounting only to £11,660, against an average of £136,000 for the four following years, in which there was little variation in the quantity of planks, while from 13,000 to 16,000 tons of timber were added to the import each year

Important Purchase.

The Montreal *Star* says that at the meeting of the Directors of the Franco-Canadian Colonization Company held at Quebec, it was decided to purchase from Mr. Senecal all the timber limits of the Hall estate, the mills, wharves, etc., including some 2,700 square miles, for $2,500,000, and Mr. Meredith, M. P., of Quebec, was instructed to draw the deed of sale. Mr. Shirley, a well known English engineer who was sent out by the shareholders in Europe to examine the property, and upon whose report the purchase was made, states the yearly output of timber alone will amount to eighty million feet, and he speaks of the timber wharves at Montmorency, which extend to some eight miles, as being the finest of their kind in the world. The *Star* is authority for the statement that "Mr. Senecal's profit on this transaction is about $500,000 and he still holds a large tract of the Hall property which he has not sold to the company. The stock books, which were opened about a fortnight age, show that a million and a half has been subscribed in Canada."

A Reduced Cut.

The Buffalo *Lumber World* says:—There is already much talk of reducing next winter's crop of logs. If fewer logs were brought down to the mills next summer, it would be an excellent thing for the trade, but we don't look with any degree of confidonce to see the cut reduced. If the experience of past seasons be any criterion for the future, the talk about a short log crop will be kept up until the men get into the woods, and on up to about driving season. Then it will be discovered that each operator has calculated that if the others cut less timber, he had better make hay while the sun shines by getting out as much as he can. Result—just as many logs as the last season and a good many more than there is any urgent demand for. This has happened a good many times, and it is likely to keep on happening just as long as poor, weak human nature is what it is.

Dakota Enterprise.

The following newspaper item well illustrates the rapid utilization of lumber in new sections of the country: "Towns grow out West. A denizen of La Beau, Dakota, was recently asked what the population of that town was, and he replied: "Well, the first lumber was received two weeks ago last Sunday. Now there are six general stores, one dry goods store, one hardware store, five saloons, one meat market, three lumber yards, one bank, one newspaper office, one telegraph office, a post office (with 280 calls and 80 lock boxs of the Yale pattern, in a building 20x20, two stories high), two hotels, and some stuctures. Since then there has been started another bank, a 50 room hotel, a hardware store, a dry goods house 30x80, and a Presbyterian church."

THE St. John, N. B., *Telegraph* says that shipments of hacmatac railway sleepers have been made this season by Mr. A. B. Spence, to Philadelphia, to the amount of about 40,000. The sleepers were loaded at St. John, various points on the river, Moncton and Hillsboro. Mr. Spence is also a large dealer in ship-knees, of which he has shipped to the United States ports about 20,000 since May last.

He Believes in the Millstone.

A letter under the above heading and written from this town appears in the *Dominion Mechanical and Milling News* as follows:—

SIR,—I am pleased to learn that a journal devoted to the interests of the milling fraternity is to be published and I wish the enterprise every success.

I would like to say a "few words" anent Rolls v. Burrs. I have worked at milling from boyhood, am thoroughly conversant with the different kinds of wheat, and the methods in use for reducing the same to flour. I would like to ask a question and it is this: How is it that so many millers are rolling their mill-stones out, and allowing the rolls to roll into their place? Pardon this lame attempt at a pun. I still cling to the "time honoured" mill-stone, and assert without fear of contradiction that it burrs are properly cared for no "complete" (?) roller system can afford to dispense with them. It is not my intention to speak disparagingly of rolls, as I think they may be good in their place for crushing grain, etc., but for good bread-making quality of flour together with close yields, and consequantly profitable milling, give me the "old fashioned way."

I would like to hear from some "brother duster" who has become a convert to the "new process" or "gradual reduction" style of milling, and I can assure him that I am prepared to "enter the lists" with him, provided that I am allowed the same bolting facilities which are given to roller mills, and therefore as a millstone miller, I will not yield the plain to the roller mill, and am determined to die hard.

Apologising for tresspassing on your time and space,

I am, yours truly,
JOHN KING.

Peterborough, 27th August, 1883.

Giant Rafts.

That "giant" raft, the arrival of which in New York harbor from St. John, created so much comment among the lumbermen of the metropolis, was a smaller affair compared with the one now on its way from Lake Superior to Alpena for the Prentiss Lumber Company. The New Brunswick raft contained but a little more than one million feet, while the Lake Superior raft contains three million feet. The New York arrival was noticeable only because it was the first attempt to transport timber in that way from St. John. Such rafts are of every day occurence on the lakes, although not made up as the ocean raft was. It is not necessary to bind the logs with chains.

The Bay City *Lumberman's Gazette* says that lumbermen are beginning to get ready for the woods, and some heavy contracts on the Tittabawassee, Muskegon and other streams have already been placed. At present prices for supplies, compared with last year, the cost of keeping men and teams in the woods should be less than last season.

LAST blocks are said to be an important article of manufacture in the towns of eastern and northern Maine. Blanchard, Lagrange, Alton, and Katahdin Iron Works will each ship about 25 car loads this season over the Bangor and Piscataquis railroad. Large numbers are also cut on the line of the Eastern & North American division of the Maine Central, and also in the towns to the eastward of Bangor. The blocks are cut from rock maple, and the work of getting them out gives quite remunerative employment to the farmers and their sons during the long winter months. A million and a half of these blocks, valued at about $36,000, were shipped from Bangor last year, principally to western Maine, New Hampshire, and Massachusetts shoe towns. This, however, by no means includes all the last business of this section, as large quantities are shipped each season by way of Calais.

The Jordan Canal.

Although the Jordan Canal would wipe away many interesting landmarks of Biblical history, Sir Admiral Inglefield states that so far he has received only encouragement to go on with the work from clergymen who have written to him upon the subject. They regard the enterprise, it appears, as the fulfilment of a prophecy to be found in the forty-seventh chapter of Ezekiel. If one will turn to that portion of the Old Testament he will see how it speaks about bringing out the waters towards the east country into the desert and then down to the sea. It mentions, moreover, the healing of the waters and the appearance of a great multitude of fish. The coincidence of these passages with the details of the Palestine channel scheme is very curious, for the first may be taken to indicate the eastern flow from the Mediterranean through the cutting across the plain of Esdraelon, and thus on by way of the desert to the Red Sea, while the second may be thought to foreshadow the fate of the Great Dead Lake of the Scriptures, its waters sweetened by contact with the invading stream.

Fruitless Ingenuity.

A Detroit convict showed rare ingenuity in planning an escape from prison. He collected the tin foil in which tobacco was wrapped, and with this made an impression of the key that locked the door of the corridor leading to the cells. He then waited till workmen were summoned to repair the closet in the ward, and contrived to secrete a piece of the lead pipe used by them. This he melted in an old tin can over a gas burner, at which the prisoners lighted their pipes during the hours when smoking is allowed. He previously secreted the handle of an old knife, in which a small fragment of a blade remained, and with this he fashioned a mould out of a piece of wood, poured in the melted lead, and turned out a key that with a little whittling fitted the corridor door perfectly. A leg was then wrenched from an iron bedstead for use as a club, the other prisoners were taken into the plot, and a general gaol delivery was agreed upon. The keeper was to be called upon some pretext to the door of the corridor, which was to be unlocked previously, and at a signal a rush was to be made for him by the convicts. The plot was discovered in the nick of time by a mere accidont.

A Slight Mistake.

She was a thin, narrow, dark-visaged woman with "specs" on, and she carried a package of tracklets and leaflets which she scattered broadcast among the sinners in the Cass avenue car in which she rode. When only one or two of the pamphlets were left a man got in. He was on his way to the depot, a countryman, going home evidently. He had a big watermelon, which he disposed of tenderly on the seat next to him, and a glass flask with a rubber cork bold ly out of his coat pocket.

"Hough!" he panted as he stuffed his fare in the box. "Hotter than harvestin' up here, ain't it?"

Everybody looked cold disapproval at him, as good, polite, Christian people do when spoken to in a street car: all but the woman with the "tracks." She fished one out and extended it to him.

"Thankee," he said, receiving it in a brown paw, "comic almanac, hey?"

"No sir," said the woman, firmly, in a high falsetto voice. "It's to save your immortal soul. Touch not, taste not, handle not the wine," and she pointed with a crooked forefinger to the glass flask protruding from the breast pocket.

"Oh, I see," said the man, smiling goodhumouredly on his sour visaged *vis-a-vis*; "but this bottle ain't for me, ma'am."

"Woe unto him that giveth his neighbour drink," quoted the woman fiercely.

"He ain't eggsactly my neighbour eyther," said the man. "You see, it's the new baby, and wife calculates to bring him up by hand, and this bottle's for him, bless his pootsy tootsy. Where's the rigging of it?" and diving into another pocket he fished out some India rubber tubing, etc.

The woman didn't wait to finish her dissertation on temperance, but got out without asking the driver to stop.

A New Invention.

A Chicago inventor, named M. H. Dement, claims to have at last solved the problem of setting type by machinery. He does it by avoiding the setting of type altogether. His invention is a combination of two others, the type-writer and the stereotype process. The machine makes impression of letters on strips of soft paper like that used in stereotype matrices. These stripes, when corrected, are arranged in a sheet which is used as the matrix in which to cast the plate. The advantage the machine has over nearly all former attempts at solving this problem is that it admits of "justifying" the lines,—that is, spacing the words in each line out so as to make the ends even all down the column. The inventor claims that the composition of a large daily paper which now costs from $1,500 to $2,500 a week can be done by means of ahis machine for from $200 to $300. He promises to have machines on the market in four months.

Some Interesting Facts.

The *Financial and Mining News* has evolved the following: Tennyson can take a worthless sheet of paper and by writing a poem on it make it worth $5,000. That's genius. Vanderbilt can write a few words on a sheet and make it worth $5,000,000. That's capital. The United States can take an ounce and a quarter of gold and stamp upon it an "eagle bird" and "twenty dollars." That's money. The mechanic can take the material worth $5 and make it into a watch worth $100. That's skill. The merchant can take an article worth twenty-five cents and sell it for $1. That's business. A lady can purchase a very comfortable bonnet for $10, but she prefers to pay $100. That's foolishness. The ditch digger works ten hours a day and shovels out three or four tons of earth for $1. That's labor.

—IT WILL PAY YOU—

TO SUBSCRIBE

FOR THE

Canada Lumberman

FOR THE FOLLOWING REASONS:

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞ TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

——CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM——

for placing your goods or wares before the saw mill men and lumber and timber dealers of the Dominion.

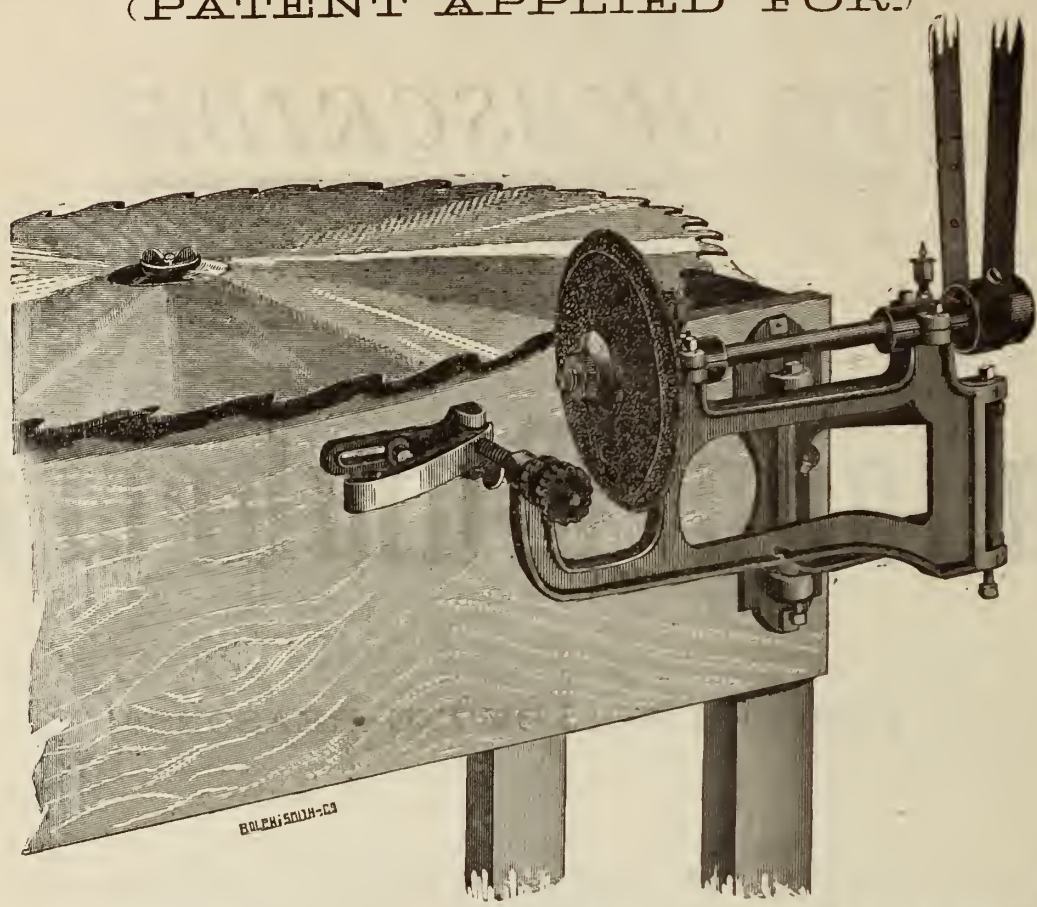
ROGERS' SAW GUMMER

(PATENT APPLIED FOR.)

No Heating!

Quick!

Simple!



Exact Work!

Cheap!

Complete!

POSITIVE STOPS! ADJUSTABLE GUIDE! Every Tooth made exactly alike!

JUST WHAT IS WANTED in every Saw-mill in Canada!

A REVOLUTION IN GUMMING SAWS WILL BE EFFECTED WHEREVER

ROGERS' SAW GUMMER

Is Introduced to replace Burr Gummers, or Grindstones, or where Emery Wheels have been run in the usual way. Every Machine Guaranteed to work as represented or No Sale. *It works EASILY; is so SIMPLE and COMPLETE that Sawyers can keep their Saws CONSTANTLY in FIRST-CLASS ORDER and thus LARGELY INCREASE the DAILY OUT-PUT.*

Price Complete, with Countershaft - - $40.00.

THE TRENTON STEAM SAW MILLS.

During the past season Messrs Gilmour & Co. have made large additions to their mills, very much increasing their size and although the producing capacity has been increased one-third the improved and labor saving machinery introduced under the management of Mr. L. Paquet enables the firm to handle the increased amount of lumber with about the same number of men formerly used.

The first change is noticed by the visitor when he enters the mill premises in the long rows of dwellings erected during the past winter and spring for the use of the employees at the mills. They are very neat and compact buildings and no expense has been spared by the firm to make them comfortable for the inmates.

Upon entering the mill yard, the building we first approach is the planing mill and the general repair and workshop. Here there are two planing and matching machines, which are run day and night to supply the large demand for dressed lumber. A large timber planer and an iron planer besides drilling machines, wood, and iron, turning lathes, &c. are also in this building. The power is furnished by four Tubular Boilers and a 90 h, p.engino. Leaving this building and passing the blacksmith shops on our left and the general mill offices on our right hand side, we approach what is called the "Little Mill." This mill is in two sections one devoted to cutting lumber, bill timber, &c., and the other to cutting shingles, ties, &c. The lumber department contains a large circular saw also a stock gate and slabber gate and turns out about 80, 000 feet of lumber per day. The shingle department contains besides the various circular saws used in cutting the logs into bolts, two double and one single shingles machines capable of cutting 150,000 shingles per day. The power here is furnished by eight Tubular boilers and two engines of 60 and 90 h. p. respectively. There are about 150 men and boys employed at this mill.

Leaving the little mill we approach the "Big Mill" the first thing that striks our attention is the improved appearance of this vast building it having been lately neatly encased in several coats of paint. To get any idea of the immense amount of work done in this mill we must follow the logs as they leave the waters of the bay through the various manipulations they undergo in the mill before they become lumber ready for sale. As the work is all done on the second floor of the mill the logs are drawn up into the mill by endless chains arranged upon log-ways reaching from the water to the upper floor, they are then sent (if very large) to the large circulars the saws of which are arranged one above the other so as to enable them to cut the largest logs that the pine forest produce or if medium sized or small they are sent to two sets of span or twin circulars to be sided down to regular sizes called stocks either 10, 12, 16, 20 as the case may be, they are then put up in piles of four, six or nine stocks according to their size and run through the gang saws these are large frames containing 30 or 40 saws in an upright position and run at a speed of 200 strokes per minute. As the logs pass through these gates they are cut into boards and are at once sorted the good square edged boards going at once to the trimmer to have the ends squared and the waney edged boards go through the edgers and then also to the trimmer.

The lumber at this stage is culled or graded for the foreign market, each piece having its grade marked upon it. The lumber then passes on to the sorting room when each kind of grade is piled separately upon the rollers and run out upon cars when it is ready to be taken to the piling ground. In the mill there is no carrying of the lumber or slabs from place to place by hand as all transfers are made by means of live rollers and moving chains, in fact the machinery is made to do away almost entirely with manual labor. To get any correct impression of the completeness of the machinery and facilities for handling the immense quantity of lumber with so little labor, one must see the mill when working personally. On this floor are also situated the lath, heading, picket and shingle saws by which the lumber and edgings not fit for the market are cut up and utilized. The refuse slab wood and sawdust are conveyed by carriers to some distance from the mill to a sheet iron grater or "Gehenna" one hundred and twenty-five feet in height and then burned.

A peep at the works on the first floor presents nothing to the experienced eye but a perfect wilderness of wheels, pulleys and belts in rapid motion. The power used in driving the mass of machinery used in this building is furnished by 16 Tubular boilers of 100 h. p. each and a monster double or twin engine of over 1,500 h. p.

This mill cuts up daily over 3,000 saw logs and produces about 350,000 feet of lumber, 100,000 lath, 100,000 pickets heading and shingles, and employs in the mill and yards 500 men and boys making a total of over 600 men employed on the premises.

Leaving the mill we go to visit the piling grounds and shipping docks. Some idea of the size of these grounds can be formed from the facts that there is at present over thirty millions of feet of lumber piled on them and that the company have over ten miles of railway laid in them to facilitate shipping and handling it in this service. There are two locomotives and 100 cars used besides several horses.

Great improvements have been made by the firm in their appliances for extinguishing fires they having purchased one of the finest steam fire engines now in Canada. It was manufactured by the Amoskeag Co. of Manchester, N. H., and said by them to be the most powerful engine ever manufactured by them. It throws over 6000 galls. of water per minute and well deserves the name of "The Monarch." In addition to this powerful engine they have placed in their new brick fire hall a stationary pumping engine capable of throwing 1,500 galls. per minute. These appliances in the hands of a well drilled fire brigade form one of the best systems for protection against fire we have ever seen.—*Trenton Courier.*

A GIANT RAFT.

The New York *Times* of August contains the following account of an immense raft which was brought from St. John, N. B., being the first attempt at raft towing in that direction:

The largest string of logs ever made into a raft was towed into the Erie Basin, South Brooklyn, at day-break yesterday morning by the tugs Cyclops and Haviland. The raft is 1,200 feet long, 21 feet wide, and twelve feet deep. It is composed of 11 sections, each of which contains about 500 logs, ranging in size from the diameter of a wagon wheel down to that of a telegraph pole. The logs are piled in huge bundles and strapped together with chains strong enough to tow the Great Eastern. These sections were placed in a string and fastened with a strong hawser to the Cyclops, and Capt. Gally of the Haviland, while the entire expedition was piloted and managed by Capt. Rufus Patterson, of St. John, New Brunswick, the veteran of the Province. The logs were bought by Mr. James Murry, of No. 26 Burling slip, in New Brunswick early this summer. The distance which they were towed is 650 miles, as the ships sail, and the freight would have been very heavy. Mr. Murray accordingly consulted with Capt. C. C. Ellis, of No. 60 South-street, a brother of the master of the Cyclops, who undertook to tow the raft to New York, at a saving of 50 per cent. in freight rates. The raft was constructed, and on Aug. 7 was started from the harbor of St. John. The trip was made without serious accident. The first three days were as calm as could be desired, but on the fourth day Capt. Patterson was obliged to seek shelter in Booth's Bay, where the raft was detained for three days. Pleasant weather was experienced after the storm until Newport was reached, on last Thursday night, when a strong gale separated the crib attached to the Cyclops, from the remainder of the string, which was sent adrift. This was a serious predicament, and the raft was in great danger of going to pieces on the breach at a loss of many thousands of dollars. The Haviland was immediately detached and sent to the rescue of the lost raft, and in the morning the two vessels came together with their charges resumed their original positions, which were maintained during the remainder of the voyage The passage through Hell Gate was easily accomplished, Stand's Point was passed without any difficulty, and at 6 o'clock yesterday morning the great raft was securely anchored in the Erie Basin, where it will remain until it can be disposed of.

The voyage of the raft has occasioned great interest among shippers, as such a trip has never been made before, and it is the general impression that this mode of transporting timber will supersede the shipping on schooners to a very large extent. The Cyclops is the largest tug in the harbor, being 128 feet long. She is owned by Capt. C. C. Ellis.

FOREST FIRES.

In a late paper by Prof. C. S. Sargent, that gentleman gives a striking account of the loss, actual and prospective, suffered from forest fires, and of the necessity for stringent legislation for their prevention. He lays special stress upon the importance of the subject for the New England states, where so large a share of the soil is only adapted to forest growth, and where a goodly portion of our supplies of white pine must come from in future years. These states already have valuable forests of second-growth pine, now reaching a size when they can properly be thinned out, leaving the smaller trees for futureneed. But he states that in Massachusetts alone ten thousand acres of forests are, on the average, burned annually— about one-third of the fires originated from locomotive sparks, and nearly all the rest from carelessness, or other preventable causes.

This burning not only destroys the standing trees, but it makes the investment of capital in growing forests hazardous; it checks the growth of a very desirable industry; and it destroys, as he points out, the capacity of the ground to continue in pine growth. When properly cut, a pine forest may be propagated indefinitely. When burued, there is a long succession of weeds and briars, mountain cherry, gray birch, willows or poplars, maples and ash trees, until a hard-wood growth is established. This maintains itself a long time if left alone; but if the ground be then cleared by cutting, cultivated for many years, and then left free from plow aud scythe, and guarded from pasturing and fire, the white pine will spring up spontaneously after its long banishment. Fifty or one hundred years must pass before this desirable crop will return. In view of so long a delay, Prof. Sargent holds, and of the considerable value that pine will soon command, it is well that special care should be given to protecting and preserving the second growth forest now approaching maturity.

THE schooner Nelsou Bartlett, a three-master, recently brought 3,089,000 lath, an unusually large cargo, from St. John, N. B., to Baltimore.

H. POOR & SON received at their tannery, at Winn., Me., 492 cords of hemlock bark from Wytopitlock station, which amounts to 1,131,600 pounds. About 10 pounds of bark are required for tanning one pound of leather.

THE FORESTRY CONGRESS.

The American Forestry Congress met in annual session August 8th, at St, Paul, Minn., and after an interesting session of three days, adjourned.

In his annual address, the President, Hon. George B. Loring, gave many valuable points of information concerning the forest area of the country, the pine supply, the value of the timber industry, etc. He said: "The forest lands of the United States amount to less than one-fourth of the entire area. The proportion of wooded area is less than in Eastern, Northern and Central Europe, and is very unequally distributed. Norway has two-thirds of its area wooded; Sweden six-tenths; Russia nearly one-third; and Germany nearly one-fourth. The countries having less forest area, arranged in order of proportion, from 18 down to 5 per cent. are Belgium, France, Switzerland, Sardinia, Naples, Holland, Spain Denmark, Great Britain and Portugal. West of the line of prairies running southwest through Indiana, Illinois, and Missouri to the Indian Territory, the central prairies, the dryer plains and much of the southern belt of the Pacific slope are destitnte of wood. The streams in all this great region are more or less fringed with trees of some sort, and the higher mountains, on the protected side, have a thin covering of forest. In the deep valleys of the western slope of the Sierra Nevadas are forests of extraordinary density, filled with soft wooded evergreen trees of enormous size. Here the sequira gigantea or big tree flourishes in isolated patches, while the coast range is the home of the sequira semnivirens, or red wood. From North Carolina to Louisiana nearly six-tenths of the farm area is wooded, though most of the area thinly, and part of it has been culled and is in second growth. Including unoccupied areas not in farms which are in forest, something like three fourths of the entire South is wooded. Comparing the census returns of 1870 and 1880, we find a decrease of wood lands in farm areas in Michigan from 41 to 32 per cent; in Minnesota from 21 to 15, and in Iowa from 16 to 11 per cent. In Nebraska tree planting has changed the record from 3 to 10 per cent. From the increase of farms in the wooded area Wisconsin has 31 instead 29 per cent. Of the value and importance of the forests covering these areas let me say: Next to the white pine of the Northern forests, the most valuable tree is undoubtedly the Pinus Australis, or long-leafed pine of the southern coast land, forming a belt of varying breadth, up to 100 and 150 miles from the Atlantic and Gulf shores. The southern pine will come into still greater prominence, as railroad and steamboat lines extend facilities for transportation, which is now being done with great rapidity.

"The condition of the pine timber supply of the United States, in connection with the statements I have made, is interesting. The destruction of this tree by fire, and the axe of the lumberman is very great. Together with the spruce it is being rapidly consumed, and I think the following figures will show that the supply is to obtained hereafer by allowing an exhausted region time to recuperate, while the comparatively uncut sections, are resorted to for filling the demands of the market. Investigations recently made show that the supply of pine in New Hampshire and Vermonnt is exhausted. and that the spruce lumber, at the rate the cutting is now going on, will last in the former State but 7 years, and in the latter but 4: in the State of Maine the pine will last four years and spruce 15 years; in South Carolina the pine forests will last 50 years at the present rate of cutting; in California, 150 years; in Arkansas, 300 years; in Pennsylvania, 15 years; in Georgia, 80 years; in Lousisina, 100 years; in North Caroline, 50 years; in Winconsin, 20; in Michigan, 10; in Minnesota, 10 years; in Mississippi, 150 years; in Alabama, 90 years; in Florida, 30 years; in Texas 250 years. That the exhausted forests in this list of States can be restored in time there is no doubt, and every means of cultivation and protection should be applied by the people and the government, both State and Federal, each in accordance with its own jurisdiction."

"The black walnut, culled from western forests to meet a limited though important demand is really becoming scarce on the northern side of the Ohio valley; but on the southern, along the foothills and in the valleys of the Appallachian range, it is abundant and almost untouched. It grows rapidly in the Western States, even beyond the Missouri. The millions of acres of existing forests in this great eastern chain of mountains has not yet been considered in the statistics of forestry here presented. Their resources have never been measured, are yet comparatively unknown, and almost untouched by the axe of the woodman."

"In addition to this the white pine of Minnesota is estimated at 6,100,000,000 feet exclusive of isolated timber in birch lands and amidst other hard wood growth. In Michigan, the estimates for the lower peninsular cover 7,000,000,000 feet; In the Saginaw district, 8,000,000,000 on the streams flowing into Lake Huron, and 14,000,000,000 on those flowing into Lake Michigan. The upper peninsular contains 6,000,000,000 more, making 35,000,000,000 feet in the principal pine districts in Michigan. The great pine forests of Winconsin are estimated to contain 41,000,000.000 fect of lumber, the largest propertion in the Chippewa and Winconsin districts. They cover an area of 22,500,000. The northern border of the pine area is less productive than the areas of the lower latitudes. The cedar swamps of Winconsin scattered the pine belt are estimated to cover 1,365,000 acres, and to contain 62,800,000 posts, telegraph poles and railroad ties. There are also large supplies of tamarack and spruce and valuable oak timber, especially in Dunn, Pierce and St. Croix counties, and other hard woods are abundant through the southern border of the wooded districts. The united area of the States south of Maryland and the Ohio river is more than 500,000,000 acres, containing nearly 400,000,000 acres of forest land."

BRITISH COLUMBIA FOREST.

We extract from the Report of the Committee on Immigration and Colonization the following portions of the evidence of Dr. George W. Dawson, F. G. S., Assistant Director of the Geological Survey:—

Q. Will you please inform the Committee as to the timber recources of British Columbia, the country over which the Douglas pine occurs, and other timber trees at present or likely in futuro to be of value? The Douglas pine, I understand, is of the greatest commercial value just at present?—This map (produced, published in Report of Geological Survey 1879-80) will illustrate some of these points. It shows the range of the Douglas fir and some of the other important timber trees. So far, the Douglas fir or Oregon pine, as it is also called, is the only tree that has attracted much commercial attention. It has been largely cut and exported. It is found on the whole eastern coast of Vancouver Island and on the coast of the mainland opposite to it. It extends northward a little back from the coast as far as the Skeena River, and in the northern part of the interior of the Province as far north as Tacla and Babine Lakes. The timber which occurs immediately on the coast, is, however, indisputably the best. There are magnificient forests there, composed almost entirely of the Douglas fir, and naturally, on account of the facilities for shipment, they have attracted the most attention, The quality of the timber is excellent and the size of the trees is great. One that was cut down at Burrard Inlet for the Philadelphia Exhibition, of which a section is in the Parliament grounds now, was measured to be 305 feet in height, had a thickness of 8 ft. 4 in., 20 ft. above the ground, and was perfectly sound thoughout. Many of these logs measure as much. Commercially speaking, the medium sized logs are more useful in the mill than these exceedingly large ones. The localities chosen for the mills are selected in regard to facility of shipment, and those now working are chiefly situated on Burrard Inlet. In addition to the Douglas fir, there are a number of other trees in British Columbia which are exceedingly valuable, and which will eventually attract a good deal of attention. There is the cedar, which sometimes attains a diameter of 17 feet, though geuerally those very large trees are more or less hollow. There is the spruce, which is an excellent wood, not so soft as our spruce on this side of the continent, and a different species; the white pine, not the same as the eastern white pine, but producing an equally good wood. As a rule this tree is remote from the sea coast, so that it has been utilized only to a small extent so far. The hemlock, again, grows to a much greater size than our hemlock, and produces good, clean lumber, and that tree is found along the whole of the coast and over a considerable part of the interior. The maple, which is rather an inferior wood, except for cabint-making purposes, owing to the curly grain, is only found on the coast. The oak is confined to the southern part of the coast, and is not in sufficient quantity to be looked upon as a commercial wood on a large scale. The yellow cedar or yellow cypress is another wood that has attracted much notice. It is found chiefly on the northern part of the coast, and is an exceedingly fine wood for cabinet-making. It is a close wood, and very lasting, penetrated by resinous substances which protect from decay to a very great extent, and give it a peculiar odor. In the interior of the Province there is the yellow pine, which inhabits the dry southern part of the plateau, and is locally a tree of great value. In fact, it is the wood most used in the interior, in some districts even in preference to the Douglas fir, where that occurs, I might state, in general, that every part of British Columbia is amply and well provided with excellent wood for construction and other purposes. The coast has the preeminence in that respect, owing to the facility of export and to the gigantic size of their forests, due to the mildness of the climate and its humidity.

Q. Point out the northern and eastern limit of the Douglas fir?—The northern limit is on the Skeena, and on Tacla and Babine lakes. To the east the limit is at the Rocky Mountains. It is abundant even on the eastern slopes of the Rocky Mountains, as far east as the Porcupine Hills, and is now being extensively used for construction in the western part of the prairie region.

Q. Principally on the rivers that may be utilized for bringing it to market?—On the eastern slope of the Rockies, yes; but on the west the timber business is carried on by floating the logs down rivers as it is here, because of the large size of the logs and the rapidity of the streams. Nearly all the timber cut for exportation on the west coast is drawn out, either by teams or on small steam tramways, to the shore, launched into the sea and towed to the mill.

Q. Will you give us your opinion as to the timber resources of Vancouver and Queen Charlotte Islands respectively?—The chief difference between Vancouver and Queen Charlotte Islands, in regard to timber, is that on a large part of Vancouver Island the Douglas fir is found abundantly, while in the Queen Charlotte Islands it is not found at all. It is replaced there by cedar, hemlock and spruce, and the yellow cypress or yellow cedar. An area of about 1,900 square miles of the flat part of the Queen Charlotte Islands is covered very densely with excellent timber, but it does not include the Douglas fir and the Islands are rather north of the usual merchantile routes at present, it has not given rise, so far, to the erection of any mills. There are very excellent sites for mills, however, in the Islands, particularly at Naden and Massel Harbors, and other places where streams from the low country reach the sea. The timber of the Queen Charlotte Islands I look upon as one of the most valuable immediate resources of the Islands, and as soon as the demand for timber shall increase a little more, they will, no doubt, be utilized. Another feature with regard to these Islands is that, owing to the humidity of the climate, the woods have been very little affected by forest fires, and even where large quantities of rotten and decayed trunks, of great thickness, have accumulated on the ground, they lie there and go to decay rather than burn.

Q. Speaking of the cedar as a commercial wood, you say sometimes it grows to a diameter of 17 feet; are the trunks covered with branches, or are they comparatively free from branches for any considerable distance from the ground? The cedar is apt to give off a number of branches, but when it attains large dimensions, the living branches are generally near the top. These very large trees are more or less hollow generally. The Indians select the largest sound cedars they find for their magnificent canoes, and the dimensions of those canoes show how large such trees may be found when one goes to search for them carefully. I might state, however, in connection with the Queen Charlotte and Vancouver Islands, that, as the area of Vancouver is considerably greater than Queen Charlotte Islands, doubtless the timber supply of Vancouver is more important than that of Queen Chaalotte Islands, at least, in correspondence with the areas.

Q. What is the diameter of the largest tree you have seen in British Columbia, and are there very many of that size or nearly approaching it?—I cannot state precisely the diameter of the largest Douglas fir I have ever seen; when a specimen was selected to send to Philadelphia Exhibition, one was chosen which was sure to be sound throughout. and there were larger trees they were not sure about. This tree had a diameter of 8 ft. 4 in., and a height of 105 ft., and there were a great many in the vicinity of Burrard Inlet approaching to this size. In fact, whole areas of forest are composed of trees of similar size.

Q. What is the average size of logs sawn in the mills at Burrard Inlet?—I should say the average size must be between 4 feet and 5 feet.

Q. In diameter?—Yes. in diameter.

Q. What class of spars can be got out, *i. e.*, their length and diameter?—Spars and masts of any size desirable for shipping can be easily got in British Columbia, and are unsurpassed for straightness and strength. I believe masts have been usually shipped hewn to octagonal form from 20 to 30 inches in diameter and 60 to 120 feet long. They have been shipped to special orders as large as 42 inches in diameter and 120 feet long. Yards are generally from 12 to 24 inches in diameter and 50 to 102 feet long.

Q. How does the timber at Burrard Inlet compare with that at Puget Sound, as to size, quality and market prices?—It is probably about the same in both places; or Burrard Inlet, not being as much cut into as Puget Sound, probably contains in proportion to its area more valuable timber at the present time.

Q. Are there any places in Vancouver Island adapted for the erection of saw-mills?—A great number of localities. For instance, in the vicinity of Cowichan and northwest towards Comox, where there is a large area of flat country covered with fine timber, besides Alberni Canal and other places on the coast.

Q. Have you any means of knowing the principal markets to which British Columbia lumber and spars are shipped, the prices obtainable in those markets, and the general opinion of its quality?—I cannot state the prices obtained in the markets. It has been shipped to a small extent to San Francisco—not in large quantity because of the duty. A good deal has been sent to South America, and to Australia, some occasionally to China, and masts and spars have been exported to England and France. Its quality, tested by strength and in other ways, is excellent, particularly for masts and spars. The only respect in which the Douglas fir compares unfavorably with white pine is its somewhat coarser grain, and that is connected of course with its greater strength.

The last raft of square timber of the season has passed through the Calumet slides.

The Hasting *Star* says that Rathbun & Son's drive of 150,000 logs has passed through there.

In a description of the great Bell Farm in our Northwest Territory a correspondent of the London Ont., *Free Press* says:—The farm is ten miles square, and there is being planted a grand avenue of 10,000 poplar trees, ten miles in length. Some of the trees were planted last year and are healthy, and average from 12 to 15 feet in height.

READER, if you suffer from any disorder of the Liver, Stomach, Bowels, Kidneys, Skin or Blood, try Burdock Blood Bitters, Nature's specific medicine for acting on those organs for the outlet of disease. 25,000 bottles sold in the last three months.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

FOREST FIRES.

Several weeks ago we especially urged extra precaution everywhere to prevent forest fires, which, owing to the conditions attendant on the dry and decaying vegetation, were liable to break out on the very least provocation. The advice given at that time was timely and suggestive; and people have exhibited great laxity in precautionary measures, so much so that we see accounts of great destruction in many directions. All over New England vast damage has resulted from forest fires of late. They are the result of the very causes to which we alluded at the time mentioned. The drouth has dried up the brooks, and transformed the country there into a veritable tinder box. Many of these New England fires are caused by carelessness on the part of hunters, who leave their unquenched camp fires or carlessly drop their matches with which they light their pipes, and in a very few hours an uncontrollable flame carries destruction with it in every direction, until cities and villages are threatened with complete destruction. The damage from this source already amounts to hundreds and thousands of dollars, and in many directions the people en masse are compelled to desist from their usual vocations to fight the destroying element. The danger in Michigan from the same source is not yet past and will not be until the setting in of the heavy fall rains, and the utmost care, and every precautionary measure is desirable in order that the great danger may be averted, and a repetition of the desolation of 1880 avoided. Every local paper in the Wolverine state should not desist from sounding the alarm until the dry season is at an end.—*Lumberman's Gazette.*

RAFTS ARRIVED.

The *Chronicle* gives the following list of rafts, etc., arrived at Quebec:

SEPT. 20.—J. J. Calvin & Co., white pine, oak, &c., sundry coves.

Stokes & Kelly, walnut logs, Bowen's (Sillery).

British Canadian Timber Co. white pine, etc., St. Lawrence Docks.

J. B. Charleson, staves, Union cove.

E. L. Kelsey (2), staves, Woodfield and Spencer coves.

Stokes & Son, staves, Dobell's (Sillery).

Collins Bay Co., oak, etc., Spencer cove.

Tree-Planting Extraordinary.

The Mexican Government has contracted with Mr. Oscar A. Droege, to plant 2,000,000 trees in the Valley of Mexico within four years from March 15, 1884—500,000 a year, in such places as the Government shall choose. The contractor pledges himself to establish a number of nurseries and to have in them each year at least 800,000 ash, 35 000 willows, 120,000 poplars, 60,000 eucalyptus trees, 60,000 trœnos-japones, 60,000 mountain cypress cedars, 60,000 acacias, and 120,000 of miscellaneous varieties. The trees must be in plantations of from 50,000 to 100,000 each, and Mr. Droege has to maintain them for two years after planting. He is not compelled to plant trees along the highways, however. Three graduates of the School of Agriculture are to be received into the nurseries each year, there to study the science of forestry. He is also to raise fruit and other useful plants for free distribution. There is to be translated from the German every year a work on arboriculture of recognized merit. An inspector is to superintend, and Mr. Droege is to receive annually 40,000 dollars (£8,500) till the sum reaches a total of 200,000 dollars (£42,500),—*Pall Mall Gazette.*

Jailing Logs.

The *Northwestern Lumberman* says:—It is a common thing for people to be jailed, but it is for the C. N. Nelson Lumber Company, of Cloquet, Minn., to introduce a practice of jailing saw logs. Last week this company was driving into what is termed up there a "jail boom" a quantity of logs, belonging to the Duluth Lumber Company and other Duluth parties; and as a continuance of the unpleasantness that has existed on the St. Louis for some time, the logs will be held in chancery until the tolls exacted by the Cloquet company are paid.

Deal Culler's Deputation.

An Ottawa despatch of Sept. 20th, says:—A deputation of deal cullers from Quebec, accompanied by the Supervisor, waited on the Deputy-Minister of Inland Revenue, seeking a more equitable distribution of the earnings of the staff. They subsequently waited on Sir Hector Langevin.

A manufactory of barrels, kegs and wooden ware generally is being established in Montreal with $100,000 capital.

"LEAVES have their time to fall," says the poet, but Wild Strawberry leaves are on the rise just now, being utilized in such enormous quantities in making Dr. Fowler's Extract of Wild Strawberry—the infallible remedy for Cholera Morbus, Diarrhœa and other Summer Complaints.

DOWNS' ELIXIR

N. H. DOWNS'

VEGETABLE BALSAMIC

ELIXIR

Has stood the test for FIFTY-THREE YEARS, and has proved itself the best remedy known for the cure of **Consumption, Coughs, Colds, Whooping Cough and all Lung Diseases** in young or old. SOLD EVERYWHERE.

Price 25c. and $1.00 per Bottle.

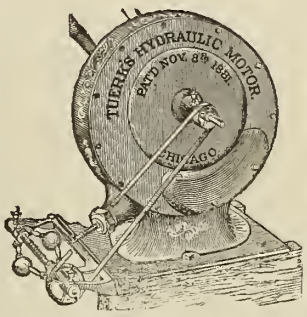
TUERK'S

WATER MOTOR.

Patented November 8th, 1881.



View of Tuerk's Pressure Motor, with Tuerk's Improved Governor Attachment.

For running Sewing Machines for families or for manufactories; also, for running Dental Lathes and Engines, Telephone Generators, Coffee Mills and Roasters, House and Church Organs; also for running one Printing Press or six, at the same time. Paper Cutters, Sausage Machines of any make or size; GRAIN, FREIGHT OR PASSENGER ELEVATORS, Straw Cutters, and all kinds of Machinery by Water Power.

HYDRANT PRESSURE.

Cheaper, Quicker and Safer than Steam.

Over Fifty Motors of other makes have been taken out and replaced with the TUERK MOTOR; among the list are the Backus, the Sabin, the Little Giant, the Hayward, Clark's Piston Engine, and others.

Names of a few who have taken out Backus Motors and put in the Tuerk Motor in their place:

C. W. Meikel, Indianapolis, Ind.
Columbus Telephone Co., Columbus, Ohio.
James Egan, Chicago, Ill.
H. C. Hawkins, Cleveland, Ohio.
Printing Office, Hannibal, Mo.
A. Solmens, Hat Manufactory, So. Norwalk, Ct.
Lake Shore & Mich. So. R.R. Shops, Elyria, O.
Index Printing Office, Evanston, Ill.
Republican, Johnstown, N. Y.
Tribune, Salt Lake, Utah.
Alton Printing Co., Alton, Ill.
A. F. Worthington & Co., Cincinnati, Ohio.
Lemon & Co., Waverly, N. Y.
Braun & Jones, Cedar Rapids, Iowa.
Gates, Douglas & Co., Cedar Rapids, Iowa.
Village of Rutland, Rutland, Vt.
W. L. Randall, Chicago, Ill.
A. J. Stoll, Sandusky, Ohio.
Killits & Wayland, Chillicothe, Ohio.
S. A. Morrow, Springfield, Ohio.
R. Putnam, Chillicothe, Ohio.
N. Shelton, Omaha, Neb.
H. J. Lewelling, St. Helena, Cal., and others.

Do not fool your time away trying other Motors, but send for the Tuerk Motor, which is warranted to do better work with less water than any other Motor or Water Engine made.

Send for Catalogue, and state what you want to run,—give full particulars and Water Pressure per square inch.

TUERK BROS. & JOHNSTON,

86 and 88 Market Street, Chicago, Ill.

BOTANIC GARDENS.

We take the following extract from "Hasty Notes on Trees and Shrubs of Northern Europe and Asia," by Charles Gibb, Abbottsford, Quebec:

"Europe may well be proud of her Botanic Gardens. The large outlay of the European Governments seems to have been money well invested. Botany in its relations to Agriculture, Horticulture and Forestry is a science deemed too valuable to be suffered to remain untaught. Russia is in no way behind in this matter. At St. Petersburg what cannot be grown out of doors must be grown within, thence they have there the largest number of species under glass in the world. Not only in the larger cities, Moscow, Warsaw and Kiev, but in the smaller towns like Kazan, Voronesh, Orel and Penza (the last not visited by us), we find Botanic Gardens such as we might feel proud to own.

A generation or two ago, when Loudon and Lindley were at work in England, the Royal Horticultural Society imported from all parts of the world the plants likely to be useful or ornamental in England. They sent agents to China. Robert Fortune, however, spent much of his time at Canton, almost in the tropics. He was not in search of plants suited to the climate of Quebec, and yet some of our best hardy shrubs were brought to light at that time. This was probably the age of greatest Horticultural interchange the mild temperate regions have ever seen, and upon it is largely based their present advanced horticulture; and yet this work has been only of minor use to us.

In the tropics, and in the sub-tropical climates, the British Colonies have taken the lead in this matter of Botanic Gardens: wherever there is a Colony of any size there almost always is a Botanic Garden. Ceylon, India, (several), Singapore, Hong Kong, Queensland, Victoria, South Australia, New Zealand, Tasmania, Mauritius, Cape of Good Hope, and many others which I am not sure enough to note have their Botanic Gardens. Also in the West Indies, Jamaica, Trinidad and Demarara. The East and West Indies have interchanged for over 100 years! Read the reports of the Jamaica and other Botanic Gardens in the library of the Montreal Horticultural Society, and you will see that it is this botanic interchange which has built up the enormous export trade of the Tropics.

Now there are two points to which I wish to draw special attention.

I. We in the cold north have hardly begun to exchange with our like climates in the old world.

II. In Canada we have no Botanic Gardens.

As to exchange with our like climates, that will begin next fall. As to Botanic Gardens we must speak less hopefully. Our Horticultural Societies have done good work. Our Universities do not neglect the science of Botany. We have some fair collections of trees, some Horticultural Gardens; but our Government has never seen the need of expenditure upon Botanic Gardens, as have the Governments of the European powers, and the Governments of other British Colonies. That this great Dominion of Canada, which stretches from the Atlantic to the Pacific, should be without a Botanic Garden, or a series of such gardens, is a fact without parallel in British Colonial history.

On the European Forestry plantations I must say a few words. The planted districts in France we did not pass through, but we obtained some idea of their method of work by visiting the Forest School at Nancy. That work one may get some idea of by reading their reports now in the Montreal Horticultural Society's library. In Germany we were continually passing extensive plantations of Scotch Pine (*Pinus silvestris*), bordered with Norway Spruce (*Abies excelsa*). The Germans are most economical in the use of wood, so that pine so extensively planted must ere long become an article of export. But where are the hardwoods needed for a thousand different purposes. Strange this exclusive planting of one species. So well are the forest plantations of Wurtemburg cared for, that the term "high culture" could with justice be applied to them. Evergreens are easily and cheaply propagated in the climate of Germany, and hence the method of planting adopted is that of close crowded planting, which of course, neccssitates continued thinning.

In Russia the Government controls, in fact "works," a large proportion of the forests of the Empire. Of natural and planted forest the Government held in 1878 what is equal to 351,780,000 acres, exclusive of Siberia, besides about 51,590,000 acres of scrub at the far north. In 1878 they received from these forests an income of 10,648,000 roubles, and expended on new plantations, and working expenses, 6,400,000, leaving a profit for the year of 4,248,000 roubles, or about $2.124,000. The extent of the plantations in Russia I cannot state. I known, however, that in three of the Steppe Governments in Southern Russia, 22,880 acres have been planted within the last eight years. There are 762 forest stations under the charge of a like number of Foresters, and as we journeyed over the prairie regions of Russia, we were continually coming across some Forestry Station wtih its surrounding plantations. Like the beet sugar factories they are scattered all over the otherwise treeless plains. Unlike the plantations in Germany the Russians have planted not only their native forms of the Silvestris pine and Norway Spruce, but largely of Pedunculata oak, ash and basswood, and somewhat of larch, birch and poplar; also in the Southern Steppe regions, yellow locust, maple, elm, honey locust and others.

HOW FORESTS CHANGE.

It is only in what novel-writers call "the depth of the primeval forest" that a fair opportunity is afforded of studying the mixed growth of our woodlands, and of observing the changes which take place as one generation of forest trees succeeds another. Such opportunities are comparatively rare in the Eastern States at present. Much of the most valuable standing timber in New England to-day is to be found upon land that has one or more times been cleared or cut over. It is therefore generally of few varieties and nearly uniform age. But if we penetrate a virgin forest beyond the devastation of the woodman's axe and the fire which follows his track, we shall find it made up of trees in every stage of growth and of every variety indigenous to that section of the country. We will find hemlocks and spruces centuries old, their branches veiled with long pendents of gray moss, towering high above the hazel and moosewood. Rarely is there the monotony of a single growth. Evergreen trees mingle with deciduous. Sunshine and shadow alternate. Now we are in a comparatively clear spot where the leaves overhead are only thick enough to fleck the ground beneath with shadow; a moment later and hardly a ray of light can penetrate the curtain overhead. Alike on the dry, stony ridges, and in the soft, moist earth of the valleys the growth is mixed. Hemlock, spruce, pine, birch, willow, maple, poplar, oak and many other varieties are intermingled with a seeming irregularity that leads us to wonder how all these varieties with so widely diverse requirements as to soil and other conditions, can flourish in such close proximity. Yet all is easily explainable if we but understand the unfailing care with which nature provides for the wants of all her children.

All through such a forest we will find at intervals the prostrate wrecks of what were once monarchs of the forest. Sometimes these have abdicated their sway by reason of their own weight and the decay of old age, sometimes their lofty heads have been laid low before the power of the nihilist wind. The latter catastrophe occurs most frequently where a thin layer—two or three feet—of rich vegetable mould overlies a coarse, loose gravel. The roots of the trees which spring up upon the rich soil above are repelled by the cold moisture of the gravel beneath and spread out for some distance around without striking deeply in. Then comes a tremendous storm, and the tall hemlock or pine is overthrown—literally torn up by the roots, bringing with them several square rods of the dark, rich earth with which they were covered. The gravelly sub-soil is thus left exposed, and there the seeds of birch, willow and maple, carried by wind, bird, or squirrel, will flourish. The dirt carried up by the roots will sink down, as the tree decays, into a knoll that will mark the death of the monarch for ages, and on it will spring up cherry, poplar and sumach. Thus, side by side, will be a marked variation in types. Not only this, but where the tree fell it swept down smaller trees and underbrush along with it, admitting warmth and light to soil which the sunbeams had not perhaps touched for centuries. In this manner the climate of that particular spot would be as much altered as the soil, and the final result might be an almost complete alteration of the character of the forest at that point. All this, too, would be accomplished by the orderly working of natural laws.

Again, on sandy plains, where the fire that destroyed the forest growth at the same time consumed the vegetable mould that gave the soil its fertility, it is curious to note nature's method of recuperating from the injury. The first step towards re-establishing a forest is made by the pitch pine or similar trees which require but little moisture. These send down their long roots, ten, twenty or thirty feet through the loose, barren gravel, to find and bring to the surface the potash and other soluble salts that are required. These elements are taken up by the tree for its own nutrition and then returned to the surface soil by the falling leaves. Thus the earth is gradually enriched and in the course of time becomes capable of supporting beech, poplar and oak again, and thus nature herself repairs the damage that the ignorance or carelessness of men inflicts upon her.

On the other hand equal provision is made for those trees which do not love the black, loamy soil, but prosper upon a poor and sandy home. Just as the surface of the plains is gradually enriched by the elements brought up from a depth, so is silicious sand from some distance below deposited upon the surface of bogs and swamps, and enables trees to thrive there which could not otherwise find a home. Everyone who has noticed with care the cultivated lands of New England has observed that where hemlock trees have fallen and decayed the soil is exceptionally poor—so much so that often, after several ploughings, the outline of the tree can be traced by the poorer growth of grass or grain, and the sorrel and coreopsis, which abhor a fertile soil, thrive there. If the decaying wood be pulverized it will be found gritty, and grains of sand can be detected with the naked eye. These are crystals of silex taken up in solution into the circulation of the tree, and on its death reverting to their crystalline form. They are evident to workers of wood because they dull the edges of their tools. Now, just this silicious matter is what is wanted by various deciduous trees, some of which cannot live upon a wet, peaty soil. Therefore, if a hemlock, spruce or pine be uprooted from such a soil, its very trunk decaying will supply a foothold for hazel, willow, and yellow and white birch. As these grow in strength they will send down roots inside the bark of the fast decaying evergreen, which, piercing the damp mould will lay firm hold upon the sandy subsoil. Finally, the trunk of the fallen tree will waste entirely away, and there the observer will find the birches growing, on soil so wet and rich that they could never have taken root there but for the death of the tree that gave them birth.—*Lumber World.*

MANAGEMENT OF BURNED FORESTS.

At the Forestry Congress in St. Paul, a paper by B. E. Vernon was read on this subject. In the management of a burnt forest, the essayist showed it is necessary to study the influence of the fire on the soil and on the standing timber before deciding upon the treatment. The vitality of the timber left standing may be injured by the scorching flames. In hardwood forests where the reproduction is expected from the stocks, as in the coppice, the reproductive power is injured in proportion to the degree of heat developed by the fire. In pineries, where reproduction can only be expected from the seed, the young seedling falls the first victim to the merciless fire. When the fire kills its original growth or causes its speedy death, the conditions of forest growth are at once changed and those alternations of species occur, which are the natural consequence of the change of their conditions. The essayist went on to shew how, in the case of a destroyed pine forest, the light-seeded species first takes the place of the old growth. Gradually, however, acorns and nuts will be deposited in the shade of the new growth, and as the light-seeded trees die off, the more valuable trees get a chance to grow and gradually occupy the lands. This new forest of hardwood trees if protected by fire will long occupy the ground, but the original pine forest will not appear again until the land, long enriched by an annual deposit of leaves, has been again stripped of its trees and ploughed by years of cultivation. The forest fire, then, which destroyed the original pine forest, also destroyed the capacity of the land to reproduce a similar crop of trees for a period which may be set down at from 50 to 100 years.

The essayist showed from this the importance of protecting the forests by dividing them into blocks, for instance, by means of avenues from two to six rods in width. Where the risk of fire is caused by the proximity of a railroad, safety belts along the endangered line are recommended. Where forests have been partially destroyed, various measures are recommended according to the character of the forest. Where the destruction of heavy timber is a total one the wisest plan is the immediate replanting of the land. Dead trees should not be allowed to remain, as they form the very best opportunities for the development of injurious insects. In forests of deciduous trees, where the heat generally is not as intense as in pine woods, it may be a cheap plan to await a new growth from the stocks and carefully nurse the more valuable species, in time filling up the bare spaces by planting shade-enduring species. In this, as in every other problem of forestry, it is impossible to prescribe any definite rules that will cover all the requirements of particular cases. A thorough elementary knowledge of the conditions of forest growth alone will enable the forester to decide what methods to adopt for the restoration of lost growths and reparation of the damage inflicted by fires on the soil and the forest.—*Lumber World.*

THE MARKET IN ENGLAND.

James Smith & Co.'s *Woods Circular and Prices Current*, dated Liverpool, 1st September, says, under the head of "Colonial woods:—" Yellow pine is arriving freely, chiefly on timber merchants' account. The only sales reported have been of wanny board, 20 inches average at 2s 3d per foot for second quality and 2s 6d to 2s 8d per foot for first class, G. F. A. Square at 21d per foot for 50 feet average. Of Newfoundland pine a cargo has been sold at 13d per foot. Red pine, of good size and quality, is in fair demand. Oak is only in moderate request, save for long lengths: a few orders are in the market, but this wood is much interfered with by the scantlings from the States. A parcel of 65 feet average, mixed quality, is reported sold at about 2s 8d per foot ex quay. Elm is in good demand, especially for prime fresh wood; large average has been sold at 2s 3d and small at 2s per foot. Ash is wanted, and has been sold at from 2s 4d to 2s 5d per foot. Hickory is quoted at from 2s 2d to 2s 6d per foot. Black Walnut continues to arrive freely from the States, and prices are lower. Birch is in fair demand, and has been sold at 17d per foot for Dalhousie, 14½ inch average, 2s per foot for Quebec, and at auction 1128 logs from Pictou were offered, and realized from 14¼d to 17½d per foot, and 394 logs from Campbelltown, realized 16 per foot. N. B. and N. S. Spruce Deals: The import has exceeded that of last year by 3333 standards, and, as there has been a smaller consumption, stocks have increased and prices have fallen, while there is a strong feeling among buyers that prices will be still lower. Sales in the early part of the month ruled at £7 2s 6d per standard for St. John, and £6 15s to £7 per standard for Miramichi, Halifax and Musquash; latterly prices have been accepted at fully 5d less per standard. By auction the cargo, ex Mark Twain, from St. John, averaged £7 os 6d per standard, and several other cargoes were only partly sold. The cargo ex Canada, from Bathurst, averaged £6 13s 7d per standard for 3 inch spruce, and £6 18s 9d for 2½ inch, the scantling bringing £6 4s 1d per standard. Yesterday by auction the cargoes, ex Director from St. John, averaged £6 19s 6d; ex Moss Glen from St.

John, £6 17s 6d, and ex Strathmore, from West Bay, £6 18s 9d per standards. Pine deals from Bathurst, ex Canada, have been sold at auction at £8 10s for 15 inches and upwards, but most of the parcel was withdrawn. Richibucto have been sold at £7 per standard, c. i. f., and Dalhousie 1sts at £8 15s, 2nd at £5 12s 6d to £7, and 3rds at £5 7s 6d to £6 10s per standard. Quebec pine deals—1st and 2nd quality are scarce and 3rds are not so readily sold, having come forward more freely; 4th quality have been sold at £7 per standard. The late sales have been at auction of 2nds at £14 15s and 3rds at £9 per standard c. i. f., and 3rd Bright at £11 2s 6d for 12 inches and upwards, and £8 15s to £9 12s 6d for 11 inches and under. Red pine deals have been sold at £8 10s to £9 per standard. Quebec staves are dull of sale and stocks of all kinds are excessive. Palings are in good demand, and spruce have been sold at 42s 6d for 45x3x3¾ inch, and at 97s 6d for 4 to 6 feet 3x1, and pine palings realized 115s for 4 to 6 feet x3x1 inch. Laths are but seldom inquired for.

READY MADE HOUSES AGAIN.

The *Northwestern Lumberman* says if there is an industry of especial consequence which is not prosecuted in the great enterprising state of Maine it is yet to be heard from. In the matter of ready-made houses the down-easters are abreast with the times. The Kennebec Framing Company is the name of a corporation in this line of business, at Fairfield, which is called the largest in existence, but pride may have got the better of judgment in the estimate of size. Regarding the enterprise the Bangor *Mining and Industrial Journal* has the following: "Dwelling houses are made like boots and shoes, in any quantity or of any size or style, and for any market in the wide world. Not long since this firm received a single order for 50 houses for Cape May, to be delivered speedily and in complete finish. These houses were not to be sheds, nor shanties, but regularly ordered dwellings, and they were made accordingly, and so delivered, and contain hundreds of occupants at this moment. An order will be received for a $50.000 hotel, or an ornate French roof cottage for a fine country estate, and these are as easily and expeditiously furnished as an ordinary boarding-house for a country village or a barn for a ranch in Kansas or Colorado. It is not to be supposed that only a coarse, rough frame is thus sent out, to be trimmed into shape on the spot where it is delivered. On the contrary, the house is complete when it leaves the factory, and as ready to go together as is a musket when it leaves the armory in Springfield; all the parts being found, even to the knobs for the doors, and the screens and shades for the doors and windows, according to specifications. Great trains of freight cars stand waiting about, and are freighted almost daily here. The refuse trimmings and edgecuttings of the lumber are carted off to a neighboring pulp mill, and there speedily turned into material for paper, or other products. Machinery for almost every conceivable use in connection with wood is at hand, and house materials, of any kind, or size, or shape, seem to drop out like meal from a hopper. In a recent instance, where a large building was furnished for a southern order, the parts were thus made, and when put together in the city where the building is now standing its length was found to vary not the eighth of an inch from the original specifications, although its length on the front numbered hundreds of feet. Every inch of this building, from the sill to the last shingle, was sent ready prepared from the factory, and 'set up' as readily and almost as quickly as a nail cask."

THE WOOD-LOT IN WINTER.

A few acres in trees is one of the most valuable of a farmer's possessions; yet no part of the farm is so mistreated, if not utterly neglected. Aside from the fuel the wood-lot affords, it is both a great saving and a great convenience to have a stick of ash, oak, or hickory on hand, to repair a breakdown, or to build some kind of a rack or other appliance. As a general thing such timber as one needs is cut of, without any reference to what is left. By a proper selection in cutting, and the encouragement of the young growth, the wood-lot will not only continue to give a supply indefinitely, but even increase in value. A beginning, and often the whole, of the improvement of the wood-lot, is usually to send a man or two to "brush it", or clean away the underbrush. This is a great mistake. The average laborer will cut down everything; fine young trees, five or six years old, go into the heap with young poplars, and the soft underbrush. The first point in the management of the wood-lot is to provide for its continuance, and generally there are young trees in abundance, ready to grow on as soon as given a chance. In the bracing winter mornings one can find no more genial and profitable exercise than in the wood-lot. Hardwood and useful young trees should not have to struggle with a mass of useless brush, and a judicious clearing up may well be the first step. In timber, we need a clean, straight, gradually tapering and thoroughly sound trunk. In the dense forest nature provides this. The trees are so crowded that they grow only at the upper branches. The lower branches, while young, are starved out and perish, the wound soon healing over are out of sight. In our open wood-lots, the trees have often large heads and the growth that should be forming the trunk is scattered over a great number of useless branches. Only general rules can be given in pruning neglected timber-trees; the naked trunk, according to age, should be from one-third to one-half the whole height of the tree; hence some of the lower branches may need to be cut away. All the branches are to to so shortened in or cut back as to give the head an oval or egg-shaped outline. This may sometimes remove half of the head, but its good effects will be seen in a few years. In removing branches, leave no projecting stub on the timber, and cover all large wounds with coal-tar. Whatsoever works in this manner thoughtfully can not go far astray.—*Ex.*

TIMBER FOR HUBS.

The *Hub* gives the following advice regarding the getting out and preparing of timber for wagon hubs:

"Cut the hub timber in months when the sap is down and the bark is tight. Cut the ordinary butt lengths, say four or five feet; remove the outer bark or ross, from the center of the sticks, leaving a covering of rough bark at the extreme ends. Sticks prepared in this manner should be cross-piled under dry sheds, where there is a good circulation of air. After drying in this manner for nine months or one year, according to sizes, the sticks can then be sawed into hub-blocks, which have each end dipped into an elastic cement, made by melting resin to which is added sufficient grease to temper it. A hole should also be bored through the heart of each block. Prepared in this manner they will soon finish seasoning, or they can be forced in heated rooms, without danger from checking. Steaming the blocks to hasten the seasoning is practiced to a considerable extent, and, many claim, without injury to the fiber of the wood; but we not recommend it, as some of the substance is dissolved by this process, and as the hub plays such an important part in the wheel it is necessary to preserve all the natural qualities of the timber.

The Big Raft.

The *Lumberman's Gazette* says the big raft towed from St. John, N. B., to New York, of which the particulars were given last week, contained more timber than we estimated. It consisted mainly of piling and contained 3,300,000 feet, It was therefore entitled to more respect then was paid to it. Some 75 tons of chains were used in binding the timbers together. A good saving in the cost of transportation was made, but the risk will probably stand in the way of the experiment being often repeated.

If you would escape the ravages of that scourge of the summer season, Cholera Morbus, keep Dr. Fowler's Extract of Wild Strawberry at hand for use. In that and all other forms of Bowel Complaint it is infallible.

THERE is no excuse for suffering from Headache, Constipation and all the wearying train of symptoms of a disordered liver, when Burdock Blood Bitters is an unfailing remedy, and only costs One Dollar a bottle. Why suffer on without a trial? 25,000 bottles sold during the last three months, with almost universal satisfaction.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

$500 Reward!

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C WEST & CO., "The Pill Makers," 81 & 83 King St East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. ORMOND & WALSH, sole authorized Agents for Peterborough Ont. w4dd12l22

CONSUMPTION
POSITIVELY CURED.
All sufferers from this disease that are anxious to be cured should try **Dr. Kissner's Celebrated Consumption Powders.** These powders are the only preparation known that will cure consumption and all diseases of the **Throat and Lungs**—indeed, so strong is our faith in them, and also to convince you that they are no humbug, we will forward to every sufferer, by mail, post paid, **a Free Trial Box.**
We don't want your money until you are perfectly satisfied of their curative powers. If your life is worth saving, don't delay in giving these **Powders** a trial, as they will surely cure you.
Price for large box $3.00, sent to any part of the United States or Canada, by mail, on receipt of price. Address

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion.

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., OCT. 1, 1883.

IT has been decided by the United States Courts that hemlock bark is not dutiable under the new tariff.

SPRUCE timber cannot be all extinct in Maine, as over $130,000 worth of spruce gum was produced in the Pine Tree state last year.

THE late log jam in Wolf river, above the Bay boom, is said to have cost the owners $5,000 in damages for the stoppage of navigation.

LUMBER is fast going out of the piling grounds at the Chaudiere. Not ten per cent of the American barges there last month remain there now.

LARGE gangs of raftsmen are being despatched daily for the lumber shantics, During the past week about 1,000 have left Ottawa and suburbs.

BROWNLEE & Co, of Detroit, have obtained a contract to furnish 5,000 poles to the new postal telegraph line between Detroit and St. Louis, Michigan.

CANAL lumber freights from Buffalo and Tonawanda to Albany last week were $2.40 a thousand, and to New York $3—the highest points reached this season.

F. R. HULBERT is getting out 600 cords of poplar on Drummond's island, Lake Huron, for a paper firm at Niagara Falls. He has 4,000,000 feet of pine on the Island to cut.

THE Ottawa *Citizen* says that the shareholders of the Algoma Lumber Co. have met in that city for organization. The company is composed of some of the most energetic lumbermen in the Ottawa Valley.

ADVICES for the week euding Sept. 15, show that the sawn lumber market has taken a decided change for the better. Several prominent New York merchants have been in Ottawa and the purchases are said to have aggregated eight millions of feet, principally comprised of the higher grades. An advance of 25 cents per thousand feet is quoted in these qualities.

EXTENSIVE forest fires are reported as having raged in eastern and northern Maine, in New Jersey, Massachusetts, Maryland and Virginia. Michigan is getting into condition for a visitation, and special precaution should be exercised.

THE receipts of lumber at San Francisco for July were 36,528,184 feet, of which 13,367,960 feet were redwood, 20,813,498 pine, 1,694,002 spruce, 580,517 cedar, and 72,207 hardwood. The amount of shingles received for the month was 14,362,500, and of lath 4,011,600.

A NEW method of binding shingles has been invented by Wm. Newson, of Manistee. It consists in the use of a wire of the same length as the common brand, chisel-pointed at each end, and bent at an angle of about 20 degrees, and notched to prevent drawing out.

A QUEBEC correspondent says:—Messrs. Dobell & Co., of Quebec, have purchased from Messrs. Barnard & Mackay, of Pembroke, a raft from Nipissing, white pine, comprising some 240,000 feet. The price is believed to be about 29½ cents, but the actual cost has not transpired.

THE Brandon *Mail* of Sept. 18th, says:—Mr. McLaren and Mr. Chistie, lumber dealers of this city, to-day purchased the entire old season's cut of spruce lumber from Shields & Co's saw mill, consisting of over a million feet. The price paid was in the neighborhood of $50,000.

AN Ottawa despatch says:—Eighty-four men have left for Mackinaw to work for an American lumber company. They were hired for $16 per month and board. Another gang will leave in a day or two for the Diamond Match Company, at wages averaging from $18 to $20 per month.

IN the three rafts to be towed from French Bay for the Collins Bay Rafting Company, there is 480,000 feet of timber, or equal to 30 vessel loads. If the tow schome succeeds, vessels will suffer. In each raft thore is used forty tons of chain, so that they are able to stand tossing about.—*Mail.*

THE publishers of the *Farm, Field and Fireside*, Chicago, are meeting with great success in securing subscribers to their publication. In addition to furnishing an excellent paper at the low price of 50 cents for six months, they propose to distribute $10,000 in presents to their readers. See their announcement in advertising columns.

WHEN Cobb & Mitchell, of Cadillac, Mich., received a telegraphic order for timber for a temporary bridge on the Grand Rapids & Indiana railroad, they stopped other work, sawed 30,000 feet for the bridge, and loaded the lumber on cars in one hour and 30 minutes. That was sawing "on order" and doing it quickly.

ADOLPH LEITELT, of Grand Rapids, Mich., is president of a new corporation that owns Cockburn island, at the head of Lake Superior. The name of the company is the Cockburn Island Timber Company. About forty men will be employed on the island the coming season, getting out telegraph poles, ties and pulp wood.

BRY & HORN, of Frankfort, Ky., have since last March shipped about 2,500 walnut logs to Berlin, Germany, for manufacture into veneers. The logs contained about 680,000 feet of an average value of $55, and amounting to about $37,000. The cost of transportation amounted to $15,000 on the lot. The rate from Frankfort to New York is $85 a car.

THE steambarge Oakland, lumber laden and bound from Bay City to Erie, Pa,, on September 17 water logged in Lake Erie, during a storm, and foundered, She had on board 350,000 feet of lumber belonging to Carroll Brothers, of Erie. All but four of the crew took to a boat and reached Connaut harbor in safety. The men that preferred to take their chances with the wreck were lost. The Oakland was one of the oldest boats on the lake and was valued at $10,000.

ALEX. MCKAY, of Ottawa, Ontario, and a party of timber lookers have been into the Lake Winnipeg region, particularly in the Bearing river district. They report plenty of spruce. but were surprised at the small amount pine found there. Mr. McKay has a 50-mile limit on Bearing river. The stream is rapid and rocky, but can be driven.

THE *Commercial Bulletin*, of New York, predicts that it will not be long before the lumber business of the South will amount to $100,000,000 per annum. The growing trade with the North in the yellow pine lumber alone sustains the calculation, and with all the other varieties of timber there that will surely be drawn upon heavily, the *Bulletin* has, we think, made a safe prediction.

THE *Northwestern Lumberman* says:—At the state land sale at Madison, Wis., lately, the average price realized was $3.60 an acre. Lumbermen of the Chippewa Valley formed a pool and bought a large amount of good land in Sawyer county, and it is said that they will clear $50,000 by the deal. The greater portion of the lands sold in Ashland, Bayfield, Chippewa, Douglas, Lincoln, Price, Sawyer and Taylor counties.

R. A. LABREE, formerly of Gardiner, Me., put in a saw mill at Jacksonville, Fla., about two years since, and added a box-cutting machine, and finally a new boiler and engine. During 1882 he shipped $60,000 worth of boxes to parties along the river. It was found difficult to obtain steamboats for this purpose, and after suffering inconvenience for two years Mr. Labree has built a boat of his own, that can carry 10,000 boxes—the daily product of his mill—and run near enough to the shore to discharge the cargo in shallow water without a dock.

THE McKellar correspondent of the Parry Sound *North Star* says:—Messrs. S. & J. Armstrong are making preparations for an extensive seasons work in the lumber woods this winter. Wm. Little has already started one camp for this firm, and they intend starting four other camps immediately. They have contracted with the Parry Sound Lumber Company to get out and drive eight million feet. They have also a contract to get out and drive two million feet for the Midland and North Shore Lumber Co. This will give employment to a large number of men and horses.

PRESERVATION OF FORESTS.

At the instance of the Government of the Province of Ontario, an exhaustive report upon the necessity of preservation and replanting forest, has just been compiled by Mr. R. W. Phipps, of Toronto. The subject is one in which increasing interest is being shown in the Dominion, and the report in question deals with it very comprehensively. The writer first calls attention to the vast wealth the Province originally possessed in its forests. When the paddles of the Frenchmen first broke the waters of the Toronto bay, he remarks, Ontario, from the Detroit to the Ottawa, was under the roof of the forest, and contained, in the opinion of one of the best qualified judges of the United States, perhaps the most valuable masses of timber which ever existed in a region of its size. Pine, maple, beech, ash, and white oak were possibly most prominent, but hickory, hemlock, ironwood, and the silver birch were scarcely less abundant. The early settlers, however, directly after arrival, began the work of destruction with a ruthless hand. They required the land, and there was no demand for timber. Hence square mile after square mile of forest was destroyed dy fire—a process which went on for years, and which has been followed up by the operations of the lumbermen. The result is that the cultivated portions of Ontario will speedily become almost denuded of trees, while the lumbermen are compelled now to go great distances for the superior quality of pine which they used to get much nearer home a few years ago. Apart from any considerations as to the future of the lumber trade which it may suggest, this state of things is obviously of much significance to the agriculturists; and it is chiefly this aspect of the matter which is discussed in Mr. Phipp's report. The consequences are, indeed, likely to prove so serious that, in the opinion of the writer, the whole of Ontario is in great danger of heavy loss, unless action be taken in time by the authorities. At the close of a somewhat elaborated enquiry, the report recommends the preservation of the higher lands in forest, and the aquisition and replanting of such lands where they have been already cleared; economy in utilization of the great forest in the north-eastern and north-western portions of the Province; the adoption of adequate measures for protection against forest fires; and lastly. the planting of trees, as "wind-breaks," on highways and the dividing lines of farms. By these means it is thought the climatic influence of the forest may be preserved, and the lumber supply &c. maintained in perpetuity. What action the Ontario Government may take on the strength of the recommendations is not yet known, but their appreciation of the importance of the subject is shown by their authorizing the gratuitous distribution of a large number of copies of the report among the farmers of the Province.—*London Times.*

FOREST DENUDATION.

The effect of the operations of the lumbermen in the woods upon the rainfall, etc., is often discussed as though the writers believed that in lumbering operations the forests were utterly exterminated, all the trees being felled and the underbrush cut leaving the land a barren Sahara. This, of course, is an absurd view, for it is seldom that more than one-half the trees on the best tracts are worth cutting, and trees are not felled for pastime or because the loggers have nothing else to do. A great cry has been raised against the lumbermen operating in the forests of the Adirondacks, and dire results have been predicted. A tourist, however, exposes the absurdity of the fears, showing that the outcry is void of good sense and knowledge of the real condition there. He says truly that only pine, spruce and cedar are now cut, because the coniferous woods only will float down the streams to the mills, and no logs of less than 27 to 30 inches in circumference are marketable. The result is that the lumbermen takes, on the average, 10 or 15 of the largest and most mature trees from an acre. Is it not better that those mature trees should be utilized by the present generation of men, than that they should fall and decay uselessly, except to generations of trees that may revel in their elements a hundred or a thousand years hence? When this subject was discussed in the New York legislature last winter, a trustworthy expert stated that if he could take the whole assembly over the Adirondack region in a balloon, not one in fifty of the members could tell where the lumbermen had cut all the saleable trees and where he had not. He was right. None but an expert, and one, too, who had viewed the premises before the despoliation could tell; and then only by missing the black tops of the spruces.—*Ex.*

A LUMBER CENTRE.

We find the following in the Chicago *Northwestern Lumberman*:—The *Lumberman* has heretofore called attention to Selkirk, or East Selkirk, Manitoba, as probable to be the most important lumber manufacturing and market centre in the Canadian Northwest. It has based this prophecy on its situation on the Red River of the North, a few miles from its outlet into Lake Winuipeg. Thus it is the gateway through which must pass the untold millions of feet of lumber and timber yet to be derived from the forests that hover along the hundreds of miles of shore inclosing the great northern lake and the lower Saskatchewan. Cedar, and other lakes, and rivers tributary to the major waters, The vast prairie territory to the west and south makes it necessary for this wealth of timber in the Lake Winnipeg region to be manufactured and distributed: it will be an inevitable result of the settlement of the country. We have received a pamphlet from officials of East Selkirk that sets forth some features of the manifest destiny of that point, which include the lumber business. The shipping interests of the place are mentioned as follows: At Colville landing. the port of East Selkirk, the wharves are usually piled up be-

yond their capacity with cordwood, shingles, lath, ties, and other products of the extensive mills of Lake Winnipeg, while the spacious warehouses of the Hudson Bay Company are all filled to overflowing with goods ready to ship to Prince Albert, Edmonton, and other points on the Saskatchewan river, as well as to various ports on Lake Winnipeg and Lake Manitoba. The Red River at East Selkirk is wide and spacious, entering Lake Winnipeg a few miles below, and here is the best harbor on the river, it being commodious and accessible. Nineteen steamers now run out of this harbor to the various ports on the navigable waters to the north and west. East Selkirk is also now quite a railroad centre, having a line of the Canadian Pacific running to Rat Portage and Thunder Bay, and a branch from Winnipeg, and another branch from Winnipeg on the west side of the River is being built. The facilities for reaching Selkirk thus being furnished by the Canadian Pacific Company show how important that corporation regards it as a shipping centre. It is needless to say that the citizens of the place have great expectations, and already are comparing their destiny with that of Chicago, the criterion of all modern urban growth. In this case, however, they do not reckon wholly without reason, as other places have done. If their locality did not hug the north pole quite so snugly their would be no question but that Selkirk is a future great city.

KEEWATIN DISTRICT.

From our own Correspondent.

VERMILLION BAY, Sept, 10.—This lively little village was further enlivened last week by the hum of the new circular mill of Messrs. McDonald & Shields, which then commenced regular operation on several acres of logs lying in this beautiful bay of Eagle Lake. There is about 3,000,000 feet of stock, nine-tenths of which is red pine of excellent quality. The engine and machinery is from the shops of Wm. Hamilton & Co., of your good town of Peterborough, and it works admirably. The amount of logs obtainable at this point not being large and being generally of moderate size, business economy suggested a mill in character with its work. A 54 inch saw, of number 8 guage, is run with a pony carriage of a new and improved pattern with steam fud engine, 16x20, supplied with steam by two 4x14 feet boilers. The cutting capacity is limited only by the strength of the saws, a No. 7 guage would be better in this firm red pine. The convenience of the carriage makes up for the slight deficiency of the saw. One man performs all the operations on it with ease, and so quickly that generally not a second is lost in rolling on or canting. Though this mill is well arranged for cutting and disposing of lumber for the present, at least it is defec ive in regard to the disposition of the refuse. Complete machinery for this purpose is a necessity in this country of high wages, and is the true economy.

The mills at Keewatin village are deficient in their supply of water, the lakes being unusually low. The Winnipeg Lumber Co.'s new mill at Rat Portage is not exp ected to start this season. Their two mills in Winnipeg have lately started on the stock carried over from last season, their new cut of logs having not yet arrived.

Mr. Sprauge's mill at Winnipeg lately cut 51,000 feet in 11 hours, at one time of the day 1,100 feet was cut in six minutes, no doubt the logs were selected, but this is good cutting for a single circular in red pine and is another score for Wm. Hamilton's manufacture.

Mr. Wm. Tait, formerly of Gravenhurst, keeps the Sutherland mill active throughout the season. Building operations have slightly improved and the labor market is better equalized than formerly.

HEMLOCK AND PINE.

The Warsaw Wis., Correspondent of the *Northwestern Lumberman* says:—There are other important facts in connection with the question of the timber supply to be considered. Hemlock, the coming lumber, grows in such abundance along the Wisconsin river as to be beyond estimate, and its quality is of great excellence. There are those who believe there is nothing so suitable for piece stuff as hemlock. Until quite recently but little attention was paid to hemlock, but latterly certain operators have put in 1,000,000 feet, or thereabouts, with their other logs, and they will gradually increase the amount. To what do these facts point? That while the rate of lumber production is very certain to increase year by year, the proportionate amount of pine consumed is likely to decrease in a few years. The nearer the owners of stumpage and mills approach the end of pine, the greater will be the effort, it is reasonable to suppose, to husband the resources. Necessarily a continuing demand must spring up for hemlock, and as much as possible of that timber will finally be icut to spin out the pine. Why then, should there not be considerable fair pinc to cut 20, or even 25 years from this date?

In discussing the life of the pinc supply theorists usually take the ground that the timber will be cut at an increased rate so long as a tree stands, and it might be inferred that the haste of the manufacturers to saw the last log would be so great and such their blind recklessness, that on the last season of the waning supply, they would prepare to put in twice the amount of pine that was left standing. There is no shrewder class of men than the lumberman, and they may be relied upon to look out for their own interests. When the pine is really on its last legs no one will discover it sooner than the men who own it. There seems to be reckless consumption now, but the fact is there is so much pine that the manufacturers have not begun to be scared. There is reason to believe that the efforts at annihilating pine will be tempered with moderation as fast as wisdom may suggest. No one can say at what time the Wisconsin forests will be bare of pine, and it is to be expected that certain parties will reserve virgin tracts for a number of years, not allowing the timber to be cut, and holding it for its future value, so that more or less good pine will be left for other generations. Neither is all the good pine owned by the mill men. A Stevens Point man having 250,000,000 feet is one of the heaviest owners, and the larger part of the timber is said to be owned by parties outside the state.

Burglaries.

The Midland *Free Press* of Sept. says on Sunday morning last, the office of the B. C. L. and T. Co., was entered, and the books of the Company were taken. A reward of $10 is offered for their recovery. On Sunday night the station was entered by burglars, but before they could secure anything valuable they were frightened off.

Forestry Exhibition.

An Industrial Forestry Exhibition is to be held at Edinburgh next year. The *Courant* says the promoters are making rapid progress with their arrangements. The programme has been completed and the classification of exhibits has been arranged. Promises of contributions exceed the most sanguine expectations. Canada makes a good display at the Fisheries Exhibition in London. No doubt the Dominion will be represented at the Forestry Exhibition.

LUMBER

Shingles, Doors, Sash, Flooring, &c.,

WANTED,

STATE QUANTITIES AND PRICE TO

SHORE & DAVIS,

Head Office, 514 Maine Street, **Winnipeg, Man.**

FOR SALE.

SPALT MACHINE

For saving Lumber refuse, second hand, but all complete and in good order, taken out to replace one of greater capacity. Address,—

THE RATHBUN COMPANY,

6l19 DESERONTO, Ont.

FOR SALE.

A LATH TRIMMER,

NEW, and in good order, will be sold Cheap. Address,

THE RATHBUN COMPANY,

6L19 Deseronto, Ont

MAPLE TIMBER.

Parties having quantities of first-class HARD MAPLE that they can cut to sizes as furnished, please communicate with us.

W. H. BROWN & Co.,

4L18 INGERSOLL, Ont.

McCraken, Gall & Co.,

WHOLESALE AND RETAIL

LUMBER MERCHANTS

And MANUFACTURERS,

☞Dealers in WALNUT, BUTTERNUT, CHERRY, CHESTNUT, ASH, OAK, WHITEWOOD, and all kinds of Hardwood and Pine Lumber. PICTURE BACKING, HOLLY, EBONY, LIGNUM-VITÆ, RED CEDAR, &c, American and French VENEERS.

Orders for Lumber and all kinds of Factory Work promptly attended to. Lumber Kiln dried to order.

Yard: Cor. Wellington & Strachan Aves.

FACTORY: Corner Soho and Phœbe Streets.

OFFICE: 39 Adelaide Street East, (First Floor, nearly opposite the Post Office.

L5 TORONTO, ONT. 1y

SAW MILLS

AND

TIMBER LIMITS

WITH

Logs, Lumber, Store Goods, &c

FOR SALE

In the District of Algoma, Ont.

Eighty-Five Square Miles (54,400 Acres) of Limits, Good Pine, First-Class Water Power, Large New Water Mill, Steam Mill, Store and Dwellings.

☞Canada Pacific Railway now running through part of the property.

For full particulars address:—

WILLIAMS & MURRAY,

L7tf GODERICH, ONT.

AXES

And LUMBERMEN'S

HARDWARE

Broad, Scoring, Blocking, Timber and Chopping AXES,

(Of Superior Shape and Quality.)

Chalk Lines, Rassing Knives, Timber Guages. Cross-Cut Saws, Files, Sleighshoe Steel, Chains, and general line of HARDWARE at the LOWEST PRICES.

☞ SOLE AGENT IN CANADA for the Sale of the following CELEBRATED AXES:—B-4-ANY, RED MANN, and WETMORE'S HAND MADE, warranted. ☜The Best in the World.☞

GEORGE STETHEM

IMPORTER OF HARDWARE,

PETERBOROUGH, ONTARIO.

WATER POWER

TO LEASE.

THE UNDERSIGNED having largely extended their raceway at Lakefield, are desirous of corresponding with parties who wish to go into manufacturing, and they are prepared to sell or lease water power on the most favorable terms, or would erect buildings of any size suitable for factories.

R. & G. STRICKLAND

1486 LAKEFIELD, ONT. w1519

SHINGLE MILL MACHINERY.

Parties requiring New Machinery for Shingle Mills, will do well to communicate with us before purchasing.

THE RATHBUN COMPANY,

6L19 DESERONTO, Ont.

How Many Miles Do You Drive!

The

ODOMETER

Will Tell.

This instrument is no larger than a watch It tells the exact number of miles driven to the 1-100th part of a mile; counts up to 1,000 miles; water and dust tight; always in order; saves horses from being over-driven; is easily attached to the wheel of a **Buggy, Carriage, Sulky, Waggon, Road Cart, Sulky Plough, Reaper, Mower,** or other vehicle. Invaluable to LIVERYMEN, PLEASURE DRIVERS, PHYSICIANS, FARMERS, SURVEYORS, DRAYMEN, EXPRESSMEN, STAGE OWNERS, &c. Price only **$5.00** each, one-third the price of any other Odometer. When ordering give diameter of the wheel. Sent by mail on receipt of price, post paid. Address

McDONNELL ODOMETER CO.,

2 North La Salle St., Chicago.

☞Send for Circular. 1s10

BARRON'S

LUMBER DRYER

J. J. CURRAN, Inventor.

CURRAN & WOLFF, Proprietors for the U.S

39 & 41, Franklin Street, Chicago.

A. F. BARRON,

Patentee and Builder for the Dominion of Canada,

Office, 9, Corn Exchange,

MONTREAL,

Send for descriptive Pamphlet containing list of parties using this Dry Kiln in the United States.

Dryers built and in working order by the following Companies:

James Shearer, Saw and Planing Mill, Montreal; James Crossen, (car builder), Cobourg, Ont.; Canada Pacific R.R., Perth, Ont.; Kingston Car Works, Kingston, Ont.; Pike & Richardson (Cooperage Co.), Chatham, Ont.; Essery Manufacturing Co., Sash, Doors, Blinds, Mouldings, &c., Toronto, Ont.; Grand Trunk R.R., London, Ont.; Steinhoff, Schnoor & Co., Staves and Heading, Wallaceburg, Ont, 12l1

THE FORESTS AND THEIR MANAGEMENT.

We take the following from Mr. R. W. Phipps' report to the Ontario Government :

FRANCE.

The administration of forests in France is entrusted to the Ministry of Finance, and the head of the Department is the Director-General, assisted by two administrators, one charged with the management of the forests and the sale of the products, the other with the police of the forests and the forest laws. In the departments there are thirty-two conservaters, each in charge of one or more departments, according to the extent of the forests in each. The immediate supervision is entrusted to inspectors, who are assisted by sub-inspectors and *gardes-generaux*, who live near, and personally superintend all operations and work of the forest guards. The brigadiers and forest guards live in houses in the forest and serve as a police over a certain range. They are required to be present at all operations, and to go round their ranges at least once a day to report any violation of forest law that may take place.

The saw-mills in the forests are usually owned by the Government and hired at a certain rate to the wood merchants, who buy the cuttings. The timber is allowed to be sawn up before it is inspected and marked by the forest guard under the superintendence of an inspector.

The forests under the management of the bureau are (State and Commune) about 7,500,000 acres. There were nearly a million more, which went with Alsace and Lorraine to Germany. Also, there are in France 15,000,000 acres of private forests.

Of schools of forestry, the French have, at Nancy, one of the best in the world, where pupils are instructed both experimentally and theoretically in all forest learning, the collegiate home studies being constantly varied by excursions of pupils, under charge of professors, to those forests where, at the time, most can be learned. Proficiency in these schools forms, of course, a strong recommendation to future advancement in the Government or private forest service. For admission to the school candidates must bring a letter of authorization from the Director-General of Forests, which can only be obtained by those from nineteen to twenty-two, without infirmities, and having a diploma of Bachelor of Letters, or attainments in classical studies to warrant such diploma. They must also have an income of $300 per annum, or a pledge from friends to provide it, and $120 afterwards till employed as garde-general on active duty.

In the difficulties which have hindered the efforts being made, especially in America, to preserve a due amount of forest, one of the most formidable has been the disinclination to interfere with private rights. It will be of service in Canada in this matter to notice how summarily, in France, this matter has been managed. I will therefore quote the principles of law upon which the forest code of France is founded, as stated with great precision by Professor Macarel (a writer deservedly of the highest estimation) in his "*Cours de Droit Administratif.*" As they embrace views applicable to other countries under like necessities—being in fact an extension of the right of eminent domain, or that maxim of Roman law, *salus populi suprema lex*—they will be especially germane to our purpose. He says :—

"*Restrictions Implied in the Free Enjoyment of the Soil.*"

"As to the woods and forests :

"The preservation of forests is one of the first interests of society, and consequently one of the first duties of Government. It is not alone from the wealth which they offer that we may judge. Their existence is of itself of incalculable benefit, as well in the protection and feeding of the springs and rivers as in their prevention of the washing away of the soil from mountains, and in the beneficial influence which they exert upon the atmosphere.

"Large forests deaden and break the force of heavy winds that beat out the seeds and injure the growth of plants ; they form reservoirs of moisture ; they shelter the growth of the fields ; and upon hillsides, where the rainwaters, checked in their descent by the thousand obstacles they present by their roots and by the trunks of trees, have time to filter into the soil and only find their way by slow degrees to the rivers. They regulate, in a certain degree, the flow of the waters and the hygrometrical condition of the atmosphere, and their destruction accordingly increases the duration of droughts and give rise to the injuries of inundations, which denude the face of the mountains.

"Penetrated with these truths, legislators have in all ages made the preservation of forests an object of special solicitude.

"Unfortunately, private interests—that is to say, the action of those who do not directly feel the power of the Government—are often opposed to this great national interest, and the laws framed for protection are often powerless.

"In France, the ordinances prior to the revolution carried too far the restrictions imposed on private owners. The new regulations fell into the opposite extreme, and allowed the proprietors free and absolute liberty to dispose of their woods.

"A large destruction followed this imprudent translation from excess of restraint to excess of liberty. The proprietors abused this unwonted freedom, and clearings multiplied indefinitely, without distinction as to the places where they were made, so that in many localities the rushing down of the denuded soil and the deforesting of mountains caused the soil needed for vegetation to disappear and left the rocks naked. The rise in the price of wood and the easy and certain resources offered to proprietors in the clearing of a planted tract, when compared with the remote and eventual advantanges offered in their preservation ; the hope of compensation, and, beyond this, the advantages, in one way and another, of cultivation, may be recognized as among the causes which sufficiently explain the inducements offered to many of these proprietors, which led them to undertake these clearings."

I would here notice that this is precisely what we have been doing Canada, and that the ill effects which followed in France will surely in no long time be felt in Ontario. They are already felt ; we have not the climate we had, nor the favouring moisture when most needed. Yet we could get along as we are. But that is just what is impossible. We must, while there is time, use some means of averting the evil, or we shall certainly become much worse off than we are. M. Macarel goes on :—

"At length, this progressive deforesting of the soil of France, joined with the incessant need of firewood, and the demand for wood by manufactories and ships, have, during forty years, made sad havoc with our forest wealth.

"A renewal of the ancient prohibitions by the law of 9 Floreal, year XI., was deemed necessary to oppose this excessive clearing of woods by private owners. It was accordingly decreed that, during the twenty-five years dating from the date of the promulgation, no wood should be cut or carried off unless six months' notice had been given by the proprietor to the forest conservator of the arrondissement of the district in which the wood was located. Within this time the forest administration might object to the clearing of the wood, and was charged to refer the question before the end of this time to the Minister of Finance, upon whose report the Government might definitely decide within the same time. It therefore resulted in this, that to make a clearing an authorization precedent by the administration was necessary, and that if the administration thought proper not to grant this, the proprietor was restrained against cutting.

"Thus, according to this branch of agricultural industry, the general law of France is, that owners are free to vary, within certain limits, the cultivation and working of their lands ; but, as to woods and forests, the public interests demand that individuals shall not be free to clear them from the soil whenever they please. From hence it follows, that the administration has a right to pronounce its prohibition against clearing whenever it is deemed that the public interests require that this be done."

The penalties for clearing when forbidden are, I may state, a fine of about $200 per acre, and compulsory replanting within three years. This law was, I conceive, in full force in 1874, as this quotation forms a part of a report to the U. S. Congress of that year. It probably is in force still, and justly so. The voice of the people, not of solitary citizens, should decide in so important a matter as deforestry a country.

The French Government have, at great expense, replanted vast and almost barren districts ; they have also established great forests along the sea shore where formerly the sand threatened to destroy whole departments, and have averted the evil. But the chief means is the prohibition of clearing ; for it is the interest of an owner who does not clear to plant and improve his forest, so as to receive an increased income from the trees arriving at maturity in increased numbers yearly.

SWITZERLAND.

In no country in Europe has the waste of forests been more rapid or destructive than in Switzerland, and in none, perhaps, has this improvidence been followed by more disastrous results. The woods, being considered common property, were uprooted ; and the soil on the mountains being exposed to the wash of the rains, was rapidly carried away, leaving broad areas of naked rock, from which the water would at once sweep down the valleys in sudden and destructive inundations. The autumn of 1868 is memorable on account of these floods.

Public attention has, however, been thoroughly awakened, and active measures are in progress to remedy, as far as may be, these evils. The cantons which have charge of these operations have for some time, at great expense, been constructing works to control the streams, and planting trees wherever practicable.

I would here remark that this is a very difficult matter compared with what it might have been. It is easy to preserve a forest on a hillside, but the soil once washed to the rock, it is another matter. I could point out places in Ontario where splendid forests stood, and yet might have stood, now for many miles

"White rock and gray rock,
Barren and bare."

The matter is now in Switzerland taken into the hands of the national Government, and the following article gives the idea :—

"Art. XXII.—The Federal Union of Switzerland has the right of supervising structures for the protection of water courses, and of the forest police in mountain regions. It will assist in protective structures for water courses, and in the planting of forests at their sources. It will enact the requisite regulations for maintaining these works and the forests now existing."

RUSSIA.

In this vast empire, where, as in the United States, we have been accustomed to believe the forest in interminable, and where, in fact, the amount of woodland in the northern two-thirds is more than twice as great in proportion to its area as in the United States, the Government has turned its attention energetically to the subject of forestry, and has undertaken to establish by regulation conservative measures. As yet, private persons and establishments owning forests enjoy the absolute right to cut and clear at will. But these do not own nearly so much as the Government, which has about three hundred and thirty million acres of wood ; the others holding about one hundred and fifty. About forty per cent. of the country (Russia in Europe) is timbered. I must remark that this amount, after so long an occupation, shows that the timber has been taken some care of already. For the immense Government woods, they have been placed under the care of the Minister of Public Domains, who has a director of the Forest Department, and the organization of the service is very complete. For the purpose of fitting young men for the duties of forest agents and agriculturists, either for the Government service or upon private estates, two special schools of agriculture and forestry have been established—once at St. Petersburg, and one near Moscow. The course of instruction extends through three or four years, and the schools are placed near forests, where every detail is illustrated. There is also another forest school at Lissino, of the second grade, where the course is very practical

SWEDEN.

In 1859 a bureau of Forest Administration was created. Forest regulations, however, extend back to 1647, and even before that, private owners were required to plant and protect from cattle two trees for each one cut.

In 1868 a commission was appointed, under the direction of Mr. E. V. Alinquist, to enquire into the need of further legislation, and in December, 1870, he submitted a report with a bill, making 392 pages, besides numerous tables.

One clause in the reported bill is a compulsory feature, which, though less stringent, is in the spirit of the enactments now in force in most of the countries of continental Europe, namely, forbidding trees to be cut for sale smaller than eleven inches at the butt, or eight inches sixteen Swedish feet therefrom.

(*To be continued.*)

PREPARING LUMBER FOR MARKET.

A correspondent of the *Southern Lumberman*, who evidently understands his business, has the following to say to saw mill men who cut lumber for the eastern market :

We know that trade is dull. We are told of it often enough, goodness knows ; but for all that, even if the market is dull, good stock, *properly prepared*, will always bring a good price. Our saw mill men, and dealers, too, are too much in the habit of shipping poor stock to the eastern market, and, if they have nearly a car-load of passably fair lumber, they will fill up by putting in a few hundred feet of stuff containing loose knots, or heart on one side and various other defects, thinking that, as the greater part of the car is *good*, that the poor will be accepted. Mistaken idea ; it will be thrown out, and if they receive any pay for it at all, the amount will be less than the cost of transportation, and thus they lessen the profits on their really fair lumber.

There is no use talking ; this matter of properly preparing lumber for the market is an all-important one, and there should be a thorough canvas of the matter between the mill men and the manufacturers. It will result in much good to both.

Let me again say to the mill men : If you expect to realize a good price for your ash and walnut lumber, do not fail to see that it is properly manufactured before it leaves the mill. It must have square edges ; sap taken off ; leave no boards with hearts in them ; trim the ends off square, and to even lengths, and see that it is not split by careless handling ; and bear in mind also that *thick* lumber, one and a half inches and over, must be more nearly clear than thinner boards, if they pass into the grades of firsts and seconds. If you are cutting ash—4 inches thick—do not imagine for a moment that a board with heart showing on one side will pass as merchantable lumber. It will not. Put such boards back on your head-blocks and saw them into thinner ones. The writer of this, who handles perhaps as much or more than any other dealer in the country, would gladly be willing to pay a better price, if lumber was brought to him in proper shape.

GAS FROM SAWDUST.

The London *Timber Trades Journal* says :—So far as we are aware, the making of illuminating gas from sawdust is a new branch of trade : certainly it is one of considerable importance from the fact that it deals with what, in the majority of cases, is a waste product. We are advised that Mr. R. Tomlinson, late manager of the Cottingham Gas Works, near Hull, has just completed the erection of the gasworks and lighting the town of Deseronta, Ontario, Canada, the works being erected for the purpose of making gas from fine sawdust. The gas produced is said to be far superior to that made from the best Silkstone coal, and to be equal to that made from the best cannel coal. It would appear that Mr. Tomlinson is specially commissioned in the above matter, for we learn that upon completion of some water mains, which he has also in hand, he intends returning to England.

As a basis for the manufacture of illuminating gas, sawdust lays claim to many specialities, more so in the wood-producing countries of Northern Europe and America, where coal has to be obtained at great cost, and where sawdust is a greater drug and a nuisance, than in our own country. Side by side with coal, they have a raw material ready to their hands, one which in many cases they would cast in the rivers, but are prohibited from so doing on the ground that it sinks to the bottom upon saturation, and, like the bark of trees, becomes injurious to

the fish. In most cases it is piled up on the banks of the rivers, where, from the size of the heaps, they are justly called "mountains of sawdust," We have seen sawdust so cast aside form features in the landscape of the Swedish river banks altogether dwarfing the mills and their surroundings, and we have no doubt but other countries, such as Russia and Canada, can give like experience of this waste product. In England sawdust is not generally a waste product; it is compressed with a solution of resin, and becomes an article of commerce for lighting fires; it is also used for strewing on the floors of certain shops after the manner of sand, as bedding for horses, and for packing purposes, &c., but the bulk of it is mixed with coal and other refuse and burnt under the steam boilers.

As sawdust can be practically applied to the manufacture of illuminating gas, it is clear, as in the above instance, that, where the supply is at hand, towns may be illuminated by it; but it strikes us as being applicable in a smaller and more general degree in the case of illuminating saw-mills, joinery works, and other establishments where sawdust is produced. We take it that its manufacture could be conducted on a simpler plan than that of coal gas, because it would be more free from mineral residue, and require less labor and plant in connection with its purification. Further, the coke or ash remaining would be a valuable fuel for heating and cooking purposes, where sulphurous fumes were objected to. We can well understand that sawdust would produce a good illuminating gas, for it is of all materials the most combustible, or capable of producing flame; for domestic purposes it would be most valuable, as its combustion would be free from such deleterious ingredients as sulphur. We think there is an opening here for the operations of our engineers to produce small cheap plants for gas-making from sawdust; such plants, although not largely applicable in England, where there is plenty of coal and but little sawdust, would be freely used on the Continent, where there is little or no coal and plenty of sawdust or waste wood.

REDUCE THE CUT.

The London *Timber Trades Journal* says:—Now that the time approaches when arrangements for work in the forests will have to be made, we cannot too strongly urge upon manufacturers at the various shipping ports the necessity there is for conducting these operations on a scale that will assist in adjusting the balance between supply and demand, which has been sadly thrown out of gear the past few years. Cutting this year should be considerably reduced, and certainly no fancy prices ought to be paid by mills for log lots.

The cause this year of the unsatisfactory state of the trade and the consequent falling prices may in a great measure be accounted for by the large winter operations of 1881-1882.

As long as the supply is in excess of the demand there is no chance for prices to recover; on the contrary they must continue their downward tendency, and no first cost, however low the scale, will be reliable as coming within the scope of the markets over here while the overproduction lasts.

It is generally believed that not alone in the timber trade, but in other manufactures, the wave of depression which is passing over the commercial world is traceable to their being "too much of the commodity." The result has been greater clearance sales either by public auction or in the ordinary way, but in which the first cost of the article disposed of has been left out of consideration altogether. The present condition of trade has reached a climax that necessitates some alteration or another if it is to be conducted on any system at all. The haphazard style of doing things cannot possibly be satisfactory to the manufacturer, and must lead ultimately to immense losses on one side or another.

Even if goods could be bought first hand to leave a profit at the prices now current, unless the over-stock ceased the downward tendency would remain unchecked. Hence from every point of view it is most desirable, especially at the Swedish ports from whence the bulk of the timber supplies come, that the forest cutting should be kept this winter within moderate limits, so that the following season might admit of the present over-stock being realized at something like paying prices.

WHOLESALE TIMBER REMOVAL.

A consequence of the greedy wholesale removal of timber, which is well worthy of consideration, is mentioned in William Morris' article on "Irish Local Government," in the last *Macmillan*. He is writing of the spread of bog in certain districts, and he says:—"On the bottom are found the stools of immense trees which kept those areas free from the clinging black peat. These trees were cut down, and furnished in many cases the export timber trade in Ireland in the seventeenth century. Subsequently to this original state the land grew under—or brushwood, and as peat grew simultaneously this growth of wood dwindled till finally it ceased, and so the hazel stools are left at certain heights in the peat as mile-stones, marking the progress in the age or rather state of bog, and after this depth of peat had been attained the areas only grew heather and the other moorland plants." The following expedient is pointed out as the remedy for this waste:—"Taking the waters into the stone by deepening the old channels and opening up new would arrest the development of this process."

LUMBER TO MAURITIUS.

Mauritius is an island in the Indian ocean, lying east of Madagascar, and belongs to Great Britain. Far away as it is the lumber market there depends on Sweden mainly for its supply of pine. It comes either direct from Scandinavia or by way of England. It is shipped in the shape of 3-inch deals, and some of it is re-sawed into 1½-inch and 1-inch stuff, with the ends left joined so that the 3-inch sawed piece can be handled as one instead of two or three pieces. The lumber is very evenly cut; and importers believing that lumber could be sawed equally as well in America, ordered lumber from here sawed in a similar way, but were disappointed at the "shameful" way the work was done, considering the perfection we claim for our woodworking machinery. Alexander Duff & Co., of Boston, have shipped lumber and shingles to Mauritius, T. B. Robinson having charge of their trade at Port Louis, the principal place on the island.—*Northwestern Lumberman.*

AN ILL WIND BLOWS GOOD.

The *Timber Trades Journal* says:—The great destruction of property caused by the recent heavy gales cannot help giving the consumption of timber some stimulus. The damage to many of the parades and piers at the watering-places of the south coast will have to be made good in the first instance by timber, and the local demand at those which have suffered the most severely will doubtless become active for a time. It is a true saying that it is an ill wind which blows nobody any good, for the winds of Saturday and Sunday evidently blew the timber merchants, down Channel way, a plum. So with the destruction of shipping, due to these gales, repairs will be necessitated that will call into requisition timber of different kinds, annd which, though small in themselves, must mount up in the aggregate to something like a respectable total, which will assist shipbuilders in reducing their stocks, and thus promote the trade.

New Brunswick Exports.

The business of shipping piling and firewood from the port of St. John has been more extensive this season than ever before, and greater preparations will be made for next season. The amount of piling shipped was 94 cargoes, containing 49,252 pieces of piling, and the large shipment made in the cribs is excluded from this. The greater portion of the piling was shipped to New York, but some cargoes were sent to St. John's, Newfoundland, to be used in the construction of the dry docks at that port. The firewood shipped was 133 cargoes, containing 8,462 cords. Of this quantity, by far the larger part was shipped to Rockland and Rockport, Me. Many schooners are constantly engaged in the latter trade. Besides this quantity, many cargoes of both piling and firewood were shipped from Quaco, Musquash and Lepreaux,

Chips.

A HOTEL to go up at St. Augustine, Fla., will require 2,000,000 feet of lumber.

TERRIFIC forest fires have been raging in the neighborhood of Hall's Bay, Newfoundland.

A SALE of 500,000 feet of black ash lumber was made recently at Saginaw, Mich., at $13 a thousand.

THE Belleville *Intelligencer* says that another consignment of timber is on the way here, from Bobcaygeon.

THE Brandon *Mail* says: "The American Lumber Company have sold their business in this city to Mr. P. McLaren. Mr. R. F. Edgar, wood dealer, will be connected with this firm."

THE *Monetary Times* says: "At the Rankine mill, on the St. John, the wharves have been rebuilt, fitted with tramways, and so enlarged that they have now capacity for 10,000,000 feet of lumber."

RUSSIA has been for a long time suffering the effects of reckless forest devastation. *Nevoe Vremya* says that the wanton destruction of timber threatens to turn some of the best wooded provinces into a barren waste.

A WRITER in the *Home and Farm* used about a quart of sawdust on each hill of a plot of potatoes and none in another plot. The sawdust hills yielded nearly twice as much as the others, and the potatoes were larger and smoother.

THE total length of public roads in France is 18,750 miles, of which 7,250 are bordered with trees, while 4,500 miles are at present being planted. The number of trees already planted is 2,678,603, consisting of elm, poplar, acacia, plane, ash, sycamore and lime.

THE *Monetary Times* says: "The quantity of lumber shipped down the St. Clair River is very great. On one day, between Detroit and Baby's Point no fewer than twenty two propellers and vessels were met laden with lumber of various kinds and shingles, one carrying tan bark and another cedar posts."

AN Ottawa correspondent says:—The Chaudiere mill men are filling up their yards rather than sell at a reduced price. Many of them are extending their piling grounds. There is considerable of a stir among American boatmen just now and freight rates have been somewhat reduced. Many of them are taking their last cargo for the season, which accounts for the reduction.

The *Northwestern Lumberman* says:—Lively logging is reported from Hubbard Lake, Mich., district. On Tuesday, September 4, 338 pine trees were standing in that locality, and by the Friday following the trees were cut down, sawed into logs, hauled to the railroad, carried to Lake Huron, 30 miles, towed to Ossineke, Alpena County, and when scaled were found to measure 250,000 feet.

THE republic of Guatemala has engaged a Celon planter to introduce into that country 500,000 cinchona trees, for obtaining peruvian bark, from which is distilled the salt known as quinine. President Barrios was led to try this experiment owing to the great increase in the use of cinchona bark, not only for quinine and as an ingredient in a substitute for hops, but for various commercial purposes.

AN Ottawa despatch of Sept. 12th says:—At the Russell House to-day the extensive timber limits of A. & P. White, Pembroke, were offered for sale. The first parcel offered was nearly four hundred square miles, on the Magnissippi; the highest bid was $200,000, but the owner considered the figure too low, and withdrew the parcel. Seventy-nine miles square and a small saw mill on the Deux Rivieres were then put up and withdrawn.

THE Kingston *News* of Sept. 19th, says:—Mr. W. Leslie has had three rafts made at French Bay, each of which is five tier deep. One of them has arrived at Port Dalhousie in tow of the tug McArthur. In the three rafts there are 480,000 feet of timber, equal to about thirty vessel loads. In the formation of each raft about 40 tons of chain is used, so that it will stand the sea as well as a barge. If the experiment of bringing timber down the lake in rafts is a success the timber vessels will suffer.

THE *Monetary Times* thus summarizes a portion of Mr. W. J. Paterson's valuable report on the trade of Montreal: "Exports of lumber and deals, especially to South America, which had declined some years ago, have recovered. The figures indicate that Montreal is attracting a good share of the deal export business. This increase is by no means accounted for by the revival of the River Plate trade, which had declined from 36,673,919 ft. in 1873 to 3,437,000 ft. in 1876, but now gives evidence of assuming its former proportions, the quantity exported last year from Montreal being 21,733,262 ft., some 48 vessels sailing hence for the Plate.

The Toronto *Globe* of Sept. 15 says:—A case has arisen in the township of Glamorgan which is likely to prove of great interest to lumbermen generally. Mr. Hilliard, of Peterborough, and a number of other, timber licensees from the Government, have been assessed for their interest in timber in question. This is the first time that such an interest has ever been assessed. A rule *nisi* for a prohibition to the township from proceeding with the assessement was applied for by Mr. Barron, of Lindsay, and granted yesterday. Lumbermen in the township are much interested in the result of the case, which will shortly be argued at Osgoode Hall.

W. A. EDGARS, of Frankville, was cured of Liver and Kidney Complaint after life was dispaired of. He had remained from ten to fifteen days without an action of the bowels. Burdock Blood Bitters cured him, and he writes that he is a better man than he has been for twenty years past.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

FITS EPILEPSY

OR

FALLING SICKNESS

Permanently Cured—No Humbug—by one Month's usage of Dr. Goulard's Celebrated Infallible Fit Powder. To convince sufferers that these powders will do all we claim for them we will send them by mail, **post paid, a free Trial Box.** As Dr. Goulard is the only physician that has ever made this disease a special study, and as to our knowledge thousands have been **permanently** cured by the use of these **Powders. We will guarantee a permanent** cure in every case **or refund you all money expended.** All sufferers should give these powders an early trial, and be convinced of their curative powers.

Price for large box $3.00, or 4 boxes for $10.00, sent by mail to any part of the United States or Canada on receipt of price, or by express, C. O. D. Address

Market Reports.

TORONTO.

From Our Own Correspondent.

SEPT. 24.—Business at the retail yards has been quiet during the last two weeks, owing to the exposition in progress here. That being over trade will resume its nominal state, and the retail trade will doubtless be brisk for the remainder of the building season. Prices remain *at least nominally the same* as previously quoted you, but there are instances which have come under my own notice where some cutting in figures below quotations has been done, although, as before stated, this cannot be done to any great extent without making it a losing game.

Shipments from our docks are more lively than at any previous period of the season, since my last letter the following quantities of lumber and shingles have left our docks: 4,000,000 feet of lumber and 500,000 M sawn shingles, so that daylight is now showing on our docks, and I trust not to be shut out again by such accumulations of lumber during the remainder of the season.

No lumber worth mentioning is being shipped by rail on through shipment to western Ontario, nearly all orders being filled from shipments made by water to Sarnia and other points, so that the Midland and N. & N. W. R. R. companies may yet find out to their cost that they have been strangling the goose that laid their golden eggs. It is a manifestly unjust proceeding on their part to charge fourth class rates on all excess weight, and yet provido no means of weighing the load at the point of shipment. It is said that the main agitator in this crusade against the interests of the lumbermen, is Mr. Robert Kerr, freight agent for the N. & N. W. R. R., backed up, of course, by that gigantic monopoly the G. T. R. R. Co., and, as a matter of course, the Midland Railway is held in leading strings, and the lumbermen know full well that to fight out this matter in the courts would be perhaps somewhat costly, as the whole resources of this railroad combination would bo available, and the ends of justice be defeated. If the heads of freight departments of the Midland and N. & N. W. Railroads wore not blind as to their own interests they would plainly see that they are playing a losing game, and the G. T. R. R. Co., are the gainers. The latter know full well that they will have the carrying of a large portion of the lumber which finds its way by the water routes, when it comes to be distributed to the customers, and tho N. & N. W. R. R. Co., will find out when too late that it is much easier to drive traffic from thoir road than to coax it back again.

MONTREAL.

From Our Own Correspondent

SEPT. 24.—Local trade has been moderately active and for some lines an improved demand has been experienced, which has caused a good deal of firmness without making any change in prices. Prospects are good for the fall trade and stocks are full so that dealers are prepared for the anticipated enquiry. There is fair enquiry on United States account, especially for hardwood, but common lumber is rather a drug in the market. Laths are steady and sell freely at quotations. We quote prices in the yards as follows:—

Pine, 1st quality, ₩ M	$35 00@40 00
Pine, 2nd " ₩ M	22 00@24 00
Pine, shipping culls, ₩ M	14 00@16 00

CORDWOOD.

Stocks are fair and likely to continue so all the fall. Prices keep pretty firm, and the present high prices seem to tempt the country people as a number of them have been in the city offering wood for sale. The local demand has only been moderate. Wholesale prices are as follows:—

Long Maple	$ 7 50
Short "	6 50
Long Birch	7 00
Long Beech	6 00
Short "	5 00
Tamarack	5 00@6 00

LIVERPOOL MARKETS.

Latest mail advices state the consumption during the past month has been large, and as there has been a great pressure to sell, prices are lower, and 2nd quality and uniform lumber is difficult to place, Spruce deals sold at prices ranging from £6 17s. 6d. to £7 2s. 6d. per standard. A parcel of Quebec ash averaging 14 inches was placed at 2s. 3½d. per foot, elm 2s. per foot and walnut 4s. 6d. to 5s. 10d. per foot.

WINNIPEG.

The Winnipeg *Commercial* of Sept. 18, says: There is a good stoady demand for lumber. The supply on hand is large and will be much more than sufficient for all requirements this season. The great number of buildings now in course of erection in the city will, however, consume a large quantity before winter sets in. The following are the quotations:—Pine lumber, 1st, common boards dressed, $26.50; 2nd do. dressed, $25.50; 1st do. rough, $26.50; 2nd do. $25.50; sheathing, rough, $25; timber 16 feet and under, $24; do. over 16 feet, for each additional 2 feet, $1; dimension and joists 16 feet and under, $24; do. over 16 feet for each, $1; fencing, $25; 2 and 3 inch battens, $30; A stock boards, all widths, $50; B do $45; C do. $40; D. do. $35; 1st clear, 1, 1¼, 1½, and 2 inch, $60; 2nd do. $56; window and door casings, $50; baso boards, dressed, $50; 1st pine flooring, siding and ceiling, $40; 2nd do. $35; 3rd do. $30; ½ inch split siding, dressed, $30. Spruce lumbor—timber 16 feet and under, $22; do., over 16 feet for each additional 2 feet, $1; dimensions and joists, 16 feet and under, $23; do., over 16 feet for each additional 2 feet, $1; boards, $22; 1st flooring, siding and ceiling, $28; XX shingles, $5.25; Star A shingles, $5.25; X shingles, $5.00; A do. $4.50; lath $4.50.

QUEBEC.

A Quebec despatch of Sept. 20, says:—Our market is still without animation, and considering the season of the year, very few sales have taken place. A good raft of about 54 feet, is reported to have been sold at about 27 cents; and a fine raft of Nipissing timber of about 36 feet average, at prices which have not transpired, but stated to be about 29 cents. In hardwood we do not hear of anything doing.

A Quebec despatch states that there is a slight improvement in the timber market, and some rafts are reported as having changed hands. Thistlo's white pine 55 feet average, has been sold at 27 cents, and a Nipissing raft of white pine at 29½ cents. The fleets this fall are late in arriving, which accounts iu a great measure for the prevailing dulness, and no great change for the better is expected before the end of the month.

BOSTON.

Cotton, Wool and Iron of Sept. 22nd, says:—There has been no particular change in the tone affairs since our last. A good fall business is progressing and values are on quite a steady basis for general assortments. Eastern lumber is firmer, because of the continued drought. Western and southern lumber are steady, with a moderate demand. In hardwoods there is a good call for desirable walnut and cherry. Ash and whitewood are comparatively quiet.

CHICAGO.

The *Northwestern Lumberman* of Sept. 22, says: The number of lumber laden vessels arrived at this port during the week exceeded the arrivals for the week previous, the comparison standing 280 this week to 241 the week before. A large proportionate number has stopped at the market docks. On Monday there was one of the largest fleets seen at the market this season, Sunday's arrivals in port being 52 and Monday's 77, the usual proportion going on the market. But, though the market was so well loaded, by Tuosday noon the fleet had been all cleaned out, and the hookers were making what speed they could for the east shore for new loads. Vessels that discharged cargoes on Saturday were seen back again Tuesday, which showed an eagerness to get around lively with the lumber, so as to take the market at high tide before an ebb should come. The activity and strength noticed as beginning week before last, and really pronounced last week, was fully maintained until about Tuesday of the present week, when the market manifested a little weariness under the intense labor it had performed, and slowed a little, though prices remained steadfast and firm. The gain of 25 cents a thousand on piece stuff that was claimed last week is now sufficiently established so that the $9 figure can be safely advanced to $9.25, though it may have to be dropped again next week, that contingency depending on the weather and the feeling in the yards, to some degree.

It is a rather remarkable circumstance that this market is devouring lumber so ravenously, when the existing condition of yard trade is considered. Not that it is intimated that the volume of demand for distribution is not fairly large, for that would not be true. When we speak of the existing condition as unfavorable to yard trade, we meau that prices are so demoralized, and margins so thin and uncertain, that the rate at which wholesale dealers are stockiug up is really something to be wondered at.

The rush of shingles has somewhat abated, and prices are steadying down, though not showing any advauce. It is scarcely possible that shingles of common and inferior grades can be worth more than now for some time to come, and really good shingles have all along sold for fair prices.

LEITH.

The *Timber Trades Journal* of Sept. 8, says: The arrivals at this port during the past seven days has been pretty numerous, the most important, perhaps, being a large steamer shipment of deals and battens from Cronstadt for Messrs. Ferguson, Davidson & Co. Though the demand is fairly good, stocks are now assumiug large proportions, and considerable quantities have yet to arrive. Unlike Baltic goods, the importation of American timber has been heavier this season than last, the result being that prices are difficult to maintain, consumers being perfectly well aware that the market is heavily stocked. In this district, also, pitch pine is now frequently used in place of yellow pine, and this is becoming daily more common. No public sales have been held during the past week, but Messrs. Mitchell, Somerville & Co. have one announced for Tuesday last.

CARDIFF.

The *Timber Trades Journal* of Sept. 8 says:—Since our last report numerous arrivals have come to hand, amongst them being one cargo of floorings, from Drammen, another with pulp, from the same place, two large Quebec cargoes, two from Miramichi, one steamer with sleepers from Narva, one from the Baltic, and the largest cargo ever imported to Cardiff, viz., 1,040 standards, from St. John. This latter cargo will be landed at Penarth Dock, where, as a rule good despatch is obtained. It is a pity it did not come into the Bute Dock, as it would have been a test for the Bute people's capabilities for discharging. As it appears now that at least half of the import of timber and deals to this place will be effected by steam tonnage, our merchants will scarcely be able to compete with neighboring ports if the despatch of steamers continues to be as slow as has been the case up to this time, as owuers cannot afford to give eight to ten days for discharging 500 to 600 standards.

LIVERPOOL.

The *Timber Trades Journal* of Sept. 8, says: The import during the past week has been more than sufficient for the wants of the trade, and with the continued depression in cotton manufacturing districts there is not likely to be any improvement, so far as can be seen at present, since the settlement of the disputes now existing between the artizans aud their employers seems as far off as ever. Apart from the generally

dull and languid condition of business, the import for the present season is apparently likely to be beyond the wants of the trade, and so long as supplies are forced upon the market in the way they are being pressed forward we cannot hope to have any better prices than those now ruling.

Spruce deals continue to come forward freely, and although some shipments are being stored on account of importers, others are being sold on best terms obtainable, and unless shipments are considerably diminished for the remainder of the season, there is apparently no reason why prices should not descend even below the figures they have touched at present.

Several lots of Quebec timber have come upon the market on consignment, and have been sold at fair prices, mostly to the local trade.

On the 30th of August, Messrs. A. F. & D. Mackay held one of their periodical auction sales of deals, birch and other woods, which was well attended. Spruce deals showed a slight decline in value, but the birch timber sold readily, and both the St. John, N. B., and the Pictou wood realized good prices.

The *Timber Trades Journal* of Sept. 15, says: There is no change in the tone of the reports of trade from the great centres of business in this locality, as all still continue to convey a deeply felt state of depression which may take some time before relief is felt. All the great manufacturing districts are evidently embarrassed with an overplus of manufactured goods, and the probability of having large supplies of the raw material to come forward. This is evidently the case with the timber trade here, as the imports continue to be far beyond the demands upon it, and the stocks on hand are increasing to a large extent.

In fact, it is possible, or even more, it is probable, that quotations may yet see a lower point if consignments continue to be pressed upon an already overladen market.

These remarks apply with greater force to the North American and Canadian shipments, as the recent heavy deliveries of hewn pitch pine timber have lightened this stock materially, and this article is now within reasonable bounds.

LONDON.

The *Timber Trades Journal* of Sept. 15, says: With bidding plentiful for goods which have a limitation on them, the activity of the trade can be better ascertained, and we take it as a hopeful sign that so many of such lots on Wednesday changed hands, though, as already stated, outside of these the prices did not betray any advance on those recently recorded, and it was only in respect of Canadian goods that the unreserved were sought after by the room, There were some heavy parcels of Uleaborg and Abo battens without reserve in Wednesday's sale that went cheap, but bidders seemed to think the prices quite sufficient, as though apparently anxious to secure the goods they showed no disposition to do so at any advance.

GLASGOW.

The *Timber Trades Journal* of Sept. 15, says: Imports of wood to Clyde during the past week comprise four cargoes of Quebec timber at Greenock, the aggregate tonnage of the vessels 4,894 tons; and at Glasgow about 2,000 loads, consisting chiefly of sundry parcels per steam liners. The importation of deals from Quebec to Clyde this year to date has been about the same as corresponding period last year (say 400,000 pieces). The arrivals of Quebec log timber in 1882 were unusually light, and this year shows a decided increase. Following are the amounts (to end of August) for the past three years:—Quebec waney boardwood and yellow and red pine: 1881, 33,500 logs: 1882, 19,600; 1883, 35,000. Quebec oak, elm, ash, and Quebec and lower port birch: 1881, 14,400 logs; 1882, 6,500; 1883, 11,600.

Much of what is imported is no doubt with the view of supplying the wants of ship-builders, who may be considered the largest consumers, for there is little movement here as yet in housebuilding, and it remains to be seen how the importers' estimate as to the quantity and character of the wood imported turns out. First-class yellow pine for deck plank no doubt is safe, and may in some cases be sold to arrive, Shipbuilders buying for the most part privately, prices do not transpire.

MONTREAL NOTES.

The Montreal *Gazette* of Sept. 21st, says:—A fair business has transpired since our last report, showing a slight improvement in the local demand at steady prices. Laths have met with fair enquiry at $1.60 per M. Stocks now are well assorted and better seasoned, and a good trade is confidently expected between now and the close of navigation. There is still some enquiry for hardwood on American account, the sale of a boat load of ash being made on p. t., but believed to be at within range of quotations. Advices state that the mills in the New England combination agreed to give no discount after the 15th instant. They previously allowed 5 per cent. There is a good demand for pine in Boston, with prices firm for best stock. A Boston dealer in pine and in hardwoods, who has just returned from an extensive business tour at the west, remarked:—"I was never more surprised than I have been to find how very scarce good lumber is becoming. You see, all through the hard times all who had timber cut off the good, because it was the only stock that it would pay to cut. Then, again people in buying timber lots bought the best, those which would give the best lumber, and now what is left is mostly Norway and common stock. Why, I went right into the forests regions of Michigan, and in one central place where there are a dozen manufacturers I could only find one who had any good lumber in any quantity. One manufacturer who had 1,000,000 feet had only a few carloads of the best quality, and it was all mostly Norway and common. There is even a great change with what it was a year ago. Manufacturers don't have to seek customers for their good lumber, and stock that I had engaged ahead could have been sold many times over. On the other hand, common lumber is accumulating, and while prices are not so easy as they have been, they are not strong. Common pine, however, has a good western outlet, but common hardwoods are not much wanted."

OTTAWA.

The Ottawa *Citizen* of Sept. 22, says:—The Ottawa lumbermen who have commenced to hire hands for the coming seasons's operations have opened a wages list with an average reduction of $4 per month all around for hush hands. Wages run from $15 to $22, with a prospect of a further reduction next month, when the harvest is finished and farm hands begin to look for a winter's engagement in the woods, There will be a great reduction in operations on some parts of the Ottawa, for instance, Mr. J. R. Booth, it is said, will have no shanties on the Opeongo, Madawaska or Mississippi next winter, which means that there will be 300 men dispensed with there. The McLachlan Bros. will also curtail their winter's work in the same district, owing to the fact that they have over 100,000 logs left over on the Madawaska ready for next season's sawing. A new slide at the High Falls is to be built during the coming winter, which will greatly facilitate the passage of timber at that dangerous spot.

THE CLYDE TRADE.

Singleton, Dunn & Co.'s timber circular dated Glasgow, 6th Sept., says:—Most of the spring fleet came forward during last month, and almost all the vessels have again cleared for Quebec for fall business. The stocks of Quebec timber are fair, and rates may be maintained if only caution is exercised later on in regard to supplies. Should the fall import be as large as the spring import, we do not think the market will support prices. No doubt the consumption is fair, but the principal factor in this is the shipbuilding branch (which continues fully employed), in which there is an outlet for only the higher grades. A slight improvement is manifest in the building trades, consequent mainly on the progress of some extensive public buildings and local railway works. North of Europe wood goods continue very moderate in price, white deals costing less c. i. f. to Grangemouth than is quoted for Canadian spruce to Clyde ports.

WHITE PINE.—An entire shipment, contract lot, was sold at, for prime deck plankwood, 50 feet average, 2s. 7½d., and 60 feet average, 2s. 8½d., delivered at Glasgow. A fair quantity of prime 55 feet average was sold at 2s. 7d. per cubic foot, in ponds, and 50 feet average at 2s. 6d. Some large sales of deckwood were made to arrive, and prices for these are not disclosed, but surmised to be quite in favor of importers.

DEALS.—1st pine—For ordinary sizes there is little enquiry, and prices low. The trade wish wide deals only. For 12 ft.x7 to 11x3, 2s. 6d. per cubic foot, was made, and for long deals rather more. 2nd pine—few sold. Prices from 18d. to 23d. per cubic ft., according to size.

A LONDON SALE.

The London *Timber Trades Journal* of Sept. 8 says Messrs. Foy, Morgan, & Co.'s sale was well attended.

The prices of Archangle goods did not look as if the corner had been turned, and we fail to trace any favourable tendency in the market when 1st yellow from the port named realizes no more than £13 15s.

For the yellow pine timber ex *Deeside* from Quebec prices took a wide range, the two first lots going at 87s. 6d., and the remaining three at a little more than half the figure named. It is true the dimensions might account for some of the difference, but they were hardly so divergent as to reduce the value so materially as the sales prices seemed to indicate.

The waney pine ex this ship went from 62s. 6d. to 72s. 7d., but there were very few pieces over 20 in. wide. Prices for goods of this description were nevertheless very unfavorable, and with respect to the flooring disposed of on Wednesday also, values were decidedly lower than at previous sales, but every stick of it was without reserve, representing some 800 standards or so of this class of goods.

FOREST FIRES.

ELLSWORTH, Me. Sept. 24.—A forest fire at West Bay, Gouldsboro, consumed the Union church, town house, and the residence of A. G. Guptill, with stables, yesterday. The fire is still raging, and other buildings are in immediate danger. The present damage to buildings is estimated at $8,000, and heavy damage has been done to the forest.

CALAIS, Me., Sept. 26.—Forest fires are very prevalent along the shore line between Calais and Machias, and along the line of the St. Croix and Penobscot railroad. They are doing a great deal of damage in Alexander, Charlotte, Baileyville, and other places. Considerable timber land has been burned over. Violent winds are prevailing, and the fires are being fought by large crowds day and night.

SANTA CRUZ, Cala., Sept. 26.—Immense fires are raging. The forests and ranches above here are already terribly damaged. A despatch from Davenport's Landing states that the entire country is in flames. One hundred and forty men went from here to aid in the arrest of the fire. The Santa Cruz Water Company have 50 men fighting the flames, which are within five miles of here. Fears are entertained for the city.

Do not delay, if suffering any form of Bowel Complaint, however mild apparently may be the attack, but use Dr. Fowler's Extract of Wild Strawberry. It is the old reliable cure for all forms of Summer Complaint that require prompt treatment. Ask your druggist and all dealers in patent medicines.

NORMAN'S ELECTRO CURATIVE APPLIANCES
RELEIVE AND CURE
Spinal Complaints, General and Nervous Debility, Nervousness, Rheumatism, Gout, Liver, Kidney, Lung, Throat and Chest Complaints, Neuralgia, Bronchitis, Incipient Paralysis, Asthma, Sciatica, Sprains, Consumption, Sleeplessness, Colds and Indigestion.

Ask for NORMAN'S ELECTRIC BELTS and you will be safe against imposition, for they will do their work well and are cheap at any price.

A. NORMAN, ESQ.—Dear Sir,—Please send me a waist belt. Enclosed find price. Head hand I got for my wife has almost cured her of neuralgia. Yours truly,
C. L. TILLEY, WATERVILLE, N.B.

Numerous of such testimonials can be seen at my office, proving that they are doing a good work and worthy the attention of all sufferers. Circulars free. No charge for consultation.

A. NORMAN, 4 Queen Street East, Toronto.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1YL7

A REMINISCENE OF THE FRUIT BOX INDUSTRY.

"It is generally supposed," says the New York *Maritime Register*, "that the boxes in which oranges and lemens are sent te this ceuntry from the Mediterranean, are made aleng the shores of that sea. This was the case years ago, but it is se no longer. Fermerly the shooks were hewed out of the log by hand in Italy and sent down to the packers. But a few years ago, Capt. T. J. Stewart, a native of Maine, a shipmaster who had traded with the Italian ports, came te the conclusion that these shooks ceuld be made much cheaper in his native state and shipped thence to the fruit districts at a profit. With him to think was to act. He accordingly retired from the sea and proceeded to Bangor, the centre of the Maine lumbering intercsts, where he put his new idea into practice. It has proved highly successful. Mills were erected in the woods miles backs of Bangor, and shooks of all description were quickly turned eut by the thousands. Shooks for orange, lemon and cranberry boxes, for onion boxes, oil and fish cases, were made in these woods, forwarded to Bangor by rail, and exported thence te our great ports and the Mediterranean fruit districts. The trade has now grown to important proportions, and it is said that few oranges and lemons arrive in this country that are not in boxes of Maine makc. Our poetical friend, who at the sight of tempting boxes of oranges lets his mind wander to the sunny skies of Italy, and thinks of scented groves and the blue waters of the famous sea, can let his thoughts also wander to the forest covercd hills of the Pine Tree state, whence cemes the wood that holds the brilliant-hued fruit. The more practieal mind, however, will rejoice in the fact that much of the timber which in former years, was literally wasted in Maine is now turned to such good advantage. By shipping orange and lemen box shooks, not only is a large and lucrative trade opened, but the transport of these goeds brings additional business to Bangor in the supplies furnished there to vessels employed in the trade. It is difficult to estimato the money extent by this, but it is easy to see that it must be of great value to the pert."

OTTAWA NOTES.

An Ottawa correspondent says :—"The sawn lumber market has taken a decided change for the better within the past few days. Several prominent New York dealers have been in the city, and their purchases are said to have aggregated 8,000,000 million feet, principally of the higher grades, and an advance of 25 cents per thousand feet is quoted on these qualites. This has given an impetus te shipping, and the lumber docks have resumed their usual bustle. There is a fair prospect of this state of things being continued now until the close of navigation. Freight rates average about the same as last year. The activity of the market will net, it is said, interfere with the determination of mill men to curtail operations during the coming winter. Present indications now lead to the supposition that the quantity of upper grade lumber to be wintered here will be somewhat smaller than last season, and should this prove correct mill men generally will close this year with a fairly good record.

Lumbermen this year are using mere beef in connection with their shantics. Some time ago nothing but pork was used, the supplies being drawn principally from Chicago, but since the export trade in cattle has assumed so large proportions farmers in the Ottawa Valley havo devoted more time and attention to cattle raising, and are now supplying many of the lumber shanties with beef. During the past week several hundred head of cattle have been shipped for the Upper Ottawa, and the prospects are that the pork trado will, in the course of a few years, be seriously affected."

TIMBER SALES IN NEW BRUNSWICK.

The New Brunswick Government recently mado a change in its system of granting timber leases on its lands. By the old plan leases were good for five years only. Now the time has been extended to ten years, and the new way has been found to work exceedingly well, lumbermen being more anxious to secure leases for that time than for the sherter peried. The stumpage has been raised from 80 cents to one dollar per thousand this year, and $1.25 for each subsequent year, en logs, and a prohibitory charge put upon small lumber. An important sale of these limits took place at Fredricton last week, and the Government is well satisfied with the result of the three days' proceedings. Over thirty-eight thousand dollars were realized, and the number of square miles leased was 3.18½. In the sales made on the 7th instant 1,270 square miles were offered, of which 1,046½ square miles were sold—959 at upset price, $7,672, and 87½ at competition, for $4,231 ; total $11,903. The highest bid was for six square miles at Dungarvon, Miramichi, when $141 per square mile was offered. Last year, the sales amounted to $31,000 for abent 4,800 square miles. The *Telegraph* is jubilant over the result, and says, "this fact shews that the lumbermen appreciate the new regulations and have been prompt to avail themselves of them. The handsome sum realized,—$38,000,—is, we think, the largest ever received at any sale, and less than $3,000 under the aggregate receipts from all sales last year.

NEW BRUNSWICK TRADE.

The St. Sohu's N. B. *News* of September 10th says :—Four million feet of logs recently changed hands in St. John, at $9 per M., for shipment to the American market, which exhibits marked improvement over prices prevalent in the early part of the season. Another lumberman has between four and five million feet on hand, which he is holding for $9.30 per M. The above transactien must have netted the seller at least $2,000. There is a good deal of vitality in tho "waning industry" after all. The European market shows no signs of improvement, but the prospect is that there will be the heaviest shipment this month that has been recorded for years. It is apparent that a more moderate cut of legs in this Province is necessary to ensure good prices. At present £12 6s. per standard is the best offered on the other side, which is about equal te $7 per M. on this side of the water. Freight figures are dull. The Crown Lands revennes from sales, &c., this year will, it is expected, aggregate over $50,000 —an excess of about 15 per cent. over last year's receipts."

EXPLORING NEWFOUNDLAND.

Mr. Hall, one of the largest lumber manufacturers in the world, and one of Canada's leading merchants, arrived here, says the St. John, Newfoundland, *Mercury*, on Thursday by the steamship Polino. He brought a party of explorers with him, who departed in the Polino for the purpose of being landed in the Bay of Islands, where, sheuld the explorers' reports prove favorable, he proposes to establish a large lumbering manufacturing business. The initiation of the scheme also depends upon the terms upon which the Government will be able to make grants of land ; and it is to be hoped that nothing will be left undone to assist in the establishment of an enterprise so well calculated to develop a portion of this country. Mr. Hall has also an idea of exploring the Exploits river. He has been looking at our dry-dock, and says that in all his vast experience he has never seen finer timber used in such work—an opinion of great value because of his knowledge of the subject.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., wil send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

Convincing Proof.

Having suffered from rheumatism for a long time I was induced to try your Arnica and Oil Liniment. The first application gave instant relief, and now I am able to attend to buisness, thanks to your wonderful medicine.

I am yours truly,
W. H. Dickison,
218 St. Constant St., Montreal.

Te Henry, Johnsons & Lord, Montreal.

Arnica and Oil Liniment is sold by all Druggists.

$40,000 IN PRESENTS GIVEN AWAY!

This Offer Good Till Thanksgiving Day Only.

The proprietors of the **FARM, FIELD AND FIRESIDE**, being desirous of having their already well-known and popular Agricultural and Family paper more widely circulated and introduced into houses where it is not already known, have determined to throw off all profit this year, and in addition use a portion of their capital for the sole purpose of increasing their circulation to **100,000** copies. Its circulation is now **65,000.** Only **35,000** more needed before the distribution takes place. After deciding to more extensively advertise than ever before, the following plan has been adopted by us:

FOR 50 CENTS

We will enter your name on our subscription book and mail the **FARM, FIELD AND FIRESIDE** regularly to you for Six Months and immediately send a **printed numbered Receipt**, which will entitle the holder to one of the following Presents to be given away at our **THANKSGIVING FESTIVAL.**

Partial List of Presents to Be Given Away.

5 U. S. Government Bonds of $1000	$5000 00	1000 Pocket Silver Fruit Knives	$1000 00
10 U. S. Greenbacks of $500	5000 00	1000 Gents' Pocket Knives	1000 00
10 U. S. Greenbacks of $100	1000 00	1000 U. S. Greenbacks of $1 each	1000 00
1 Matched pair of Trotting Horses	1000 00	10 Gents' Gold Watches, English Movement	800 00
1 Grand Square Piano	800 00	10 Ladies' Gold Watches, English Movem't	600 00
1 Grand Cabinet Organ	200 00	20 Boys' Silver Watches, American Move't	200 00
1 Three-seat Rockaway	200 00	8 Solitaire Diamond Finger Rings	400 00
1 Silver Dinner Service	100 00	3 Patent Harvesters	1000 00
5 Top Buggies	1000 00	1 Normandy Work Horse	500 00
20 U. S. Greenbacks of $50 each	1000 00	2500 Elegant Oleograph Pictures	2500 00
1000 Photograph Albums $2 each	2000 00	5 Raw Silk Parlor Suit Furniture	1000 00
2 Village Carts	200 00	1460 Gold Finger Rings, Ladies' Breast Pins, Gents' Scarf Pins, Lockets, Fans and Chains.	
1 Pony Phaeton	100 00		

And 92,935 other presents valued from 25 cents to $1.00, which makes a grand aggregation of 100,000 presents, thus guaranteeing a present to each and every new subscriber who sends us **50 Cts.** as directed.

All of the above presents will be awarded in a fair and impartial manner by committee chosen at the Festival by the Subscribers; this festival will take place without fail. It will not be necessary for Subscribers to attend the Festival, as presents will be sent to any part of the United States or Canada. Yet it is to be hoped as many will be present as possible. **THE 50 CENTS** which you send us is the regular price for Six Months' Subscription, and therefore we charge nothing for the presents. **OUR PROFIT** will be in your future patronage, as we believe you will like our paper so well that you will always remain a subscriber. **YOUR SUBSCRIPTION FREE.** Get five of your friends to join you by cutting this out and showing it to them. Send us $2.50 and we will send you the **FARM, FIELD AND FIRESIDE** for six months, and a numbered receipt for each of your subscribers and one extra for your trouble.

SEND TEN SUBSCRIBERS with $5 and we will send **12** subscriptions and twelve numbered receipts. We shall limit the number of new subscriptions to **100,000,** so we would advise all our friends to forward subscriptions early.

THE FARM, FIELD AND FIRESIDE

is one of the oldest and ablest edited Family and Agricultural papers. It contains twenty large pages (Eighty Columns), including elegant cover, bound, stitched and cut. And now has a circulation of **65,000** copies, and we are sure to reach the **100,000** at the time set, and the distribution of presents will take place on that date. It contains **Stories, Sketches, Poetry, Farm, Garden, Household and Agricultural Departments by the best Contributors of the day,** as well as an **Illustrated Fashion Department, Needle and Embroidery Work.** Illustrations of different parts of the **UNITED STATES** and Biographical Sketches of Eminent Men and Women. In short, it contains that which will interest, instruct and amuse the whole family.

THE PROPRIETORS are men of means, who always have done as they agree, and our paper is long established and reliable, with sufficient capital to carry out and fulfill to the letter any offer we may make.

TO THOSE WHO DO NOT ATTEND THE FESTIVAL we will send a printed List of the Awards, and all Presents will be forwarded to Holders of Receipts as they may direct. If you have not seen this elegant and beautiful paper, send for a Sample Copy which will be Sent Free.

ONLY 50 CENTS secures the **FARM, FIELD & FIRESIDE** Six Months, and a numbered receipt. The paper is worth double the subscription price. *As to our reliability we refer those who do not know us to any reputable Publisher in Chicago.*

Money in sums of $1.00 or less may be sent in ordinary letter at our risk, larger sums should be sent by Registered Letter, P. O. money order or Express. (Mention This Paper.)

REMEMBER these are Presents to our Subscribers given to them absolutely Free. Cut this out and show to friends, acquaintances and neighbors, as it will not appear again, and is the last opportunity you will have to take advantage of this extraordinary offer. Two-cent Postage Stamps taken in sums less than $1.00.

The FARM, FIELD AND FIRESIDE, 89 Randolph Street, Chicago, Ill.

Read These Testimonials.

CHICAGO, Aug. 21, 1883.
We have furnished the paper for the FARM, FIELD AND FIRESIDE for several months, and have always found its Proprietors honorable in their dealings, and prompt in their payments.
CHICAGO PAPER CO.

CHICAGO, Aug. 21, 1883.
The Proprietors of the FARM, FIELD AND FIRESIDE have paid me several thousand dollars for press-work on their paper. I have always found them prompt in all transactions.
A. G. NEWELL.

August 15, 1883.
I am highly pleased with your paper. The information concerning Poultry management alone is worth five times the price of your paper, saying nothing about the valuable Farm information and interesting stories, etc.
W. R. SIMPSON,
SLIPUP, Morgan Co., Ala.

BRAIDWOOD, Ill., Aug. 11, 1883.
I am very much pleased with your paper. Every number seems to me to become more attractive and profitable. I have showa it to several of my friends, who were at once delighted with it.
Mrs. J. F. EHLE.

WAUSEON, O., Aug. 11, 1883.
I received a copy of the FARM, FIELD AND FIRESIDE some days ago and must say that I was well pleased with it. I find it *a first-class journal for the farmers*, of whom I am one. With such an agricultural journal every farmer can receive much benefit.
M. H. HAYES.

MEXICO, Juniata Co., Pa., July 24, 1883.
I herewith send you the names of fifteen subscribers to the FARM, FIELD AND FIRESIDE, which I secured in less than as many minutes.
B. L. SHUMAN.

SOUTH UNION, Ky., July 13, 1883.
It is certainly the best paper I ever saw, neat, plain, instructive and beautifully illustrated.
E. L. HOTE.

ILDERTON, ONT., Aug. 3, 1883.
I have lately been a subscriber to your tasty and profitable paper, and must say I am more than pleased with it. I gave my subscription, in the first place, more to have a chance for one of the many presents than for anything contained in the paper; but I find the paper is worth three or four times the money beside all presents.
S. W. PAISLEY.

PORTSMOUTH, VA., July 9, 1883.
I received the papers all right and am delighted. My friends and subscribers say they are surprised at its size and beauty. Every person that has seen the paper acknowledges it to be the best paper printed, and say it is *worth $2 per year.*
TIMOTHY MOSELEY.

SEEDLING TREES.

Prices of forest-tree seedlings are such as to place them within reach of the very poorest. In fact, as the great bulk planted are of spontaneous origin, they are to be had for mere gathering, in regions where found. When trafficked in, prices range, owing to variety and size, from six inches to four feet, all along from 50 cents to $3 per thousand. Nursery-grown grades range higher. Many millions are now planted annually. The cost of planting depends much on circumstances, price of land, labor, varieties planted, skill in planting and many other minor details. Cottonwood seeding can be furnished in quantity, from 50 cents to a $1 per thousand; box elder and soft maple from $1 to $2, and oaks, ash, walnut, hickory, catalpa and chestnut from $5 to $10. The usual distance apart are by multiplies 1-8 12-16, etc., that intermediate ground may be utilized by being cultivated in other crops until trees are sufficient size to protect themselves, when, in farm parlance, they are permitted to "take the greund."

Most experimenters at first planted tree seeds where they were to remain permanently. Experience has shown this a mistake, for numerous reasons. Principally by this mode uneven stand, growth, grade, size and vigor are to contend with. By planting seeds first in beds and, say at one year's growth, assorting, grading and transplanting permanently, each grade to itself, better results are secured. Same grades as to size and vigor do better together; grow more evenly; the weak are not crowded out or overshadowed by the stronger,—a practical illustration of "survival of the fittest."

By this plan small plants, if healthy, do about as well in the end as large. No variety is known net readily transplanting at one year old. Even varieties of top root characteristics, oaks, walnuts, hickeries and chestnuts are really better, I am convinced, for tap root pruning. By it laterals or fibrous feeding roots are induced. Or if larger sizes are desired before transplanting, root-pruning, by running a tree-digger under the rows and allowing them to remain a year or two longer, good results are obtained. As a rule, however, better success is had by transplanting young trees, when near as possible all the roots are preserved. Small trees cost less to purchase, transport, handle and transplant. Alternating—especially certain varieties—has not given satisfaction. Trees in some respects are not unlike mankind—will not fraternize. For instance, oaks, walnuts and hickories will not fraternize with maples, cottonwoods and elms. When planted near each other, the latter will invariably lean away from the former, assuming a crooked, gnarly appearance, and in the end virtually die out.—*Lumber Trade Journal*,

INTERESTING CASE.

The Assize Court at Ottawa has to-day been occupied with a case having a close interest for shippers, that of the Canadian Pacific Railway vs. Allen Grant, to recover $2,700 for carrying lumber from Mattawa to Quebec. The defendant refused to pay on the ground that he contracted for the delivery of the timber last fall in time to sell in the fall market, and that through the scarcity of rolling stock the timber was not delivered for several months after the contract time had expired. He therefore puts in an offset of $60,000 damages. Judge Armour, in giving judgment, declared that the claim for freight should only have been $2,100, and allowed defendant an offset of $1,400 for losses sustained by defendant's men having to remain idle through scarcity of cars. The question of losses sustained in the sale of timber was reserved for the consideration of the Court of Appeal.

TIMBER LAND FRAUD.

WASHINGTON, Sept. 13.—The commissioner of the general land office said to-day, in reply to enquiries with regard to timber land frauds discovered in California: "I have had a knowledge of these operations for some time, and have had agents out there making investigations. In consequence of reports received from them, I have suspended action upon all timber land cases in California, Oregon and Washington territory, and persons interested are not getting any patents and they will not get any until I am fully satisfied of the honesty of their entries. In explanation of the nature of the illegal operations, Commissioner McFarland said Congress by special act provided for the sale to individuals of separate tracts of timber land in California, Oregon and Washington Territory at $2.50 per acre. Fraud in those cases consisted in the procurement by one person of a large number of such lands, through the co-operation of others who purchased them, only to transfer them to him in clear violation of the spirit of the law. Commissioner McFarland also says that frauds of a similar character have been discovered in connection with entries of coal lands in Colorado; that he now had a force of special agents at work there, and he intended to examine carefully every entry of such land. Land officers in Colorado have been directed to suspend action in coal land entries, until the results of the examination becomes known.

Prospects in the States.

The *Northwestern Lumberman* says:—A glance at some salient points in existing circumstances will make this assumption appear plain. At Saginaw there is a stagnation in sales and shipment that is unwonted for that great source of supply. This is attributed to a lack of choice lumber and an accumulation of coarse stock. Probably this is the correct conclusion to some extent, for we find that the Lake Superior country is sending a great deal of lumber to the East, while more than the usual amount is going from northern Lake Michigan ports and some from Green Bay. Yet the condition of affairs at Albany, New York, Connecticut points and other New England places of consumption must be taken into account as an index of the dullness at Saginaw Valley, as well as the situation in Ohio. At the East trade has been very cautious all the season, and the discretion of handlers seems to increase this fall rather than diminish. Albany reports indicate nothing like a brisk demand. Steadiness, and an ordinary attendance of buyers is the best report that can be given. At great points of consumption, like New York, there is little urgency to business, dealers having only to meet a steady call, and buying simply for that purpose. The demand can almost be termed moderate.

Mill Refuse.

The Wausau, Wis., correspondent of the *Northwestern Lumberman* says:—The disposal of refuse is becoming something of a question. There is so much timber that the slabs, edgings and trimmings are of little account. They are used to fill in and make piling ground, and can be had to burn for the asking. The mill men have gone to no special pains about burning the refuse. It has been dumped from tramways on to the ground, or against the sides of brick walls, and burned without ceremony. The first burner to be put in was that of the Michigan Lumber Company, rather recently built. It is of iron, 35 feet in diameter and 78 feet high. The first glance would lead to the impresson that it was entirely safe, for the smoke floats through the dome of netting that surmounts the burner, entirely free from sparks. The secret of this is that in order to be safe the company placed a second spark arrester directly across the top of the burner, which cannot be seen from the ground. The dome is of one-half-inch mesh, and the inside netting has a quarter-inch mesh. It has worked entirely satisfactorily.

Setting out Fires.

There is a law in Washington Territery against the careless or malicious setting of fires in field, on prairie or in forest, either on one's own land or the land of another. If anybody sets a fire on any land not his own, and it spreads and does damage, the penalty is a fine of $5 to $500. If maliciously any one kindles a fire on his own land with the object of having it spread to the land of another and do damage, the penalty is a fine of $20 to $1,000 and imprisonment for from 3 to 12 months. When a person wishes to kindle a fire on his own land, for the purpose of clearing it of logs, brush, or otherwise, he "shall do so at such time and in such manner, and shall take such care of it to prevent it from spreading and doing damage to other persons' property, as a prudent and careful man would do, and if he fail so to do he shall be liable in action to any person suffering damage thereby to full extent of such damage." Hunters and fishers are liable to the penalties inflicted on others for carelessness with fire. Is it possible that the citizens of a territory are wiser regarding the protection of their timber from fire than the "old heads" of the three great pine states of the Northwest?—*Northwestern Lumberman.*

QUEBEC CULLERS' OFFICE.

The following is a comparative statement of Timber, Masts, Bewsprits, Spars, Staves, &c. measured and culled to Sept. 31:—

JAMES PATTON,
Quebec, Sept. 21. Supervisor of Cullers.

Rat Portage.

A correspondent of the Toronto *Globe* says:—Rat Portage is the seat of an extensive lumber trade. The splendid mill of the Rainy Lake Lumber Company was unfortunately burned down a few weeks ago. Jarvis & Burridge have a large saw mill, not yet ready to begin cutting. There are three other large saw mills in the immediate vicinity of Rat Portage. Only about a mile west of the town is the steam mill of Bulmer, Bailey & Co., with a cutting capacity of 80,000 feet per day. A little farther on is Hunter & Co's. mill, rated at 100,000 feet per day; Dick & Banning's mill, with a capacity of 50,000 feet per day; and the Keewatin mills, under the managing directorship of D. L. Mather, having a cutting capacity of 75,000 feet per day.

Trees for Prairies.

Mr. Egleston gives the following as the order of preference as to successful growth of trees grown in Minnesota: First, cottonwood; 2nd, white willow; 3rd, soft maple; 4th, box elder; 5th, white ash; 6th, poplar; 7th, black walnut; 8th, white elm; 9th, butternut; 10th, white oak; 11th, black ash; 12th, hard maple; 13th, Norway pine; 14th, red oak and grey willow; 15th, basswood; 16th, red elm. For value for different purposes the order is as follows: For fuel in the near future, or wind breaks—willows, cottonwood and poplar; for fuel for next generation—maples and ash; for lumber—white oak, walnut, catalpa, ash, elm; for shade—box elder, white elm, ash, walnut, maple.

"Deal."

Readers of technical journals are often puzzled by the use made of the word "deal" by nearly all foreign publications, and some home ones. As generally used it means simply a piece of softwood lumber; but the strict definition of the word, as understood by the English timber merchant, is, softwood timber, imported and sawn to the section of 9x3 inches, or 8x4 inches, or 10x4 inches. Similarly "planks" are 12x3 inches or 12x4 inches, and "battens" 7x2½ inches, or 7x3 inches, all irrespective of length, which varies considerably, and of the country port they come from.—*Wood-Worker.*

Mills Burned.

NEW YORK, 21.—A fire early this morning in the planing mill of Robert Ellis swept through the building with such speed that the workmen were compelled to flee, leaving their coats behind. In less than five minutes the entire mill was in flames. Fifty lumber piles were burned or damaged. G. L. Schuyler & Co. estimate their loss on the lumber at $70,000; Ellis' loss on the planing mill is $15,000.

ROCHESTER, 21.—Crouch's sawmill was burned to-night. Loss $30,000.

OTTAWA NOTES.

There are at present a gang of men busily engaged in fishing oak out of the canal in the vicinity of the Deep Cut. The foreman told a reporter that the oak which they got was worth from sixty to seventy dollars per thousand feet, which is quite an inducement for these fishers of oak.

McLaren's New Edinburgh saw mill is about to be demolished and a new mill erected on the site at a cost of $35,000 The new structure will not, it is thought, be commenced until after the sawing season has closed.

Mr. H. McLean on Sept. 23rd sent a gang of 200 men to the Coulonge to work in the shanties Another gang of shanty hands left on the same day for Michigan.

The last raft of square timber of the season has passed through the Calumet slides.

Gigantic Land Fraud.

SAN FRANCISCO, Sept. 12.—A proposed gigantic land steal, involving several million dollars worth of United States redeemed timber lands, has been discovered. The lands are situated in the northern part of California, and comprised the most valuable redwood timber on the coast. Applications for possession were signed by dummies. Several hundred applications of this kind have been filed with the Government officials here, and it is alleged Government officials are in collusion with the parties engineering the scheme.

THE *Northwestern Lumberman* says:—A proposed gigantic land steal, involving several million dollars worth of United States redeemed timber lands, has just been brought to light. The lands which are situated in the northern part of California, comprise the most valuable timber lands on the coast. Applications for possession have been prepared and signed by dummies. Hundreds of these have been filed with Government authorities, and it is believed that the Government officials are acting in collusion with the parties engineering the scheme. If these schemes should succeed they will control one-sixth of the lumber supply of the state.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfits and terms free. Money made fast, easily and honorably. Address TRUE & Co., Augusta, Maine.

FOR THE

Canada Lumberman

FOR THE FOLLOWING REASONS:

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞ TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw mill men and lumber and timber dealers of the Dominion.

VOL. 3. PETERBOROUGH, ONT., OCTOBER 15, 1883. NO. 20.

The Ottawa *Free Press* says :—Two trains of umber per diem are now being run out from the city by the Canada Atlantic Railway.

A LARGE amount of lumber will be left over at Manistique, Mich., when the navigation season closes. It is being carefully cross-piled.

THE Menominee manufacturers are not afraid. There is every prospect that an immense log crop will be gathered on that stream and tributaries the coming winter.

THE North American Contracting Company are shipping a large quantity of lumber from Rat Portage to Calgary, for the construction of bridges and culverts on their work.

THE Winnipeg *Times* of Sept. 23rd says :—The steamer Glendevon arrived at Selkirk yesterday morning with two barges heavily laden with lumber, and after depositing them in the harbor she cleared for Fisher River.

A seven-foot rise in the Chippewa river, Wis., on the night of September 25th, cleard out the scattering logs from Paint creek and Little Falls to the Beef Slough works. Between 10,000,000 and 15,000,000 feet were started.

THEY are sawing lumber at the mouth of the Menominee without any reference to the cry of accumulation. At the close of last week the N. Ludington Company had cut 23,000,000 feet, the Carney mill 28,000,000, and the McCartney mill 15,000,000.

THE Ottawa *Citizen* says :—One of the best sales in timber this season was that made recently by Messrs. Barnard & Mackay, of Pembroke, who disposed of a white pine raft consisting of 24,000 sticks to Dobell & Company of Quebec at 29½ cents per foot.

THE *Northwestern Lumberman* says that a sink hole near South Lyons, Mich., has swallowed up three acres of heavy timber. These sink holes are a peculiar feature of Michigan. They have devoured sections of railroad. Several thousand loads of dirt disappeared on the Washburn farm. South Lyons, and another hole on the Clark farm has been taking in 1,200 to 1,600 loads of dirt a day for some time.

NORTHWEST TERRITORY.

We make the follwing extracts from the official report of the evidence of Prof. R. Bell, F. G. S., Assistant Director of the geological survey, before the Committee on Immigration and Colonization :—

Q. What kind of timber is found there?—(James' Bay waters)—On the head waters of the Moose River, white pine is abundant and of good size. Red pine also exists and extends rather further north than the white. Then there is "Jack pine" or "cypress," or more properly the Banksian pine, which, though not a timber tree in its southern extension, becomes so in the northern region, which is its home. In the Albany region, I have seen large groves of this tree, quite different from the ordinary scrubby variety, and from which one or two very good saw logs might be cut. Then there is tamarack of good growth, and white spruce, cedar in the southern part, a great deal of white birch, and other trees, which will some day be valuable.

* * *

Q. If the navigation of Hudson's Bay becomes practicable, it seems to me, if there is much timber in that locality, it will be a valuable item of export. Perhaps you can tell us what the extent of the timber resources of these rivers that fall into Hudson's Bay are—whether there is likely to be a large export of timber from that region?—The Moose River, which is perhaps the most valuable for timber, has some, perhaps twenty principal branches that spread out and cover a transverse area of more than two hundred miles from the neighborhood of the Ottawa westward, to beyond Michipicoten valley. These join together and form several fine large streams running northward parallel to each other, and they unite to form the Moose, which falls into the head of James' Bay. The southern parts of these streams are clothed with white and red pine, and, as you go northward, you have good cedar, spruce and tamarac and the Banksian pine. The southern branches of the Albany also afford valuable timber; but northward of that, I do not think you could say the timber would be valuable for export commercially, as long as we have the other rivers to fall back upon. As to the limits of timber generally, I have paid a good deal of attention to the subject of scientific foresting, and have prepared maps showing the northern limit of every tree that occurs in Canada. The most northern species is the spruce, the limit of which runs from Seal River north of Churchill to the mouth of the Mackenzie River, or in a north-westward direction; and on the other side of the Bay, from Richmond Gulf up to Ungava Bay in Hudson's Straits, and down to the Straits of Bellisle. The whole country to the southward of that line is wooded.

Q. You speak of that being the northern limit. For a considerable distance south of that the timber would not be merchantable?—No. it is scrubby, but it becomes larger as you go south and westward. In my last report there is a map showing the northern limits of thirty of the principal trees. We have about sixty species of timber trees east of the Rocky Mountains and thirty west. There are 340 kinds of timber in North America, and we have ninety of these in the Dominion.

Q, There is a considerable quantity of good timber in that locality, is there not?—Yes, but after leaving the lake a good deal of the forest is burned in the neighborhood of the river.

Q. The Ontario Government hns sent a man to Lake Temagaming?—Yes, that discharges into both the Montreal river and the Sturgeon River. I have gone from the north shore of Lake Huron to James Bay by a zigzag course, following no particular course.

Q. Have you any knowledge of scientific forestry?—As I mentioned before, since 1860 I have paid a great deal of attention to that subject. In that year I published a statement of the limits of the trees and shrubs, particularly in regard to Lake Superior, and wherever I have gone since then I have noted the species of trees existing and tried in every way by information from travellers to ascertain what the exact northern limit of each kind is. I think now they are indicated on my maps so that the lines can be depended on as nearly accurate. This is of great interest and importance, because it shows the limit of our wealth in timber, and is a valuable indication of climate, and also, because the distribution of trees suggest some important geological problems.

Q. Have you noticed the map showing the northern limits of some kinds of timber prepared by the Interior department?—It was a very bad copy of a temporary manuscript map of my own.

Q. It is not true as to the northern limit of some timbers in Ontario?—No, not strictly true. I have altered it in some places since that copy was made.

Q. White oak occurs 100 miles further north than is shown there!—Yes, to the northern end of Lake Temiscamingue.

Q. If a country was denuded of its timber by fires, what effect would that have on the climate and rainfall?—If it was entirely denuded, it would have a considerable effect, but if it is only denuded in comparatively small areas each year, the average rainfall remains the same.

Q. In a series of years the aggregate effect would be cumulative, I suppose?—Yes, the effect of one year would influence the next year and so on.

Q. Do you think it is because the timber is getting limited that the streams are falling off, because there is nothing to hold the water and it rushes down more rapidly in the spring, and in the summer gets lower?—Where a great deal of clearing has been done, as in parts of western Ontario, it has that effect. Perhaps the aggregate rainfall does not differ, but the water flows off rapidly and is over, whereas formerly the trees shaded the ground and otherwise retained the moisture.

Q. It is not so much that the timber is being stripped?—Perhaps that influences the rainfall to some extent, but another reason is, that the water runs off more rapidly from cleared land than from forest land. Every log yiel across the little streams in timbered land helps to keep the water back.

Q. Is not the rainfall much less on the broad, open prairies—at Moose Jaw, Regina—and so on, than in Manitoba proper?—I think it is considerably less.

Q. How do you account for that?—It is owing to the country being denuded of its timber?—Its elevation has something to do with it, and probably the currents of air that bring the moisture from the south cannot precipitate it till they reach a more northern latitude. The rainfall is not regular. You cannot draw regular lines on a map to represent it. It would be represented rather by irregular lines and areas.

Q. You think it more influenced by currents of air than by the timber limit of a country?—Both will affect it, When heated air, bringing a large vuantity of moisture comes to a country, it may be induced to precipitate the water in the way of rain from different causes chilling it. It has been found so in Europe. The higher mountains and the proximity of cold lakes condense it, while the heat of an extensive bed of sand will prevent it condensing, The heat from the ground keeps the moisture in suspension in the air, and it is carried on.

Q. Do you believe the planting out of the timber in those regions of the Northwest which are now timberless would improve the climate? It would increase the rain probably, but is a problem whether timber would grow there. Where it does not grow naturally, it is doubtful whether it would grow at all. In approaching the open country the tree lines do not end abruptly as if the prairie country had been cut out by fire, but tend southward before they reach the beginning of the prairie, and are replaced by western species, showing that the present condition of things has existed for an immense length of time.

Q. Do you imagine that on our treeless prairies of the west, it is impossible to cultivate forests?—Some worthless trees for timber like willows or cottonwood would grow, but they would never amount to much. Coniferous trees and hard woods, I think, will never be induced to grow permanently where they are not found naturally,

Q. That would limit very materially the utility of the science of forestry?—To that extent. But it has to do with keeping up the existing forests.

Q. The greatest arguments in its favor have been used by the people of the Western States as to the planting out of trees?—It is to be hoped they will succeed, but it is very doubtful to what extent, I think, as yet. It is very hard to alter the face of nature. Generally the condition of things we find existing is what has long existed and must continue to exist. Otherwise we should find a greater tendency to change.

FORESTRY SCHOOLS.

So much interest has been excited by the recent discussions on the subject of forestry and by the fact that England alone of all European nations possesses no school of foresty, that the following resume of those now in operation on the continent may be useful. Austria heads the list with nine schools—viz., the Imperial High School of Agriculture and Forestry at Vienna, with 6 professors and 329 students; the Eulenberg school, with 6 professors and 50 students, the course lasting two years; the Weiswasser school, with 5 professors and 80 students; the Lemberg school, with 12 professors and 50 students; the Aggsbach school, near Melk, with two professors and 24 students; the course of forestry in the technical high school, of Gratz; the Syria Forest Culture school, wirh three professors and 26 students; the Carinthia school; the Vorarlborg school. Prussia has three institutions, commencing with the Royal Forest academy at Neustadt, Eberswalde, with a director, 14 professors, and other assistants. The course is two and a half years, and the number of students about 67. The Munden Royal Forest academy has a director, 10 professors, and 78 students, The Forest school at Groose Schemebeck and the forestry courses to the army forestry battalion are for the training of lower forestry officials. At the former school are 4 professors, at the latter 11, all of them practical foresesters. Saxony has an excellent forestry academy at Tharand, with ten professors and assistants. In Wureemburg instruction is given at the Royal Agricultural academy at Hohenheim and the University of Tubingen. In Baden the forestry department of the Carlsruhe Polytechnic forty students. Bavaria has a forest academy at Aschaffenberg, with a director and seven professors, in addition to which are six chairs of forestry in the University of Munich; Hesse Darmstadt has a forestry institution attached to the University of Geissen; and Saxe-Weimar has possessed one since 1808, with a director and four professors. In Switzerland the department of forestry forms the fifth division of the Federal Polytechnic school at Zurich, in which are thirty students. France possesses a school of forestry at Naney, and one of the forest guards at Barres, in addition to several agricultural schools and agronomic industrial school, in which forestry is taught. Russia has four schools—viz., the Agricultural and Forestral academy at Petrovsk, near Moscow; the Agronomic institute at St. Petersburg, with courses in silviculture; the Forest school at Lissino, and the forest division of the Agricultural institute at New Alexandria. There is an Italian school of forestry at Vellombrosa, a Spanish school of forest engineering, at Staff Lorenzo del Escurial, near Madrid; a Danish school, attached to the Royal Veterinary and Agricultural college at Copenhagen; and a Swedish forest institute at Stockholm, besides thirteen private elementary school. In the United States forestry is taught in the state agricultural college at Lansing, in Michigan state, which possesses a good labelled arboretum and a large collection of native and exotic trees under cultivation. Great Britain alone, which needs more attention than any other country in the preservation of what forests she has left, possesses no school whatever.—*London England Times.*

"THE SAGINAW OF THE WEST."

A correspondent of the *Northwestern Lumberman* says:—"The town of Selkirk is situated on the Red River, 22 miles from the city of Winnipeg and 25 miles from the mouth of the river in Lake Winnipeg. The town site is the most magnificent in this part of the country. The town claims at the present time the most beautiful park in the Northwest, and is already becoming famous as a pleasure resort, since the Canadian Pacific Railway opened its line on the west sides of the river. Week after week brings train loads of excursionists in search of pleasure, everybody going away well pleased with the place.

The town contains about 2,500 inhabitants, and at its present rate of growth will more than double that number in two years. Almost every nation of the globe is represented here, and all are prosperous, Costly residences meet the eye on every side, and that the people are satisfied with their prospects is shown by the look of contentment that rests on every face. This is a very peaceable place, the policemen are almost unnecessary, and our police court is very seldom used. Selkirk boasts of all the modern conveniences and luxuries. Its attractions are various. Just outside the town is situated a fort of ancient times, looking grand in its decay, a rare spot for the brush of an artist. North of the town is situated the great St. Peter's Indian Reserve, and at every hour of the day you may see the aborigines coming into town with their wagons loaded down with game and fruit, with which the country abounds. Some live by hunting and fishing; others are wealthy farmers. In appearance they are repelling, being of coarse and swarthy features and with jet-black hair. Men and women alike wear long hair, plaited and hanging down to their waists, though some of the wealthier ones are very stylish.

There are six steamers plying between Selkirk and points on lake Winnipeg, chiefly employed in the lumber and timber trade. The Northwest Lumbering Company's mill is the only one in Selkirk. They manufacture all kinds of lumber, rough, dressed and matched, lath and shingles. Their logs are obtained from Lake Winnipeg and its tributary rivers, and towed up the Red River. They have also a mill on Lake Winnipeg, where there are five mills and one shingle factory, all owned by different lumber companies. The Selkirk company contemplate buying a steam tug for their own use in the spring. The officers of the company are Alex. Moffat, president, and T. H. Carman, secretary and treasurer.

All the lumber, lath and shingles from lake Winnipeg comes to Selkirk to be shipped further west by rail. North of lake Winnipeg it is wooded country, covered with dense forests; white pine, spruce, tamarack, oak and poplar being the principal varieties. It also boasts of some fine cedar valleys along its rivers. There is a ship-yard here, building barges to meet the demands of the lumber traffic. Selkirk is destined, at no distant day, to be the Saginaw of the West. It has, also, other advantages. The country to the northeast and west is a magnificent farming and stock-raising country. Already several stock ranges have been started in this vicinity. There are three large brickyards in full blast here, and a stone-quarry to supply the building stone for our western cities. We have railway communication now on both sides of the river. A ferry at present serves for transit across the the river, between the east and west parts of the town, but negotiations are afoot for the construction of a railway bridge, which will add largely to our commerce."

INTERNATIONAL FORESTRY EXHIBITION

We have already stated that an International Forestry Exhibition is to be held at Edinburgh next year. A short time ago the Executive Committee of the International Forestries Exhibition, now open in London, resolved to hold an International Exhibition of Horticulture, Floriculture and Forestry at South Kensington in 1884; but representations having been made to them by the Lord Provost of Edinburgh, on behalf of the promoters of the proposed Forestry Exhibition, in which it was pointed out the simultaneous holding of two such Exhibition would prove materially injurious, they decided to postpone it for a year. Consequently, the Edinburgh Exhibition will not have a rival.

The Edinburgh *Courant* announces that Her Majesty the Queen has been graciously pleased to extend her patronage to the Exhibition, and it is also to have the patronage of important public bodies and a large number of noblemen and gentlemen in different parts of the country. The Executive (the Marquis of Lothian being president) are now issuing their programme and classification to Foreigu Ambasadors, Colonial Governors and others, requesting their co-operation, assistance, and suggestions. The same journal learns that from communications which have already taken place, there is every reason to believe that the wishes of the promoters will be cordially responded t , and that the Exhibition will come up to thei most sanguine expectations. The *Courant* says the exhibits have been arranged into eight classes, as follow:—Class I., Practical Forestry; Class II, Forest Produce, raw and manufactured; Class III, Scientific Forestry; Class IV., Ornamental Forestry; Class V., Illustrative Forestry; Class VI., Forest Literature and History; Class VII, Essays and reports; Class VIII., Land Collections. It is pointed out that under the first-class are included implements and tools used in forestry, draining, enclosing, etc.; and also surveying instruments and appliances; models of foresters' huts, charcoal kilns, timber slips, slnices, dams and weirs; plans of river embankments, rafts and appliances for floating timber; models and machinery for transplanting timber and transplanting trees; sawmills—wood-working and pulp machinery in motion or otherwise; and fencing materials. The Forest Produce Class will embrace specimens of woods, whether adapted for general utility or only purposes of ornament. and whether they are of homc, naturalized, or foreign growth. Included are woods for railway purposes and pavements, carving or basket work, and all tanning and dyeing substances, drugs, spices, charcoal, peat, cones, seeds, and fruits of trees. shrubs, etc. In Class III., that of Scientific Forestry, are included botanical specimens of forest flora, microscopic sections of woods, parasites—fungi and lichens injurious to trees, forest fauna, injurious to woods, entomology—useful and noxious insects and damage produced, preservative processes applied to timber, geological specimens and diagrams illustrating the different formations adapted to the growth of trees, fossil plants, trees found in bogs, etc. Growing specimens of rare and ornamental trees and naturalized species—in tubs or otherwise, and rustic work—arbours, bridges, seats, &c., will find a place under the class for ornnmental forestry; while Class V., to which special attention is invited, will include paintings, photographs and drawings of remarkable and historical trees; foliage and scenery; delineations of trees in their native countries or of recent and important introductions; illustrations of photographs showing effects of blight, accident, or any abnormal condition, including that of parasitical plants; and sketches of work and operations in forests. The forest literature and history class is intended for publications of all kinds on forests; and also (to which special attention is invited) working plans of forests, and plantations on estates, valuations on estates, etc.; and maps, charts, etc., illustrative of the geographical distribution of forest trees, and their altitude. Premiums are to be offered for essays and reports on different subjects.

The Exhibition will afford Canada another favourable opportunity of displaying specimens of her chief sources of natural wealth, for which purpose Parliament may be requested to vote a sum of money.—*Ottawa Citizen.*

WILL THE CUT BE CURTAILED?

That a curtailment of lumber operations in the woods is the great desideratum for the season which is just about to commence will not probably be disputed. No man who understands the situation or has given the subject anything like a thorough consideration will for a moment attempt to question the excellence of such a policy on the part of the manufacturers. The law of supply and demand in the lumber trade, like every other business may be considered an unfailing barometer as to prices and profits, and if the supply can be kept in the slightest degree deficient, little apprehension need be felt for the prosperity of the industry; at least every manufacturer may rest assured of remuneratiou for the business performed. But the desirability of a certain line of action on the part of a large body of business men does not always secure the much needed concert of action. Lumbermen being generally very similar to any other class of business men, their movements are generally governed by their pecuniary interests. Besides the lumber industry is of such enormous proportions, and its ramifications extending "into the uttermost parts of the earth," any concerted movement becomes decidedly uncertain, if not impossible. Movements inaugurated during the past season, also, in regard to railroad shipments from initial points direct to the distributing points, is destined to work almost a complete revolution in the trade so far as any dependence of one section for its stock on the ability of another section to supply is concerned. It will, therefore be seen at a glance that any concerted action on the part of the manufacturers of Wisconsin to control prices on the law of supply and demand might easily be thwarted by their brethren in Michigan who are engaged in the same line of business, and *vice versa*. However much may be the desirability, therefore, of a curtailment of operations, the cupidity of human nature usually governs individual action regardless of the general interest; and it is not surprising to learn that large manufacturing concerns are constantly increasing their capacity not only by additional motive power and machinery, but are also erecting new works more adjacent to the timber limits under their control. If the present capacity for output could be simply maintained without increase, the lumber business might be considered beyond the reach of disaster because of the continually increasing demand through the influx of population in the west and northwest, as well as by the natural growth of thriving cities in the east. The south also is just awakening to an era of increased prosperity which will doubtless very materially increase the demand; but there is a positive and absolute certainty that the latter will be at once met by drafts on the magnificent forests in the southern states, which precludes any advantage to the trade in that direction.

The absolute and unvarying certainty of the law of supply and demand may be understood by an examination of the business the past season. The low percentage of first-class lumber, not only in the Saginaw valley district, but in every other direction where manufacturing is extensively engaged in, has kept the demand urgent and prices unwaveringly firm; while the great percentage of coarse lumber at every point has depressed the market, weakened prices, and otherwise injuriously affected the trade in that class of stocks. But with these recent facts staring the manufacturers in the face, it is very doubtful if the policy will be generally adopted of curtailing operations providing it should prove a favorable winter for logging operations. Notwithstanding the fact that we see the opinion generally expressed in our exchanges that there is to be a general curtailment, it is quite probable that "the wish is father to the thought." In support of this opinion, we may refer to the Saginaw *Courier* as an illustration. In a recent addition of that generally reliable sheet on matters pertaining to the lumber business, it expressed the opinion that there is to be a very material reduction in the coming winter's crop of logs; and as if in refutation of any such probability it states that signs were posted all over that city of "Men wanted for the woods." When we take into consideration the fact that it is barely time for the first notes of preparation for a war on the giants of the forests, and that men are thus eagerly sought after, it cannot be considered as very assuring that the cut of logs is liable to be very materially curtailed, providing the clerk of the weather does not lend his aid in that direction, however desirable such a policy may be.—*Lumberman's Gazette.*

FULL OF TIMBER.

The *Timber Trades Journal* says:—It is amusing sometimes to look back at the old trade predictions and compare them with the state of things as they turned out afterwards. The *Standard* newspaper, ten years ago, accurately described the state of the timber trade in England at that date. But its views of the course which supply and demand were bound to follow have been sadly, or perhaps we should say fortunately, negatived by the course of time. In 1879, six years later, prices were lower than they had been in 1872, and spruce was sold in Liverpool in the latter part of the summer of that year at about £6 per standard by the cargo, and it is not even now a paying commodity to import, as the supply is too large for the demand, though a better state of things is shortly looked for. As to the anticipated difficulty of getting supplies from northern Europe, we need only refer our readers to the present state of the market. The problem of the day is how to restrict them to moderation.

With these introductory remarks, we reprint from the *Evening Standard*, of the 7th February, 1873, the following paragraph, which has

something of the nature of a curiosity about it now:

"Rise of Prices in Baltic Wood.—For some weeks there has been an enormous rise in the price of wood in the north of Europe, recalling that which occured at the end of the year 1853. Taking for a basis the prices current at the beginning of 1872, the increase already amounts from 30 to 60 per cent. in Sweden, and 20 to 50 per cent. in Norway, varying according to description and qualities, and from all accounts we must expect from day to day still higher prices. That the price of wooden goods would infallibly advance in Sweden and Norway had been for some time expected, in consequence of the continually increasing distance of the forest districts from the coast, the difficulties always arising in cutting for sale and transporting the wood from the forests to the saw mills, the enhancement in value of the forests in growth, with the expense of maintenance and manufacture, and especially from the enormous increase of exportation to various countries, an increase which has now assumed such proportions as to exceed greatly the most favorable anticipations of the growers in the north of Europe. We must add that a belief prevailing in the Scandinavian countries that the total production of wood, however much it may be increased in 1873, will not in the presence of such numerous inquiries, suffice to meet all requirements, still exercises a certain influence, and tends to exaggerate the demands of sellers. At any rate, it is evident that unless the full prices asked are paid importers will not be able to get a single cargo for the opening of the coming season."

It seems so natural that as timber, which takes a lifetime to grow to merchantable size, but may be cut down in a few minutes, should become scarcer and less accessible, as the enormous demand for it increases, that the argument seems unassailable. But the facts of the day which are immediately before us demolish it altogether. In spite of all that has been and is done to destroy and consume the forests of Europe and America, the world is full of timber till.—*Timber Trades Journal.*

THE AUSTRALIAN TRADE.

Messrs. Gemmell, Tuckett, & Co.'s lastest report, dated Melbourne, July 30th, says:—Deliveries from the store-yards have been above the average at this season of the year, indicating that a large consumption is still going on. Had shipments to this market continued on a moderate scale, there is no doubt prices would have continued remunerative to shippers; but the excessive quantities of t. and g. flooring, lining, and weatherboards from the United Kingdom, and advised coming forward from Norway, have had a most depressing effect on prices for these lines, and dealers now will only purchase for their bare requirements. American lumber.—Sales ex Emily F. Whitney, Cashier, and Minnie H. Gerow. Prices realized fairly sustain last months quotations, white pine shelving being quitted at £10 2s. 6d. to £12 2s. 6d.; dressed 1 in. clear pine, £15 15s.; Michigan clear pine, 1¼ in., £12 17s. 6d.; 2 in. £15 15s. to £15 10s.; 3 in., £16 to £15 15s.; 4 in. £16 2s. 6d. to £16; 10 in. w. p. t. and g. ceiling, £8 2s. 6d. to £3 17s. 6d per m. ft. super. Stocks held by the trade are moderate. The cargo ex Monarch, DOM brand, is advertised for sale by auction on 10th proximo, and should realize an advance on late rates. Most of the trade, however, hold stocks sufficient to carry them on until the new season's goods arrive.

Messrs. C. S. Ross & Co. in their report say:—The sales of building materials have not been equal to the usual average per month, and prices for some lines are lower. The demand for consumption is reported to be much lighter than that of the previous month, and as the weather is not favorable for building operations the deliveries will not be large for the next quarter. Sales have been well attended, but the trade being heavily stocked the bidding has not been brisk, and a considerable portion of the offerings has been withdrawn. The stock of timber in hand is far heavier than usual at this season, and unless shipments cease very low prices must result. The arrivals have been the Blair Hoyle, Loch Vennachar, Mylomene, Eaton Hall, Mermerus, Miltiades, Cuzco, Glenmorven, Kent, and Catania, from the United Kingdom, with flooring, red deals, &c.; Minnie H. Gerow from New York, and Scottish Prince from Boston, with spruce deals, &c.

THE PACIFIC COAST.

The San Francisco *Journal of Commerce* speaks as follows of the Pacific coast lumber business.

But very few of the people of the Pacific coast, unless it is those directly interested in it, are aware of the immense importance of the lumber trade, On Stuart street, from Market to the Pacific Mail dock, are seen lumber yards, and here and there are seen vessels unloading lumber at the wharves, and this is all, but these piles of lumber, these modest little coops of offices represent thousands upon thousands of acres of land, millions upon millions of capital, giving employment to thousands upon thousands of hands, all the way from Santa Cruz on the south to Alaska on the north. Here are represented, with few interruptions, a chain of forests of valuable timber—mines of treasure to their owners—mostly all owned by San Franciscans, operated from here, furnishing the people of almost the whole world with valuable lumber. This chain or range of forests begins with a span at Santa Cruz, and expands in Mendocino and Humboldt counties, widens into vast forests of white pine in Oregon and Washington Territory, and finally terminates in a wilderness of timber in Alaska. The magnitude of this great interest becomes apparent on investigation. White-winged vessels are silently arriving, bringing to San Francisco a portion of the treasure secured from these forests. There is no speculation in this trade, no digging and delving in dark holes for hoped for treasure; the forests are there, the lumber is needed, and the product is sure. The lumber business of the Pacific coast takes rank where it justly belongs—alongside of her wheatraising industry.

California produces immense quantities of redwood, the only section on the known globe where this useful and even ornamental wood can be found. Herc laurel equals the far-favored mahogany, while the sycamore is becoming known as a most useful and ornamental wood. Puget Sound and Oregon furnish pine and cypress, and all these woods are found in apparently inexhaustible quantities. In fact it is stated with, we believe, the utmost fairness, that the thirty years' consumption of lumber on this coast has so far made no preceptible impression upon our immense forests, and that not one-fiftieth of our lumber has been touched. It is asserted by some, but denied by others, that the redwood and pine on this coast will reproduce itself in thirty years, but be that as it may, there is no danger that the supply of lumber on this coast will become exhausted in the lifetime of our children, or our children's children, and the development of the lumber interest, the new forests opened, new mills erected, new markets for their product found, will afford ample opportunity for the safe investment of capital for years to come. In fact the lumber interest of this coast is in its infancy; we are but at its threshold, and its possibilities cannot be foretold. In it at the present day are men who have grown gray in the service, but we can safely say they are men of honor, honesty and probity; they are men who have assisted in developing and expanding one of the greatest interests of the coast, and they are entitled to every praise for their indomitable energy, and are to be congratulated upon their success.

Erie Canal Trade.

The Tonawanda *Herald*, dated September 27, stated that an immense fleet of Western barges arrived the Sunday and Monday previous. lumber laden, with the docks already well filled because of the recent scarcity of canal boats. Freights went up a quarter, and the rate paid all week so far has been $2.75 to Albany and $3.50 to New York. This, with tolls off, is $1 better than this time last year, and the boatmen are as happy as clams at high tide. No waiting for loads, and everything serene. Those who get loads now have cause to feel glad the coming winter.—*Northwestern Lumberman.*

THE COARSE LUMBER PRODUCT.

A prominent and long time lumber commission dealer, of East Saginaw Michigan, has expressed his deliberate opinion about the condition of tho lumber business in eastern Michigan, which brought out some points worthy of comment. Among other reasons for the existing depression in the lumber interests of Saginaw valley and the Huron shore, this commission man said that Norway lumber had gone so low that there is no margin on stumpage, some sales of lumber having been made at an actual loss of $2.68 a thousand. This decline of Norway stock, he says is a clear case of over-production. The figures of last year, and those of the present, on this stock, were too high to stand the strain of the load of product that was put on the market. That is the reason why so much Huron shore Norway has been coming to the Chicago market this season, and why dry dimension of this description has sold from $9 to $10 when green east shore white pine was selling for the same money. Taking into consideration the difference in freight between Bay City, Tawas, An Sable or Alpena, and east shore ports on this lake, and the difference of $1 a thousand between dry and green lumber, Norway dimension has virtually sold on this market the present season at $1.50 less than white pine stock.

Added to the overproduction of Norway in eastern Michigan, is the unwonted accumulation of coarse white pine, which has been held too high for the market demand, and has thus remained a drug in the hands of holders. The larger portion of this coarse stock at Saginaw goes to Ohio; but dealers in that state this year have largely refused to take it, because they considered prices were too high. Consumers have turned their attention to poplar, whitewood, and other varieties of timber native to the state, and production of these kinds of lumber have thus been greatly stimulated. Tennessee, West Virginia and Kentucky have also been drawn upon for supplies. Poplar, especially, has been used to a surprising extent as a substitute for pine.

While coarse pine in Eastern Michigan has become a burden to movement, good lumber is in demand in excess of supply. This class of stock goes mostly to Albany and the East. But while it is very gratifying to the manufacturers and handlers of good lumber to know that such property is "good as tho wheat," and is in no danger of a decline in price, it is less pleasant to contemplate its rapid decline in proportionate quantity. The commission dealer referred to is of the opinion that the average stock of Saginaw river lumber does not contain a tenth as much of the upper qualities as it did five years ago.

The growing scarcity of good lumber has led the Saginaw manufacturers, as it has those on the western side of the state, to conclude that coarse stock must be worth proportionately as much as the higher grades. This feeling no doubt grows out of the fact that it costs as much to log and manufacture the poor product as it does the good—and perhaps more, when the relative value of stumpage is considered. But it should be borne in mind by the saw-mill owner that the merchants and consumers will have their say about the value of coarse lumber, as they have this year. They will not continue to take all the coarse stuff the manufacturers may offer, and at prices that the latter may wish to realize in order cover costs and afford a profit. As was seen before in the *Lumberman*, the price of inferior lumber cannot be forced above a certain point. Clear pine may one day be worth much more than now in this market, while second common may not be worth more than it is to-day. The reason of this is found in the fact that the common uses of coarse lumber do not admit of prices above a certain range being paid for it. Besides there is an abundance of substitutes for coarse white pine, such as the poplar and whitewood of tho middle and southern regions of tho country, the basswood and hemlock of the North and Canada, spruce, Norway pine and the mountain pine of the Rockies. Railroad facilities for reaching sections where all these timbers abound are being extended, and distribution is becoming constantly easier and cheaper. The Saginaw manufacturers are already beginning to realize the competition of whitewood and poplar in Ohio and Indiana. Choice pine lumber may vault upward, but a poor quality must always sell for a moderate price until the supply is exhausted. Owners of stumpage might as well figure of this basis from now out.—*Northwestern Lumberman.*

BIG TIMBER.

The California *Architect and Building News* has the following: Hundred of visiting Knights Templar had an opportunity, while in this city, of seeing two of the largest pieces of timber that ever passed through the hands of the mill men. It was amusing to hear the remarks, and watch the various changes in the different countenances caused by a survey of probably the finest pieces of timber that was ever sawed. One piece is 144 feet long by 18 inches square, and contains 3,456 feet of lumber. For over 100 feet there is no knot that a five cent nickel would not cover, and in the whole piece of timber the largest knot can be covered by a half dollar. It is wonderful that a stick of timber of the size given should be so remarkably clear of knots. Its companion is of the same length, 16 inches square, and contains 2,352 feet. When it is taken into consideration that tho tree from which the first mentioned piece of timber was taken was cut several feet above the ground, and that 150 feet from the cut made to foll the tree it was of such a size as to enable the mill man to saw the log so as to produce a piece of timber of the size given, one can imagine the size the butt must be, and partly comprehend the amount of labor required to handle such an immense stick. It costs about one-half more to land in our wharves a stick of timber of the size mentioned than it does of ordinary lengths. These pieces of timber were sawed at the Port Blakely mills, Washington Territory, the owners being Renton, Holmes and Co., the well known lumber merchants of this city. A short time ago there was received in this city a stick of timber 104 feet long, 24 inches square, and almost free from knots. After its arrival here it was allowed to be on inspection for a short time, when it was taken to one of mills and sawed into joists, as the purpose for which it was manufactured was given up and no use could be found at the time for a stick of timber of such largo dimensions.

CALIFORNIA REDWOOD.

The San Francisco *Bulletin* says:—J. D. Walker, of the firm of Falkner, Bell Co., is among the overland passengers announced to arrive in this city. This gentleman for the past two months or so has been on a visit to Scotland. During his absence he has successfully negotiated the transfer of a large area of California timber lands, for a sum aggregating between $1,500,000 and $1,750,000, to a recently organized corporation in Scotland known as the California Redwood Company, of which it is understood the firm of Falkner, Bell & Co. will be the representative agents on this coast. The purchase embraces land, mill, tugs, embarcaderos, and other incidental accessories to the general lumber trade. The main object of the new enterprise is to meet the demand that is developing at Eastern and European capitals for the fine redwood lumber for interior house finishing and ornamentation. Woods, like everything else, it is to be presumed, have their ages or periods. One generation will use nothing but mahogany. Another give walnut the preference. Laurel, rosewood, and oak each come more or less in prominence as caprice or fashion may require. It is only of late that outside attention has been given to the products of the Pacific coast, and California redwood has rapidly gained favor among those by whom the study of fancy woods is accepted as partaking somewhat of æsthetic character and taste.

In the whole world there are no known redwood forests outside of California. Carefully prepared official estimates give the quantity at 25,825,000,000 feet, and this amount is comprised in the coast belt that extends from Humboldt County, just below the Oregon line, down as far south as the Mexican border. It it a significant fact, however, that one-fourth more finished lumber, suitable for interior house-work, can be obtained from Humboldt timber than from timber grown from any other county in this State. This circumstance may account for the investments of the California Redwood Company being confined to Humboldt County. Unlike many other kinds of trees, redwood stumps can be utilized to profitable advantage. For veneering purposes slices from these stumps are said to be highly prized, and may probably in time prove almost invaluable.

The capital stock of the California Redwood Company is nominally £900,000 or about $4,500,000. There are 90,000 shares of £10 each, of which 60,000 shares are classed as preferred and 30,000 shares as ordinary. One-half of the stock—say, $1,225,000—has been paid up in cash. It is understood that debenture bonds will also be issued to the extent of £450,000. The prospective calls for land area approximating some 70,000 acres, though probably 50,000 acres will more nearly represent the land involved. From advanced sheets of the Census Bulletin issued by the Government we are able to give the total amount of redwood in California, measured by sections, as follows:

	Feet, Board Measurement.
From Oregon boundary line to Redwood Creek	800,000,000
Redwood Creek to Mad River	9,000,000,000
Mad River to Eel River	2,145,000,000
Eel River to Mattole River	4,450,000,000
Mattole River to Cotonana Creek	200,000,000
Cotonana Creek to Russian River	7,630,000,000
Santa Cruz Region	1,550,000,000
Total	25,825,000,000

It is considered as somewhat remarkable that the redwood belt begins just below the Oregon line and stops just before reaching the Mexican boundary of lower California.

As it may be of interest to known how much redwood lumber is cut annually in this State, we give the quantity that is calculated to have been cut during the census year ending May 31, 1880, as follows:

	Feet, Board Measurement.
Sawed lumber	125,390,000
Shingles and stakes	26,380,000
Split railroad ties	23,265,000
Posts, &c.	12,900,000
Total	25,825,000,000.

HOW TO POSTPONE THE FAMINE.

The *Lumberman Gazette* of Bay City, Mich., says:—If there is absolute danger of a timber famine at any time in the future near enough to render it matter of interest to the people now on earth, it were well that measures were taken to avert it. That may be done in at least three ways. By the planting of forest trees and the care of forests, by the invention and use of substitutes for lumber, and by greater economy in the use of lumber and timber. Regarding the latter it may be said that there is wide field for the exercise of economy. The use of lumber by the Americans is wasteful in the extreme, and there is danger that the waste will continue as long as they are obtainable at the comparatively low prices now prevailing. Because wood is cheap, it is wasted in almost every use made of it. The smoke of its consumption for various purposes ascends by day and by night; in the city and in the country, from stoves, furnaces, bonfires, brush and log heaps. It is consumed in a great number of ways that might be abandoned. It is put into buildings where other material might be more economically used if the element of time were given its proper weight. It is put into bridges where iron would serve a better purpose and in the end prove cheaper. It is used in vessels, but may in time be supplanted by metal. A tremendous quantity is used for fences, which might be dispensed with to a great extent or built of earth or wire; and a vast amount is worn out by the hurrying feet of men and horses in sidewalks and pavements. That wooden pavements and sidewalks are extravagant compared with stone and gravel is no doubt true, although the lower first cost of wood leads to its very extensive use. It is also pleasauter to walk and drive on wood, and these considerations will no doubt prevail until timber reaches a price which will make it more immediately expensive than some other material. The waste of lumber in sidewalks, however, is enormous, even admitting the necessity and propriety of its use for that purpose. There are miles of sidewalk in this city, laid with plank, five and six feet wide when for all practical purposes they could as well be three and four feet wide. An immense saving might thus be effected not only of timber but of money. And if the plank were bordered with grass the appearance of the streets would be improved rather than injured, When the predicted timber famine shall begin to make itself felt there will be room for great savings in sidewalks, and perhaps somebody will invent a style of walk which can be more cheaply constructed of some other material. Then, perhaps sidewalks will not be so ruthlessly condemned as worn out as is the case now, and instead of common councils ordering new walks laid there will be more repairing of walks allowed and the great amount of half worn plank which now goes into bonfires or summer wood will be utilized until it is no longer available. Under the present extravagant use of the gifts of the forest, because timber is comparatively cheap, a dozen broken plank in a hundred feet of sidewalk will provoke the powers that be to order a new one built, and the half and quarter worn planks must be thrown aside to become the prey of the flames. This city is no exception. The same process of waste goes on all over the land, accelerating the approach of the lumber famine which is declared to be nearing. The abundance of the gifts of the forests lead to their wasteful use. An incredible amount of available lumber is cast of as valueless, because it has been once used, and the cost of saving and utilizing it would be too great. As timber advance in price as compared with labor, economy in its use in countless ways will increase, substitutes will be found, and the result may be that the supply will be so husbanded that, with the growth of timber under the impulse of forest cultivation the famine may be indefinitely postponed.

BOARD OF TRADE RETURNS.

In an article on the Board of Trade Returns for August, the *Timber Trades Journal* says: How the timber trade figures in these returns has now to be taken account of—a trade that has nothing to offer in exchange for its imports but hard coin of the realm. The cotton-mill owner who imports the raw material finds a market for the manufactured article in the very land where he laid out his money in the first instance, and thence derives a profit, but the foreign shipper looks to the timber merchants for money only, because, from the nature of the business, all it can be converted into is outside the requirement of the country from which the raw material comes, and of the eleven or twelve millions sterling drawn every year against it not a shilling need necessarily be spent in the United Kingdom. Thus a large increase in the importation of timber represents a decrease in our circulating medium to that extent, and we rather regret to see that the supply which came forward in August, on a not very animated market, was one of the largest for that month that we have on record. Only on two occasions has it been previously exceeded. In 1876 the August return was 1,059,520 loads, and in the following year 1,147,829. Nor has a million of loads since been reached in that or any other month (though six years have intervened) until the present season. Neither can we consider it less than a formidable irruption for the trade to bear up against, at a time when it is holding its own with some difficulty, as to the obtaining of a fair return for its outlay. Not that there is really any harm done yet; the short supply of the spring months, in comparison of last year, is not, even now, wholly effaced. We have still over 10,000 loads to the good; but when a single month has rolled in upon us within a small fraction of 175,000 loads more than it did last summer, some apprehension may reasonably be felt lest September should follow on the same lines and the 10,000 loads be so overwhelmed as to be hardly discernable with a powerful eye glass in the heap of excess next month.

There appears to be an unfortunate habit of reserve and reticence among the importers in the chief centres of trade, who seem to think their business is best conducted by letting their neighbors know as little as possible what their respective engagements are, and thus it happens that if the demand mends for any particular size or quality of wood in an outport, orders go forward for perhaps half a dozen cargoes of it from so many different firms, each ignorant of what the other is doing, and the result is that what

was in good demand a month ago may next month be an almost unsaleable drug on the market.

But the same men who are shy of inter-com munication with other members of the trade in their own locality are often frank and outspoken with those they meet away from home, and who are not concerned with the affairs of their neighberhood except remotely, and not at all in opposition. Then they give and take information freely, and not unfrequently obtain knowledge of what is going on in the very place they came from, which they find most valuable to them in its after application.

Is it not, therefore, very desirable that the trade should have some place of meeting, where everybody from the remotest confines of the empire can foregather to transact business and obtain from one or another all the information it concerns him in his affairs to known? But this brings us round to the subject of the importance of a Timber Exchange in London of a cosmopolitan character; but as that is we understand a subject on which we shall have occasion to write at full length in an early number, we must withhold our pen here. We are concerned for the moment only with the Board of Trade returns, and must not forget the Latin precept, "*Ne sutor ultra crepidam.*"

RAINY RIVER.

A Winnipeg *Times* representative had on Sept. 25th a conversation with Mr. T. Sheppard, manager of the Rainy Lake Lumber Co., at Fort Francis. Regarding the present supply of lumber Mr. Sheppard said:

"We have about 160,000 saw logs and 60,000 shingle logs at present rafted, this would represent if cut about 18,000,000 feet of lumber. On account of the destruction of our mill at Rat Portage by fire, we shall probably cut little if any timber during the coming season."

"What are the varieties of timber in the limits of your company?"

"The logs we have cut are all red and white pine of good quality. Hardwood, such as birch and maple, is scarce and of poor quality. White oak is the principal hardwood."

"What are the agricultural facilities of the Rainy River country?"

"It is, I think, about the finest district for farming purposes in the Dominion. The land is easily cleared, and is a very rich sandy loam with clay subsoil. A good many settlers have gone in this season, and a large quantity of grain—estimated at about 10,000 bushels, principally oats—has been raised. The Rainy Lake Lumber Co. are taking in a threshing machine this fall. The lumbermen will consume all the products of the soil for many years to come, a good market being thus provided for the settlers at their own doors."

"Is Fort Francis progressing?"

"The town now consists of about fifty houses. It is mainly supported by the Rainy Lake Lumber Co. and Hudson's Bay Co., both of which have large establishments there. We have a regular steamer once a week from Rat Portage now, and it is intended to put another on the route so great has been the traffic. The run is made in 24 hours, the distance being about 135 miles."

Mr. Sheppard left for his backwood home.

A LESSON FROM FIJI.

The following letter appears in the Toronto *Mail*.—Mr. Phipps drew his instructive examples from many quarters far apart, but I don't remember that he went as far as Fiji, and yet there too, where civilization has given us the last illustration of its blessings and its curses, he might learn. In the May *Contemporary*, Sir A. Gordon's article on "Native Councils in Fiji' contains the following.—"On one occasion a speaker, commenting upon the destruction of forests and the neglect in some places of the cocoanut plantation, ended by saying:—'The question is, who is to blame?' Roko Tui Bua at once rose, and with great dignity replied:—'We the Rokos, are to blame; the Bulis are to blame; the magistrates are to blame. We Rokos to often give an order and think no more of it. The Buli hears our order, and perhaps repeats it, but does not enforce it. The magistrate says, 'I cannot see that the law speaks of this.' Do you think they will send us yams and bananas and sugar canes from England? Is the government to plant our trees for us? If we are men, we have to live; we have hands; our fathers planted, and we too must plant, and our children after us. In many parts where there was formerly much water there is none to-day. *It is because the timber is cut down the land is bare the water dry.* I hear some say 'who ever heard of planting forest trees?' I heard of it; I have seen it done. I know of trees that have been preserved for years. Many will say, 'what folly! Do these trees bear fruit?' Well, what about your house? Is that built of fruit or wood?'" Bravo! So Canadians may learn from Fijians.

Yours, &c.,
JOHN CARRY.

Port Perry, Sept. 24, 1883.

A FAMOUS SHIP.

The London *Timber Trades Journal* says:—We have more than once made mention of the famous old New Brunswick built ship, Marco Polo, formerly well-known in the Australian passenger trade, and celebrated for her quick passages, having once made the voyage out and home within five months under canvas alone. Latterly, and for some years past, she had subsided into the timber trade, which has always been the *refugium peccatorum* of ocean-going ships, as they lose their character at Lloyd's, and are no longer considered trustworthy for general or perishable cargoes. After many vicissitudes and revivals the old ship met her fate at last on the coast of Prince Edward Island, in the Gulf of St. Lawrence, and the wreck and cargo were sold last week for the insignigcant sum of £600. Her cargo alone would be equal, if all there, to above 2,000 loads, as she was originally over 1,500 tons register. From the small price obtained, probably little but her sails and rigging with her ground tackle are expected to be landed, with probably some of the cargo, the cost of saving which may be nearly as much in a sea way as it is worth. All that can be saved from the wreck, if sound and good, will, doubtless, ere long be afloat again in some new colonial ship. The biography of the Marco Polo, if it could be fairly written, would be almost as interesting as that of the great traveller after whom she was named.

A NEW DEPARTURE.

Something novel among Maritime province ship-builders is announced in the St. John papers. Mr. McKie, a well-known Boston shipbuilder, has had constructed for him in St. John under his own superintendence for the most part, the frame of a 600 ton three-masted schooner. This material, when in shape, will be freighted to one of the yards in the vicinity of Boston, where it will be put together and the vessel completed. "The scheme is novel, and the more it is considered the more apparent its advantages become," the *Telegraph* goes so far as to say. What with rafting timber to American seaports and freighting vessel-timbers, New Brunswickers and Americans are becoming quite too previous.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

READER, if you suffer from any disorder of the Liver, Stomach, Bowels, Kidneys, Skin or Blood, try Burdock Blood Bitters, Nature's specific medicine for acting on those organs for the outlet of disease. 25,000 bottles sold in the last three months.

"LEAVES have their time to fall," says the poet, but Wild Strawberry leaves are on the rise just now, being utilized in such enormous quantities in making Dr. Fowler's Extract of Wild Strawberry—the infallible remedy for Cholera Morbus, Diarrhœa and other Summer Complaints.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., OCT. 15, 1883.

ATTENTION!

In view of a proposed change in the business relations of the proprietors of this Journal it has become necessary that they should insist upon an early settlement of all overdue subscriptions and accounts. As the present proprietors have been exceptionally lenient with their patrons in money matters, they trust their present appeal for a prompt settlement of their little bills will not be made in vain to any of them. Individually, it is true, these bills are not large, but when taken collectively they amount to a sum which renders it of importance that they should be converted into bankable funds without delay, even had not such a course been rendered absolutely necessary for the reason already stated.

THE manufacture of barrels, kegs, and all descriptions of wooden ware is about to be commenced at Montreal with a capital of $100,000.

THE Pope lumber mill, of L'Assomption, Que., an exchange bank asset, is under negotiation at a price said to be over $80,000. It cost them $75,000.

EDDY of Hull, claims to have the largest saw mill and the largest match factory in the world. The mills of Messrs. Perley & Pattie and J. R. Booth of the same city, each turn out 2,000,000 feet per week.

PROMINENT lumber merchants in Bangor, Me., are negotiating for the erection of a large steam mill on the shores of Silver lake, in that state. Into this lake the logs of 100,000 acres of heavily timbered land can be driven, and the sawed product can be loaded from the mill into cars for shipment to Bangor.

A KINDLING-WOOD company, called the Eureka Manufacturing Company, is being formed at Muskegon, Mich., with a capital of $10,000. The object is to build a factory near the mill of the Beidler Manufacturing Company to replace the one burned at North Muskegon.

OWING to the moderate views of log operators this season, it is predicted at Saginaw that the horse market this winter will be quiet in Michigan. Lumbermen have stock enough on hand to begin operations, and light operations from Canada, Ohio and Illinois will likely be the rule.

CALDWELL, the well-known lumberman and mill owner of Carleton Place, has 800,000 logs lying on the Upper Mississippi river and its tributaries. He cannot get them down on account of the decision in the McLaren-Caldwell case and his mill is at present idle for want of stuff to cut.

FIRST-CLASS wood-working machinery is being rapidly introduced into many sections of the southern states. Factories are springing up on every hand. On account of their superb timber growths, Kentucky, Tennessee, North Carolina, Louisiana and Arkansas, are the most favored localites at present. Saw mills, shingle mills, barrel and stave factories are busy and the number is rapidly increasing.

AT a meeting of the shareholders of the New Brunswick Land and Lumber Company (limited) held in Fredericton, the following directors were elected:—Lord Elphinstone, Hon. Isaac Burpee, Hon. Donald A. Smith, Sir John McNeill, George Stephen, Samuel Thorne, E. R. Burpee, K. Tod and O. H. Northcote. At a subsequent meeting of the directors Lord Elphinstone was elected President, and W. J. Whitehead, Secretary-Treasurer.

THE statement that shantymen were being offered $30 a month and board to go to the Michigan lumber regions is incorrect. Eighty-four men have left for Mackinaw to work for an American lumber company. They were hired for $16 per month and board. Another gang has been hired by the Diamond Match Company at wages averaging from $18 to $20 per month. The lumber business on the Ottawa and tributary rivers is being restricted owing to the slack market.

T. W. HASTINGS, of Mosher & Fisher, Bay City, Mich., says that his firm will curtail the log crop the coming winter at least one-half, and will put in but 20,000 feet and no Norway. Whitney & Remick will curtail one-half of their intended in-put. Judd, Clark & Co do not propose to cut a stick, and a number of large concerns propose to take in all the sail they usually carry. At the close of the season it is estimated there will be 300,000,000 feet of logs in the Tittabawassee booms.

THE Albany *Argus* says :—There has been a good attendance of buyers in Albany, who have purchased freely, although no exceptionally large sales have been reported. The transactions have been in all kinds of pine, which are firmly held, and the tendency of the market is toward an advance, which is rendered necessary by the high rates of lake and canal transportation. In Michigan and Canada the transactions have been only fair, Good and high runs are scarce and in active demand. There is a scarcity of vessels on the lakes and boats on the canal. Many of the latter have been freighting from here to New York and vicinity, but have now gone west again, and expect to make two more trips to Albany this season. Spruce and hemlock continue scarce. Recent rains have not been enough to furnish sufficient water in Northern New York to keep the mills in motion, but enough has been manufactured to keep a fair supply in the market, without any accumulation on the yards. Lath are coming in steadily, and are taken as soon as received. The stock of hardwoods is only fair, but continuous receipts keep an assortment in the yards, for which there is a steady demand. Shingles are in sufficient stock for the requirements of the market.

THE Lumber Manufacturers' Association of the Northwest have decided that log cutting should be curtailed, because the forests cannot stand the drain and the present production largely overstocks the market.

THE Hull correspondent of the *Timber Trades Journal* says :—This season has seen quite a revival in Quebec pine, some of the local firms have operated in it with satisfaction, although they have not touched it for some years.

A DISASTROUS fire occurred at Woodstock, Ont., on the forenoon of Sept 18th, completely destroying Pocock's planing mills on York street, together with a large quantity of lumber; the loss is about $10,000. Cain's printing office caught fire in several places.

THE Belleville *Intelligencer* of Oct. 9, says :—Five drams of timber, containing 160,000 feet, were forwarded from here on Satuday last, to Quebec, in tow of the *Bonar*. Four drams, containing 125,000 ft. will be sent from here on Saturday, to the same destination.

THE Belleville *Intelligencer* says that Messrs. Gilmour & Co. intend to cut 150,000 pieces on their timber limits this winter, 70,000 of which will be floated down the Moira. They now have about 100,000 pieces in the different streams of Hastings and Peterborough counties.

THE long pending suit brought by Messrs. George and Andrew Holland, to recover possession of certain timber and mineral lands in Portland township, Ottawa County, decided at Aylmer in favor of the plaintiffs. Some years ago the Quebec Government cancelled the title of Messrs. Holland and resold the land to Ross Bros., who are now compelled to pay costs and render an account of all timber taken from the land by them. The decision is an important one, as numbers of titles to land were cancelled at the same time as the one in question.

THE DESTRUCTION OF THE HEMLOCK.

The following lettor appears in the Montreal *Witness* :—

SIR,—I cut the following extract out of one of your late issues : "Canadian hemlock bark is to be admitted free of duty into the United States. We have cleared most of our forests pretty well of hemlock and in a few years more the freedom of so large a market will make tanning a lost art in Canada for lack of bark. Can nothing be done to protect it and to secure a continuance of so important a natural industry ?"

A remedy was once proposed by the Conservative Government, about 1872 or 1873, if I remember right, viz., an export duty on hemlock bark. The leading tanners had petitioned for an export duty on the ground that their important industry was threatened with destruction by the wholesale exportation of hemlock bark, and the Government introduced a motion to that effect, but allowed it to drop on account of the opposition of a few members in whose constituencies hemlock was still plentiful and whose constituents found it their interest to export the bark to the states. I remember the incident well, having supported the Government on that question. You remember that, in those days, protection was at a discount; no public man, Liberal or Conservative, dared to call himself a protectionist, and it was alleged that such an export duty would be rank protection. Now, under the National Policy, I suppose the Government will not be ashamed to protect our leather industry, even if, in order to do so, they must have recourse to protection. Absolute protection appears to me as contrary to common sense as absolute free trade, especially for a country like ours. Would it not be better to study our wants, apply either the one or the other of those systems to each separate case, as it will be found more advantageous. Such ought to be the aim of a true National Policy. In the case of hemlock bark, the United States appear to have found it so, when they deviate from their policy of protection to admit hemlock bark free of duty. Hemlock timber will, before long, become valuable, as pine and spruce are getting scarcer. It is well known that, in a great majority of cases, hemlock is now felled merely for the sake of the bark and the timber allowed to rot on the ground. Everything that encourages the export of hemlock bark tends to encourage that great waste.

H. G. JOLY.

Pointe Platon, Sept. 29, 1883.

ALGERIAN FORESTS.

The forests comprised in the colonized parts of Algeria include at the present time 14,000,000 of trees—viz., 6,019,011 large forest trees and 8,373,569 mulberries, resinous, and ornamental trees. According to the official returns there are 278.325 hectares covered with cork oak, 605,622 with evergreen oak, 42,742 with cedar, while the remainder of the forest area is occupied by the tree known as oak-zeen, Aleppo pine, chuya, wild olive, encalyptus, pistachio, locust bean, broom, etc. The majority of the cork trees are in the province of Constantine, fringing the coast of La Calle and Bougie. Here also grows the oak-zeen, peculiar to Algeria, which resembles the white oak, but has a leaf like a chestnut. Some of these trees, and especially in the forest of Skira on the Tunis frontier, grow to a colossal size and are excellent for shipbuilding purposes. The chestnut flourishes in the forest of Edough, near Bona, while the plains in the neighborhood of the coast contain elm and ash, and the river valleys willow, elder and poplar. The lower chains of the Atlas range are covered with evergreen oak, mingled with broom and sweet acorn oaks. On the ranges above are the thuya, Aleppo pine and maple, though these latter are limited in their localities, such as the Aures hills and the environs of Bathna, where the summits of the mountains are thickly planted with cedar. Toward the coast of the province of Algeria are the forests of Sahel and Mazafran, near Koleah, the latter possessing huge ash trees interlaced with the wild vine ; but the true forest country does not commence until we reach the Atlas mountains, where at the forests of Ak-Fordoun with very large oak-zeens, the forest of Beni-Menasser, consisting principally of wild olive the forest of Ourensenis, of thuya and Aleppo pine, and the venerable forest of Tenlet-el-Haad where the cedars are from five feet to eighteen feet in circumference and from forty-five feet to 100 feet in height.

BRITISH COLUMBIA TIMBER.

Mr. Alexander, of the National Investment Company, who recently returned to Toronto from a trip to the Pacific coast, gave some interesting notes of his experience to a reporter :

"The Douglas fir, sometimes called Oregon pine, is the principal timber exported. At the spikedriving on the C. P. R., the Governor of Washington Territory said that all the Oregon pine came from Washington Territory. He should have added British Columbia. The demand for that timber is increasing from year to year. There are dense forests of it around the Sound, and on the shores of British Columbia, but the most of the accessible limits have been secured. At Burrard's Inlet ten large vessels were loading, one mill running night and day. The destination of these cargoes were, London, San Francisco, Melbourne, Port Philip, China, and South American ports. The timber for San Francisco and Australia consisted largely of flooring, planed, tongued and grooved. The forests are not so liable to be burned by bush fires as in the east, except where they have been logging camps, the rainfall during the winter months being sufficient to keep the mosses and ferns damp, the sun's rays being excluded by the density of the forest."

THE UPPER ST. JOHN.

The Fredericton *Capital* says : On the Upper St. John, Hon. Mr. Randolph will cut about 10,000,000 feet, a reduction of about 30 per cent. on last year's yield, which he is understood to have sold at very good figures. Robert Connors, Wm. H. Murray's main man, who usually operates to the extent of from 15,000,000 to 20,000,000 feet, and who last season only cut 8,000,000, states that he will not realize more than half that amount this year. Last winter between 35,000,000 and 40,000,000 feet of spruce were harvested on the Upper St. John

and 65,000,000 on the Aroostook. Mr. Connors states that not more than 50 per cent. of these figures will be realized the coming season. Mr. William Richards believes that not more than 50,000,000 feet of logs will be harvested on the South West Miramichi this season, which is about 60 per cent. of an average yield. It is reported on good authority that Mr. Gibson will not operate to more than two thirds of his operations of last year, or about 16,000,000 feet. Hon Thos. F. Gillespie says that 40,000,000 feet of deals are awaiting shipment on the North Shore, and that operations will probably be light this season,

A Lumbermans' Library.

The *Lumberman's Gazette* of Bay City, Michigan, says :—Although most Michigan lumbermen are very considerate of the physical wants of their employees in the woods duriug the winter, they have heretofore paid very little attention to their mental culture, and any reading matter in the woods had to be secured by the workmen themselves. Stewart Ives, of Big Rapids, however, proposes to inaugurate a new era in this direction which is very creditable to his head and heart. He has made arrangements to furnish a number of the leading periodicals for his camp, and besides has furnished about 125 volumes of standard books as a library for the use of his men. This is a commendable act, and one which we hope to see very extensively imitated by other employers. We believe it will be productive of excellent results, in the improved morale of the men composing his working force. It is a subject at least worthy the consideration of every person employing a large force in the woods.

Tree Planting.

A despatch from St. John, N. B., as to the Dominion and Provincial Exhibition there, says :—"The fourth day of the exhibition witnessed a very large attendance. The judges in all the departments are making awards. The Historical Society, in honor of the centennial year, planted a large number of trees on Queen's Square to-day. The work was done by the eading citizens. The Lieutenant-Governor planted a tree in honor of the Queen, and Mr. Cushing one to the Prince Consort, Bishop Sweeney another to the Prince of Wales, the coadjutor Bishop to the Princess of Wales, Chief Justice Allen to Prince Victor, Sir Leonard Tilley to Prince George, Senator Boyd to the Princess Louise, and Mayor Holly, of Portland, to the Marquis of Lorne. The descendants of the loyalists planted trees in memory of their forefathers.

A Good Day's Work.

The William Hamilton Company of Peterborough have just been informed that the mill recently erected by the Georgian Bay Lumber Company at Waubashene, and for which they supplied the whole of the machinery has proved itself to have a capacity of 375,000 per day of twelve hours, which every mill man will admit is an exceedingly good record for mill containing but 1 large circular with steam feed ; 1 of Hamilton's Patent twin circulars with steam feed ; 1 Poney gang, with seven inch crank ; 1 Slabbin gang and 1 Stock gang. This record we may say is beyond the most sanguine expectations of either Mr. Hamilton or the proprietors of the mill, and is the best possible evidence of the skill and ease with which the Wm. Hamilton Company of Peterborough turn out their work.

Death of Mr. James Little.

MONTREAL, Oct. 6.—Mr. James Little died at his residence, Cote, St. Antoine, on Tuesday, October 2, in his 80th year, Mr. Little was long a resident in the Niagara District, Ont., and moved to Montreal about twelve years ago, to be in the vicinity of timber limits, where he carried on extensive lumbering operations until within the last few years. Mr. Little was the first person to make a really vigorous effort to arouse public opinion on the subject of the destruction of our forests, and contributed many articles on the subject to the press. His son has followed in his father's footsteps in regard to forestry. Mr. Little had a large circle of acquaintances in Ontario, where he was even better known than in Montreal.

TIMBER STEALING.

Timber stealing of all kinds, from that practiced by the impecunious householder who helps himself to fuel from his neighbor's fence or wood-pile to that practiced by men who count their operations by the million feet, has unfortunately been too common to excite much comment, but it is not often that the theft is attempted on so large a scale as is involved in a California scheme. The timber in question is located on Government lands in northern California and includes the most valuable redwood timber on the coast. The *modus operandi* consists in obtaining possession of the lands by means of applications signed by dummies. Several hundred of these applications have been filed with the government authorities, but it seems that some one has "smelt a mouse" and the grand jury is to investigate. If the scheme were successful, the promoters of it would get fraudulent possession of several million dollars worth of redwood—one sixth of the total lumber supply of the state. It is to be devoutly hoped that they may be frustrated in their clever project.—*Lumber World.*

Timber for Dakota.

The Northern Pacific Railroad managers are trying to ascertain the kind of timber that will best grow in Dakota and Montana, along the line of the road. Much of the timber planted in northern Dakota under the timber claim law has proved a failure, because the trees were not adapted to the dry soil and climate. The Northern Pacific men in interest think that the country can abound in trees if the right kinds are planted.—*Northwestern Lumberman.*

Lumber for Railways.

The New York correspondent of the *Northwestern Lumberman* says :—Some of the journals make a big hue and cry about the decline of railway interests, but the consumption is really enormous with them. Car stuff, ties, timber and lumber is used in large quantities. Conversing with Mr. Hageo, the purchasing agent of the Delaware, Lackawana & Western Railroad Company, I was informed that between 1,000,000 and 2,000,000 feet of lumber and timber was at the present time being used in construction and improvements in Buffalo, N. Y., while 250 carloads per month were being used in and about the coal mines worked by the company. And it is a positive fact that the lines centering at this place are doing more business than ever before in every variety of transportation.

THE *Lumberman's Gazette* says :—Reports reach us that the shingle cut at Manistee was very materially reduced during the month of September, by several mills shutting down completely, and others restricting the daily amount of the output. The action of the shingle manufacturers at Manistee, not only during the past month, but on other occasions, demonstrates that they grasp the situation, and resort to practical methods to forward their own interests by affecting the market. If lumber manufacturers would resort to similar practical methods, they would experience less trouble about the market and prices.

THE *Lumberman's Gazette* Oct. 10, says :—The loggers' delight, "the beautiful" snow has fallen to the depth of an inch or two at several points in northern Michigan, and the busy notes of preparation in many directions in the woods, where solitude has for several months reigned supreme, and the sound of the axe and crash of the timber being felled for camp-building and other purposes would almost incline one to the opinion that "the woods are full of" the red sash brigade, and the "slaughter of the giants" had already commenced.

WATER POWER
TO LEASE.

THE UNDERSIGNED having largely extended their raceway at Lakefield, are desirous of corresponding with parties who wish to go into manufacturing, and they are prepared to sell or lease water power on the most favorable terms, or would erect buildings of any size suitable for factories.

ST. LAWRENCE CANALS.

Notice to Contractors.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for St. Lawrence Canals," will be received at this office until the arrival of the eastern and western mails on TUESDAY, the 13th day of November next, for the construction of a lock and regulating weir and the deepeniog and enlargemeot of the upper entrance of the Cornwall Canal.

Also for the construction of a lock, together with the enlargement and deepening of the upper entrance of the Rapide Plat Canal, or middle division of the Williamsburg Canals.

Tenders will also be received until TUESDAY, the 27th day of November next, for the extension of the pierwork and deepening, &c., of the chaonel at the upper entrance of the Galops Canal.

A map of the head or upper entrance of the Cornwall Canal and the upper entrance of the Rapide Plat Canal, together with plans and specifications of the respective works, can be seen at this office, and at the Resident Engineer's office, Dickenson's Landing, on and after Tuesday, the 30th day of October next, where printed forms of tender can be obtained.

A map, plans and specification of the works to be done at the head of the Galops Canal can be seen at this office and at the lock keeper's house, near the place, on and after TUESDAY, the 13th day of November, where printed forms of tender can be obtained.

Contractors are requested to bear in mind that tenders will not be considered unless made strictly in accordance with the printed forms, and—in the case of firms—except there are attached the actual signatures, the nature of the occupation and residence of each member of the same ; and further, an accepted Bank cheque for the sum of *Two Thousand Dollars* must accompany the Tender, which sum shall be forfeited if the party tendering declines entering into contract for the works at the rates and on the terms stated in the offer submitted.

The cheque thus sent in will be returned to the respective parties whose tenders are not accepted.

This Department does not, however, bind itself to accept the lowest or any tender.

By order,
A. P. BRADLEY,
Secretary.

Dept. of Railways and Canals,
Ottawa, 28th Sept., 1883
d73-1aw

THE FORESTS AND THEIR MANAGEMENT.

We take the following from Mr. R. W. Phipps' report to the Ontario Government:

INDIA.

The necessity of preserving tropical forests has fortunately attracted the attention of Government in British India, where the importance of maintaining an equilibrium of temperature and humidity is of much immediate consequence to the social welfare; and the growing demands of railroad use, and the various applications of the arts, render it a subject of direct practical utility.

The matter has been agitated since 1850, and and in 1864, Government laid the foundation of an improved general system of forest administration, for the whole Indian empire, having for its object the conservation of state forests, and the development of this source of national wealth. The experience acquired in the forest schools of France and Germany has been brought to apply in this great national undertaking. Among the more important general principles laid down for the execution of this measure is that all superior Government forests are reserved and made inalienable, and their boundaries marked out to distinguish them from waste lands available for the public. The Act of 1864, defining the nature of forest rules and ponalties, has been adopted by most of the local governments, and the executive arrangements are left to the local administrations. Various surveys have been mado to obtain accurate data concern ing the geographical and botanical characteristics of the reserved tracts, and the kind of timber best adapted for various localities has been carefully ascertained.

In 1866, the Government resolved upon sending out five young men, duly qualified by education in the forest schools of France and Germany, for the forest department of India. An arrangement was made the same year by which forest officers in the India service, who might choose to come to Europe on furlough, would be able to increase their professional knowledge by studying forest management and other subjects connected with forests in Great Britain and on the continent. A number of officers have availed themselves of these arrangements, and some of their reports have been published.

Of these, that of Captain Walker, and that of M. Gustav Mann, I have largely used elsewhere, as the reader will have observed.

"At tho moment of our writing," says the author of a report from which I have obtained much, presented to the United States Congress in 1874, "the public journals are giving most painfnl accounts of the distress in India from famine. From a careful study of this subject we cannot doubt that this calamity is due to the fact that the forests have, of late years, been swept off by demand for railroad and other uses much more rapidly than formerly, and that the exposure to winds and sun thus occasioned may have largely contributed to these painful results. The remedies are to be sought in the restoration of that due proportion of forest shade upon which agriculture depends for success. If the officers to whom the opportunities for European observation fall, improve them as well as some reported by Captain Walker, we may reasonable hope for a radical though not on immediate restoration of abundant harvests throughout the vast countries of India."

Now, since this was written, we have Sir Richard Temple's valuable book, "India in 1880," which I have noticed before. This gives us some idea of what has been commenced by the gentlemen who have been writing the reports we have used. He says:

"The Government of India has enacted a law regulating all matters connected with forest conservancy, and the provisions of this law are being carried into effect by the several local governments. The forests are divided into two categories; first, those which are 'reserved,' being preserved and worked through state agency, in a most complete manner; secondly, those which are 'protected,' being preserved less thoroughly. The best timber markets are mainly supplied from the reserved forests. Care has been taken to determine what tracts shall be 'reserved' and 'protected,' and to mark off their boundaries. The area thus defined in the several provinces already, or likely to be defined ere long, will prove to be hardly less than eighty thousand square miles for the whole empire. The primary object of the administration is to preserve the forests for the sake of the country. Due attention is also given to the financial outturn; much income is already secured. The expenditure is over five hundred thousand pounds annually, but the receipts amount to nearly seven hundred thousand, and in time the forest department will have a prosperous revenue.

"The superior officers of the department are for the most part British, trained in the forest schools of France and Germany. The Inspector General of Forests with the Government of India is Dr. D. Brandis, whose services to the empire have been conspicuous in organizing a system of forestry which is sound and scientific, and is yet adapted to the circumstances of the country. Instructions in forestry is afforded to natives also; forest schools are established for them, and in time they will take a large share of the administrative work.

"As might be expected, the system of forest conservancy, though generally accepted by the natives who dwell near the 'reserved' and 'protected' tracts, is sometimes opposed by them. There must always be some danger lest the foresters should, in their zeal for conservancy, infringe upon the prescriptive rights of the inhabitants. The local civil authorities are vigilant and prompt in asserting and vindicating the rights of the people in this respect; for the recognition of which rights, indeed, ample provision is made by the law. They should, however, be caroful to support the forest officers in the execution of duties which are of the utmost consequence to the welfare of the country. Many of tho hill tribes habitually burn patches of valuable forost, in order that the ashes may so fertilize the virgin soil as to rendor it capable of producing a crop without tillage. Having reaped one harvest, they leave tho spot marked by charred stumps of timbor trees, and move on to repeat the same ravage elsewhere. This barbarous and watefully destructive practice is gradually and cautiously checked, by reclaiming these people from agricultural savagery, and inducing them to plough lands, and raise yearly crops by ordinary husbandry.

"According to the latest returns there appear to bo 29,600 squaro miles of demarcated reserve forests, 3,500 square miles of protected areas, and 35,000 square milos of unreserved forests, or 68,000 square milos in all. This appears a comparatively small arca for so large an empire, especially when it is rememberod that of this not more than one half is effectually preserved. Some extensive forest tracts exist, however, in the Madras Presidency, of which a return remains to be rendered. There are, further, 31,000 acres of plantations in various districts."

These plantations, I may remark, are those commenced by the foresters under Dr. Brandis, and are being every year added to at the rato of some thousands of acros. It may be noticed that the forest officers trainod in Europe for India, and at work there now, number forty-six out of a staff of ninety-three, who have, of course, an immense uumber of subordinates.

Concerning other countries, it may be generally remarked, that all the nations of continental Europe are moving in forestry matters, and that there are many schools besides those I have mentioned.

SOUTH AUSTRALIA.

The colonies of Australia and New Zealand are working earnstly in the matter of tree culture. In South Australia there is, we are told, far too little woodland. The consequences are that so arid is the country in parts that the reports state that they can never expect to grow wheat unless the rainfall can be, by the assistance of plantations or otherwise, increased.

South Australia has moved vigorously in the matter. They have appointed a conservator of forests, Mr. J. E. Brown, F. L. S., who has written a valuable work on tree culture there. Reserves have been mapped out, of which one is about fifty thousand acres, another nine thousand, another twenty thousand, with smaller ones of six or seven hundred—the larger evidently intended to be improved into forests on the European plan—the smaller as nurseries and seed-bed for young plants. Houses have been built for nurserymen, and all suitable buildings erected, and forest rangers and police appointed. The forest board had been in existence three years in 1879, and from the report of operations sent in by Mr. Brown in that year, giving full and admirably worded details concerning the soil, trees, aud method of procedure adopted and to be adopted on all the reserves, there is little doubt that South Australia will, considering how rapid growth, when encouraged, is there, (twice as rapid as in Britain) soon possess large and valuable forests, fit to yield yearly a regular and large quantity of timber, without either clearing or injuring the woodland reserves.

NEW ZEALAND.

To show the destruction of timber even where unnecessary for clearing it may be observed that it is evident New Zealand possessed, when first colonized to any extent, in 1830, much land in a prairie or unwooded state, as her area was sixty-six million acres, and her wooded area twenty million acres. However, by 1868 she had destroyed five million acres of woods; and by 1873, she had lost eight, leaving her but twelve million acres. The destruction was principally caused, not by clearing, but by carelessness in allowing bush fires; and it was evident the land would, at that rate, soon be deforested altogether. The well-known writer, Hochstetter, says:—"Individuals should not be suffered to turn the country into a desert to the detriment of whole generations to come. The woods are ransacked and ravaged, in New Zealand, with fire and sword. During my stay in Auckland, I was able to observe from my windows, during an entire fortnight, dense clouds of smoke whirling up, which proceeded from an enormously destructive conflagration near tho town. When the fire had subsided, where had been a large beautiful tract of forest was now nothing but ashes." An official of the New Zealand Company had also pointed out to him the destructive propensities of the settlers in cutting down valuable wood. He says:—"A melancholy scene of waste and destruction presented itself to me when up to see the forest. Several square miles of it were burning, having been fired in order to make room for the conveyance of logs down the creek. Noble trees, which had required ages for their perfection, were ruthlessly destroyed in great numbers."

In consequence of this state of affairs, public opinion in New Zealand was loudly expressed, and numerous reports were presented to the Legislature causing animated debates, and large and valuable compilations of these were published. By this time, there is every reason to believe, if these reports and plans have been properly attended to and carried out, New Zealand has made good progress in the matter, though we have not, as in South Australia, an actual Forest Literature, such as the conservator has published.

(To be Continued.)

PRESENTATION TO QUEBEC CULLERS.

On Thursday Sept. 20th at the Supervisor of Cullers' Office, Quebec, the following presentations were made by the square timber cullers attached to the office:—

To James Patton, Esq., Supervisor of Cullers, a very handsome ice pitcher and goblet, the former bearing the following inscription:

"JAMES PATTON, Esq.,
SUPERVISOR OF CULLERS,
From Cullers of the Square Department,
as a mark of respect.
Quebec, Sept. 20th, 1883."

To J. J. Walsh, Esq., Acting Deputy Supervisor of Cullers and Cashier, similar articles, with inscription as above.

"To Edmund Gowen, Esq., accountant, a meerschaum pipe, with usual attachments."

The spokesman was Mr. Culler Thomas Gilchen, who complimented the supervisor and his acting deputy for the interest taken in the cullers by them, and more especially the square timber cullers, who on this occasion beg their acceptance of some trifling articles to mark the unanimity and good feeling that at present existed between the cullers and the chiefs of the office. Mr. Gilchen before finishing would beg leave to remark that should the same kindly disposition be shown in the future, and he had no reason to fear otherwise, judging from the past twelve months, the cullers would be more than happy.

Mr. Supervisor Patton, in his own happy manner, thanked the gentlemen present, and begged to assure him that it always gave him pleasure to be on friendly terms with those over whom he had the pleasure to preside. For the future he assured them that with the assistance of his very efficient and obliging Acting Deputy Mr. Walsh, he had no fear that all would go on in the future in the same satisfactory state.

Mr. Walsh, in responding, thanked the gentlemen present for the very handsome present, as also for the kindly manner in which they had alluded to the part taken by him in the working of the office for the past year. It always gave him pleasure to see things work smoothly and and they might rest assured with such a man at helm as our worthy supervisor, the same harmony and good feeling would continue. Mr. Walsh before resuming his seat complimented the cullers on the increase made to their salary in the way of having their expenses paid, and stated that it only required to be pointed out to the Hon. Mr. Costigan and his deputy, Mr. Miall, for these gentlemen to at once see the justice of their claim by ordering the additional amount in question to be allowed the cullers.

Mr. Gowen stated that he would give his answer in writing.—*Quebec Daily Telegram.*

QUEBEC CULLERS' OFFICE.

The following is a comparative statement of Timber, Masts, Bowsprits, Spars, Staves, &c. measured and culled to Sept. 28:—

JAMES PATTON,
Quebec, Sept. 28. Supervisor of Cullers.

NATIVE WOODS FOR DECORATIVE PURPOSES

A writer in the *Railroad Gazette* gives some ideas about our native woods and their uses that may be of value to our mechanics. He says that white wood is valuable because it remains where put, notwithstanding the fact that its surface is perhaps as easily affected by water as almost any wood. In Virginia there are tracts formerly known as the "Wild Lands" in which much fine forest remains, tracts where the tulip poplar, or the white wood, shows trees that will square two feet for sixty feet of length, and where the beech, oak, the hickory, and the sugar maple have never been touched. One of the finest tracts of the much used cherry tree is found along the eastern edge of the outcroppings of the coal measures of the northern part of this region. Those who have been accustomed to see miserable, caterpillar-eaten specimens of this tree, would be surprised by the splendid trees found growing in these forests—trees three and four feet over the stump and sixty feet upward before reaching a limb.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

W. A. EDGARS, of Frankville, was cured of Liver and Kidney Complaint after life was dispaired of. He had remained from ten to fifteen days without an action of the bowels. Burdock Blood Bitters cured him, and he writes that he is a better man than he has been for twenty years past.

WOOD PAVING IN NANTES.

At the present moment, writes a correspondent from Nantes, the Rue de Rivoli and Boulevard Montmartre are being paved with wood. This work seems to interest tbe public much, and the proceedings are regarded with the greatest curosity, French people being fond of novelties. We know tbat the new wood pavement system is imported from England after having been used for many years in St. Petersburg, and tbat the society which bas the contract for certain streets and avenues of Paris is a French one, and that it employed Englisb workmen to begin with, but now a few of them only are retained. The wood employed is Norwegian redwood, and not French wood, as mentioned by me in a previous letter. The experiments made in tbe Champs Elysees, Boulevard Poissonniere, and Rue Montmartre, have shown tbe advantages of this system, which are much appreciated by tbe public—maintenance of the chaussee, increased facility for the locomotion, comfort in driving, and tbe considerable diminution of dust and noise, insupportahle to tbose living close to busy thoroughfares. Even tbe Macadam system, which bas the advantage of lessening the noise, is expensive in maintenance, and requires on dry summer days to bc sprinkled with water, as it emits enormous quantities of sand and dust. The former is allowed to flow down tbe drains, causing no little damage. Tbe dust also blows about in the air, dong harm to people's lungs and eyes, and causing great inconvenience to the neigbboring houses. The Paris Board of Works have already decided to lay about 80,000 metres of wood pavement, and it is boped that it will rapidly extend. We in Nantes bave entered minutely into the question of tbe advantages derived from the use of wood pavement, knowing that much would be gained by this system being adopted, although we are likewise aware that not every kind of soil adapts itself to its use, as the down end of the wooden blocks is more subject to putrefaction when in contact witb damp ground. Otber cities may, no doubt, take tbe subjeet into consideration, and thus benefit the timber trade generally.—*Timber Trades Journal.*

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* writing on Sept. 8th, says:—The fall sbipments are again being much inconvenienced by rain in the lower Gulf ports, and it is fortunate for shippers that by means of steamers they can minimize tbe amount of damage that will accrue to damp goods while on passage. Unless wbere extra precautions have been used, I should not be surprised to hear of complaints from our customers at the Cape and Australia, whose goods have been shipped after midsummer. This heavy rainfall has of course facilitated floating operations to the principal export places very much, and has had a not unimportant effect on the present condition of the market. With tbe small number of logs in the streams, of 1882 year's cuttings, the aspect of matters would now have been mucb more favorable to mill owners had even a partial failure occurred with the floating.

REVIEWS.

DIO LEWIS'S MONTHLY for October is the best of its three numbers. Our Rich Men, by Dio Lewis, ought to help many persons wbo fancy that bappiness and money are synonymous. Our Young Women, by Rev. Dr. Howard Crosby is a brave discussion of an enormous but fashionable evil. Idol-Worship in India, by Amrita Lal Roy, will set many Christians to thinking: evidently we have not understood idol-worship. Sandwich Island Sketches, by Dr, C. L. Tisdale, is the first of a series of instructive and interesting sketches of the Little Kingdom. Crossing the Mediterranean, by Anna Ballard, will recall some of the most remarkakle scenery of the world to those who have made the same trip. The Shakers, by Dio Lewis. will give new ideas to those who have not studied that singular people. Weight of the Human Brain, by Dio Lewis, will deeply interest all who keep up with modern thought in this important field. A True Story of Lake George, by Mrs. Lillie Devereux Blake, is one of the best of this charming writer's stories. A True Ghost Story, by a Boston Lawyer, is capital, and gives one a vivid notion of a high sense of honor and duty among college men, Open the Cage Door, Treatment of Prisoners, and Treatement of the Insane, all by Dio Lewis, will be read with interest hy the philanthropic. House-Drainage, by Colonel Waring, of Newport, is a thoughttul paper by an eminent expert. A Fine Complexion, is by a well-known lady writer, who knows what she is talking about. Our Brains and Nerves, by Dio Lewis, is in his happiest vien. The Check-Rein, by Hon. Geo. T. Angell. The Hygienic Department, is full of variety and interest. Beer, is by one of our best writers upon this class of subjects. Diphtheria, by Dio Lewis, is a clear discussion of the causes, prevention and treatment of this dreaded malady. About Nursing, by Dr. Dewis, is commended to young women. The Fashions (illustrated), Aunt Bonncybell, will he read with eager interest by the ladies, and it will make them think too. Our Cooking School, by Miss Julia Colman, grows better and better. Stray Thoughts, will interest and amuse.

THE *Woodworker* says:—Oshkosb, Wis., is noted for its sash, doors and blinds. There are eight sash, door and blind factories, which produce annually, as shown by last reports of the manufacturers, 600,000 doors, and windows and blinds in proportion. When it is considered tbat Oshkosh is only one of many cities engaged in this business. an idea of the enormous annual consumption of these articles may be arrived at.

THE *Woodworker* says:—First-class woodworking machinery is being rapidly introduced into many sections of the Southern States. Factories are springing up on every hand. On account of their superb timber growths. Kentucky, Tennessee, North Carolina, Louisiana and Arkansas, are the most favored localities at present. Saw mills, shingle mills, barrel and stave factories are busy and the number is rapidly increasing.

THE Ogemaw *Herald* learns that it is the intention of Messrs. Wells, Stone & Co. to build and put into immediate operation a large long timber mill on the line of the new road running througb their lands. The intention is to cut Norway pine into bridge and car timber of all lengths up to 65 feet, and ship by rail direct from the mill to all points demanding this necessary staple. At a glance it will he seen that sucb an enterprise will be a source of remuneration to the projectors. It is understood that tbe mill will he ready for work this present season.

THE Birtle correspondent of the Winnipeg *Times* says:—A company comprising Messrs. D. W. Comming, of Birtle, J. C. Boyd, Col. Tisdale, & Alex. McColl of Simcoe, S.S. Fuller, of Stratford, and T. R. Fuller, of Toronto, has obtained several extensive and valuable timber limits in the Riding and Duck mountains, which they intend working on a large scale. Mr. Boyd has been up inspecting three of the limits which are situated on Bird Tail river and which he reports to be capitally situated and composed of splendid timber. He leaves for Ontario at once to make arrangements for shipping milling machinery to this point, and the company intend putting a gang of men into the woods this winter.

AN organization meeting of the Algoma Lumbering Company was held at Ottawa on Sept. the 27. The object of tbe Company is the carrying on of a general lumbering business in the North-west. The head office will be at Fort William, the Company having extensive planing mills and docks there now in operation for dressing and shipping lumber. Fort William is also an important distributing point as all tbe south going trade centres at that place. The capital of the Company is $40,000, all of which is paid up, and the five directors are the only shareholders of the Company. The following are the officers and directors appointed at the meeting:—G. A. Griery, President; J. C. Edwards, Vice-President; George A. Priest, Managing Director; John Grier, B. Grier, Directors; and J. Wardrope, Secretary-Treasurer.

MAPLE FLOORING.

It is of late years that maple for flooring has come into general use in the western markets, and since its introduction the demand for it has increased rapidly. It was the prediction of many that in time there would really be no end to the demand, but already it is less active than it has been, and the only reason that can be assigned for it is the favor into which yellow pine is growing. To our knowledge, several large buildings have gone up in this city, in which the southern lumber has been used as flooring, and for which purpose maple was the second choice of the builders; but in this case as in all others, a man takes his first choice, if he can do it for the same money. Yellow pine for flooring is growing in favor every day, and maple is giving way to it. There is no danger, however, that maple flooring will be wholly crowded out. It makes an excellent floor, and it has friends which will use it instead of any other kind of wood. Its sales will be very limited, though, in comparison to wbat they would be had not yellow pine come into the field as a competitor.—*Northwestern Lumberman.*

Shipments for Detroit.

DETROIT, Oct. 2.—The lumber shipments by the lake during September were 29,641,000 feet from East Saginaw, and 73,870,000 feet from Bay City. East Saginaw shipped 6,709,000 shingles and Bay City 18,537,000. Total lumber shipments from Saginaw river from the opening of navigation to October 1st, were 597,189,967 feet against 656,568,846 feet for tbe corresponding period of last year. The total shingle shipments to October 1st this year were 117,539,000 against 136,282,000 last year. It is estimated that the lumber cut of the Saginaw river saw mills will fall short of that of last year 175,000,000.

The London *Post* says:—McKenzie Bros. and Campbell of Kirkfield have this season already shipped rbout 30,000 telegraph poles for the Western Union. The business bas been greatly facilitated hy the wide guage. A large quantity of cedar and other wood has also been taken out.

THE London *Post* says:—During the early summer months the bulk of the lumber traffic was carried down the Whitby line and shipped from Whitby harbour. Just now the beaviest lumber trains are sent over the main line to Port Hope. Has Port Hope stolen the handling of lumber from Whitby?

Do not delay, if suffering any form of Bowel Complaint, however mild apparently may be the attack, but use Dr. Fowler's Extract of Wild Strawberry. It is the old reliable cure for all forms of Summer Complaint that require prompt treatment. Ask your druggist and all dealers in patent medicines.

THERE is no excuse for suffering from Headache, Constipation and all the wearying train of symptoms of a disordered liver, when Burdock Blood Bitters is an unfailing remedy, and only costs One Dollar a bottle. Why suffer on without a trial? 25,000 bottles sold during the last three months, with almost universal satisfaction.

Health is Wealth.

DR. E. C. WEST'S NERVE AND BRAIN TREATMENT, a guaranteed specific for Hysteria, Dizziness, Convulsions, Fits, Nervous Neuralgia, Headache, Nervous Prostration caused by the use of alcohol or tobacco, Wakefulness, Mental Depression, Softening of the Brain, resulting in Insanity and leading to misery decay and death, Premature Old Age, and Spermatorrhœa, caused by over-exertion of the brain, self-abuses or over-indulgence. One box will cure recent cases. Each box contains one month's treatment. One dollar a box, or six boxes for five dollars; sent by mail prepaid on receipt of price. We guarantee six boxes to cure any case. With each order received by use for six boxes, accompanied with five dollars, we will send the purchaser our written guarantee to refund the money if the treatment does not effect a cure. Guarantees issued only by ORMOND & WALSH, sole authorized Agents for Peterborough, Ont. JOHN C. WEST & CO., Sole Prorpietors, Toronto.

As will be observed from our list there has been no change in prices since the date of our last report. Retail business has been fair for the summer, but there has been nothing much done in a large way, as people are buying nothing but what is absolutely wanted; probabilities are there will be a little more activity from this out, as people will now be stocking up for the winter. Prices have not varied much lately and no doubt wholesale buyers could at present make very satisfactory terms with manufacturers. The American demand seems to have ceased, as there have been no enquiries lately. Laths are just about holding their own.

CORDWOOD.

Wood is coming in freely and there is more on the Canal bank now than there has been all summer. Prices are a trifle weaker, but not nominally lower, and it is thought that no decline in prices will take place this fall. The demand lately has been brisker than for some time past. Wholesale prices are as follows:

Long Maple	$ 7 50
Short "	6 50
Long Birch	7 00
Long Beech	6 00
Short "	5 00
Tamarack	5 00@6 00

TORONTO.

From Our Own Correspondent.

Oct. 10.—Retailers have all the demand they desire, so far as I have been able to learn there is not a single complaint, teams and men are all busily employed attending to the wants of customers. To meet this demand wholesale dealers are placing on the local market double the quantity required of some lines of lumber, so that prices have to some extent weakened. This is more especially the case in the coarser grades of boards, prices for which, by car load, are fully $1.50 to $2.00 per M. lower than at the commencement of the season. This need not have been the case had shippers been alive to their own interests a large portion of this overplus stock could have been held back, instead of shipping forward and taking up all the available space in the various railroad yards. Consumers and retailers alike are quick enough to avail themselves in cases of gluts in the market.

Since the date of my last letter, shipments from our docks have been fairly active, the following quantities having gone over the rail of vessels since last writing you—1,000,000 of shingles and 3,750,000 feet of lumber. So that the quantity now on our docks have assumed only normal proportions, and will doubtless be still further thinned out before the close of uavigation.

On a former occasion I alluded to the action taken by the Midland Railway Company in charging their customers for shunting cars of lumber to various switches within the city limits. Immediately after the publication of that letter the charge was done away with, and Mr. White assured the customers of the road that lumber should be placed at any point within the city proper to which they had access, free of all charge, but the love of the almighty dollar seems to have proved too strong, and fresh notices have been issued to all their patrons informing them that this method of trying to filch the last possible dollar from the pockets of the lumbermen will again go into operation, so that the charge on a car of 24,000 pounds, from Midland to the western confines of the city, will now amouut to $20.40 to the yard and $3.50 shunting, including the C. V. R. R. charge for the use of switch, making in all $23.90. Mr. Robt. Kerr of the N. & N. W. R. R. is credited also with inaugurating this briliiant stroke of railroad policy, promising on his part to adopt a similar tariff for shunting, but all such methods will surely react upon its authors in due course of time.

QUEBEC.

The correspondent of the Toronto *Globe* writing on Sept. 29th, says:—Our market continues dull and depressed, with few sales. In Ottawa timber, one very choice raft of 70 feet has lately changed hands at 36 cents; one of 45 feet at 22 and 23 cents; and one of 51 feet at 23½ cents, with red pine of 45 feet at 16 cents. It is currently reported also that a contract has been made for the coming season's production of the Baptist Mills at Three Rivers, but as the sale was effected on private terms, the figures have not transpired. They are, however, said to be low. Some 12,000 to 15,000 pine deals, roughly valued at from $6,000 to $8,000, were accidently destroyed by fire yesterday in the cove of Benson Bros., New Liverpool, opposite the city. Fully insured.

The Quebec *Chronicle* of Oct. 5, says:—This week has been about as dull a one as we can remember, and since ws issued our report last week we believe only one raft has changed hands, that being one of 47 to 48 feet, at 20 cents. Several new rafts have come to market, but we do not think there is any inclination on the part of shippers to invest at present. In hard woods there is no animation, and the general belief is that a good deal of this timber will winter on manufacturers account.

WINNIPEG.

The Winnipeg *Commercial* says:—Business continues very fair, and about as active as could be expected at this season of the year. Quotations are as follows:—Pine lumber, 1st, common boards, dressed, $26.50; 2nd, dressed, $25.50; 1st, do rough, $26.50; 2nd, do., $25.50; sheathing, rough, $25; timber, 16 feet and under, $24; do. over 16 feet, for each additional 2 feet, $1; dimension and joists 16 feet and under, $24; do. over 16 feet for each $1; fencing, $25; 2 and 3 inch batttens, $30; A. stock boards, all widths, $50; B. do., $45; C. do., $40; D. do., $35; 1st clear. 1, 1¼, 1½, and 2 in, $60; 2nd do. $56; window and door casings, $50; base boards, dressed, $50; 1st pine flooring, siding and ceiling $40; 2nd do $35; 3rd do., $30; ½ inch split siding, dressed, $30. Spruce lumber—timber 16 feet and under, $22; do. over 16 feet, for each additional 2 feet, $1; dimensions and joists, 16 feet and under, $23; do. over 16 feet, for each additional 2 feet, $1; boards, $22; 1st flooring, siding and ceiling, $28; XX shingles, $5.25; Star A shingles, $5.25; X shingles, $5.00; A do. $4.50; lath $4.50.

BOSTON.

Cotton, Wool and Iron of Oct. 6, says:—General business is moving along on quite a firm basis for desirable supplies of pine, and there is a good steady consumptive demand. Western fine common, selects and uppers are held with particular steadiness, and are well in hand. Eastern luuber is in active movement, with both spruce and hemlock stiffly held. Laths are also in strong position and high. Southern pine is moving quietly and steadily. As to hardwoods, there is little change to note. Desirable walnut is quite steady. Poplar is in excessive stock and slow of sale. Choice dry cherry is in good request. Light colored ash and oak find a ready market.

CHICAGO.

The *Northwestern Lumberman* of Oct. 6, says: The wind for the past week has been favorable for the lumber luggers, and a fleet has come along every day. The arrivals at this port, up to Wednesday, were 265, against 204 the week preceeding, and the usual proportion at the sales docks has kept the market fully supplied with offerings. Sales were made with fair dispatch until Tuesday, Monday showing an especially brisk business, about 25 cargoes having been disposed of on that day. But after that the movement was slower, because the yard docks had become cumbered with unpiled lumber, aud the arrivals coutinued without abatement. The yard men saw their opportunity, and taking the alleged drop in dimension in the alleged price list for a club, they pounded away at that class of stock with their accustomed zeal and vigor. The stuff stood up well under the slugging, and only slight concessions were realized. Cargoes were sold as low as $9 for short piece stuff, but not enough changed hands at that figure to make it necessary to alter the quotations. Meager or ordinary arrivals will probable restore the tone prevailing before this. No. 2 inch stock did not feel the load on the market like dimension, the offerings generally being purchased at former prices, or very nearly so. Good stock is still wanted in excess of arrivals, and a cargo of such lumber is eagerly competed for as soon as it swims in the market basin.

Quotations are as follows:—

LONDON.

The *Timber Trades Journal* of Sept. 22, says: The trade were well represented at Messrs. Simson & Mason's great sale of Wednesday last; and though no recovery in values was to be traced in the prices the unreserved goods fetched, there appeared to be a more hopeful spirit amongst those present, and bids were plentiful, if only at a very moderate limit. Nothing seemed to hang fire, and notwithstanding the low average the sale realized throughout, taking into consideration the limited quantity of good Swedish deals, &c., that were submitted, we think it compared favourably with other sales in respect to prices generally.

LEITH.

The *Timber Trades Journal* of Sept. 32, says: The arrivals show a slight improvement over last week's, and several large consignments are daily expected. White Swedish 6½ × 2½ battens are not very plentiful here, and bid fair to become more scarce as the season advances.

On Tuesday last Messrs. Mitchell, Thomson, & Co. exposed for public competion at Granton a large and varied assortment of American and Baltic goods. Considered alongside of the large attendances this firm as a rule attract to their sales, yesterday's turn out was certainly disappointing; still a good few large buyers were present, the town being perhaps better represented than the couutry. The sale as usual began with the waney yellow pine, the first lot going at 2s. 9d. per cubic foot, the top price of the sale for this class of goods. The lowest figure was 2s. 5d., the average price being about 2s. 7d., a good portion of the shipment being cleared out. The larger timber of the cargo had been set on one side, and did uot bring forth any offers when exposed. American oak did not seem in great demand, one lot bringing 3s. 5d., and a few logs 3s. per cubic foot. Only one lot of Riga wainscot was sold at 4s., and red Memel fared little better, 14d. being all that could be got. As a rule large quantities of floorings and linings are cleared out at Granton, but this sale was an exception. Although several lots of 5½x1½ white flooring were sold at 11¾d. per superficial yard, the bids for linings were mostly all too low to enable the auctionee to go on.

A novelty was offered in the shape of a cargo of Sequoia redwood. Mr. Thomson stated, before offering it, that this was the first cargo ever imported to the district, though a few odd parcels had found their way to the market previously. He further stated that the timber had been tried by several Edinburgh builders (whom he named) and found to give satisfactiou. The exposers further gave the tiuber a splendid character, stating that, after fourteen year under grouud, prices had been fonnd to be as fresh as ever. There certainly appeared to be

every inclination to give the timber a chance, as the consignment went off fast, many cabinet-makers being among the purchasers. The wood is of a dark red color, and is very heavy, seeming to have a great deal of water in it, which, perhaps, accounts for the difficulty with which it is said to burn. An unsaleable portion of the consignment seemed to be a large quantity of shingles for roofing purposes, 2s. 6d. per bundle being the highest offer.

LIVERPOOL.

The *Timber Trades Journal* of Sept. 22, says: The importation of all kinds of wood goods continues to be far beyond the wants of the trade, and until there is a very marked improvement in the general business of this district, no relief from the present state of depression need be looked for, unless shippers can stop the present glut of supplies which are at present being put upon the market.

This is especially the case with Canadian, New Brunswick, and Nova Scotian goods, such as deals and birch timber, which have come forward far too freely; and, further, they have been pressed upon the market by means of auction sales, so that prices have been reduced to a point below which they apparently cannot further go.

LIVERPOOL TIMBER SALES.

On 14th Sept. Messrs. A. F. & D. Mackay held one of their periodical auction sales of spruce deals, birch timber, &c., at which there was a fair attendance of buyers; and although a fair amount of competion was shown, prices were a shade lower than previous sales.

On Wednesday, Messrs. Farnworth & Jardine offered a cargo of Dalhousie spruce deals, birch, spruce, and pine timber, and although there was a good attendance of the local trade present nothing excepting the spruce deals was sold, all the timber being withdrawn owing to want of bidding.

Immediately afterwards Messrs. James Smith & Co. offered a good assortment of various descriptions of deals, timber, &c., consisting of St. Sohn, N. B., spruce deals, Quebec pine deals, and other goods, but with the exception of three lots of Bay of Islands, Newfoundland pine little else was sold.

The sale was one of the poorest this firm has ever experienced, and the buyers present evidently had got their upplies, and were apparently only there to watch proceedings.

NORWAY.

The *Timber Trades Journal* of Sept. 15, says: Last week we called attention to the necessity there was, if the markets here were to recover, for the shippers abroad to curtail their production, and in respect of Norway we seem to see something like a moderate cutting for next year and the following one, but the full effect of which will probably not be felt till 1885. A correspondent who has recently been spending some time in Norway visiting the various mills, and whose *bona fides* we have no reason to doubt, informs us that the log floatage to Drammen will this year be considerably less than was anticipated.. The annual floatage to Drammen is 180,000 to 200,000 dozen logs, but this year there will be only 50,000 to 60,000 dozen, less than a third of the ordinary supplies.

From the Glommen and the other great tributary streams the floatage, we understand, will be much the same as last year, viz., about 280,000 to 300,000 dozen logs.

The trees in this part of Norway—in fact, pretty generally thougout the country—are bought of the small peasant proprietors, and these latter are just now unusually stubborn in insisting on former prices, while the buyers on their side show equal obstinacy in declining to purchase except at lower figures than previously paid; as a consequence of this business at the annual trade fairs was positively nil.

The same correspondent tells us that, from what he gathered during his stay, the traders in Norway have the impression that no speedy improvement in the great markets of England, &c., is to be expected, and, acting on this conviction, they (the mill-owners) are by no means anxious to purchase logs for conversion, except at reduced prices; so that it stands to reason, if this state of things continues, the production for the forthcoming year must necessarily be very much curtailed. It is said that the present prices obtainable in the markets of the United Kingdom barely cover cost, which we can fully believe, and hence there is no real inducement to continue trading except on the most confined scale.

It is easy to understand how disagreeable it is to a large producer who has been accustomed to employ hundreds of hands in his mills, cutting thousands of standards of deals, to bring his establishment down to an all-round reduced scale, and no doubt it is this disinclination to acknowledge that they have been working at a loss which keeps many of these large mills working full time when really they ought to be curtailing their output in every possible way.

With regard to the attitude of the peasantry who have timber to sell, and who, when they wanted money, had to resort to the fairs to raise it by disposing of their trees to the manufacturers, a great alteration has taken place; the branch banks now established in the interior, especially in the Valley of the Glommen, from whence two-thirds of the timber is supplied, have come to the assistance of the small forest owner, and he can at a pinch raise money on the timbers as it grows, without the necessity of going to town at all. Formerly men of this class were entirely dependent on the Christiania merchants, to whom they looked to put them in funds when they needed it. If the peasant can maintain this independent attitude, it is evident the Norwegian timber trade must meet with an interruption.

Whether the same condition of things exists in the neighboring country of Sweden our correspondent does not say, but doubtless the position is not materially different in respect to the prime cost of growing wood.

RAFTS ARRIVED.

The *Chronicle* gives the following list of rafts, etc., arrived at Quebec:

SEPT. 27.—Stokes & Kelly, walnut Bowen's Cove.

J. R. Booth, white pine, &c., St. Lawrence Docks.

Grant & Miller, white pine, &c., Cap Rouge.

D. Moore, (2), white pine, &c., Cap Rouge.

British Canadian Timber Co., white pine, &c., St. Lawrence Docks.

J, R. Booth, white pine, &c., Cap Rouge.

Jos. Bolduc, deals, Bridgewater cove.

F. B. Howard, deals, Lake St. Joseph.

J. B. Grier, white pine, &c. Cap Rouge.

OCT 4.—Jas Reed, deals, Mill cove.

Stokes & Son, staves, Dobell's cove.

Muir Bros, staves, Bowen's (Sillery).

Estate of late John Bonfield, white pine, St. Lawrence Docks.

Fraser & McCoshen, white pine, St. Lawrence Docks.

Simon Wigle, staves, Union cove.

Flatt & Bradley, staves, St. Michael's cove.

J. Cockburn, white pine, &c., Cap Rouge.

Muir Bros., oak, &c., Bowen's (Sillery).

MONTREAL.

The *Gazette* says:—The wet weather of the past few days has been a great drawback to the local trade, as buyers will not operate when stocks show to disadvantage, consequently a very limited business has been done during the week both in hard and soft woods, There has. however, been an active enquiry for laths at the late advance, sales being reported at $1.70 per 1,000, and some dealers find great difficulty in satisfying the demand. Advices from Ottawa state that a good demand exists for pine, which is moving out pretty freely by barge. There is still a brisk movement of deals to British ports, and rates are quoted at 65s to 67s 6d.

Falling Leaves.

"There is something inexpressibly touching in the fallen leaves," sighs an esteemed author. There is, there is, indeed. It's when you slip on one of the articles on a wet morning, and touch the unsympathetic pavement. But there is in reality touching language—language uttered from the heart, yes, from the depths of the soul, in the many thousands of testimonials and letters (unsolicited) that come from those who once were sufferers from lung diseases, asthma and consumption, and who have used N. H. Downs' Vegetable Balsamic Elixir, and have been restored to their wonted health and activity.

RELEIVE AND CURE

Spinal Complaints, General and Nervous Debility, Nervousness, Rheumatism, Gout, Liver, Kidney, Lung, Throat nd Chest Complaints, Neuralgia, Bronchitis, Incipient Pralysis, Asthma, Sciatica, Sprains, Consumption, Sleeplessness, Colds and Indigestion.

Ask for NORMAN'S ELECTRIC BELTS and you will be safe against imposition, for they will do their work well and are cheap at any price.

A. NORMAN, ESQ.—Dear Sir,—Please send me a waist belt. Enclosed find price. Head band I got for my wife has almost cured her of neuralgia. Yours truly,

C. L. TILLEY, WATERVILLE, N.B.

Numerous of such testimonials can be seen at my office, proving that they are doing a good work and worthy the attention of all sufferers. Circulars free. No charge for consultation.

A. NORMAN, 4 Queen Street East, Toronto.

NORMAN'S ELECTRO CURATIVE TRUSS is the best in the world. Guaranteed to hold and be comfortable. Circular free. N.B.—Trusses for Rupture, best in America, and Electric Batteries always on hand at reasonable prices. 1t17

APPLICATION FOR INCORPORATION.

The following notice appears in the *Canada Gazette* :—

"Notice is hereby given that within one month after the last publication of this notice in the *Canada Gazette*, application will be made to His Excellency the Governor General in Council under "The Canada Joint Stock Companies Act, 1877," for letters patent incorporating the undermentioned applicants and those other persons who may become shareholders in the proposed company as a body corporate and politic for the purposes hereinafter mentioned :—

1. The proposed name of the company is "The *Peterborough Review* Printing and Publishing Company" (Limited).

2. The purposes for which such incorporation is sought are :—

(*a*) To purchase and acquire from Messrs. Toker & Co. the good will and right to print, publish and issue the newspaper called the *Peterborough Review*, both daily and week editions, and also the good will and right to print, publish and issue the newspaper called the *Canada Lumberman*, both being published by the said Toker & Co., at the Town of Peterborough, in the County of Peterborough, and Province of Ontario, together with the general printing and publishing business, book-binding and genera stationery business carried on by said Toker & Co., at the said Town of Peterborough, together with all plant, machinery, stock property and assets used by the said Toker & Co., to print and publish said newspaper and carry on their said business ;

(*b*) And after such purchase and acquirement by said proposed company, the printing, publication and issue by them, at the said Town of Peterborough, of the said *Peterborough Review*, both daily and weekly editions, and also the printing, publication and issue by the said company, at the said Town of Peterborough, or at such other place in the Dominion of Canada as may from time to time be deemed advisable, of the said *Canada Lumberman*, and also the carrying on by the said Company of a general printing and publishing business, book-binding in all its branches and a general stationery business, at the said Town of Peterborough and at such other place or places throughout the Dominion of Canada, as may be deemed advisable.

3. The chief place of business of the said company is to be at the Town of Peterborough, in the County of Peterborough, in the Province of Ontario.

4. The amount of the capital stock of the said Company is to be forty thousand dollars.

5. The number of shares is to be eighty, and the amount of each share five hundred dollars.

6. The names in full and the addresses and callings of each of the applicants are John Carnegie, of the said Town of Peterborough, printer and publisher, Edward John Toker, of the said Town of Peterborough, printer and publisher ; John Hilliard Carnegie, of the said Town of Peterborough, Gentleman ; George Hilliard, of the said Town of Peterborough, lumber manufacturer, and Robert Archibald Morrow, of the said Town of Peterborough, Gentleman.

7. The said John Carnegie, Edward John Toker and John Hilliard Carnegie, all of whom are residents of Canada, are to be the first or provisional directors of the proposed company.

8. The said company intend to transact business throughout the Dominion of Canada.

9. And notice is also hereby given that the said applicants will in their petition ask for the embodying in the letters patent of the following provisions :—

At each annual meeting it shall be the duty of the shareholders present to estimate and establish by resolution the then actual valuo of the shares of the stock of the company, such estimate to be based on the financial result of the operations of the company as exhibited by the statement of its affairs then before them, and in case at any time during the then next ensuing year any share or shares in the stock of the company are offered for sale, whether under execution or otherwise, and the sale thereof has not been enterod on the books of the company, or if any share or shares of the company have become transmitted by bequest, inheritance, or in any other way whatsoever, then the said company shall, during the two months next after such sale, offer for sale or transmission has been notified to the company, have the privilege of acquiring such share or shares so sold or to be sold or so transmitted as aforesaid, upon payment or tender of the price of such share or shares calculated at the value thereof as established at the then last annual meeting, the company having the first preference of purchase and then the shareholders, and in such order and on such conditions as regards the respective shareholders as may be fixed by the By-laws of the company.

R. H. DENNISTOUN,
Solicitor for the said applicants.

Dated at the Town of Peterborough, this 26th day of September, A.D., 1883.

BOARD OF TRADE RETURNS.

The following are the returns issued by the Board of Trade, for the month of Aug., and for the first eight months of the year :—

MONTH ENDED 31ST JULY., 1883.

Timber (Hewn).	*Quantity. Loads.*	*Value. £.*
Russia	60,763	117,483
Sweden and Norway	62,204	100,796

A VISITOR FROM NATAL.

Mr. John Nicol, of Durban, Province of Natal, South Africa, has been in Ottawa, Mr. Nicol is accompanied by Mr. Thos. Bell, of Messrs. D. W. Bell & Co., general merchants, of London, England, who are also his European correspondents. The objects of their visit to Canada is chiefly pleasure, but they come also to see improvements that might exist and look into matters connected with the business in which they are interested. In conversation with a *Free Press* reporter Mr. Nicol said that he had been a resident of Natal for twenty-two years, during which time he had never seen snow. He described the climate as one of the finest possible, the average temperature being all the year round betwcen seven-five and ninety. The extreme heat was sometimes as high as a hundred and twenty, while the lowest reached was about sixty-five above zero. Mr. Bell here joined Mr. Nicol and in reply to an enquiry by the reporter said that Mr. Nicol was the largest contractor and building material manufacturer in his country. In the course of his business he used a great deal of timber and lumber, having to take timber chiefly from the Baltic. In connection with his pleasure trip he intended making a thorough study of the manufacture of lumber, with a view of adopting improvements in his own country. He visited the saw mills of Mr. J. R. Booth and Mr. McLaren, and was perfectly astonished at what he saw. He thought the mode of manufacturing was perfection and the product good. In his town he would see if it were practicable to import lumber or timber from Canada. Durban is the largest town in Natal and has a population now of about 8,000. Messrs. Nicol and Bell left by the C. P. R. and Grand Trunk for the west, They stop over at Toronto, Detroit and Chicago, and will visit Bay City and Saginaw, thr great lumber producing centres of the United States. After visiting the principal cities across the line they will leave for England.

AMBER.

Some very interesting researches have recently been made on the flora of the amber-bearing formations of East Prussia by Messrs. Goeppert and Menge. In ancient times there must have been in this part of Europe a group of conifers comprising specimens from almost all parts of the world. Among the splendid specimens of the California coniferæ were the redwood, the sugar pine, and the Douglas spruce ; and of the examples of the Eastern States were the bald cypress, red cedar, thuya, and the *Pinus rigida* from the eastern coasts of Asia were the Chilian incense cedar, the parasol fir, the arbor vitæ, the glyptostrobus, and the thuyopsis ; and the scotch fir, the spruce, and the cypress of Europe, and the callitris of Southern Africa. It appears that the deposits of amber for which the Baltic is noted are the product of gonerations of these resin-bearing trees. The richest deposits are situated along a strip of coast between Memel and Dantzic, though the real home of amber has been supposed to lie in the bed of the Baltic between Bornholm and the main land. It rests upon cretaceous rocks and consists chiefly of their debris, forming a popular mixture known as blue earth, which appears to exist throughout the Province of Samland at the depth of 80 to 100 feet, and to contain an almost inexhaustible supply of amber. Immense quantities of amber are washed out to sea from the coast or brought down by rivulets and cast up again during the storms or in certain winds. Tho actual yield by quarrying is 200,000 to 300,000 pounds a year, or five times the quantity estimated to be cast up by the waves on the strip of coast above mentioned.—*London Times.*

ST. JOHN N.B,

The *Daily News* says :—For some time past there has been a considerablo traffic over the Intercolonial in ship's masts and spars. They are shipped at Point Levis and transported to Halifax and St. John. They cover two aud a half to three cars, the longer pieces being nearly ninety feet in length. This trade was opened last year by Charles Nevins, of St. John, and greatly increased during the present season. Timber of this kind is becoming scarce or inaccessible in New Brunswick. The expense of loading and carriage is a very considerable item when brought from Quebec. During the past week a little more activity has transpired in this line, but prices are without alteration. Local coutractors are enquiring for certain kinds of stock. This is, of course, only what may be expected as the season advances. As a rule there is generally a spurt in the autumn for material to complete jobs in hand before the winter sets in. Many people are now suddenly discovering that they must have certain work done at once, hence the rush.

QUEBEC.

The *Chronicle* of Sept. 28 says :—Since our last quotations there has not been much done in the way of sales, though it is reported that a lot of Three River Deals, havo beeu sold on private terms. In Ottawa Timber we hear of one very choice raft, about 70 feet, having changed hands, reported at 36 cents ; a raft of 45 feet, at 22 cents and 23 cents. Also, a raft of 51 feet at 23½ cents, with Red Pine of 45 feet, at 16 cents.

It is currently reported on the street, that a contract has been made for the coming season's production in both Pine and Spruce Deals of the Messrs. Baptist's mills, Three Rivers. The sale was effected on private terms, and figures have not trauspired, but prices said to be low.

REDUCING THE CUT.

The Chicago *Northwestern Lumberman* says : A Wisconsin lumberman of years of experience, a man of superior judgement, aud one who looks couditions squarely in the face, made the remark in the office of the *Lumberman* a few days ago that the welfare of the lumber business for 1884 would depend on a retrenchment of operations the coming logging season. If 150 of the manufacturers of the Northwest could be brought together, and were to express their views on this question, it is doubtful if one of them would disagree with the Wisconsin gentleman to an extent that the universal verdict would not be that retrenchment is necessary. Every intelligent lumberman in the three states knows that the cut of logs for the winter should be a light one. He knows that the mills last season cut too much lumber, and that an endeavor to work off the stocks this season has resulted in lowering prices. He can see new mills being built, and new lumbering sections opening up. The product of the Southern mills is taking the place of white pine to an increased extent every year. All these conditions are plainly seen, and what action will be taken ? No arguments are needed, for the position is thoroughly understood. In the Saginaw and Muskegon districts, and in Wisconsin, there is talk of reducing the cut, but whether it will be carried into effect is another question.

If you would escape the ravages of that scourge of the summer season, Cholera Morbus, keep Dr. Fowler's Extract of Wild Strawberry at hand for use. In that and all other forms of Bowel Complaint it is infallible.

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

$500 Reward !

We will pay the above reward for any case of Liver Complaint, Dyspepsia, Sick Headache, Indigestion, Constipation or Costiveness we cannot cure with West's Vegetable Liver Pills, when the directions are strictly complied with. They are purely Vegetable, and never fail to give satisfaction. Sugar Coated, Large Boxes, containing 30 Pills, 25 cents. For sale by all Druggists. Beware of counterfeits and imitations. The genuine manufactured only by JOHN C. WEST & CO., "The Pill Makers," 81 & 83 King St. East, Toronto, Ont. Free trial package sent by mail prepaid on receipt of a 3 cent stamp. FORESTRY PRESERVATION.

The London *Times* in an article on the late movement of the Ontario Government in this direction, says: "At the instance of the Ontario government an exhaustive report upon the necessity of preserving and replanting forests has just been compiled by Mr. R. W. Phipps of Toronto. The subject is one in which increasing interest is being felt in the dominion, and the report in question deals with it very comprehensively." The *Times* gives a critique of the whole report, and concludes by saying: "What action the Ontario government may take on the strength of the recommendations is not yet known, but their appreciation of the importance of the subject is shown by their authorizing the gratuitous distribution of a large number of copies of the report among the farmers of the province."

Mr. Phipps, who has been given charge of the affairs, is going on with this important work with that systematic thoroughness which characterizes his management of whatever he takes in hand. Large numbers of circulars have been issued and numerous replies obtained. Many places in the settled portions of Ontario will be visited before winter, and when the lately issued report is laid before parliament at the coming session it will be supplemented by another, giving the experience of many individuals in different parts of Ontario in raising trees, stating the soils most suitable to the different varieties, the method of planting most suitable, the relative merits of raising from the seed, from seedings transplanted from nurseries, and from those taken from the forest; and results gained in each case, with much other information calculated to assist those intending to plant, and to prevent the losses and disappointments which have often resulted from mistakes in commencing or want of after care.

With earliest spring Mr. Phipps will make a tour through the great forest region in the northeast portion of Ontario, passing from the front near Kingston back towards and past Lake Nipissing, obtaining from lumbermen, farmers and other practical men their opinions as to the best methods of continuing in productive forest such portions of territory as it may be advisable to preserve in woodland, and of preventing the ravages of brush fires in all portions of the country. In the report which will deal with this matter we may expect from Mr. Phipps' well-known powers of description many vivid pictures of the scenery presented, and much valuable information concerning the resources of a large portion of our country not as yet well known to our population, while the report also will, judging from the last, be most useful to the general purpose of forestry—its principal aim.—*Toronto World.*

Timber and Houses in Skye.

Throughout the isles timber is a rare and precious article, most frequently the gift of ocean. The man who secures a good log of driftwood has obtained a prize worth having. It may have been a brave old tree, tempest-torn from its home in some distant forest, carried to the sea by rushing torrents, and perchange tossed by the waves and wafted to and fro by many a current, ere it drifted to its rest on these far isles. Or it may be the masts and spars, or perchance the cargo of some wrecked vessel—whatever its story it is treasure trove, and most deeply valued. Though encrusted with barnacles or riddled by pholades it can all be turned to good account; the smallest piece will make a stool or a settle, or a box or a part of a door; while large timbers become rafters—precious heirlooms, for a young couple cannot wed till they have accumulated enough rafters to support their thatch, and should they have occasion to "flit," the only part of their bothy that commands any pecuniary compensation is the roof, not the work only, but also the heavy thatch saturated with thick greasy peat-reek, (in other words with a thick coating of soot). This, when broken up, forms a valuable manure for the unfertile crofts.—*Temple Bar.*

SAND POWER.

The Virginia City *Enterprise* says:—"Jim Townsend has six of his arastras running to their full capacity. From a millwright who assisted in putting up the machinery we have some particulars regarding the novel apparatus, which is Mr. Townsend's own invention. The arastras are placed in a little sandy flat, where only sufficient water for drinking purposes and to moisten the ore operated upon is to be obtained. The arastras are actually operated by sand, which drives a large overshot wheel. On this wheel sand takes the place of water. It was at first Mr. Townsend's intention to run the arastras by means of a large windmill or windwheel, but as this wheel would run too slow at times, at other times so fast as to be liable to tear everything to pieces, and again would not run at all, he hit upon a regulator. This regulator is sand, a great pile of which has been raked up to the works. The windmill runs a belt containing a great number of buckets, and these carry the sand up to a big tank, just as grain elevators carry wheat in a flouring mill. A stream of sand being let out upon the overshot wheel, it revolves just as it would under the weight of a stream of water, and the arastras move steadily on at their work. When there is much wind, sand is stored up for use when calm prevails, so that the arastras are never idle. After a sufficient quantity of sand has once been accumulated, there is no more trouble on that score, the same sand being used over and over again."

THE CHEHALIS REGION.

The Chehalis Valley *Vidette*, in descanting upon the lumber facilities of Washington Territory, states that the timber of the Chehalis river and Gray's Harbor basin will yield from 2,000,000 to 10,000,000 feet to the quarter section, the forests being yet comparatively untouched. This lumber, of which there are said to be millions of acres lining the shores of the Chehalis, the Black, the Satsop, the Hoquoim, the Humtlips, the Johns and Elk rivers, and their scores of tributaries, embracing nearly 2,000 miles of waterway, down any and all of which logs can be run, in nearly all seasons, and most cases to the great central reservoir of Gray's Harbor. To this is added an entrance from the Pacific Ocean, "the great highway of lumber fleets—straight, short, broad—upon the bar of which there is over 20 feet of water at the lowest tides, and which for smoothness, safety and general good qualities and characteristics is far superior to any entrance north of San Francisco." Mill sites, with admirable advantages, are numerous. Logs are worth $5, the cost of saying is about $3, and the lumber sells at from $20 to $50.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

SAVING THE TIMBER.

The *Lumberman's Gazette* says:—The first annual meeting of the National lumber Manufacturers' Association of the Northwest was held at Chicago on Wednesday. This association was organized for the furtherance of the interests of lumber manufacturers, and those present were united in their determination to adopt measures looking towards a better condition of affairs. The gentlemen who were present represented an industry connected with a wide extent of country comprising vast tracts of land in the three great lumber states—Michigan, Wisconsin and Minnesota. The *Inter-Ocean* in speaking of the important gathering says :—"Figures are difficult to comprehend sometimes, but an idea of the immense amount of capital represented in this association may be gained from the fact 3,000,000,000 out of the 8,000,000,000 feet of lumber manufactured in those states annually was represented, besides the capital in the mills, the logs in the booms and in the timber, in addition to shipping and other interests. The association also represents an interest which employs 70,000 men directly and many others indirectly. The meeting was remarkable for the unanimity of feeling in regard to the matter of over-production, and the views of the members are set forth in strong language in the resolutions given below."

The following preamble and resolutions were adopted.

Whereas, In the present depressed condition of trade in this country in all branches of man ufactured goods, taken in connection with a depressed condition of the products of the soil and farm, a depressed condition in which lumber deeply sympathizes ; and

Whereas, We cannot sse one prospect of an improvement in the price of lumber, except in such a curtailment of the amount of the lumber produced in the country as shall render the supply adequate. but not in excess of the ability of purchasers to consume ; and that in this view of the cases we recommend to all engaged in logging operations a careful consideration of the conditions of the country and a shaping of their winter operations accordingly ; therefore.

Resolved, That in view of the fact that under the impetus of excessive log cutting, the lumber supply of the northwest has for the past year or two been in excess of a healthy demand for consumption, inducing a partial stagnation in the lumber business of the country ; and in vinw of the fact that the probable supply of old logs left over the coming winter will be abnormally large, we recommend to all manufacturers of lumber in the pine-producing regions such conservatism in their endeavors during the coming winter as will tend to restrict the tendency toward an over supply of logs during the year 1884.

Resolved, That only in such conservatism can we hope for a profitable return for investment of labor and capital, either to log producer, lumber manufacturer, or lumber dealer.

Resolved, That such curtailment can be accomplished only the individual effort and good judgment of such manufacturer, irrespective of what his neighbor may do, trusting to the good sehse of the lumbermen as a body to accomplish a result which can only tend to the best interest of all engaged in the trade.

Resolved, That there is no more standing timber in the northwest than the future demands of the country will require, and it is as well for the interest of the consumer as producer to cut only such quantities as the yearly ability of the country to consume may demand. It is, therefore, a matter of public policy as well as a matter of self interest to timber-owners to consider their interests in the future while providing a sufficient but not excessive log supply for present consumption.

Spruce In England.

The *Timber Trades Journal* of Sept. 29, says: Spruce went cheap ; the cargo ex Crane seemed to be the most attractive, and several lots of regulars were secured by one firm, who evidently was satisfied he had a bargain at £10 10s. The planks at £12 15s. and £13 were also cheap enough for anything, and with any turn in the market it would not surprise us to see similar goods realizing a few months hence a coupie of pounds a standard morc. The 2nd quality planks also went cheap at £8 10s. Unsorted spruce seemed to average about £7 for regulars, but even at this were very low considering the moderate stocks. Some odd lots went cheaper, but anyway buyers had no cause to complain.

The lowest prices the 1st quality, ex Ellida, from Quebec, fetched, we make no comment on, as they speak for themselves, and merely observe that with Quebec goods, as with those from some of the favorite Baltic ports, buyers cannot always dispense with an inspection.

HOW TO PRESERVE BELTS.

Belting is a very heavy item of expense to every mill man, as it is indeed to every manufacturer using machinery for the prosecution of his industry, and anything which will tend to reduce such expenditure is worthy of presentation for their benefit. An experinced engineer says he has made a belt last him ten years by each Saturday evening turning the inner side out, washing it well with warm water and soda, scraping and oiling it, and then going over the same operation Monday morning before starting the machinery. By doing this and keeping his pulleys clean he finds that they will run at full speed with five pounds of steam when the belts are on loose pulleys, while a larger engine alongside, to which no such attention is given, cannot run with less than thirty pounds under like circumstances,—*Lumberman's Gazette.*

EVERY day reports from the south indicate that the ownership of pine lands there is being gradually contracted to few holders.

THE *Lumberman's Gazette* says :—Cedar operations will not be heavy this winter as the demand for posts and poles does not warrant an extensive output. One Bay City dealer who last winter got out 900,000 pieces will not get out more than 200,000 this. The prospects for the cedar trade are not good.

A HOODED circular saw guard has been invented and patented by Mr. Leonhard Hofmann, of Cincinuati, Ohio, which is adjustable to any height above the saw table to allow for the working of any thicikness of lumber. The adjustment may be made instantly, and the guard is held rigidly in place at any elevation desired. It is designed to prevent accidents by circular saws.

WHAT right have the parties who are daily making a practice of appropriating logs and cedar, found floating in the bay, to their own use and benefit ? If a man can so claim property thus found, what protection is there against his claiming your wife or your wood-pile if he finds them on the streets. Until I am satisfied on this point, I shall in the interest of home comforts, keep my wife in and chain the dog to the wood-pile.

THE PRAIRIE PROVINCE.

WINNIPEG, Man., Oct. 10.—The first real snowstorm of the season occurred to-day. The ground is covered, but it is so soft that it will undoubtedly disappear and be followed by the usual Indian summer.

R. B. Angus, Vice-President of the Canadian Pacific Railway, General Manager Van Horne, and Superintendent Egan reached Calgary this evening after a thirty-six hour run from Winnipeg.

Rev. Dr. Grant, Principal of Queen's College, Kingston, who has just returned with Sandford Fleming from a trip through the Rock river route of the Canadian Pacific, reports Major Rogers, in charge of the Rocky Mountain survey, having successfully achieved a triumph for a direct line. There are three distinct passes, as follows:—In the Rockies proper, Kicking Horse ; in the Selkirk range, Rogers' pass, and in the gold or Columbia range, Eagle pass. This virtually settles a long-disputed question, and gives the Canadian Pacific the shortest of all trans-continental railways. From Winnipeg to Port Moody on the Pacific is only about one thousand four hundred and eighty miles, whereas from Portland to St. Paul is one thousand nine hundred and eleven miles. Another interesting fact is that it will present the most striking and picturesque scenery of all trans-continental railways. The mountains on Bow river, on Kicking Horse, and in the Selkirks are singularly grand and beautiful. Principal Grant has pierced the Rockies now by four distinct passes, and knows whereof he speaks.

AMERICAN SAWS: We represent Four of the Best American Saw Factories

☞SAVE YOUR TIMBER
By using THIN Saws.

McLAUGHLIN Bros., Arnprior, run two 66-in. Brooke Bit Saws, 800 revolutions per minute, on 6 to 10-inch feed.

They use Steam Feed

THE BROOKE BIT-TOOTH SAW

No. 1 TOOTH.

With this Saw you have either a Bit Tooth Saw or ordinary Inserted Tooth Saw, with teeth two-and-a-half inches long, both fit same socket and are interchangeable in a few minutes. These Bits require no gumming, and very little filing; are so firmly held that they will stand all necessary swaging, and can be worn down to dotted line shown in cut; they rest on lugs, saving the strain on the rim of the saw. For these reasons they will cut more and better timber at less cost than any other tooth. EXTRA BITS (per 100) No. 1. $9; No. 2,$8.—(per 1000), No. 1, $80, No. 2. $70.

Two sets No. 1 Bits have cut 500 m. feet pine, in 60-inch saw, running 800 revolutions per minute, on 6-inch feed. E. E. PARSONS, Arnprior.

VIZ.

AMERICAN SAW Co.

Emerson, Smith & Co.

R. HOE & Co.

Hubbard, Bakewell & Co.

Inserted Tooth, BIT TOOTH,

AND

SPECIALLY THIN SOLID SAWS

We run 60-inch to 72-inch Solid Saws, as thin at center as 10 guage at rim—saving, over a 7 guage saw—1000 feet of lumber in every 25,000 cut.

McLAUGHLIN BROS., Arnprior, run two 66-in. Hoe Saws, on 6 to 10-in. feed, 800 revolutions per minute.

☞Write them.

HOE'S PATENT BIT SAWS.

One of the best Bit Saws made, above cut represents usual size tooth, one size larger and smaller made. ☞Send for particulars and prices.

SAVE TIMBER

GROW RICH

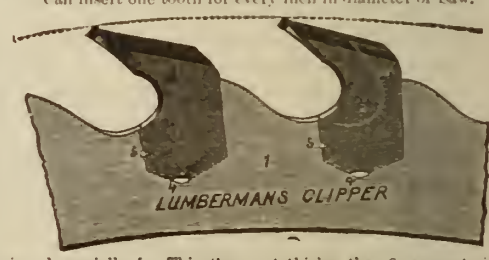
EMERSON'S EXTRA THIN SOLID SAWS

Having special facilities for the manufacture of extra thin saws for board mills, we are prepared to receive orders for Circular Saws as follows:—54 inches in diameter, as thin as 12 guage at rim and 11 at center, 54 to 56: 11 guage at rim, 10 at center, 66 to 72; 10 at rim, 9 at centre. Our unparelleled success with thin saws during past few years has induced us to recommend them to our customers. Our superior facilities are:—1st, Evenness of Temper; 2nd, Perfect Accuracy in Thickness, Saw balances perfectly; 3rd, Properly Hammered, to have equal strain in all its parts and at same time run true. This department is under the special supervision of J. E. Emerson, who has had 30 years experience and is without doubt the most successful circular saw maker in the world.

☞NO EXTRA PRICE FOR THIN SAWS.☜

EMERSON'S LUMBERMAN'S CLIPPER SAW

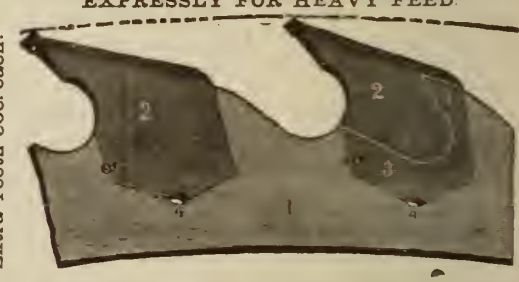
Can insert one tooth for every inch in diameter of Saw.

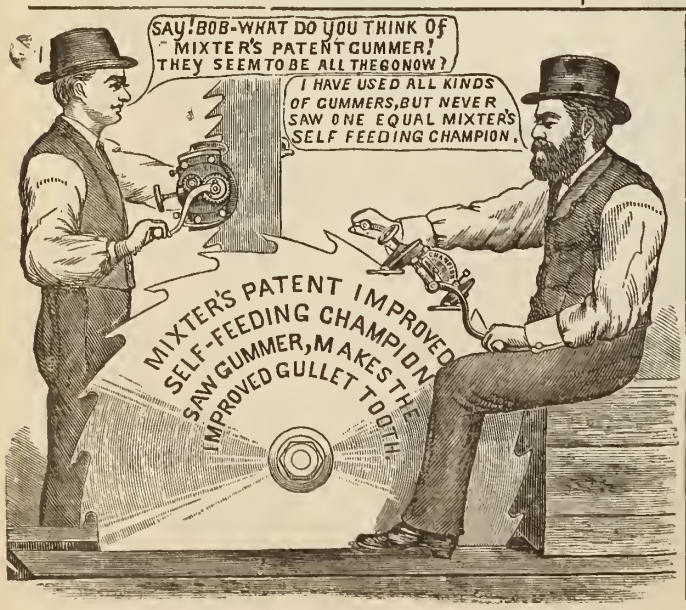


Designed specially for Thin Saws not thicker than 6 gauge at rim, or thinner than 15 guage at rim.

The CLIPPER FLANGE SAW

EXPRESSLY FOR HEAVY FEED





Alligator Jaw Wrenches

5 sizes, grip from ½ to 3 inches, Iron. Solid Steel Jaw. Price 50c. to $5.50.

Cut represents No. 1. Larger sizes have Solid Handles.

WE KEEP IN STOCK ALL KINDS OF

Saw Mill Furnishings

SAW GUMMERS:—Stone's Original, large and smal size Mixter's Self-feeding Champion; Emery Wheels and Stands

SAW SWAGES:—Hoe's, Emerson's, Mixter's, and American Saw Co.; from $1.50 to $6.00.

SIDE FILES, BELT STUDS, Detachable Belt Fastners.

JARECKI'S PATENT SCREW, PLATE, and PIPE CUTTER, ⅛ inch to 2 inches, $28.00; smaller ranges in proportion

Band Saws, Scroll Saws, Rainbow Saws for felling trees, American Shingle Saws, Lace Cutters. Cant Hooks. Flue Scrapers, Leather, Cotton and Rubber Belting.

SPECIAL AGENTS FOR GANDY'S PATENT MILL BELT, runs wet or dry; the best and cheapest main driver.

WORTHINGTON and BLAKE'S PATENT STEAM PUMPS. ECONOMIST PLANER and MATCHER COMBINED, large range of work, light, handy, durable, cheap.

Ewart's Detachable Chain For Log Jacks, Refuse Carriers, Sawdust Carriers, all sizes. Live Rolls, Tranfers, Slow Speed Driving Belts, Tie Loaders, Slash Tables, Trimmers, Lumber Sorters, Shingle Block Elevators, and many uses about a saw mill.

HIGH CLASS HEAVY and PORTABLE SAW MILL MACHINERY our Specialty.

Waterous Engine Works Co., Brantford

Send for New Price List and Chain Circular. ☞Mention this Paper.

THE CANADA LUMBERMAN

AND MILLERS' MANUFACTURERS AND MINERS GAZETTE.

PUBLISHED SEMI-MONTHLY.

The only Newspaper devoted to the Lumber and Timber Industries published in Canada.

SUBSCRIPTION $2.00 PER ANNUM

VOL. 3. PETERBOROUGH, ONT., NOVEMBER 1, 1883. NO. 21.

R. H. RANGER & Co., at East Wilton, Me., have a panel factory, at which they cut basswood panels panels from the circumference of the log, as it is done in the establisment at Saginaw. The log is first steamed, and comes out of the machine a board, flat ribbon, which is then sawed into the sizes desired, and used mostly for sleighs and carriages. This firm has a large European trade.

THE *Northwestean Lumberman* says :—The long-sighted New York lumber dealers have had a splendid oportunity to make a small fortune in lath. Aug. 8, lath sold in that city at $2.20, and'last advices placed current prices at $3.75, with some sales at $4, and there are indications that the top is not reached yet. An advance of 70 per cent. in two months may be called a good one, looking at it from the dealers side of the question.

THE Thunder Bay Sash & Door Monufacturing Company, at Port Arthur, Ont., on the north shore of Lake Superior, haf a capital of $30,000. The intention is to erect a three-story frame building 44x80 feet on the ground, an engine house, dry kiln, storehouse and office. The company is to be represented at Winnipeg, so as to make sales throughout the Canadian Northwest, The object is to capture some of the trade now enjoyed by the Americans.

THE *Northwestern Lumberman* says :—Timber land in Maine is valuable, both for forest products and agriculture. George H. Fogg, of Eddington, started to make a farm out of 100 acres of forest land, which he bought in the town of Kingman for $5 an acre. He cut 230, 000 last blocks and the frames for two 500-ton vessels off the lot, and having cleared 40 acres, he this year cut 75 tons of hay and raisd 15,000 bushels of potatoes, and has 60 acres of timber left. He must have realized over $2,000 on his 100 acre lot already, and more to hear from. It would bother a prairie farmer to do as much.

THE Parry Sound *North Star* says :—The case of Ferris *vs.* the Parry Sound Lumber Company, for damages for flooded land, was tried at Barrie this week and resulted in the jury giving a verdict of $100 damages in favor of Ferris. The amount sued for is $1000. A similar case brought against the Muskoko Boom Company by Captain Harston, of Ilfracombe, for "drowning" 25 acres of land, was also tried at the same court. The damages claimed in this case was also $1,000 and the jury awarded damages to the amount of $50. These cases show that juries cannot be persuaded to award "fancy" damages in such cases and proves that in advising settlers to settle their grievances with the lumbermen without a recourse to the courts we were in the right.

THE LATE MR. JAMES LITTLE.

In its remarks on the death of the late lamented Mr. Little, the Montreal *Herald* says:—

In 1830 he was married at St. Catherines, and moved with his wife to a place on the Grand River, now called Caledonia. The whole section was, at this period, a wilderness inhabited by the Six Nation Indians, and Mr. Little passed months at a time without seeing the face of a white woman. He engaged in lumbering, and ultimately his business extended over nearly the whole peninsula lying between Lakes Erie and Ontario. He carried on an active business for nearly thirty years. He came to Montreal at the age of 70 years, and at once became one of the most persistent advocates of forest protection, his personal knowledge of the lumber business and the rapidly decreasing area of forest territory enabling him more rapidly to draw attention to the facts. He was in a great measure successful, as he lived to receive an acknowledgment of the soundness of his views by a special vote of thanks from the American Forestry Congress, and by having his named placed as honorable president of the Forestry Association of this Province. No one to read the able articles that have appeared in the Columns of the *Herald*, and other papers could have imagined that these were the productions of a gentleman who had already passed the allotted seventy years, yet his death now at the age of 80 shows that he had passed this period, and recognizing as we do the great importance of forest conservation to the welfare of the country, can truly say that few men have done so much for the country's good, having their whole life's vigor to assist them. He was the first person in Canada to send lumber to the United States markets, Albany being reached by night and day coaches from Buffalo in a week's time.

SOME MAINE WORKINGS IN WOOD.

The *Mining and Industrial Journal*, of Bangor, Me., says : There are 2,000 clothes-pin factories in this country. Were it not for our forests of white birch, beech and other kinds of hardwoods, the world's washday would be dark indeed, as nearly every clothes-pin made in the world is made in the United States. There are some 200 factories in Ohio and Pennsylvania. Maine has several. One of these is at Strong, a thriving town under the shadow of Mount Blue. This mill is owned and operated by J. W. Porter & Son, who also turn out large quantities of croquets sets) base-ball bats, ten pins, staves, excelsior, and wooden articles of various descriptions too numerous to mention. The clothes-pin is made of white birch, which is the best of all hardwoods in the lath, but mnst be worked green or it roughs up. Two machines make the clothes-pin ; one turns it and another saws the slot. Then 10 bushels of pines are dumped together into a large drum, which is made to revolve rapidly ; in this way the pins are rubbed against each other and polish themselves. There is a machine which turns out a complete clothes-pin, doing both the sawing and slotting, but this pin is straight and its prongs have no spring to them ; while the prongs of the pin made by the two machines are concaved, and the pin is not so easily split. Croquet sets are turned out here with astonishing rapidity, by means of a variety of lathes. They are made of all kinds of hardwood. A maple bolt is chopped into round balls at the rate of 2,000 an hour, by knives that shape the opposite hemispheres of two balls at once. One clip makes a ball—that is, half of one ball and half of another. By means of patterns and travelling knives, mallet-heads and handles are made in a variety of shapes. The fashionable mallet the past season had a head twice as long as the old-fashioned mallet and a handle about half as long. The mallet-heads are subjected to the same shaking up and self-polishing in the drum that smooths the clothes-pins. The sets are decorated by machinery, the states, mallets and balls being placed in a painter's lathe and one revolution make a strip. One may invest 50 cents, $5 or more in croquet. The demand has never been so great as during the sast summer. A single New York firm ordered 10,000 sets. As to base-ball bats, the dealers fairly begged for them. The supply failed, for some reason or other, and they could get their orders filled nowhere. Ash and willow make the favorite bats. Willow timber is not easily had, however, as the manufacturers of artificial legs manage to secure all the supply. There's nothing equal to willow for a wooden leg.

PANURGE ON FORESTRY.

The following letter appears in the *Mail*.—

SIR,—Looking into Rabelais a day or two ago I lighted on an ancient illustration of the waste deplored by Mr. Phipps. Pantagruel appoints Panurge to the lordship of Salmigondia, upon which the latter dissipates the revenue of three years in a fortnight. One of the means by which this was accomplished is given as "felling timber burning the great logs for the sale of the ashes." Those who have lived forty years in Canada have been amply familiar with this process. But Panurge had a good word to say for his extravagance, which I fear poor Canadians had not wit enough to imagine. He says: The virue of fortitude appears therein, by the cutting down and overthrowing of the great trees, like a second Milo, making havoc of the dark forests, which did serve only to furnish dens, caves, and shelter to wolves, wild boars, and foxes ; and afford receptacles, withdrawing corners and refuges to robbers, thieves, and murderers ; lurking holes and skulking places for cut-throat assassinators ; secret obscure shops for coiners of false money, and safe retreats for heretics; laying woods even and level with the plain champaign fields and pleasant healthy ground, at the sound of the hautboys and bagpipes playing reeks with "high and Stately timber" etc., etc. At any rate it would seem that Fenchmen three hundred and fifty years ago were no wiser than Canadians, and that the acute and witty scholar had eyes for their folly and many words for its reprehension.

Yours, &c.,

JOHN CARRY.

Port Perry, Oct. 13.

TIMBER AND HOUSES IN SKYE.

Throughout the isles timber is a rare and precious article, most frequently the gift of ocean. The man who secures a good log of driftwood has obtained a prize worth having. It may have been a brave old tree, tempest-torn from its home in some distant forest, carried to the sea by rushing torrents, and perchange tossed by the waves and wafted to and fro by many a current, ere it drifted to its rest on these far isles. Or it may be the masts and spars, or perchance the cargo of some wrecked vessel—whatever its story it is treasure trove, and most deeply valued. Though encrusted with barnacles or riddled by pholades it can all be turned to good account ; the smallest piece will make a stool or a settle, or a box or a part of a door ; while large timbers become rafters—precious heirlooms, for a young couple cannot wed till they have accumulated enough rafters to support their thatch, and should they have occasion to "flit," the only part of their bothy that commands any pecuniary compensation is the roof, not the work only, but also the heavy thatch saturated with thick greasy peat-reek, (in other words with a thick coating of soot). This, when broken up, forms a valuable manure for the unfertile crofts.—*Temple Bar.*

Michoacan Forests.

The state of Michoacan, which Humboldt pronounced the paradise of Mexico, lies in the southwestern part of that great republic, and borders on the Pacific ocean. Besides being a country of extraordinary richness in soil and minerals, it has a vast abundauce of valuable woods. The hills and mountains are everywhere clothed with luxuriant forests, in which grow a great variety of valuable woods, such as ebony, mahogany, etc. These forest growths are said to be more abundant in Michoacan than anywhere else in Mexico, and it is predicted that as soon as the present progressive policy of that country causes Michoacan to be peuetrated by railroads, its trade in valuable woods will become immense.—*Northwestern Lumberman.*

ON Oct. 4, 8,500 bushels of Oregon wheat arrived at Duluth over the Northern Pacific railway, the first shipment of the kind, to Duluth, ever made by way of the newly completed route. This receipt of wheat marks a new area in northwestern traffic aud development.

THE LUMBER INTERESTS OF CHICAGO.

On the southwestern border of Chicago is another city whose buildings are the blackened piles of lumber, and whose busiest highways are the passages between, just large enough to afford entrance for a wagon. Through this district flows the sluggish water of the south branch of the Chicago River, its current changing direction with the wind, and its odors unvarying, except to grow a little more intolerable when some huge propeller is fast in the mud, and her own screw, aided by the tugs pulling at her, stirs up the oozy bottom.

Extending into the yards on either hand are long slips from which rise the graceful spars of the lumber schooners, or the stumpy and blackened masts of the barges. Some of these carry nearly a million feet of lumber. The "lumber shovers" who unload them wear a leather apron extending from the belt to the knees, and leather guards to protect the palms of their hands. During the cold raw weather of early spring these men can be seen at work stripped to the waists, regardless of the freezing rain and the brisk lake winds which make such sad havoc with weak lungs.

Almost as far as the eye can distinguish objects through the smoky atmosphere the vast expanse is roofed with the sloping tops of the lumber piles. Here and there rises a planing-mill or sash factory, or more conspicuously the huge grain elevators with their iron roofs and slate-covered sides. Tracks and sidings admit to the heart of the lumber district the locomotive with its string of cars of almost every road in the country, coming to be loaded with the rough lumber, packing boxes, or the finer manufactures of doors, stair rails, and the like. The trains make quite a study of color in the otherwise dingy prospect. Even the cars of the same lines are of different shades from varied exposure to the weather. The air resounds with the hum of the planing-mills, the snorting of the busy switch engines, the jolting of the wagons on the corduroy roads, the rattling of tackles and the whistling of tugs on the river. Scores of chimneys and stacks fill the air with smoke, and the breeze carries with it the finer dust from the saw mills, which finds snug lodgment in the eyes of the visitor, whose effort for relief bedaub his cheeks with the damp soot deposited there.

Scattered about in other localities, generally along the river, are other yards, singly or in groups, aggregating as large an area as that of the "lumber district" described. Even at the mouth of the river, on artificial ground, the mills and lumber piles extend eastward half a mile or more beyond the site of the old lighthouse and Fort Dearborn. The stock of lumber on hand varies from four to seven hundred million feet of sawed stuff and timber, one to three hundred million shingles, forty to seventy million laths, with pickets, cedar posts, etc., in proportion.

The shipments sometimes reach two hundred million feet of lumber and one hundred and fifty million shingles in a single month. The local trade amounts annually to over five hundred million feet.

The town of South Chicago, at the mouth of the Calumet River, twelve miles south, has extensive yards, and, according to the interested parties, bids fair to rival the present city in the future. Many of the citizens of Chicago wish the lumber trade was transferred entirely to the Calumet, for they look with apprehension upon the acres of dry lumber, and fear a repetition of the calamity of 1871. A fire getting good headway in this locality, if fanned by the strong southwest winds prevalent in the summer and fall, could badly fail to destroy the city as completely as before, despite the efforts of what is called the most efficient fire department in the world.

The region which produces this enormous quantity of lumber extends along the eastern shore of Lake Michigan and half the length of the western side. Reaching far into the interior of the state are streams which bring down the logs rafted together to the saw mills at the river mouths. These lumber towns along the shore are wooden to the last degree. Many are built upon piles driven into the sandy marshes, the buildings all frame, and even the roads made of sawdust, into which the foot sinks as though in dry sand. Their well water is frequently as yellow as saffron from the decaying wood through which it comes. It seems almost a miracle that any of the inhabitants should escape if one of the forest fires which occasionally sweep through the lumber regions attacked this town. No provision is being made to perpetuate the forests, but they are being cut down right and left, making it only a question of time when the white pine timber will be as scarce as rosewood. As a gentleman connected with the lumber interest remarked, "We are doing nothing for posterity except to decree that they shall not build wooden houses."

The lumber is brought to the Chicago market chiefly by schooners, propellers, and barges, the latter being towed two or three at a time by powerful tugs. The receipts of lumber by rail, except from the south, are comparatively light, although the Chicagoans think it would make a comfortable business for what they facetiously call the "surburban towns," viz., Milwaukee, St. Paul and St. Louis. The immensity of the lumber business of Chicago can not be realized except by taking a drive through the lumber district, and spending an afternoon in the rooms of the Lumberman's Exchange, poring over the statistics compiled by the secretary. There are two hundred and twenty firms engaged either as brokers, manufacturers, or dealers in lumber. Last year one firm alone handled on hundred and twenty-five million feet, averaging in value about $18 a thousand.

Besides this trade in pine the hardwood lines are in increasing demand. The costly hard woods, domestic and imported, and the cheaper hard pine from Mississippi, form no inconsiderable item in the year's receipts. During the last year the receipts of lumber at Chicago made a grand total of 2,676,757,842 feet, and 1,215,455,494 shingles. Of this, three hundred million feet were of hardwood. The long-leaf yellow pine, heavy almost as mahogany, and so pitchy that a sliver of it will burn like a taper, is rapidly growing in favor for interior work. Good selected stock has a beautifully figured grain, and when darkened a little by time is surpassed in effect by but few of the more costly hard woods. The shipping trade in lumber from Chicago extends northwest, west, and south to the limits of the country, not always stopping there. Some of the lumber towns of Michigan are active competitors for the trade with the Eastern States; but, nevertheless, the city of railroads manages to forward a goodly amount into their markets.

Chicago, being in the centre of a vast system of water and rail transportation lines, is destined to become a larger dealer in lumber every year, although now the largest market for forest products in the world. The millionaire in the metropolis and the section hand on one of the new western railroads both buy the material for their homes from her yards. The boards for the farmers' fences and the ties on the road-bed of the railroad which carried him to his western home pass through the hands of the Chicago lumbermen. The forests of Michigan are still enormous, and the undeveloped West demands their wood. The trade is guaranteed for years to come, and fortunes await those who can skillfully conduct it.—*James J. Wait in Harper's Weekly.*

AUTUMNAL RUMBLINGS.

The *Timber Trades Journal* of Oct. 6, says: A fortnight ago our Liverpool authority gave the following uncomfortable account of the state of the timber trade in that port:—

"The importation of all kinds of wood goods continues to be far beyond the wants of the trade, and until there is a very marked improvement in the general business of this district, no relief from the present state of depression need be looked for, unless shippers can stop the glut of supplies which are at present being put upon the market."

Since then about eighty ships with wood goods have arrived there, and the same tone was apparent in the report of last week, but a little more hopeful, though on what the hope was grounded was not very apparent. We find the following from the same hand:—

"The importation of North American goods, both timber and deals, continues to be in excess of the requirements of the trade, and therefore, there is no improvement in prices; at the same time, these are at such a low ebb that there is a probability of shipments being greatly curtailed."

Well, that may be accounted a reasonable source of hope, on a small scale. But as long as there is a ship to load, and the ports are open, we are not likely to have to record the novelty of her coming away in ballast. It is added, however, that

"the last advices from St. John, N. B., report that several of the city mills are shut down, as manufacturers of spruce deals see that it is impossible to make sales at a profitable figure until the English markets show some considerable advance."

This shutting down of the mills is heard of every season, but we have never known it prevent our getting a very plentiful supply in the end. Sometimes it is a drought that stops them, another time great floods have broken up the rafts and scattered their contents over the intervening lands, where they remain high and dry, far away from the navigable channel through which they were bound to their destination. Now, having *glutted* our market (as they find out), some of the mill owners indignantly shut down their mills, we may presume because only such shabby prices are to be obtained in our chief emporiums. But we have been given to understand that there is always a brisk demand from the States, at the lower ports, which might be expected to keep them going when trade is slack here. At all events, neither in Liverpool nor in London is the reported closing of any number of spruce mills likely to add a doit to the prices obtainable at the public sales in the month of October. Natural causes are now at hand which will stop shipments altogether at most of the ports, both in America and in Europe, and on the termination only of the season—be it early or late—will the trade look for an interruption to the regular routine of importation at this period of the year.

Talking of the approach of winter, it may be permitted to remark that in Europe there are reasons for anticipating that it will be a severe one, and not unlikely to set in early. It is worthy of notice that we appear to have been indebted for the very fine summer we have had chiefly to the southern winds, which have prevailed, with short intervals of change, since the beginning of April. From southeast to south and west has been the rule, northerly and easterly blasts have been of short continuance, and just as they began to be annoying and to effect vegetation the wind has again gone to its old quarters, and however rough it might be, it was almost always genial, and with all the sunshine and rain that was necessary, and lattorly—that is, in September—whole weeks of calm, sunny days, though the month began and ended with a storm. In fact, we have had in this country a good old-fashioned English summer, in which each succeeding month brought with it the characteristics which tradition had of old assigned to it.

It used to be calculated that southwest winds prevailed for three-fourths of year in England, but of late this rule has not held good, and not above three years ago the learned and scientific occupied themselves in putting forward theories, to show that the climate of these regions was gradually changing for the worse; and even astronomy was almost turned inside out to account for it. Looking, therefore, to the future of the year, as likely to be consistent with that part of it which has gone before, we may expect that the east and north winds will get their turn with a long innings as the days shorten, already we have a taste of them, and that Boreas will re-assert his reign as Christmas approaches, and when he rules at that period he lets us all know it. There is a compensating balance in the seasons as well as in the solar system itself, but its laws are less perfectly known. Rain, wind, and sunshine, heat and cold, are reduced to an average by meteorologists, and, though the years may vary, they find their level in a series and come around again to the happy medium, in which flowers, fruits, and harvest, follow each other in rapid succession "and scatter plenty through a smiling land," after which we may expect that the rigours of winter will be equally conspicuous, and if it should be an early one, so as to close the Baltic in November, the trade would then have substantial grounds for believing that the import season could not be much further prolonged. That shipments will continue to be made for this country, whether we need them or not, may be pretty plainly seen in the intimation of our Swedish correspondent's last letter. He states, under date of September 22nd, that

"it is not likely any large quantity of goods will be sent from Norrland to London, or similar centres, on consignment this fall."

He then warns us that

"if tonnage can be had at reasonable rates, consignments to a limited extent will be made from Finland, not only to London, but to one or two continental ports."

This is not suggestive of a limited extent, and probably some other British ports may be favored with these contemplated consignments, though the timber merchants of the neighborhood may be by no means expecting such preference. At the beginning of the season the trade of this country was assured that consignments to British markets were not to be thought of, as it was evident they were not in a condition to bear them. Prices have given way on this side since then, say 10 per cent. at least, and now consignments are openly talked of as imminent, to a limited extent, which seems to have no other limitation than that of the tonnage to be got hold of before the final arrest of the proceedings by the advance of General Frosty-fist to the rescue. That is all the security merchants on this side have to protect them from an excessive fall importation. But there is a part of our correspondent's letter which seems to foreshadow a change for the better, though it be more remote than he thinks. At any rate, he speaks out, and with an emphasis which indicates that he is very much in earnest. He describes to us the state of the forests and the results of the measures taken for regulating the cutting, and then he adds

"In spite of the present depression in the trade, it is my firm belief that we are on the eve of a substantial rise in the value of growing timber, and especially of redwood."

It is not easy to see how, while production is going on at such an enormous rate in Sweden and Finland, any check can be interposed that will raise prices here; but if shippers have to pay more for the growing wood they will hardly continue to ship it on speculation with the probability of a loss on every cargo.

We fear that for this season at least the prediction will not benefit the trade of this country. There appears to be already so large an accumulation of stock in the hands of the mill-owners that they may be considered almost independent of growing timber for the present, and any attempt to increase its price might throw many lumberers out of employment without affecting the free on-board market, till the stocks now preparing for shipment began to be seriously diminished by the demands of another season.

Teakwood.

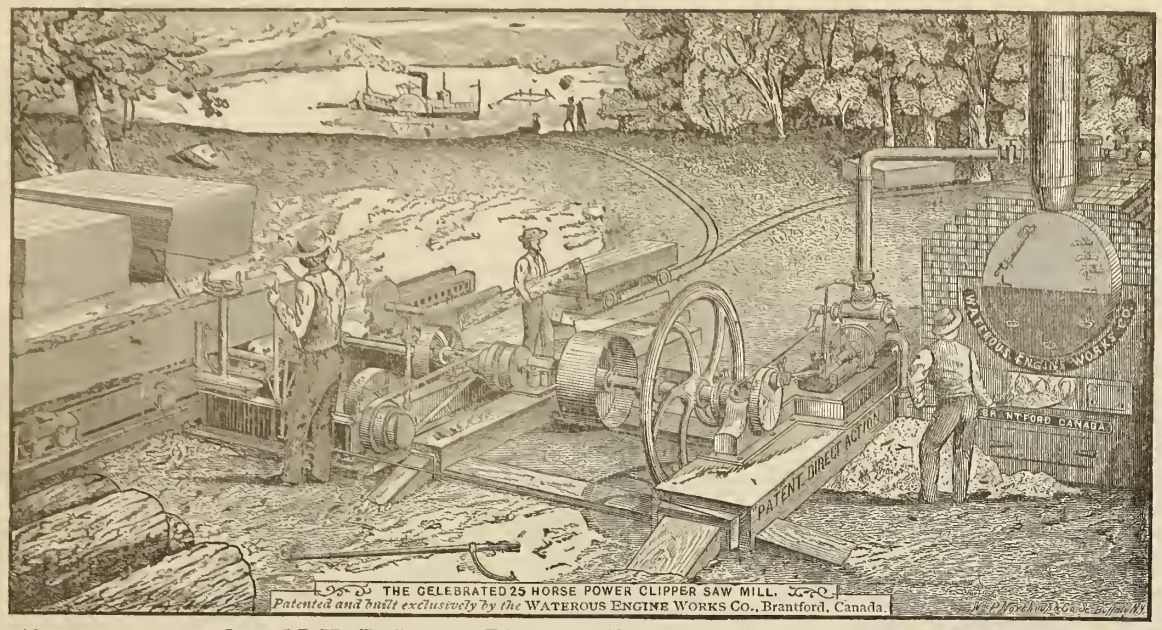
I understand, says a writer in the *Garden*, that some of our enterprising hot-house builders are introducing this wood into horticultural buildings, and it is expected it will supersede pine to a considerable extent. It is light, strong, and durable, and not difficult to work. Teak baskets for orchids are now common, and gardeners know how much more lasting they are than those of hazel and other common woods. Lightness and elegance of structure are important considerations in hot-houses in more ways than one, and in this respect teak has the decided advantage, for it enables the builder to dispense with heavy rafters and beams, and is not much less durable than iron, to which it is preferable in other respects.

An Ancient Forest.

The *Timber Trades Journal* of Oct 6th, says: At a meeting of the Tees Conservancy Commissioners, on Monday last, Mr. Fallows stated that 134 heavy trees, varying from 10 ft. to 40 in length had been dredged from the river. They were, doubtless, part of the forest which existed in the locality in remote times.

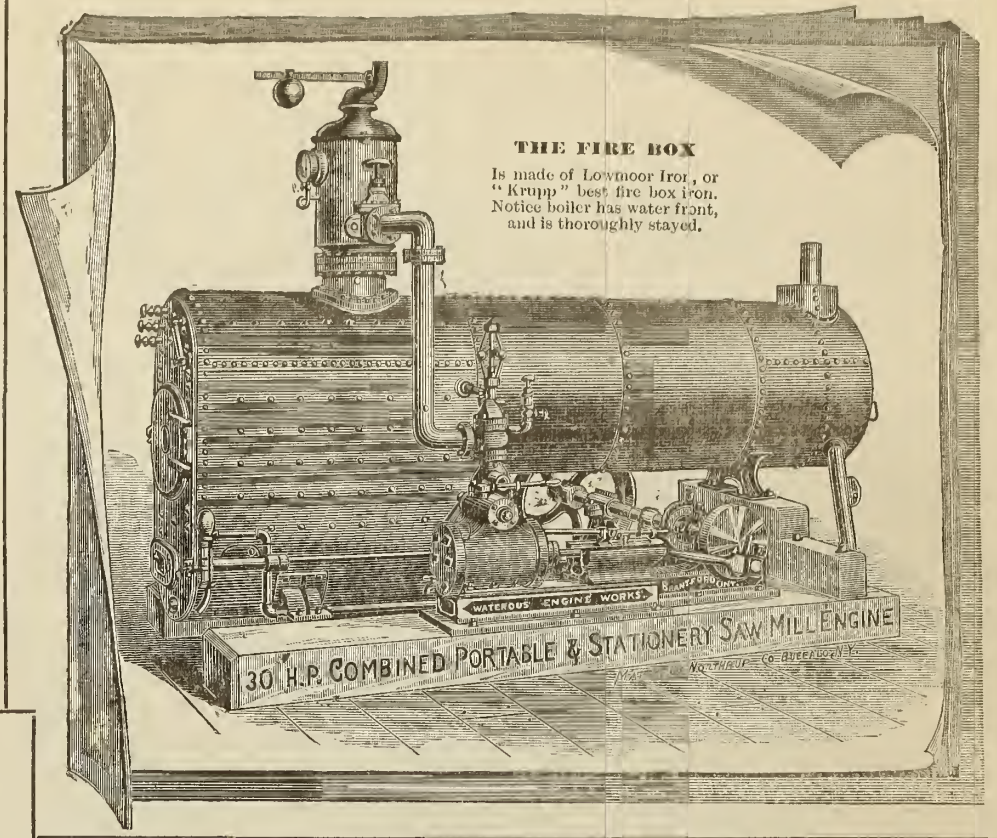
Semi-Portable and Portable Direct Action and Belted Saw Mills!

TEN DIFFERENT SIZES.



Above cut represents **Our 25 H. P. Patent Direct Action Mill** which we guarantee to cut 8,000 to 12,000 feet of lumber per day of ten hours, and to be the most efficient, economical and durable mill built in America, and will saw lumber cheaper per thousand than heavy large size belted or gang mills. For over a quarter of a century the leading pioneer mill of Canadian settlers. ☞Specially constructed for hard work.

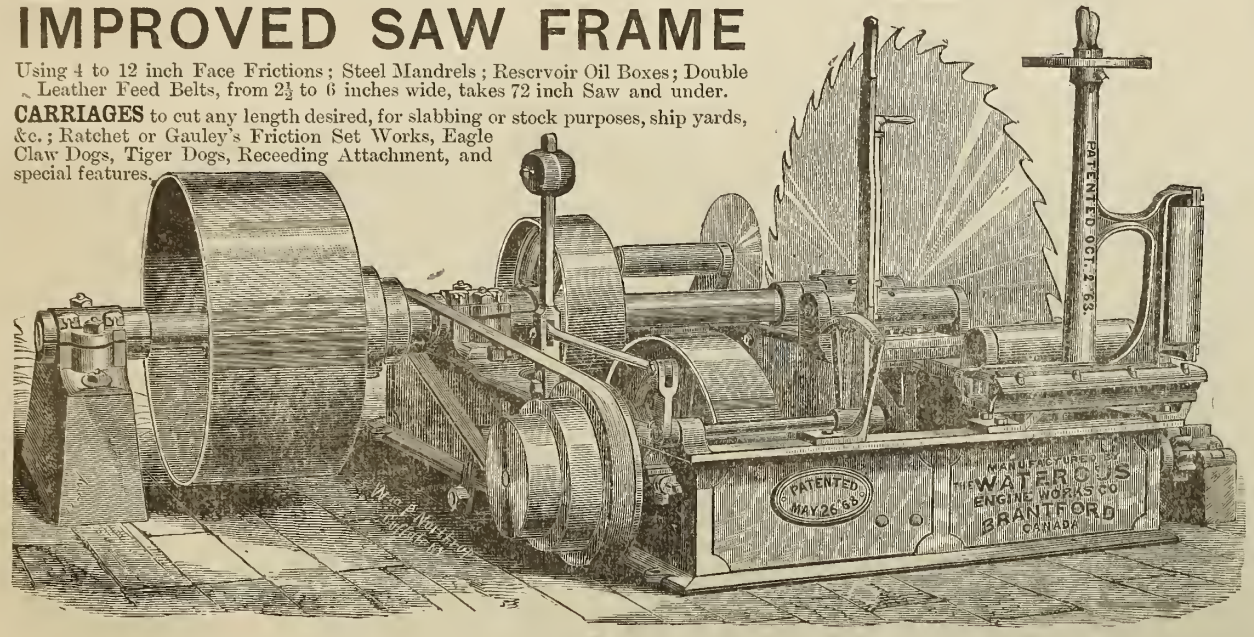
☞This Cut represents the Engine furnished with Nos. 8, 12, 16 and 18 Saw Mills.



IMPROVED SAW FRAME

Using 4 to 12 inch Face Frictions; Steel Mandrels; Reservoir Oil Boxes; Double Leather Feed Belts, from 2½ to 6 inches wide, takes 72 inch Saw and under.

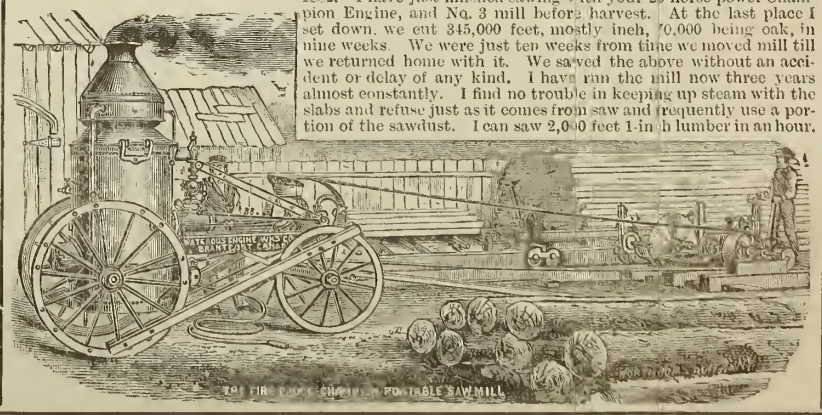
CARRIAGES to cut any length desired, for slabbing or stock purposes, ship yards, &c.; Ratchet or Gauley's Friction Set Works, Eagle Claw Dogs, Tiger Dogs, Receeding Attachment, and special features.



Champion Portable Saw Mills

12, 16, and 20 H. P.

GEORGE BOOK writes as follows:—"ST. ANNS, ONT., July 27th, 1882.—I have just finished sawing with your 20-horse power Champion Engine, and No. 3 mill before harvest. At the last place I set down, we cut 345,000 feet, mostly inch, 70,000 being oak, in nine weeks. We were just ten weeks from time we moved mill till we returned home with it. We sawed the above without an accident or delay of any kind. I have run the mill now three years almost constantly. I find no trouble in keeping up steam with the slabs and refuse just as it comes from saw and frequently use a portion of the sawdust. I can saw 2,000 feet 1-inch lumber in an hour.



The following are a few who have bought these mills:—

Canada Pacific R. R. Co.
G. B. Hall & Co., Que. (2)
Dominion Land & C. Co. Sherbrooke, Que. (2)
Sorel R. R. Co., Que. (2)
Cochrane Ranche Co. Bow River, N.W.T.
Nor.-West Milling and Mining Co., Bow River, N.W.T.
Toronto and Nor.-West Colonization Co., Near Brandon.
Morton Dairy & Farming Co., Turtle Mountain.
Allan Grant, Ottawa.
Geo. Perley, Ottawa.
Michipicoten Native Copper Co.,
W. W. Stewart, Montreal

A. & P. White, Pembroke, have one of these 30 H. P. mills at Deux Rivieres, C. P. R. R.
G. C. V. Hall, Quebec, has one of these 30 H. P. mills at St. Agnes, Quebec.
Also, W. & R. Wallace, Gardner's Creek, N.B., with 60 foot Ship Yard Carriage.

Double Edgers, 2, 3 and 4 saws; Automatic Lumber Trimmers, 5 to 9 saws each; Log Turners, Slash Tables, Log Jacks or Haul-up of all Capacities, Endless and Single Chain; Automatic Log Rollers, Transfers, Live Rolls, Shingle Machines, Drag Saws, Knee Bolters or Block Splitters, Shingle Packers, Gang Lath Mills, Stave Machines, Automatic Sawdust Feeders for Gangs of Boilers, Sawdust, Slab and Refuse Conveyors, Elevators, Pickering Governors, Worthington and Blake Steam Pumps, American Planing and Matching Machines, American Saws, Solid and Inserted Tooth, Extra Thin Circular Board Saws a specialty, Swages, Gummers, Emery Wheels, and all kinds of Saw Mill Furnishings kept in stock.

☞WATEROUS ENGINE WORKS CO., Brantford, Canada.

Send for New Price List and Illustrated Circular, of special interest to saw-mill men. ☞Mention this Paper.

THE FORESTS AND THEIR MANAGEMENT.

We take the following from Mr. R. W. Phipps' report to the Ontario Government:

THE BRITISH ISLES.

There are many forests, both Crown and private, in the British Islands, concerning which, as they appear to be managed on different systems, I shall merely state such points as seem to have some bearing on possible operations in Canada, or may show the progress made in late years in planting and foresting operations.

In the New Forest, Hampshire, containing 91,000 acres, much has been planted with Scotch fir and larch in 1853, and with oak in 1857. What is noticeable is that the first, planted as nurses, are planted here so much before the others (both are elsewhere frequently planted at once). It is done to establish the nurses, and give shelter from the cutting winds prevalent here. They transplant here from the first nursery to another—the last one near the ultimate destination of the trees.

The Dean Forest, in Gloucestershire, has 22,000 acres, in all. The commissioner visited twelve plantations here, ranging from 1844 to the present year. Nurses and hardwood are put ont together.

In Scotland, the nurseries of Lawson & Sons, near Edinburgh, are noticed. They contain 270 acres. There were thirty millions of conifierœ seedlings in the beds. The *pinus pinaster* is largely used for planting on light sandy soils near the sea.

Before sowing or forming the nursery bed the land is trenched to fourteen inches, and a crop of potatoes taken off to clean it. In the following spring the seed beds are laid out, and the upper soil carefully prepared to suit the nature of the trees which are to be sown. Most of the coniferæ prefer a light dry soil with a considerable proportion of sand, and this has the advantage that the seedlings are easily shaken out and freed from each other for transplanting. In the case of Scotch fir and larch, the seed is sown in May or June, and left in the seed bed for two seasons. The seedlings are then planted out in lines fourteen inches apart, and three inches between each plant, are left thus for sometimes two years, and then planted out for good. It is thought better, if the frost can be prevented from killing the seedlings, to sow in April, and transplant one year after, or even the same autumn, as soon as the leaf bud is hard. The spruce requires two years in the seed beds, as its growth is slower than that of larch. The *pinus pinaster*, *austriaca*, and *laricio* are sown in May or June, and transplanted the same autumn into rows six inches apart, the plants close together. Hence they are transplanted the following autumn, into rows fourteen inches apart, where they are left one or two years before being planted out. It is considered an object to shorten tap-roots and encourage laterals. (This last idea, it will be noticed, may assist the tree; but not that main object of forest preservation, the connection between the upper and lower strata.)

The Earl of Seafield's woods, in Strathspey, give an instance of the rapidity with which planting is going on in Scotland. There are 60,000 acres, of which half are in timber, yet so young, that the commissioner saw little large wood ready to cut, but plenty of thinnings. The overseer intends gradually to plant the whole, so that, in course of time a thousand acres could be cut annually and a thousand planted out, which could not, it is said, fail to bring in a large revenue, without trenching on the capital of timber. Three lines of Scotch fir the commissioner saw lifted and tied in bundles for planting out. This was done expeditiously by the five-pronged fork, two men digging out the young trees, which are then lifted by women, the earth shaken off, and tied in bundles for planting. This list will give some idea of the progress made on only one estate:—Duthil hill, 700 acres, planted six years; Deshar, 1,100 acres, within seven years; Sluemore, 600 acres, five years; Revock, 700 acres, four years; Bengalupin, 1,200 acres, six years; Advie, 300 acres, one year.

A point here presents itself which, though it seems vague, and not according with Canadian experience, it might to be well to examine and find the meaning of. The Strathspey overseer considers that "in Strathby, at least, the land should be left barren and untouched, after it is cleared of trees, until the natural herbage, whether heather, grass or moss, which existed before the trees grew, recovers; and that if planted before this takes place, failure will result."

It may be remarked that oak is now little planted here, its use for ship-building being much less than formerly; while, even for backing for ironclads it is abandoned in favor of teak, which has not the injurious effect upon the iron produced by the contact of oak. Scotch fir and larch are much planted, and are rapid in natural reproduction. Whenever the natural vegetation has sprung up in places formerly covered with coniferous trees, the seeds germinate. This is then protected by wire fences with great success. In a large tract of self-sown forest in Granton district, enclosed six years ago, the Scotch fir average six feet high, while individual trees run up to ten feet.

Wire fence, tarred, three feet eight inches high, can be constructed for seventeen cents per yard, posts and all, and is much used. After ten years, or when the trees have grown out of harm's way, pasture is sometimes let. Enclosed plantations for this purpose command 2s. 6d. per acre, while ordinary hill side pasture gets but 6d.

The Earl of Mansfield's woods, in Perthshire. These are about ten thousand acres. Planting is going on constantly. There are nine district foresters, and a large staff of woodmen. A large plantation of Douglas pine is mentioned as doing remarkably well. They were planted in pits fifteen feet apart, fifteen inches square, and ten inches deep, with larch and Scotch fir nurses at four feet apart. The pines average twenty-five feet in height. The nurses are being removed. The overseer disagrees with the Strathspey statement as to leaving the land bare, and considers that it is only the insects (the beetle) which hinder the growth of seedlings on land cleared of conifers. He succeeds well by excluding cattle for one year, letting the grass, etc. grow, then burning it when dry, and planting out.

The Duke of Athol's woods, in Perthshire, comprise 10,000 acres, and were commenced in 1728, principally with larch, which has done well in places, but is now undergoing the substitution of Scotch fir which pays better. Oak coppice cut at intervals of twenty years yield $60 per acre.

WOOD-WORKING FACTORIES.

A correspondent of the *Builder and Wood-Worker*, who has evidently "been there," writes: We do not have to draw largely on our imagination for persons who make up the rank and file of men setting up and running planing mill machinery. We just take the men as we find them, and the machinery, and by uniting them together the picture soon becomes a reality, and the mystery of imagination ceases at that moment to be mysterious. But the kaleidoscope does not produce a greater variety of fantistic forms than does the vast number of mills through the country, each showing some different person and different style in the management and care of that particular mill. Each has his own particular way, which shows itself in every nook and corner, and about every piece of machinery that has anything to do with. You go into a place and see everything in a tumble down style, and belts running half off the pulleys on the leader and the other half off on the driven, and boards and pieces of plank nailed up here and there, half worn through by belts they are trying to lead or drive somewhere, the said belts having three or four more lacings in each, and going around the pulleys like a Virginia fence, making it almost like running a gauntlet to get through the mills. Tools lying helter skelter, here and there and, perhaps, on the floor in the shavings; and the first thing you hear from them they go rattling through the suction fan, or the fireman has pulled them out from under the furnaces when cleaning out to start the fire in the morning; and so through the whole arrangement of the mill, everything from top to bottom at loose end.

We do not have to draw largely on our poor ideality to complete this picture. The person having charge, very likely, leaves everything to the care of irresponsible workmen, whose only care seems to be to get through as little work as possible, and get their overalls off ready to jump out of the mill at the first sound of the whistle or bell; the aforesaid man in charge having left sometime before, that he may spend a little time in a favorite grogery and get fortified for the afternoon's performance or, perhaps, get braced up for to-morrow. Such companionship completes the picture drawn and is true to life.

Now take the opposite conditions, and we see belts running perfectly everywhere; everything is free and clear. One lacing in a belt and perhaps, what is infinitely better, the belts are made continuous by lapping and riveting; everything is in its place. If you want a wrench or file or any tool necessary about the mill, all you have to do is to go where they are always kept and you are sure to find the tool you want, and never, or scarcely ever, find a tool in the shavings or rattling through the suction fan, and there never is found little piles of pieces of boards lying around in the way, taking up room that could be used to very much better advantage as a clean place, where you could put some useful thing if you wanted to. I do not ever see this man leaving any responsibility, which he ought to bear, resting on the shoulders of those who are not fit persons to trust it with, and he makes it a rule to see that everything about the mill and machinery is properly attended to. The oiling is looked after, and there is never a hot box because he knows the condition of every box and bearing about the mill. You never can go through the mill and hear a squeak here and another there and another over yonder, as if there was half a dozen wagons going through that had not been greased for the last decade. You always find this man there quite as soon as any of his men are, and has everything ready to go ahead as soon as the machinery starts up, and is there until the mill shuts down, and never has to visit any saloon or grogery on the way home to brace up for any future task or duty.

This is one picture which this kaleidoscope shows us, and we turn it just a little and we see another. It does not necessarily follow that because a man is orderly and keeps everything in its place, that he would be one that understood just how to file a saw, or sharpen a knife or a side-cutter, and keep it in good working shape. Keeping tools in their place and keeping them in good condition to do their work well and easily, are two very different things, although it would seem that a person who was nice and orderly about one thing would be so in others, and would take pride in the work of his hands.

We will go into a mill, however, and look around, and we come to a saw bench and see a saw with one large tooth and one small one, and one long one and a short one, and one filed very fleaming and another almost square; and and looking at some sawn stuff, it looks as if a thousand demons had gone through it with a hurricane. More than as likely as not this abused servant had three or four black spots on it showing how terribly it had been handled.

This is a specimen of the rest of the tools in the mill. A pair of side-cutters on a bench near by confirms the statement. One is filed short and another a long bevel, and the grooving bit of one stands out one eighth of an inch further than the other, and one is filed standing and another the opposite, every individual bit is sharpened at a different bevel. We look for stuff that has come from the mill with tools in this shape and we find the last production and, oh! horrors of horrors, the demons have been here surely and have been recruited. Do we wonder that carpenters complain of the bad work done by planing and matching machines? But there is a relief to this picture, and a little turn of our magic picture maker brings it to us in an instant.

We see a man just stopping his saw, and before he shuts off he takes a piece of broken grindstone, and carefully holding it up to the saw, just brushes it over. Noticing this we ask, "Do you joint a saw every time you take it out to sharpen?" He tells us "No," not always, but as often as once a day he just goes over it to keep the teeth of an even length, which helps to keep the out corners full and makes the saw run enough better to pay for the trouble. When he takes the saw out he holds it up to you, and you see every tooth is so near alike that the eye can not see any difference in their size or shape, and the saw shines like a piece of burnished silver. This draws out the remark that he has not got any black spots on his saw. Pleasantly he tells you there is no need of any if you use the saw right. If you keep a saw round, and the outside corners full, and a good fair set in it, and don't crowd it if it binds in the cut, which it will do sometimes, there is no need of making black spots on a saw. He shows us some of the sawing, and you are surprised that a man can do so nice work, but when he comes to put in another and you hear it make that fine, clean clear cut, so peculiar to a saw in order, that you do not wonder that his sawed stuff looks so nice. He tells us that they have one man to look after the saws and no other man ever has anything to do about filing or setting, which makes the saws all come from the filer, uniform in set and shape of tooth, and if there is hard wood to saw, there is always something ready for the work. We now go on to see the man sharpening the knives of a matching mill, and we see him taking pains that the knife is straight, and he gives it a good bevel so that there will be a good clearance in the cut, so as not to go pounding through stuff instead of making a clean easy cut, which old planing mill men can tell by that peculiar sound given by a mill when it is in good nice working trim. The side-cutters are now looked after, and we see that each bit has done an equal share of the work and are all dull alike; and in filing them to use again, pains are taken that every bit is the same bevel and they are set out alike, and if for working two sides they are set perfectly square and filed, so that they will make a tight joint on the surface. We see the work coming from this mill as near perfect as it can be. The work comes just right, and the matching is neither too loose nor too tight. So ends this picture.

We might keep turning and changing the views almost indefinitely and still there would come continually perfect representations of the different characters, who have the charge of some one of the thousands of mills running in the different parts of the country. Each individual must show his individuality in his personal work, and owners must test these different realities to see which best comes up to the standard which they demand.

NUMBER OF TEETH IN A SAW.

It certainly seems to me that a man must be devoid of all reason and common sense when he undertakes to tell what guage of saw, number of, or shape of teeth is the best for all purposes. Why, sir, I have seen saws advocated in the numerous articles in your paper of late that would do (if properly filed) splendid work on some mills, and on others would not go one-half its diameter into the log before it would be broken into hundreds of pieces and scattered all over the adjoining country. Where would a 20 to 30 tooth, No. 10-gauge, 56-inch saw be in a 24 inch cut of yellow Texas pine, on a 9 to 12 inch feed, with belt and engine power behind it sufficient to drive the arbor its 850 revolutions per minute, whether the saw went straight or crooked? It would be *non est* in about a second after it touched the log. Again, what would be the result of a 100-tooth, 7-gauge, 56-inch saw on a 1½ to 2-inch feed, in yellow poplar or white pine, with light power to drive it? It would scrape away (not cut) until the belt slips, engine checks down, and the speed of itself slowed down so that the centrifugal force is not sufficient to keep the saw straight against any pressure on the teeth, and consequently doubles up or flops over one way and then the other, until it gets hot from the point of teeth to the eye, and you can do nothing with it until it is cooled off: then you start again and have a repetition of the same.

Now, all I will say in reply to those who think the fewer teeth you have the lighter your saw will run, is for them to try the experiment of laying a board down on some solid foundation, and then take a quarter-inch chisel and place it just far enough from the end so that it will cut

a chip and not scrape, and they will find the chisel can be pushed through any common wood very readily ; and then take the same chisel and same board, place the chisel two or three times as far from the end in some other place, and they will find, instead of being able, as before, to push it through by hand, it will require several blows on the chisel, with a mallet or some thing else, which seems to me proof enough that it does take more power to each tooth of the saw that has the less teeth do the same work. Now, they will all probably admit that, but claim that it does not take double the power to each tooth of a 20-tooth saw that it does to a 40. Now, of course, there is reason in all things, and if your feed is enough, say 3½ or 4-inch, so that your 40-tooth saw can get a firm hold on the timber and cut, the teeth of the 20-tooth saw will each take more than double the power, and besides will require a heavier saw, as the strain is not so easily divided on the rim ; in fact, it would scarcely run at all on that feed in hard wood. But if the feed is not more than 1½ or 2 inch, so that the 40 teeth could not cut but scrape, why of course the 20 teeth would cut and consequently run lighter.

Not long since I was filing for a large mill where among the saws were three new ones from Henry Disston & Sons, all splendid saws, good temper, etc., excepting they were 6x8 gauge. (All saws for sawing logs should be straight—they run steadier and can be run with less swage than a bevel saw.) Now two of these saws were 80 teeth and one a 60-tooth. Our feed when the frictions were new was 7-inch, but we would not put on new ones until the feed would wear down to 2-inch. When the frictions were new the 80-tooth saws would go on the arbor in their turn, and run one-quarter of a day, cutting about 15,000 feet, when I would change for a fresh saw, whether they needed changing or not ; but when the turn come for the 60-tooth to go on, it would only be with utmost care in filing and cautious handling of the carriage runner in hard logs and deep cuts that it would stand up for more than 1½ to 2 hours. But when our feed had worn down to 5-inch, the 60-tooth would stand up as straight as a stretched string in all cuts, and do its work on 80 pounds of steam where the other saw required from 90 to 100 pounds to do the same work. There is no rule for the guage of saws, number or shape of teeth that will work regardless of feed. On the feed depends everything, and I defy any living man to prove otherwise. Now, one can first find out his feed and timber to be sawed, then tell very near (if he understands his business) what gauge of saw and number of teeth would do the work properly, with the least power.

I have found 12 teeth to the inch of feed on straight 8-gauge saws to be about right for yellow pine. Very hard wood or thinner saws require more teeth in proportion, A saw should be strained or hammered, so that when it is at its speed and cutting in the log, the rim, (which is expanded by contrifugal force and work the teeth are doing) will not warp sideways, but be perfectly straight and stiff. If the eye is tight and stiff when standing still, it will hold the rim from straightening out when in motion ; consequently, as it expands it must go somewhere and will warp and assume a snake-like appearance. On the other hand, if the eye is too open or loose, and the expansion of the rim does not take up all the slack when running, the saw will not be stiff and firm, and will give back when striking the log, causing the eye to push out or in, and rub either log or board and heat. Every saw filer should be a practical saw hammerer, or at least understand the theory of it ; for very often much trouble arises from a saw not being properly strained for the speed it is run, though the number of teeth and shape of them may be all right.—*J. F. Capron, in Cincinati Artizan.*

LARGE STICKS OF TIMBER.

Descriptions of some of the big sticks of timber of the Pacific coast, are well calculated to excite the credulity of many of our mill men who are used to dealing with much smaller timber. The *Architect and Building News*, of San Francisco, in speaking of some of these large sticks, says : One piece is 144 feet long by 18 inches in size, and contains 3,456 feet of lumber. For over 100 feet there is no knot that a five-cent nickel will not cover, and in the whole piece of timber the largest knot can be covered by a half dollar. It is wonderful that a stick of timber of the size given should be so remarkably clear of knots. Its companion is of the same length, 16 inches square, and contains 2,352 feet. When it is taken into consideration that the tree from which the first mentioned piece of timber was taken was cut several feet above the ground, and that 150 feet from the cut made to fell the tree it was of such a size as to enable millman to saw the log so as to produce a piece of timber of the size given, one can imagine the size the butt must be, and partly comprehend the amount of labor required to handle such an immense stick. It costs about one-half more to land on our warves a stick of timber of the size mentioned that it does of ordinary lengths. These pieces of timber were sawn at the Port Blakely Mills, Washington Territory, the owners being Renton, Holmes & Co., the well-known lumber merchants of this city. A short time ago there was received in this city a stick of timber 104 feet long, 24 inches square, and almost free from knots. After its arrival here it was allowed to be on inspection for a short time, when it was taken to one of mills and sawed into joists, as the purpose for which it was manufactured was given up and no use could be found at the time for a stick of timber of such large dimensions.—*The Woodworker,*

FOREST FIRES.

Passengers on the Fredericton express Saturday evening, from the time the train left Nerepis until it reached Rusagornish station passed through a continuous gauntlet of fire. At several points near the track, especially along the Fredericton branch, large fires were burning freely there, lighting up their surroundings for miles. Innumerable small fires also seemed to have been set by the falling leaves, which, all on fire, were carried long distances by the wind. Several miles back of the track huge fires in the woods were reflected in the zenith like the lurid glow of a burning city. The air along the rail was stifling and some of the passengers suffered considerably. Fredericton was enclosed in a dense pillar of cloud this morning, which utterly shut out the sky and rendered all objects invisible at a distance of about one hundred yards. Big fires were raging back of the city near the race track, seriously threatening the city. The effect of another week's drought is fearful to contemplate. Earnest prayers for rain were offered in most of the city pulpits at the capital yesterday. At Douglas, Stanley, Heron's Lake, Hanwell, and Keswick, the fires have spread over thousands of acres, and miles of fences on the Keswick have been destroyed. From Stanley, Major Wilkinson (71st Batt.) and a company of men only succeeded in reaching St. Mary's Sunday night after a gallant struggle, as the fire lapped over the Miramichi road in places and the horses were badly frightened. Farmers at Manners-Sutton had a hand to hand fight with the flames. Great anxiety prevails at Fredericton and outlying districts.—*St. John, N. B. News.*

THE lake receipts at Buffalo, N. Y., for September, were 37,350,000 feet of lumber and 6,100,000, shingles, and for the season to October 1, 165,127,000 feet of lumber and 30,096,000 shingles.

THE Northwest Lumber Company, at Selkirk, Man., will this winter improve its mill. An addition 30x40 feet will be made, that will contain a first-class trimmer and slash board. An office 18x24 feet will also be put up at once.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

A REMARKABLE RESULT.—W. A. Edgars, of Frankville, was a terrible sufferer from Chronic Kidney and Liver Complaint, and at one time was so bad that his life was despaired of. He was cured by four bottles of Burdock Blood Bitters.

Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., NOV. 1, 1883.

THERE are twenty saw mills along the line C. P. R. from Thundor Bay west, with an aggregate cutting capacity of about 1,000,000 feet per day.

AN Ottawa correspondent says that Mr. W. H. Baldwin has invented and manufactnred a gang circular saw mill which he calculates will saw up three eighteen ineh logs per minute.

AN artificial riso of soven feet in the Chippewa river cleared out from 10,000,000 to 15,000,000 feet of seattering logs, bringing them from Paint creek and Little Falls to the Beef Slough, Wis., works.

THE Kingston *Whig* says :—People have little conception of the supplies that go out on the Kingston and Pembroke R. R. for the lumbermen. One consignment of 250 half chests of tea was sent by a grocer to a shanty this week.

JOHN F. Carr, a New York lumber doaler, who has for many years interested himself in working up the redwood trade, rocently shipped 40,000 feet of that lumber to Australia, and has made several shipments to England and Germany.

THE finc forests of Arkansas are beiug rapidly opened up to trado, by the numerous saw mills which are rapidly springing up all over the timbered sections. More mills are probably being built thero than in any other state in the union.

THE Edmonton *Bulletin* of Sept. 29th says: Dan Noyes delivored three rafts of saw logs to Hardisty & Fraser's mill on Wednesday. On the trip down one of them was partially wrecked at Big Islands owing to the low wator. About thirty of the logs were lost.

MR. RUSSEL HEATH, of Carpenteria, Cal., has an English walnut orchard of two hundred acres of rich level land noar the seashoro. The trees aro from ten to twonty-five years planted. His crop in 1882 was 630 sacks of 70 pounds oach ; this season he oxpects the harvest will aggregate about one-third more.

A CORRESPONDENT of the *Northwestern Lumberman* who has visited the mill of the Tacoma Mill Company, located at Tacoma, Washington Territory, says that the logs, as they come into the mill, are covered with teredos, a species of small shell-fish. The slaughter caused by the saws is tremendous, and a constant fishy smell pervades the mill.

THE *Northwestern Lumberman* says that a reliable estimate lately made upon a certain quarter section of redwood timber in California was 32,000,000 feet. In comparing this with the pine lands of the Saginaw, Mich., distriet, it is stated that 2,000,000 feet was an extraordinary growth on the best of the land, when good forties were plenty, and 100,000 feet to an acre is called the biggest yield on record in the Saginaw region.

THE *Timber Trades Journal* says :—The adoption of wood paving in the principal provincial towns is steadily on the increase. Some towns, such as Norwich, Liverpool, &c., have spent largo sums in recent years. At Plymouth this paving has been so much appreciated that the Corporation has resolved to lay down a further quantity in Bedford Street, and at Northampton tenders are invited for laying down 1,200 yards of wood paving to replace granite blacks.

A KENTUCKY paper states that Dana, the great coal man of the Kanawha valley, says that sawdust has saved him hundreds of thousands of dollars. When a coal barge becomes so leaky that pumping will not overtake the inflow, sawdust is used as follows : A nail keg with both ends out, nailed to a handle, and with dampened sawdust packed thorein, is jogged against the bottom of the barge, the sawdust hunting the crevices, and the remedy is effectual. F. R. Kaulberseh saved a demoralized barge at Galliopolis in this manner recently.

THE proposal to hold an "International Forestry Exhibition" in Edinburgh during the summer and autumn of next year has been taken up with much earnestness in Scotland, and a large sum has already been obtained, without any direct appeal to the public at large, as a guarantee fund. Besides specimens of forest produce, implements used in forestry, fungi, rustic work, etc., there will be a collection of illustrations of trees, scenery, forest labor, and the like, along with books, maps, and reports bearing on forest history, surveys, and the geographical distribution of trees.

THE committee of the proposed International Exhibition of Forestry, at Edinburgh, has already received largo contributions and hearty co-operation of the Duke of Buccleuch, Lords Derby—who takes a particular interest in forestry—Rosebery, and others. It is intended that the exhibition shall embrace all the objects of forest economy, and illustrate the various modes by which, in different countries, forest products are utilized ; while also bringing together specimens of forest fauna and objects illustrative of the commercial, scientific, social, and legislative aspects of forestry and forest conservancy throughout the world.

GAS FROM SAWDUST.

To the Editor of the Canada Lumberman.

DEAR SIR,—My attention has been directed to an article in your issue of Oct. 1st, entitled "Gas From Sawdust," which contains certain erroneous statements which seem to me to need correction.

The article in question quotes an item from the London *Timber Trades Journal*, in which it is stated that "Mr. R. Tomlinson, late manager of the Cottingham Gas Works, near Hull, has just completed the erection of the gas works for lighting the town of Deseronto, Ontario, Canada, the works being erected for the purpose of making gas from fine sawdust."

The Mr, R. Tomlinson referred to in the above item came here some months since in search of employment as a pipe fitter and was employed by me in that capacity for a few weeks, but I was obliged to discharge him on account of his too frequent potations of "fire water." Mr. Tomlinson had an exuberant imagination which becomes very vivid indeed when under the influence of "fire water," and it is probable that during one of his frequent potations he communicated the *information* concerning the Deseronto Gas Works to the London *Timber Trades Journal*.

As a matter of fact I am, as far as I know, the only person who has conceived or put in practice the idea of making illuminating gas from sawdust, and the works here for making gas from sawdust have been erected solely under my supervision.

The statement in your article that the gas made from sawdust is far superior to that made from Cannel coal is an erroneous one, sawdust gas being by no means equal to that made from Cannel coal, but the quantity obtained from an equal weight of sawdust is about four times as great, and the addition of a small amount of Petroleum gas brings the illuminating power up to any point desired.

Yours respectfully,
GEORGE WALKER,
Manager of Gas and Chemical Works for the Rathbun Co., Deseronto, Ontario.

NORTHERN MANITOBA.

Meeting Mr. F. T. Graffe, lately arrived from an exploring expedition up the Winnipeg and Bear rivers, some one hundred and twenty miles distant from Winnipeg, a *Times* reporter interviewed him and obtained the following information :—

"The settlement abuts on the Indian reservation which extends some three miles above Fort Alexander. The soil is, generally speaking, a rich clay loam, heavily timbered with poplar, birch, spruce, tamarac and jack pine—the ridges being covered with a good quality of oak. Soft maple and blue beech are met with in the low lands, and thickets of cranberries (high bush) and wild plums are numerous."

"As a lumbering country what do you think of it ?"

"I have seen none better in the Province. There are two saw mills situated on the Winnipeg river—one driven by steam and the other by water power, the latter being located at Pine Falls, seven miles from the mouth of the river. As regards the capacity of these mills, I cannot speak positively, but I should judge that they would each average about 45,000 per day, consequently the settlers are well provided for in so far as building requirements are concerned."

TIMBER AND HEALTH.

How fatal are the results which attend careless indifference on this point, says the *Builder*, is singularly shown by what has followed in Italy on the disforesting of the once well-wooded peninsula. Not alone have the recent terrible inundations in the north of Italy been directly traced to this cause, but the fatal *aria cattiva*, the poisonous breath of the marsh lands, which has within twenty years or so invaded almost every province of the peninsula, now reigns supreme, driving from the once fertile plains thousands of the unhappy inhabitants. Here we see the direct influence of false economy in this one direction. When we consider, in addition, that Italy could, undoubtedly, by proper management, grow a large portion of the timber which at present she has to import, we see another direction in which a false economy has impoverished and impoverishes an already poor nation. England, without having reached this sad position, cannot be said to be beyond blame. There exists in our country many a broad stretch of land which, by the action of science, might be rendered productive, and at the same time beautiful. The growth of timber is not of a nature to tempt the speculative demands of modern private initiative ; it is for this reason that it behoves the Government, or, at least, local authorities, to take up the question. They, at least, standing virtually independent of the consideration of immediate gain, are the only fit instruments by which such work can be done ; but the system once set in order, the returns, it is evident, will be no less regular, even more so than from the ordinary sources of profit. A close study of the matter—an inquiry into the admirable methods adopted on the continent, in France, in Belgium, and in Germany—would form an interesting subject of inquiry either for some Government commission, or for some privately appointed body. The question is one of something more than passing interest. Whence are we to obtain our supply of timber? Nature unaided will soon cease to be able to satisfy our demands ; but we have here another of the many instances where science intelligently directed can solve the difficulty, and thus once again be of the utmost service to the world not alone practically, but æsthetically.

THE OTTAWA RIVER.

Mr. W. C. Edwards, of Rockland, some time ago addressed a letter to Mr. J. W. McRae, of this city, in regard to matters concerning which lumbermen doing business along the Ottawa have reason to complain. He points out that for the last year or more there has been some agitation regarding a proposed scheme for the purpose of overcoming two difficulties which almost annually are a source of great loss and inconvenience to the inhabitants residing along the banks of the river and to lumbermen, namely, (1) the flooding of the banks of the rivers in the spring of the year, a vast area of what would be valuable agricultural soil being rendered almost unfit for cultivation ; and (2) extreme lowness of the river in midsummer. This is a question which has already occupied the attention of Mr. John Rochester, and it will be remembered that he brought it up in Parliament but so far nothing of a practical nature has been done. The desirability of action is again being forced on public attention. Mr. Edwards points out that both difficulties have been growing for some time as the country has been cleared up, and are seriously felt by all who have anything whatever to do with the navigation of the river. Unless something be done to remedy the state of affairs complained of the evils must continue to grow. Mr. Edwards says :—

"First, the clearing up of the forests on the main river and its several branches causes the snow to melt rapidly as this progress of clearing goes on and thereby a greater volume of water is poured into the river during a shorter space of time each year, and it must be patent to an ordinary observer of such things what the course of this difficulty must be. Unless some artificial means are resorted to to hinder it, it must go on increasing year by year, and the damage mus be greater. Next, from the same cause the navigation of our river must grow continually worse. Not only does the surplus water, or the water created by the melting of our winter's ice and snow, run off earlier in consequence of the clearing up of the forests, but for the same reason our average downfall of rain is becoming lessened during the summer season, and evaporation is very much increased, all tending in one direction, viz.: To cause the navigation of the stream to grow year after year more difficult. Now in my opinion both these difficulties would be greater to-day than what they are were it not for the many dams built by the lumbermen on the several branches of the Ottawa, and the streams and creeks tributary to the same for driving purposes. Was the whole body of the water kept back by this means, until required by the lumbermen, allowed to flow into the main stream each year, the deluge caused thereby would be very great, and bad and all as matters are to-day they would be very seriously worse."

Mr. Edwards goes on to point out that damage done is of so serious a nature that the attention of Parliament should be called to it. He says it has been suggested by practical men who have given the subject consideration that the difficulty complained of can be overcome by a process of damming up the larger lakes in the main river and some of its branches, which are not and never will be dammed by the lumbermen. By this process of damming he thinks the freshets could be largely decreased in volume by holding back in the dams large bodies of water, which would otherwise run off. It is held that if the water thus retained in the spring were allowed to run off gradually in the summer it would furnish a sufficient supply to keep the navigation of the Ottawa good throughout the season, Mr. Edwards urges Mr. McRae to take the matter up by securing the formation of a committee at Ottawa for the purpose o

making such representations by petition to Parliament as will convince members of the desirability of supporting the carrying out of such a scheme as is proposed. The question is one of considerable importance, and one which must sooner or later demand attention.—*Ottawa Citizen.*

PAPER PULP FROM CEDAR BARK.

A new use of cedar has been undertaken at New Bedford, Mass. The Acushnet Paper Mill, at that point, is nearing completion, and was built for the express purpose of manufacturing pulp and paper of cedar bark. It is the first enterprise of the kind ever undertaken, though the process has been satisfactorily tested on a small scale. An agent of the company is now in Maine purchasing a supply of bark. There is a large quantity at Bangor, Calais, and at St. John, N. B., where large quantities of cedar shingles are sawed. The bark is taken from shingle buts, that are 16 inches long, and are bundled for shipment like lath. The Acushnet mill will work up three cords of bark a day. The first product will be used for carpet linings, but the paper is said to be equally adapted to other important uses. For carpet linings it will be unequaled, on account of its quality of keeping off insects. Eastern ingenuity is bound to devise an endless variety for the utilization of woods, this invention for making paper of cedar bark, being the latest evidence of it.—*Northwestern Lumberman.*

WOOD PULP ROOFING.

A Mansfield, Ohio, company is said to be manufacturing a roofing material from woodpulp, consisting of two-thirds spruce and one-third poplar. It is then prepared, under patents owned exclusively by the company, in such a manner as to give the greatest durability, and adapt it generally for roofing purposes. It is claimed to be the best roofing in the world, all things considered. It is not affected by heat or cold, as metallic roofs are, nor can it corrode. It is much lighter than slate, and can be walked upon without injury. It is practically fireproof though not absolutely non combustible. It can be used on any kind of roof having not less than 1½ inch fall to the foot. It is especially adapted to locations where smoke and sulphurous gases abound, which generally destroy metallic roofs in a short time. It is flexible, and can be used for valleys, flashings, ornamental cut-work in gables, panels, bay windows, verandas and irregular-shaped roofs. It can also be used with perfect success for sheathing warehouses and grain elevators,

QUEBEC CULLERS' OFFICE.

JAMES PATTON,
Quebec, Oct. 19. Supervisor of Cullers.

International Exhibition of Forestry.

The thirtieth annual meeting of the Scottish Arboricultural Society was held recently in Edinburgh. Thanks was awarded to Mr. Little, Montreal, for a gift to the Society's museum of 60 specimens of Canadian wood. Referring to the International Exhibition of Forestry to be held in Edinburgh next year, one of the members said the prospects of the exhibition were highly gratifying. The exhibition was assuming much wider proportions than he ever had contemplated; and it appeared to him that if it went on as at present this would not be the only exhibition of the industrial arts in Scotland, but be only one of a yearly series, such as those held at Kensington. If the Lord Provost and Magistrates granted the use of Castle Hill gardens, the committee could erect buildings of a handsome description thereon in the form of Swiss chalets of a rustic nature, emblematic of forestry. One of the courts might be devoted to Indian exhibits, another to Australia, another to Canada, another to the United States, and so on. The idea met with much favor.

Timber for Well Work.

The best timber for curbing a well is hemlock, which is very durable when under water, and gives no flavor to the water. If hemlock cannot be procured, tamarac would be the best. The timber should be cut in two or three inch planks, and put together by halving the timbers at the end and holding the halved parts dovetailed or cornered together, so that the sides cannot be forced in by the pressure of the earth—the upper half of one piece fitting upon the lower half of the other piece.

THE *Northwestern Lumberman* says :—There is another story afloat about a buzz-saw encountering a bomb-shell that was embedded in a log. this time the incident happened in New Orleans. Before it was in South Carolina. The forests of the South were well peppered with shot and shell during the late unpleasantness, and it would not be surprising if embedded shells should use up several saws. But when once one of these stories is stated there is no telling how it will multiply.

ST. LAWRENCE CANALS.

Notice to Contractors.

SEALED TENDERS, addressed to the undersigned, and endorsed "Tender for St. Lawrence Canals," will be received at this office until the arrival of the eastern and western mails on TUESDAY, the 13th day of November next, for the construction of a lock and regulating weir and the deepening and enlargement of the upper entrance of the Cornwall Canal.

Also for the construction of a lock, together with the enlargement and deepening of the upper entrance of the Rapide Plat Canal, or middle division of the Williamsburg Canals.

Tenders will also be received until TUESDAY, the 27th day of November next, for the extension of the pierwork and deepening, &c., of the channel at the upper entrance of the Galops Canal.

A map of the head or upper entrance of the Cornwall Canal and the upper entrance of the Rapide Plat Canal, together with plans and specifications of the respective works, can be seen at this office, and at the Resident Engineer's office. Dickenson's Landing, on and after Tuesday, the 30th day of October next, where printed forms of tender can be obtained.

A map, plans and specification of the works to be done at the head of the Galops Canal can be seen at this office and at the lock keeper's house, near the place, on and after TUESDAY, the 13th day of November, where printed forms of tender can be obtained.

Contractors are requested to bear in mind that tenders will not be considered unless made strictly in accordance with the printed forms, and—in the case of firms—except there are attached the actual signatures, the nature of the occupation and residence of each member of the same; and further, an accepted Bank cheque for the sum of *Two Thousand Dollars* must accompany the Tender, which sum shall be forfeited if the party tendering declines entering into contract for the works at the rates and on the terms stated in the offer submitted.

The cheque thus sent in will be returned to the respective parties whose tenders are not accepted.

This Department does not, however, bind itself to accept the lowest or any tender.

By order,
A. P. BRADLEY,
Secretary.

Dept. of Railways and Canals,
Ottawa, 28th Sept., 1883 d78-1aw

THE LIVERPOOL MARKET.

The October circular of Messrs. Farnworth & Jardine contains the following :

The arrivals from British North America during the past month have been 59 vessels 51,527 tons, against 24 vessels 18,598 tons during corresponding month last year, and the aggregate tonnage to this date, from all places, in tho years 1881, 1882 and 1883, as shown by the table below, has been 256,860, ,284,089, and 322,082 tons respectively.

The arrivals have again been heavy, and, notwithstanding there has been a large consumption, stocks are rapidly increasing, and the market is weaker.

CANADIAN WOODS.—Yellow Pine Timber: There has been a fair demand for prime square and waney timber, but commoner qualities are difficult to sell; stocks are heavier than they were a year ago. Red Pine has been in fair demand, though at rather low prices. Elm and ash have come forward more freely and have met with ready sale. Oak: There has been a steady demand and prices have been fairly maintained; planks for waggon building still rule at disproportionately lower prices. Pine Deals: The better qualities are scarce and wanted, but of third quality there is a large stock and prices rule low. Staves: Pipe continue in good demand, but puncheon are dull of sale at low prices.

NEW BRUNSWICK AND NOVA SCOTIA SPRUCE AND PINE DEALS.—The consumption has been good but the arrivals have been very heavy and stocks are increasing, being fully double the very light stock of last year, though only 25 per cent. larger than in 1881, prices are lower and have now touched a point at which importers may fairly consider it safe to hold. Lower Port Pine Deals have arrived pretty freely, and have been sold at low prices. Birch: There has been a rather large import and the consumption has also been large; prices are easier.

NORTHWEST TERRITORY.

We take the following extracts from the official report of the evidence of Prof. Maconn, Botanist to geological survey, hofore the Committee on Immigration and Colonization :

Q. On these very dry plains, you say they were dry because the water could not permeate the soil?—Yes; particularly on accouut of the old soil. The salt lands of the North-West get so thoroughly baked in the dry weather that it is impossible to penetrate them, and yet when they are broken up in the spring and are a little moist, they are like ashes, and remain so in the summer if they have been broken, but if not, the rain evaporates and none goes into the soil, and that is my reason for saying it is climatically not barren.

Q. What about the rainfall?—The rainfall of the south is light and the rainfall of the north is heavy. Wo all know what the cause of the deficiency of rainfall in Ontario at the present time is, There is a gentleman who has a big farm and it is without grass or anything upon it, and he sees a rainstorm, a thunder storm, coming in the distance, and one part of it goes to the right and one to the left and he is without a drop, and when it passes him the two parts meet again. Why? Because the farm was radiating too much heat and the clouds were dispersed, and instead of the rain storm stopping it dispersed. It is the same in the North-West. The rain is brought from the south, and over the grassy plains, scarcely any rainfall takes place until it comes in contact with the wooded country, and then down comes great quantities of rain, and that is the reason. As soon as cultivation commouces and trees are planted the North-West, instead of being at its worst, as it is now, will improve climatically, the rainfall will be less in the north and greater in the south, and sottlers will be sure of having no drought.

Q. You think there should be treo planting?—Certainly.

Q. Explan why the heat radiating causes the clouds to separate?—South of our boundary there is a radiating surface in the Unitod States of ovor 300,000 square milcs—it may be 500,000. Upon that great plateau to tho south, there aro scarcely any treos. As the moisture that comes in from the Gulf of Mexico or even from the Gulf of California goes over that plain instead of being deposited there, the sun is pouring down heat and this heat is radiated again in the atmosphere, and the result is that moisture and heat are both carried north, both from the east and west, and as they come up over on to our plains, as soon as they strike the Wood Mountain and the Turtle Mountain and the Moose Mountain, where we have a series of broken hills, environed by ponds and covered with wood, the rain pours down. The clouds pass on, and on the interior plain, where there is no wood, you can see a thunder storm playing round a little hill—a local storm—and in another place you get none, because it is a dry region. At the Elbow of the South Saskatchewan there is a group of sand hills. When I was there, there was no rain at the Elbow though there was everywhere near us, because it was too hot. The Clouds passed on up to Humboldt till they struck the wood, and the rain there fell in torrents. We get in the Northwest the rain that ought to fall on the American plateau geographically, but it is carried on up to our country, and I can see the heat flowing far to the north, beyond where any one of us believe, and I see the summer climate there suitable for anything. The heat and moisture of the south is spread over our whole North-West, and in time this will be better understood. When my head is in the grave men will say "Macoun told the truth though it was hard to believe him." Mr. Fleming once asked me, when they woro putting tho railway into the Leatherhead Pass, "why is the country up from Edmonton to Leatherhead so very wet?" I said "it is on account of the glaciers that are around the hoad of the Athabaska and the North Saskatchewan, and tho air comos down and condenses the moisture, and down it comes in groat quantities, and that is the reason why the Peaco Rivor region is a praire and has a light rainfall, because tho rainfall that should go thero is stopped on the watershed of the Athabaska and the Saskatchewan.

Q. Do you think that trees can bo successfully cultivated on the prairie now treeloss, and please give your reasons for such belief?—I profoss to be a scientific botanist, and on that ground I tako my stand. Hore aro certain points: Men have said to mc, "What is tho uso of talking about troes on the prairie? If they were suited for the prairio they would have been thero." Pleaso notico this. Throughout the whole world ovory species of tree has its own particular region. I will give you a remarkable fact in connection with tho prairie maple that is now being planted—tho ash-leaf maple, tho *negundo aceroides*. Where thero is a great deal of moisturo in tho air that trce is not hardy. It is not hardy to tho oast and it is hardy on our plains. That shows that when men say the maple will not grow there bocause it is not found there they are wrong. The maple of the North-West is not hardy in many parts of Canada and the United States, becauso the air is not suitable for its growth. Down to the south of the Coteau, near Regina, at the base of the Dirt Hills, I found growiug *fraxinus viridis*, what you call rim ash, the river ash. Tho Indians make their baskets of it pincipally. I fouud it growing along the base of the Coteau and not in river valleys, but on tho opcn prairie, and other trees in that rogion. Tho bcech, which is a very prominent tree in our woods, nover grows further west than the straits of Mackinaw. Would any ono who found the maple in an isolated group at the west end of Lake Superior, say it is stopped there by the cold? No. Looking at it in that way, I say our maple and trees of that nature, and all our oaks, every one, are sure of being successfully grown in the North-West. All our oaks, because the eaks grow naturally—I am speakiug of our white and black oaks—on a sandy, dry soil in our woods. If the land gets very dry there, which it does net, but if it should, then these trees would have moisture enough to keep them growing. All that is necessary is for the seeds to be taken out to the North-West and planted, and the proof of my words will be found at once. What is the reason why tho country is found without wood? I have gone up and down the prairie on a straight line from north to south, and have always found—I have travelled for eighty miles on a stretch, and have never seen a bush except a rose-bush, not a willow or a poplar, but I got permanent water. Tho first willows I struck were at the northeastern corner of a pool. For instance, there is a pool. The fire would burn on each side and leave the grass, and I would find the willows where the fire could not touch them. The first poplars we would strike would be always in a little depression, where the fire would come up to a little hill first where there was short grass. I found on the big plain north of the Cypress Hills, where trees are not supposed to exist, twenty-three big poplars, 2 ft in diameter, some of them in the midst of the sand-hills, where the fire could not touch them—enormous trees standing alone, buried in sand—and there they are yet, unless they were cut down last year by the C. P. R. people. Willows and poplars do not grow from seed, except when it suits them. They do not depend on their seeds. Cut a willow or a poplar stalk, and put it down and it will grow. These trees propagate from their roots, and then thousands of little trees grow up. People say they come up from the seeds. It is nonsense. They come from the roots. As soon as the root of the willow or poplar is burnt out and rotted, there is no power in the prairie to re clothe itself with wood.

Q. This conflicts with the statements given by Professor Bell?—Professor Bell is a geologist. I am a botanist, and I may conflict with any gentleman, for I speak my own knowledge from my own standpoint.

Q. You say the trees are devoured the same as cattlo would devour if thcy were uufenced, and the fire cannot get at them the same as if there were a fence to stop the cattle?—Exactly, thcy are fenced from the fire. In the driest part of the country, I was camped near the Elbow of the South Saskatchewan, where none of the storms would come near us. There was lots of wood. We were in sand hills and tho fire could not burn it out, and in every place where there is sand there is wood.

Q. Mr. Darwin agrees with you entirely. He mentions where a piece of wild land was fenced, and there was no appearance of trees, and in a fow years it was full of vegetable and animal life?—Not a doubt of it.

Q. Have you examined the catalpa tree?—I have. I was talking with Mr. Saunders, of London, about that trce. Any tree that ripens its wood—I mean, for instance, our common lilac; it takes a rush in the spring, grows about 8 inches or 10 inches and stops, and no power can make it grow any more that season—any tree of that type can stand the North-West climate, because it will harden its wood. If the catalpa hardens it wood, it will stand the North-West, because it is not the intense cold that kills trces. It is their inability to resist changes of temperature. That is where the question comes. If the North-West was subject to such changes as we have here—for instance, a sudden thaw, and the temperature rises to 50°, and a few days after the sap would be flowing, say, moving down to 40° below zero again. Our trees burst and our fruit is destroyed in that way.

Q. We could not expect, theu, that our fruit trees would succeed in that climate?—You are right there.

Q. How about these Russian varieties?—I have brought this pamphlet with reference to that.

Q. Do you believe that at any time these prairies were covered with timber?—I have not the slightest hesitation in this answer. No one on this Committee, who is acquainted with the east, ever saw trees growiug in a salt marsh. Every salt marsh in tho North-West, I am quite sure trees would not grow there, because vegetation of a certain character will not grow where there is a superabundance of salt. Then the St. Pierre beds, where the wasting clays are goiug on, there are certain tracts of those lands that I do uot thiuk were ever covered with trees in the past. They were unsuited for the growth of trees. With the exception of these two tracts, I believe our whole North-West has been covered with trees.

Q. You only saw small trees there?—Poplar, the two or three kinds of poplar, or the poplar of the region.

Q. You never heard of stumps being discovered in any excavations in the North-West, have you?—No.

Q. You say the whole country of the North-West must have been covered with forest, except those places you montioned?—Yes, I am quite positive.

Q. Except those places, you believe the same conditions geographically and climatically exist, that existed when the forests were there?—Yes; except that to-day the North-West is at its worst, because the south is abnormally dry and the north abnormally wet, owing to the want of forests in the south.

Q. But not sufficiently to prevent vegetation?—No.

Q. If the fire sweeps over the ground, it destroys the trees and burns the stumps?—There is a book written in the year 1859. In that book, Professor H. G. Hind, of Windsor College, N. S., records his explorations. Where he saw large forests, I passed over in 1880 and never saw a twig, because the stumps and everything were gone as you state.

Q. Did you ever observe shrubbery and some trees on the north side of the hills and the south side bare?—Yes. Here is where Palliser went wrong on that. I went and looked at the same hill he mentioned. The sun shone on the southern part of the hill. All the fires come from the southwest or the west. As soon as the fire comes, the south of the hill is dry. The fire comes to the south side of the hill and sweeps off a line of the timber. Next year it goes further in, and at last the whole southern part of the hill is clear of timber. The other side of the hill is damp and the timber remains there because it is not burnt off. There is not a river throughout the length and breadth of the North-West, and up to latitude 62 or 63 that the north side of the river is totally without wood, while on the south side it is just the opposite. In latitude 56 the cactus was growing on the north side of the river, and on the southern I got the Arctic flora. The southern slopes are always dry and always burnt.

Q. Is it not the case on the Qu'Appelle River at some points?—The Qu'Appelle River, from one end to the other, is without wood, except in the ravines.

Q. I travelled through the treeless valley of Dakota and found in a number of places, where the timber had been protected, where there perhaps was not a tree within a hundred miles, there were places between lakes where the fire had never reached, I have seen timber cutting 60 cords to the acre, and that satisfied me a large portion of the country had been covered with timber. They are planting there now, altogether almost, ash-leaf maple and the catalpa, and they claim that those two trees will flourish the best in the North-West?—I am in favor of the catalpa.

Q. You attribute the bareness of the southern slopes of the hills altogether to fires. Would it not be caused by the heat of the sun rotting the bark of the trees?—No; I deny that. No proof can be given that the sun destroys any trees in the North-West.

Q. Not even fruit?—That is a question I want to find out. I agree that our present fruit, with one or two exceptions, will never do in the North-West.

Q. Do you think that if raised from the seed, they would become acclimatized there?—I do: at least a part of them.

Q. Does not the wild plum occur there?—Yes.

Q. Would not that make an excellent stock for fruit trees?—No; I have tried it. It will not work.

Q. There was no indication of decay in these two trees, while in a number of others there was indication of decay?—I think the catalpa is like the lilac, grows for a time and then stops for the season.

Q. You gave an interesting description of the country about Gaspe and north of the lower St. Lawrence, but there is a very extensive country between Lake Nipissing and Lake of the Woods near the line of the Pacific Railway, and the climate is mild towards fall. How do you accouut for that. What influence would these inland lakes have on the climate?—Lake Superior makes the climate in the vicinity of the lake of a low temperature all the year round. The reason I mention this is—I compared the

tables for Halifax, N. S., and the tables for Fort William, Lake Superior, and found the two had about the same summer temperature. Three miles outside of Fort William, as you go up the Dawson Road, the whole character of the country changes, and instead of having the temperature of the lake shore, it has the temperature of the more favored localities in Ontario—speaking from plants. I could see no difference in the plants.

Q. About the Mattawan?—Yes. When I was at Mattawan, I found everything there growing as thrivingly as anywhere else. The influence of the lake ceases as soon as you attain the level above the lake. I was at the Pic and Nipigon and all around there, and, as you receded from the lake, I found the temperature change, and one or two miles from the lake it became the same as the whole way across. I am positive that all that we need is the application of common sense to the knowledge we have, to show that our vast interior here has a climate suitable to the growth of everything we need. But local causes produce local effects, and I am speaking only on the general line. I have no doubt the whole of the line of the Pacific Railway will be found suitable for continuous settlement except through the marshes.

Q. Half of that country or a large portion of it is covered with water. There are many deep lakes between Lake Nipissing and Lake of the Woods, both south and north of the watershed. These lakes get highly heated in summer though they are cold in the spring. You find a temperature of 70 very often in the lakes. Must not that have an influence on the climate in the fall?—Yes. Snow will fall there before frost comes, and I would not be the least astonished to find that potatoes could be left out in the ground the whole winter, simply because frost comes so late. Owing to the water and the heating power of it, the temperature does not sink locally until it sinks generally, and a sudden change finds everything growing, and down comes the snow and covers it.

Q. Where it was wooded, I understood you to say it would have the effect of bringing the rain fall. What extent of wooded land would it require to produce that result?—In a protracted drought, it would require a great deal to change the condition, but, where the drought was not protracted, a very little would change the temperature so as to cause condensation and produce rain, but where the drought is long protracted—it is not for me to say how much; I could not do it; I shonld be going into the region of theory.

Q. You said water was falling all around some hills where you were?—Yes; and never came near those sand hills because they were so hot.

Q. How much territory was there?—Only five or six square miles.

Q. The trees prevent the evaporation of the absorbed heat?—Yes; and cause condensation.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

DO NOT BE DUPED.—A recently advertised and highly puffed remedy for deafeness has lately been exposed as an unmitigated fraud. Not so with Hagyard's Yellow Oil; none name it but to praise. John Clark, of Millbridge, testifies that it cured him of deafeness.

A GREAT SOURCE OF EVIL.—Every farmer will admit that one of the most destructive evils of good crops is that of worms or parasites that prey upon vegitable life; other species of worms infest the human system and are productive of much suffering and ill health. Freeman's Worm Powders will effectually rid the system of this trouble, are pleasant to take and contain their own cathartic.

Chips.

The Boston correspondent of the *Northwestern Lumberman* says:—The spruce market is showing considerable activity, a prospect of a shortage at the mills has had a tendency to run up prices, and as the demand is good, the situation is encouraging to those who are able to fill orders. It is even a better state of affairs in hemlock. The demand is larger than the supply, and prices are very firm.

OAK of the finest qualities, chestnut, various kinds of pine, poplar, beach, locust, elm and hickory are abundant in East Tennessee. Black walnut, ash, cherry and holly are obtained in large quantities. The shipments of timber are rapidly increasing in Boston, Cincinnati, New York, and to Europe. Eepecially is the European demand for oak, black walnut, and locust of importance.—*American Lumberman.*

IN the whole world there are no known redwood forests outside of California. It is a significant fact, however, that one fourth more finished lumber, suitable for interior housework, can be obtained from Humboldt timber than from timber grown in any other county in that state. Unlike many other kinds of trees, redwood stumps can be used to profitable advan tage for veneering purposes, slices from these stumps are said to be highly prized, and may probably in time prove almost invaluable.—*American Lumberman.*

THE hand of fate has again been laid heavily upon the property of O. D. Peck & Sons, Oshkosh, Wis., or rather the probability is that it was the hand of an incendiary. Within the last few months this firm has had its saw-mill burned to the ground, and last Thursday the planing mill was destroyed, having on two previous occasions been severely damaged by fire. This time the loss amounts to $75,000, including a quantity of sash, doors and blinds stored in an adjacent warehouse, which was burned. The insurance is $41,300.—*Northwestern Lumberman.*

THE *Lumberman's Gazette* says:—It may be set down as a fact that 350,000,000 fect of the log cut of last winter in the Mississippi district has been hung up and will not reach the market this season, and the same state of affairs exists in the Saginaw valley district, as also in Wisconsin, although to what extent has not been definitely settled, which makes an enormous shortage in the anticipated supply, and the lumber business therefore, so far as prices are concerned, may be considered more than ordinarily safe from fluctuation. The purchases already made for delivery next season also demonstrate beyond a peradventure the faith that dealers have in the stability of the market.

THE economy practiced in the saw mills hereabouts, says a Bay City, Mich., paper, excites the admiration of every observer. There seems to be no waste whatever. The dust as it falls from the saw passes on to the engine room where it is used for fuel. It is very valuable for this purpose. The edgings of the timber are generally used for filling dock property and worked up at the woodenware factories. The ends of the logs are sold for stove wood. Large edgings are turned into slabs which are piled up a short distance from the mill and used for fuel. In view of the remarkable faculty possessed by lumbering men of turning every portion of the logs to some account, the fact that large fortunes are made in the business excites no surprise.—*The Woodworker.*

THE Ottawa *Free Press* says:—E. B. Eddy fairly deserves the name of the most enterprising lumberman in the Ottawa Valley. Since the erection of his new premises he has had a complete electric fire alarm system (larger than the city of Ottawa's) put in operation, the stations of which cover every important point throughout the mills, factories and yards. The alarm bells are placed in the residences of the superintendent, foremen, etc., and also connected with the fire station. In addition to the above Mr. Eddy is now having his extensive establishments fully equipped with electric light thermostats for automatically and immediately giving notice of fire, even before any smoke or flame is visible. Mr. Eddy evidently realize the value of electricity and will have one of the best protected concerns in the country.

Market Reports.

TORONTO.

From Our Own Correspondent.

OCT. 24.—Shipments by water are now rapidly drawing to a close. Owing to the low rates prevailing vessel men can not afford to pay sailors $2.50 per day and carry lumber te Oswego at $1.25 per M, so that after the end of this month most of the lumber crafts will tie up for the winter. The total shipments from our decks for the last two weeks amounts to 3,000,000 feet of lumber and 550,000 of shingles, and it is likely that as much more may get away before the winding up of navigation. The retail yards seem to be doing a fair trade, although the plasterers strike is having considerable effect in reducing the volume of trade. Architects offices are said to have plenty of work in prospective, and usually when this is the case some one of the building trades mar their prospects by a labor strike. If, as predicted by some, the coming winter should prove open and mild, considerable building will be carried on in this city.

It is now almost certain that the stock of logs to be got out this winter will be much smaller than usual, owing to the large quantity of lumber to be wintered over, Our banks are steadily refusing to advance mill men funds to any considerable extent, with which to stock up their mills, and it is devoutly to be hoped for that this policy on the part of the banks will be regularly adhered to, and, if so, the opening of the spring of 1884 will witness a much better state of things, to the ultimate advantage of all concerned.

The only article in the wood line that has money in it just now is cordwood. the price of which is advancing steadily after that of coal. Dealers are now offering as high as $5.50 per cord for good hardwood, on car, here, so that any persons holding any large quantity of good wood are likely to reap a golden harvest.

The charges mentioned in my last letter for shunting cars of lumber to the various sidings within the city limits are being rigidly enforced to the great annoyance of all the lumbermen concerned.

You will doubtless have noticed the last report made by N. & N. W. R. R. Co. showing their traffic receipts to have increased some $15,000, as compared with the same period of last year, but they have neglected to inform the public that this increase is mainly due to the increase in their passenger traffic, whereas, but for their folly in advancing the tariff on lumber to western points their receipts on that kind of traffic should have doubled itself during the past two years, the lumber trade having increased with western Ontario nearly double during that time—wisdom will come to them in due time.

WINNIPEG.

The Winnipeg *Commercial* of Oct. 16, says: The demand for lumber continues brisk, and there will likely be a lively business done between now and Christmas. The quotations remain as follows:—Pine lumber, 1st, common boards, dressed, $26.50; 2nd, dressed, $25.50; 1st, do rough, $26.50; 2nd, do., $25.50; sheathing, rough, $25; timber, 16 feet and under, $24; do. over 16 feet, for each additional 2 feet, $1; dimension and joists 16 feet and under, $24; do. over 16 feet for each $1; fencing, $25; 2 and 3 inch batttens, $30: A. stock boards, all widths, $50; B. do., $45; C. de., $40; D. do., $35; 1st clear. 1, 1¼, 1½, and 2 in, $60; 2nd do. $56; window and door casings, $50; base boards, dressed, $50; 1st pine flooring, siding and ceiling $40; 2nd do $35; 3rd do., $30; ½ inch split siding, dressed, $30. Spruce lumber —timber 16 feet and under, $22; do. over 16 feet, for each additional 2 feet, $1; dimensions and joists, 16 feet and under, $23; do. over 16 feet, for each additional 2 feet, $1; boards, $22; 1st flooring, siding and ceiling, $28; XX shingles, $5.25; Star A shingles, $5.25; X shingles, $5.00; A do. $4.50; lath $4.50.

MONTREAL.

The Montreal *Gazette* of Oct. 19th, says:—The local market has been quiet during the week, but former prices are sustained. There is a good demand for hard wood for the American market, but supplies are not excessive here, and dealers, therefore, do not care to sell. Laths have again advanced 15c. being now up to $1.85 per thousand and are likely to go higher still, as they are very scarce.

QUEBEC.

The *Chronicle* of Oct. 12 says:—There seems to be no change for the better in this branch of business. Some more rafts have arrived, but the Quebec shippers seem to be well stocked for all present requirements, and are not inclined to purchase except at even lower rates than the present. We hear that 100,000 feet of choice St. Lawrence pine, of 18½ inches, changed hands at 32 cents. We hear of no other transactions this week.

ALBANY.

BOSTON.

Cotton, Wool and Iron of Oct. 20, says:—The general market holds its own quite satisfactorily. There is a good, steady demand for supplies of white pine of all grades above common. Coarse and lower grade lumber, as a rule, is little wanted. Spruce and hemlock continue firm and in steady demand. Laths are as scarce as ever, and prices are high and stiff. Southern pine moves fairly at about previous prices. The best grades of cherry are in good request, and similar remarks apply in a less degree to ash and walnut. Our quotations are for car-load lots,

CHICAGO.

The *Northwestern Lumberman* of Oct. 20, says: The arrivals of lumber cargoes at this port during the past week have been less in number than during the week previous—namely, 218 this week and 265 last week. On Saturday 59 loads put in an appearance, and on Sunday 26, so that a big fleet was present at the sales docks, about 6,000,000 feet being afloat for the usual busy time on Monday and Tuesday. From Monday to Wednesday the wind helped the luggers away from port, but was unfavorable to those that sought to get in. The result has been to effectually clean out offerings, so that on Thursday morning there was nearly a bare market, and the winds still unfavorable to the incoming fleet. This state of things leaves the hookers nearly all over the lake loading, with the prospect that when the wind changes there will be another rush and a crowded market.

Though prices have been rather limber, and on dimension have wavered around the pivotal point of $9, the offerings have not been in such quantity as to cause an absolute glut and stagnation, though sales were somewhat slow the latter part of last week on account of an unusual fleet on Thursday. Cargoes have sold right along since Monday, the disposition of the commission men being sufficiently accommodating to start and keep up a movement. It is conceded by all that dimension has sagged a little in price, while No. 2 inch stuff has settled somewhat, in sympathy with dimension. The cause of this decline is apparent to all—too much coarse stuff is being offered in proportion to No. 1 lumber. The weakness of inch lumber pertains mainly to the poorer and less desirable qualities, and simply because dealers do not desire to continuously load up with it when they can not get good stock to sandwich in with the poor.

Really good cargoes are scarce, and any that give promise of turning out a fair percentage of selects and uppers are eagerly sought and well paid for.

LONDON.

The *Timber Trades Journal* of Oct. 13 says:—The waney board at Wednesday's sale was in request at £5 5s. to £5 15s. a load, but the two lots of square pine went very low at 67s. 6d. and 72s. 6d. a load. Stocks of ash are large, which seemed to tell unfavourably on the sale of the parcel of Quebec ex *Brilliant*, without reserve, on Wednesday, but the dimensions were not very large. Amongst the deals spruce went low, and the old parcels of pine as well did not exhibit any improvement on previous prices.

The Miramichi pine ex *Atlantic*, without reserve, went cheap enough, best wide stuff 12 to 20 ft., 11 up to 16 inch board, being knocked down at £12; but the price did not appear to create any surprise, the wood being known to be of a very coarse nature. The 2nds, also broad, went at £10 10s., the planks, and deals falling at a little better than spruce prices.

We observe that several of the reserved lots were bid for, and these mostly were allowed to go at 5s. on the broker's quotations. Whether this is indicative of more activity in the demand, or is due to the low upset price the goods were offered at, we can hardly say, but we are inclined to think it is to the latter that the seeming readiness on the part of the room to buy the reserved lots may be attributed. We are afraid the turning point in prices has not yet arrived.

GLASGOW.

The *Timber Trades Journal* of Oct. 13 says:—The consumption during the quarter ending 30 September last shows great activity, being as nearly as can be computed as follows:—Quebec waney board-wood and yellow and red pine logs, 16,900 loads; Quebec oak logs, 1,800 loads; elm, 980 loads; birch (all sorts), 725 loads; pitch pine logs, hewn and sawn, about 13,000 loads.

Compared with corresponding quarter in 1882 these figures show an increase over all to the extent of about 9,000 loads. The stock of birch, it will be observed, is very low. This year has been quite exceptional as regards lower port birch, of which there has been hardly any arrivals. Any early import would bring good prices. The consumption of Quebec deals (all sorts) for the past three months amounts to about 2,000 St. Petersburg standards, and of lower port deals to 2,500 standard.

LIVERPOOL.

The *Timber Trades Journal* of Oct. 13 says:—We are still having a fair amount of timber-laden vessels on the arrival list, and these give the market no rest, for if a satisfactory price be not obtainable by private treaty, the goods are immediately put up for sale by auction, and forced off at the best price obtainable.

On Friday last, three auction sales were held by three different houses: at eleven o'clock in the morning by Messrs. Farnworth & Jardine, who offered 873 logs Nova Scotian birch timber and a few spruce deals; at twelve o'clock Messrs. A. F. & D. Mackay offered a parcel of St. John, N. B., spruce deals &c., and a cargo of Miramichi birch and pine timber, pine and spruce deals, &c.; followed by Messrs. Edward Chaloner & Co., offering a cargo of sawn pitch pine timber, planks. deals, &c.

SWEDEN.

The Stockholm correspondent of *Timber Trades Journal* writing on Oct. 6th, says:—Fall shipments from the north of Sweden are continuing reasonably moderate, although probably ample enough for the requirements of the English and French markets after the surfeit of goods sent forward to the countries named earlier in the season. One or two consignment shipments of sawn redwood to London by steamer are reported, but now that even steamer freights and insurances have risen, the chances of favorable auction realization are sufficiently remote to act as an effectual curb on ventures of this kind, notwithstanding the allurements held out to millowners by those whose interest it is to facilitate consignment business. I am therefore inclined to believe that the consignments now going forward are due to special circumstances, and this method of realizing Swedish sawn wood will only be resorted to in few cases this autumn. Planed wood, however, on the other hand, is being frequently shipped on consignment to London, even by the best firms,

one or two good marks being only obtainable there through the medium of the auction sales.

The statistical return of the Swedish wood export up to the end of August, 1883, as compared with the two preceding years for similar period, reads as follows, viz. :—

	1883.	1882.	1881.
Sawn and planed wood	548,805	475,816	339,685 stds.
Sq. & partly Sq. timber	9,599,160	11,287,313	7,946,325 c. ft

This return is deserving of the very greatest attention by both exporters here and importers on your side. At the end of August, for instance, it is reasonable to assume that the irregularities of the earlier months, caused by an earlier or late opening of the ports, and which impair the comparative value of the statistics, have been effaced, and that we can first then form a pretty shrewd guess, not only what the total export of the season will be, but also how great an advantage stocks imported earlier in the season may be expected to have over those of September and October. I wish here to except London, however, as it has been found an extremely imprudent thing to base business calculations on what the stocks there may be expected to be like even a month hence, Returning to the statistics we find that the excess of sawn and planed wood in 1873 over last year, which was 46,971 Petersburg standards at end of July, had jumped to 72,989 standards at the end of August: or, if we compare the present year with 1881, we are surprised to learn that the excess in 1883 of 165,266 standards up to 31st July had advanced at one leap to 209,-120 standards at close of August. These figures are illustrative of the enormous development of producing power called forth by two or three prosperous seasons. It speaks well for the vitality of the trade that, notwithstanding the enormous export both last year and this, prices have not fallen more than they have done. It may in any case be taken for granted that full stocks exist at the present time in consumers' hands, and that a continuation of the export in similar volume to this and 1882 will inevitably lead to a disorganization of the trade in spite of the somewhat improved aspect of the market at present.

THE GLASGOW TRADE.

Singleton, Dun & Co.'s timber circular, dated Glasgow, 4th October, says :—

Stocks are much heavier than was supposed, and to balance this it will be necessary that shipments during the remainder of the season be on a very restricted scale. In almost all the items of stock the import up to the present has been over an average, and when to this is added the extra imports from the north of Europe at exceedingly low rates, it will be seen that the market on the whole is very tender. The consumption has been very fair, but the cry is here as elsewhere, that "there is no money in the business." It is quite evident, that as regards Quebec goods, holders dread the extreme prices, and turn over what they have as rapidly as they can, profit or no profit,— and, as regards Baltic goods. the facility with which supplies can now be put in the market by steamers make it useless to "hold" large stocks, as the moment there is a prospect of a spring in anything, extra supplies are forthcoming to make up a suspected deficiency. There is no doubt that European goods are largely displacing Canadian, and what with this, and the wretchedly low prices for pitch pine, the prospects for Quebec goods are the reverse of promising. Our local industries are fairly employed, and the aggregate consumption of wood will be large during the coming winter.

Boardwood.—The stock is unusually large, and it should be noted of inferior quality to the usual average. Prime 20 in. average was placed at 2s 6d to 2s 7d. A parcel, really good, 45 feet average was sold at 2s 1½d, and a parcel 19 in., excellent wood, at 2s 5d per cubic foot. A parcel, fairish 21 in. average, went at 2s 5½d, and some 24x27 in average at 2s 7d to 2s 8d, while a parcel 28 feet and up, by about 24 in average, is offering at 2s 10d. Common qualities are very hard to move, and importers desire to quit these at best rates obtainable.

White Pine.—Deck plank wood—Sales of this were made at 2s 7d. to 2s 8d per c. foot for prime 55 to 60 feet average, and a lot of choice 70 feet average at 2s 11d per cubic foot. The stock of prime deck plank wood is small however. Good fair average is most difficult to move, and importers decline now to contract for such. Joisting was sold at, for 35 feet average, 18d to 19d, and for 45 feet average 19d. A parcel of good 40 feet average brought 19d, and a line of 75 cubic feet average realized only 19d. It is most difficult (almost impossible) to obtain prices to cover cost of this wood, consumers finding it easy to get other cheaper woods substituted, and only when sellers are induced to accept low rates will white pine be taken. The stock, however, is not very large, and if quantities are not greatly increased, present rates should be sustained.

Red Pine.—The stock is moderate; but rates do not improve. It is quite hopeless to realize prices to cover Quebec quotations so long as European goods and pitch pine are so abundant and cheap. For 30 feet average 12½d to to 13½d was taken, and for 40 feet average 15d to 16d per cubic foot.

Deals—1st pine—The demand is only for wide and long. Oddments are seldom asked for. Parcels were sold at from 2s 3d to 2s 11d, and an entire parcel, all under 11 in., at 2s 6d per cubic foot. 2nd Pine—Demand very slow. 3rd Pine—For 12 to 16 ft. 11 x 3, price is from 13d to 14d.—chiefly 13½. A nice parcel, all 10 to 11 x9 and 11x3, recently landed, was cleared at 12d 12½d. Broad deals are worth 15d to 17d per cubic foot, according to specification. At Greenock some parcels were sold at 11½d. 4th Pine—At Greenock several parcels were sold at 9½d to 10d. At Glasgow a small parcel was sold at 11d, and a parcel 12 in. and up at 13d.

THE AUSTRALIAN TRADE.

Messrs. Gemmell, Tuckett & Co.'s latest report, dated Melbourne, August 27th, says :—Since last issue the deliveries from the storeyards have been below the average of several months past, and we do not look for any improvement in this respect during next month. Dealers report a fair town trade, but a considerable falling off in the demand for up-country. American lumber.—Sales, ex Scottish Prince, Emily F. Whitney, Coriolanus, and Freeman. Michigan clear pine realized 1¼, 1½, 2, 2½, 4 in., good quality, £17 to £17 2s. 6d. ; inferior, 1¼, 2 in., £14 7s. 6d. to £15; 12x1, 14x1, 16x1 dressed clear pine, £16 to £16 2s. 6d. ; w. p. shelving, 12, 14, 16 in,, £11 7s. 6d. to £12 10s., according to quality ; Canada clear pine, 1¼, 1½, 2 in., good, £14 17s. 6d. to £15 5s. ; 1¼, 2 in., inferior, £12 15s. to £13 7s. 6d. per M. feet super. Prices on the whole show an advance on last month's rates. The trade hold moderate stocks, and prices are likely to continue firm.

Messrs. C. S. Ross & Co. say :—We have to report a fair amount of business since last issue, but owing to a falling off in the demand for consumption and heavy arrivals, prices generally are lower. The arrivals of flooring boards have been excessive, and as importers show no inclination to hold, prices are declining. A fair average business is reported for consumption ; but as money is dearer with a tendency to harden, the building operations of the colony will not be so large as last year. The arrivals for past four weeks have been the Ben Cruachan, Loch Sloy, Lock Long, City of Agra, Holmsdale, Arisides, Crofton Hall, Macduff, Gulf of Carpentaria, Gulf of St. Vincent, Respigadera, Pathan, Newcomen, Aristomene, Leddington, and Amalfi from United Kingdom, with red deals, flooring, laths, &c. ; Sumarlide, from Fredrikstad ; Broderene and Union, from Laurvig, with flooring ; Freeman, from Boston, with spruce deals, t. and g. ceiling, clear pine, &c.

The Ottawa *Free Press* of Oct. 20th, says :—Chaudiere and other saw mills in this district are still running regularly. Night watches in some of them have been discontinued. The market remains quiet, a steady business being done. No more lumber will be carried over this winter than last, and although all the stock yards will be well filled, as usual, most of the stock is disposed of. As regards the prospects in the woods, it is said that the quantity to be taken out this winter will be only about one-third the quantity taken out last season.

RAFTS ARRIVED.

The *Chronicle* gives the following list of rafts, etc., arrived at Quebec :

Oct. 11.—J. K. Ward, pine, &c., St. Lawrence Docks.

McArthur Bros., staves, New London cove.

D. D. Calvin & Co., oak, &c., sundry coves.

David Moore, white pine, &c., Cap Rouge.

Collins Bay Co., oak, &c., Sharples' cove.

Cook Bros., white pine, St. Michael's cove.

Oct. 18.—S. A. Julien, deals, Commercial wharf.

John McRae & Co., staves, Indian Cove west.

Ross Brothers, deals, Bridgewater cove.

Simon Wyle, staves, Woodfield cove.

McArthur Bros., deals, Levis.

D. D. Calvin & Co., oak, &c., sundry coves.

WOODEN COLUMNS.

A series of experiments have been conducted on the testing machine at the Watertown arsenal by Prof. Lanza, of the department of mechanical instruction of the institute of technology. The object in view was to ascertain the strength of wooden columns of the size and length commonly used in the construction of cotton and woollen mills. The experiments were made at the instance of the Boston Manufacturers' Fire Insurance Company, of which Edward Atkinson is president. This testing machine was recognized as an invention of the greatest importance in the bestowal through a committee of experts, of the gold medal, the highest award of the recent mechanics' fair. Although it has been for some time in operation for scientific and other tests, it gains through this fact a new interest for the public. A part of the columns thus tested were yellow or hard pine, and a part oak. About a dozen so far have been subjected to the process of compression in the machine, the strain having been brought upon them endwise for the purpose of ascertaining what is called the "crushing strength" of the timber. Outside of these experiments and a few others at Watertown, none have been made on wooden columns of sufficient size to furnish reliable data for practice. The experiments made elsewhere, and those on which the formula in textbooks are based, have been upon columns of about two inches on a side and of four or five feet in length. From the results thus reached the strength of columns of dimensions actually used in buildings has been computed. It is plain that a series of experiments conducted under the direction of experts, and by them authoritively recorded will constitute much more satisfactory data for the text-books. The experiments, therefore, have a significance beyond the nowise unimportant one that pertains to them in the matter of mill construction. All but two of the columns exporimented on were round hollow columns, of from eight to oleven inches diameter, the two being about nine inches square. The greatest amount of pressure exerted in any case was about 250,000 pounds. The tests have disclosed frequent instances of defective boring in the columns. The object in boring is to open an air passage through the heart of the stick for the prevention of dry rot after it is in position in the building. It is essential, of course, that the bore should extend from end to end, but this has not always been effected. The sticks were bored first from one end then from the other, and the borings have sometimes failed to meet in the middle of the stick. The tests also show that to taper the sticks is a mistake, inasmuch as it weakens the column more than hasheretofore been estimated. Reasons for exercising more caution in other respects in the construction and adjustment of wooden columns in building having also been disclosed.—*Boston Advertiser.*

CANADIAN SHIPMENT TO LONDON.

The *Timber Trades Journal* of Oct, 6, says: The arrivals this year from Quebec are somewhat in excess of those of last year, so that if the increase in yarded stocks had been even more marked, it would not have been a matter of surprise. There were between the 1st of January and the 4th of October, 1882, 28 cargoes from Quebec, 19 from Montreal, and five from Saguenay. This year to similar date, Quebec supplied 32 cargoes, Montreal 23, and Saguenay only 1. On the whole the difference is only slightly in favor of the present season.

From the spruce ports the present year is also more prolific in tonnage and brings the stocks up considerably in excess of those of 1882, though the shipments this year up to the present time are by no means inordinately large.

There are more spruce deals in stock now than this time twelvemonth by 80,041 pieces, and battens of this description are already 67,703 or so over and above what were in stock at similar date last year, ends are also more by 7,756 pieces.

The arrivals last year up to the 4th October were: Miramichi 5, Halifax 2; St. John 3, and Betsiamitz, 3; altogether 13, against ten cargoes come forward up to the present time from the ports named.

The Canadian shipments, including the spruce cargoes with the pine, give a preponderance for 1883, as against the year before. The difference in favor of the present year being, as stated, all made up of spruce shipments.

WALNUT IN VIRGINIA.

A correspondent to the *Tradesman*, Chattanooga, Tenn., writes as follows concerning the lumber interest at Pocahontas, Va.: Two large firms are engaged in the lumber business here, their operations being at present confined to the walnut trade. Some days as many as 100 waggons come to this place loaded with walnut logs and lumber. Recently, one of these huge logs which came in measured 1,000 feet of lumber, and is worth about $85. Twelve thousand dollars worth of logs have been sent off in a single week. The representatives of the Tazewell Lumber Company says that they have bought enough walnut lumber in Tazewell to keep 10 teams running for 25 year to haul it to Graham. The other firm, J. M. Thomas & Co., has sold and has on the ground 1,600,000 feet. It sells to a Baltimore firm, which ships the pick of the stock direct to Amsterdam and Bremen. The rate of depletion will soon exhaust the walnut, but there remains almost untouched millions upon millions of oak, hemlock, ash, pine, hickory, cherry and other woods, which will make this a centre for lumbermen for years to come, as it is the natural trading point for six counties, three in Virginia—Tazewell, Bland and Russell—and three in West Virginia—Monroe, McDowell and Wyoming.

Summer Frosts and Tree Planting.

The following appears in the *Globe*:—The visit of Messrs. Gordon and Payne to the North-West will, no doubt, be the means of adding very largely to our present stock of information in regard to the North-West climate. Lieut. Gorden, in conversation with a *Globe* reportor, said that summer frosts were not uncommon in some parts of the North-West, but how far they would interfere with wheat culture was impossible yet to say. In the Far West, he thought many of them might be prevented by the planting of whole townships in forest. Such plantations would furnish a screen of vapour over and around them for some distance, which would check the excessive radiation of heat into space which now occurs in clear weather as soon as the sun goes down. The forests would alone repay their cost by furnishing supplies of wood to the railways and to settlers.

At East Wilton, Me., a large amount of birch lumber is annually shipped to Scotland for spool making. Large quantities of boards are also shipped from that point to South America and places in this country.

The claim of the Keewatin lumber company to the island in the Lake of the Woods has been relinquished. The Dominion government has entered into arrangements with the company to grant them certain additional timber limits on Clearwater and Ptarmigan bays, in order to secure their lease to the islands to facilitate mining operations.

The elm trade between Ontario and the United States is growing in importance. There are large tracts of low lands in western Ontario, covered principally with elm. Of late years the demand for hoops and staves has prompted the conversion of this elm into cooper stock, and numerous stave and hoop mills have been started, and considerable capital invested in the business.—*The Woodworker.*

Several of the Michigan lumberman have declared that unless the existing extra rate of 20 cents per thousand feet for transporting logs, charged by the Michigan Central road, is removed, they will not put in any more logs by rail, claiming they can be floated more cheaply.

It is now asserted that the box shook business did not originate in Bangor, Maine, but that the first shooks ever manufactured by the process now in vogue were cut out in Dexter, on a machine invented by Reuben Flanders, and which machine has for many years cut out on an average one hundred thousand boxes per annum and is still running in the old mill.

An Abandoned Vessel Saved.

The *Timber Trades Journal* of Oct. 6, says: On Wednesday week the mate and three seamen of the Familien Minde, a Norwegian vessel, took into Newport a derelict Portuguese vessel named Poren Amelia, which they had picked up off the banks of Newfoundland on the 26th August. She was loaded with timber, and during a gale the master and his son were washed overboard. The crew then abandoned her. The vessel and cargo will prove a valuable prize for the sailors. The Familien Minde arrived in the Thames on Tuesday, and as she was coming up the river the mate of the Portuguese vessel, who had been brought on by the barque after having abandoned his vessel, tied a grindstone to his neck and jumped overboard. It is supposed that he committed suicide to avoid the consequence of having abandoned his ship.

Lake Winnipeg and Bearings River,

Mr. Alexander McKay, of Ottawa, Ont., recently made a trip from Winnipeg, Manitoba, to Lake Winnipeg and vicinity, to investigate the situation. He was interested personally to the extent of the ownership of a 50-mile limit on Bearings river. A gentleman who accompanied Mr. McKay says regarding the Lake Winnipeg and Bearings river district, that there is considerable spruce and comparatively little pine there, and none of any size. The Bearings river is very rough, and the rapids are very numerous, though not to such an extent as to seriously interfere with log-driving. The cost of operating will be considerable, but the lumber business, it is supposed, will pay reasonably well.—*Northwestern Lumberman.*

New Iron Frame Gang Mill.

The William Hamilton Manufacturing Company of Peterborough are now engaged in constructing an Iron Gang Frame for the mill now in course of erections for Messrs. Cook Bros., Serpent River Georgian Bay. This gang is largely the personal design of Mr. Wm. Hamilton, and when completed will weigh over twenty tons. We shall give our readers a full discription of it ere long.

The *Timber Trades Journal* says:—Another illustration of the extreme old age to which wooden vessels survive is that of a smack of 37 tons register, named the John and Samuel, which is now discharging old iron at Greenock. She is 121 years old, having been built in London in 1762. This little craft, which is one of the oldest merchant vessels afloat, seems in fairly good trim.

The London *Timber Trades Journal* says:—There appears to be a considerable movement in the spruce market, which, in company with Baltic whitewood, has remained in a very dull state for the most of the season, and now, as the shipping season is practically over, the importers in Liverpool and elsewhere are able to form a moderately accurate estimate of the quantities that will have to be dealt with.

The Ottawa correspondent of the *Globe* under the date of Oct. 17th, says:—"Mr. J. B. Tackaberry sold by public auction to-day the following timber limits on the Georgian Bay, belonging to James McLaren and others:—Limit 48 sold for $20,000 to Thomas Kenney, and also limit 56 for $36,000; limit 63 to James Worthington for $24,500; limit 64 to Thomas Kenney for $5,200; limit 72 to James Worthington for $15,000. The sale in all amounted to $110,000."

Tried in Toronto.—Mrs. Mary Thompson, of Toronto, reports the removal of eight feet of tape-worm by the use of one bottle of Dr. Low's Pleasant Worm Syrup. This medicine is reliable for all kinds of worms that afflict children or adults.

A Common Annoyance.—Many people suffer from distressing attacks of sick headache, nausea, and other bilious troubles, who might easily be cured by Burdock Blood Bitters. It cured Lottie Howard, of Buffalo, N. Y., of this complaint and she praises it highly.

Caution.—We advise all who are afflicted with a cough or cold to beware of opiates and all medicines that smother and check a cough suddenly, as serious results surely follow. Hagyard's Pectoral Balsam loosens and breaks up coughs and colds in a safe and effectual manner.

McCraken, Gall & Co.,

WHOLESALE AND RETAIL

LUMBER MERCHANTS

And MANUFACTURERS,

Dealers in WALNUT, BUTTERNUT, CHERRY, CHESTNUT, ASH, OAK, WHITEWOOD, and all kinds of Hardwood and Pine Lumber. PICTURE BACKING, HOLLY, EBONY, LIGNUM-VITÆ, RED CEDAR, &c. American and French VENEERS.

How Many Miles Do You Drive!

The

ODOMETER

Will Tell.

This instrument is no larger than a watch. It tells the exact number of miles driven to the 1-100th part of a mile; counts up to 1,000 miles; water and dust tight; always in order; saves horses from being over-driven; is easily attached to the wheel of a **Buggy, Carriage, Sulky, Waggon, Road Cart, Sulky Plough, Reaper, Mower,** or other vehicle. Invaluable to Liverymen, Pleasure Drivers, Physicians, Farmers, Surveyors, Draymen, Expressmen, Stage Owners, &c. Price only **$5.00** each, one-third the price of any other Odometer. When ordering give diameter of the wheel. Sent by mail on receipt of price, post paid. Address

McDONNELL ODOMETER CO.,

2 North La Salle St., Chicago.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

EPPS'S COCOA

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold in tins only (¼-lb. and lb.) by Grocers, labelled thus:

Burdock BLOOD BITTERS

READY MADE HOUSES.

We have before referred to the large business carried on in some sections of the country by the manufacturing of ready made houses. A correspondent of the *Old Colony Memorial* paid a visit not long ago to Fairfield, Me., where a large establishment is located for the production of these knock down houses, and he says that few have any idea to what extent this business has been carried in Waterville and its neighborhood, or to what perfection it has been brought. In the establishment to which we refer dwelling houses are made, like boots and shoes, in any quantity, and of any size or style, and for any market in the wide world. Not long since this concern received a single order for 50 houses for Cape May, to be delivered speedily and in complete finish.

These houses were to be not sheds or shanties but regularly ordered dwellings; and they were made accordingly and so delivered, and contain hundreds of occupants at this moment. An order will be received for a $50,000 hotel, or an ornate, French roof cottage, for a fine country estate, and these as easily and expeditiously furnished as an ordinary boarding house for a country village, or a barn for a ranch in Kansas or Colorado. Do not suppose that only a coarse, rough frame is thus sent out, to be trimmed into shape on the spot where it is delivered! On the contrary, the house is complete when it leaves the factory, and as ready to go together as is a musket when it leaves the armory at Springfield, all the parts being found, even to the knobs for the doors, and the screens and shades for the doors and windows, according to specifications. Great trains of freight cars stand waiting about, and are freighted almost daily here. The refuse trimmings and edge cuttings of the lumber are carted off to a neighboring pulp mill, and there speedily turned into material for paper or other products. Machinery for almost every conceivable use in connection with wood is at hand, and house materials of any kind or size or shape, seem to drop out like meal from a hopper. In a recent instance where a large building was furnished for a southern order, the parts were thus made, and when put together in the city where the building is now standing the length of the latter was found to vary not the eighth of an inch from the original specifications, although its length on the front numbered hundred of feet Every inch of this building, from the sill to the last shingle, was sent ready prepared from this factory, and "set up" as readily and almost as quickly as a nail cask.

On the Line of the C. P. R

Falling Leaves.

"There is something inexpressibly touching in the fallen leaves," sighs an esteemed author. There is, there is, indeed. It's when you slip on one of the articles on a wet morning, and touch the unsympathetic pavement. But there is in reality touching language—language uttered from the heart, yes, from the depths of the soul, in the many thousands of testimonials and letters (unsolicited) that come from those who once were sufferers from lung diseases, asthma and consumption, and who have used N. H. Downs' Vegetable Balsamic Elixir, and have been restored to their wonted health and activity.

The William Hamilton Manufacturing Co'y

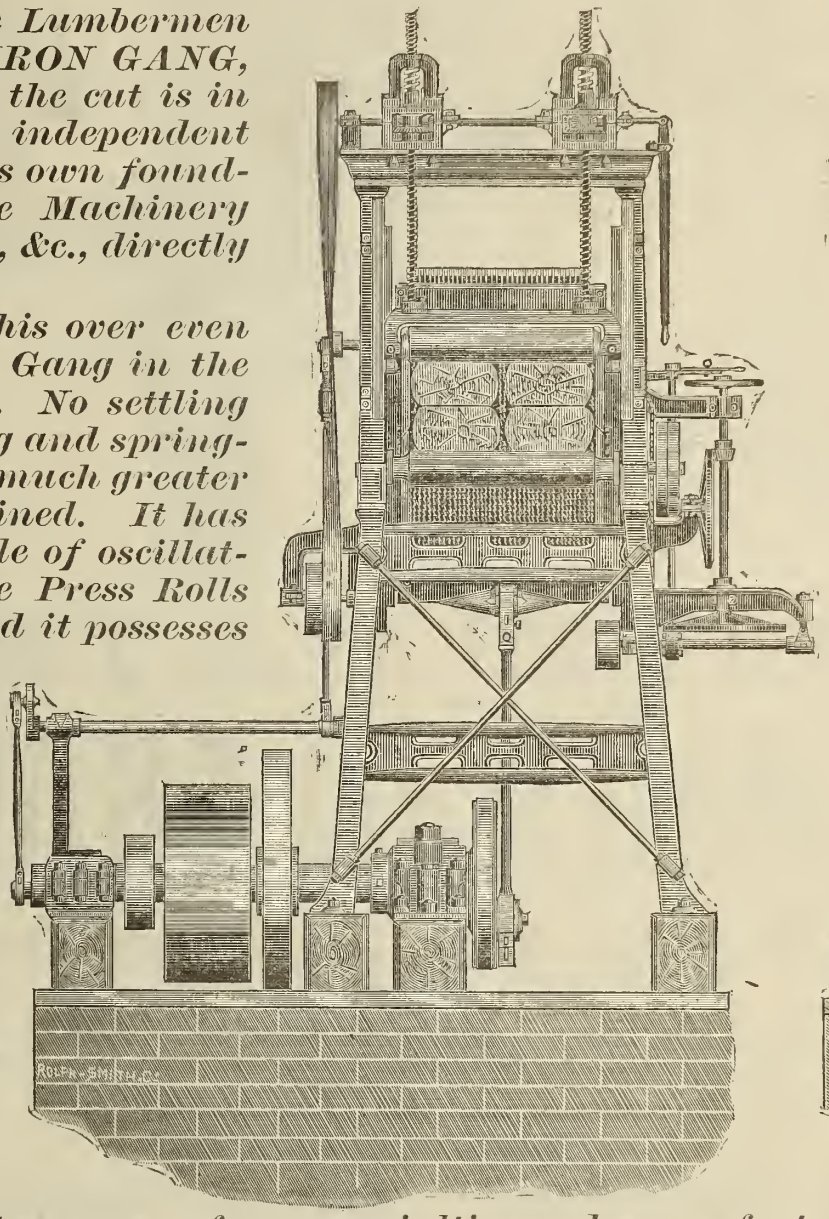
MANUFACTURERS OF (LIMITED,)

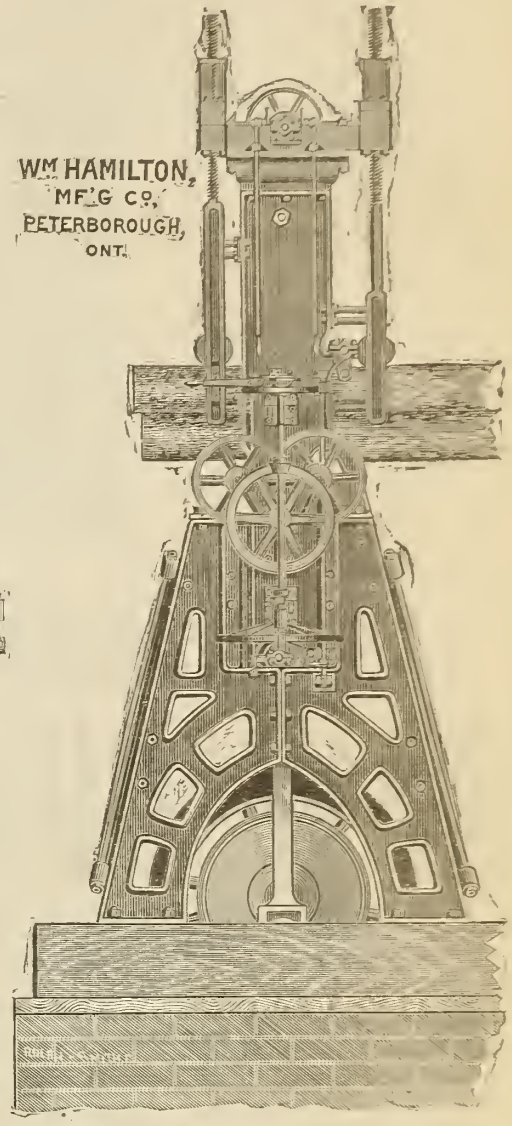
Saw Mills and General Machinery

PETERBOROUGH, - - - ONTARIO.

We introduce to the Lumbermen of Canada our New IRON GANG, which will be seen by the cut is in itself a complete and independent Machine, resting on its own foundations, having all the Machinery for operating, feeding, &c., directly attached.

The advantage of this over even a well built ordinary Gang in the mill frame is evident. No settling out of line, no yielding and springing of timber, while a much greater working speed is obtained. It has the most improved style of oscillating motion, it has the Press Rolls operated by power, and it possesses generally all the good features of best American Gangs, with heavier frame work and heavier shafting, all with a view to rapid, steady & correct working. A good look at one of these massive machines satisfies the sawmill man that they are in every way capable of continuously performing heavy duty throughout the season.

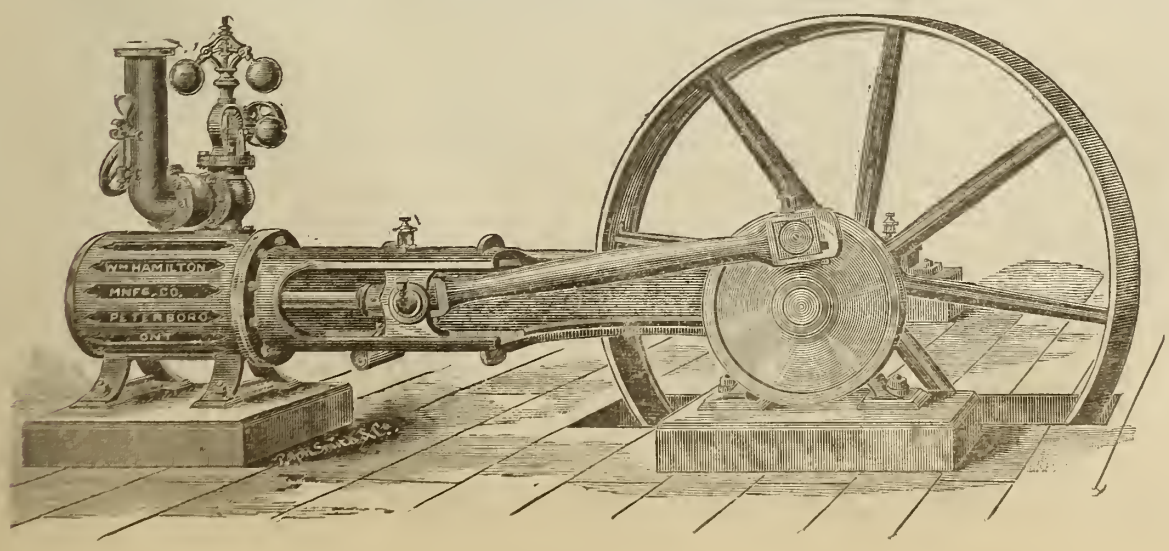




☞ *We make these Gangs one of our specialties and manufacture them of different sizes.*

—ALSO—

ENGINES AND BOILERS.



This cut represents our **SAW MILL ENGINE**, of which we make the following our Standard sizes, 12x16, 16x20, 18x24, and 24x30, built Strong and Substantial for Heavy Work. The Piston Rod, Cross-head Pin, and Wrist Pin, are made heavy and of the best steel; the Connecting Rod has solid ends and is tightened up by screw and wedge, avoiding all danger of keys getting out; the Slide Valve has a simple balance valve, requiring no attention from the Engineer, as it is self-adjusting. The Engine Shaft and Fly Wheel made very heavy. Belt Pulleys put on when required in place of Fly Wheel, and all regulated by the Judson Governor.

ROGERS' PATENT

SAW GUMMER and SHARPENER

The Handiest Machine for these purposes ever Invented.

Saw Mill Owners in providing for the season of 1884, ought not to lose sight of ROGERS' SAW GUMMER for it will save them more money in proportion to the amount invested than any other machine.

Only $30, including Emery Wheel; Table and Countershaft, $10 extra.

A few of ROGERS' SAW GUMMERS were put on the market last season, and we quote some of the commendations received:

JAS. HADDEN, Foxmead, says:—
"Your machine is all I expected."

CHAS. ANDERSON, Anton Mills, says:—
"I have given it a good trial, and am well pleased with it. "I find it is one of the indispensibles in a saw mill." * *

ROBT. R. WEIR, Orillia, writes:—
"It works like a charm, and is very accurate in its work."

CRONEN PATTON, Hoc Roc Mills, Gravenhurst, says:
"The Rogers' Saw Gummer purchased from you gives "good satisfaction, * * it cannot be beat."

D. DAVIDSON, Pentanguishene, writes:—
"We are well pleased with the Gummer."

W. W. BELDING, Wyevale, writes:—
"I have the Gummer running and it is giving good "satisfaction."

THE CANADA LUMBERMAN

AND MILLERS' MANUFACTURER AND MINERS' GAZETTE.

PUBLISHED SEMI-MONTHLY.

The only Newspaper devoted to the Lumber and Timber Industries published in Canada.

SUBSCRIPTION $2.00 PER ANNUM

VOL. 3. PETERBOROUGH, ONT., NOVEMBER 15, 1883. NO. 22.

THE Sandy River Lumber Company, o Maine, is shipping dimension and hardwood in large volumne, to Cuba and South America.

A fire at the cove of Messrs. Benson Bros. New Liverpool, destroyed from $5,000 to $8,000 worth of deals. The loss is covered by insurance. But for good fire appliances the loss would have been $100,00 to $150,000.

THE saw mill of Smith & Sons at Turtle Mountain, is being reorganized with a probability of new members. This has been, excepting the loss by fire last winter, which was a severe one. a prosperous affair as well as a boom to the settlers.

MR. GIBSON, the lumber king of New Brunswick, has, this season, according to a St. John paper, shipped from St. John 87,000,000 feet of deals, in 115 vessels, for the English and French markets. Last season his total shipments reached 100,000 feet in 136 vessels.

CHICAGO is the greatest lumber market in the world. The single item of sawed lumber received there in 1881 would lay an inch flooring fourteen feet wide round the earth at the equator. The amount of lumber manufactured in the three states of Michigan, Wisconsin and Minnesota during 1881 would lay such a floor fifty feet wide.

WASHINGTON has for several years been expending about $20,000 annually in planting, propagating, and the care of shade trees, and in consequence is credited with being the best shaded city in the world, not even excepting Paris. The total length of the shade furnished by these trees is 125 miles, many of the sidewalks being covered by a complete arch of foliage.

THE Ottawa *Free Press* of Oct. 27th says:—Messrs. Flatt & Bradley, large lumber dealers of Hamilton, yesterday purchased 5,357 acres of heavy wooded land at Cessellman, part of the Cessellman estate, for the sum of $135,000, and will immediately commence extensive lumber operations. Mr. J. J. Flatt, the senior member of the firm, is now here, and will commence at once to erect two large saw mills and a large general store on the property.

THE Ottawa *Free Press* says that Eddy's new planing mill and box factory are running in full force now. One hundred and fifty men will receive employment winter and summer by this new addition to Eddy's enterprises. The boxes are shipped principally to Montreal and American points where they are in great demand. One million feet, board measure, are turned into boxes every week, and this already enormous figure is likely to be increased.

SALE OF LIMITS.

The Ottawa *Citizen* of Oct. 29th says:—An extensive sale of valuable timber limits, comprising an area of 150 square miles, took place in the Grand Union Hotel, on Saturday afternoon last. The sale was by public auction and conducted by Captain R. C. W. McCusig. The limits in question were:

No. 4—First range, block A, in the Province of Quebec, described in the license thereof, as follows:—

To commence at a point where the line dividing the ranges 1 and 2, block A intersects the east shore of the head waters of Lake des Quinze, being due east from No. 10 mile post, planted on the boundary line between the Provinces of Ontario and Quebec; thence following the said range line east astronomically 3½ miles; thence south astronomically 13 miles to Lake des Quinze to the point of beginning. Not to interfere with prior licenses existing or to be renewed in virtue of regulations on the 16th day of October, 1880.

No. 4, Second Range, said block A—To commence at a point where the east line of berth 3, 2nd range, block A, intersects the north limit line of limit granted to Mr. John Poupore, thence following the said line of limit No. 3, due north 11 miles; thence east astronomically 5 miles; thence south astronomically 10 miles; thence due west to Lakes des Quinze 3½ miles; thence on the west shore of Lakes des Quinze, from a post planted by P. L. S., C. I. Bouchette, due west to the point of beginning, about ½ mile. Not to interfere with prior licenses existing or to be renewed in virtue of regulations on the 16th day of October, 1880.

No. 9, Second Range, Block A—To commence at a point on the southeast corner of berth No. 8, 2nd range block A; thence following the east limit line of said berth No. 9, due north 10 miles; thence east astronomically 5 miles; thence south astronomically 10 miles to the range line, and thence west astronomically to 5 miles to the point of beginning. Not to interfere with prior license existing, or to be renewed in virtue of the regulations on the 16th day of October, 1880.

The property, it would seem, was first purchased from the Government by Mr. David Moore, and afterwards sold by him to the late Mr. Taggart for the sum of $40,000, subject to a heavy mortgage, only a small portion comparatively being paid at the time of transfer. Since the death of Mr. Taggart the mortgage was foreclosed and the property in consequence brought to the hammer. They did not realize as much as it was thought they would, owing to three causes. In the first place it has been a dull season in many ways with most lumbermen; secondly, the terms of sale were pretty stiff, and lastly, the season of the year was not the best to put them in the market. Nevertheless, the sale attracted considerable attention, and there were at it many of the best known lumbermen of the district as well as other parties connected with the trade, amongst whom were Messrs. C. Edwards, A. W. Fleck, J. R. Booth, D. Miller, McCormick, E. Moore, James Skead, David Moore, Roach, T. Smith, Lambert, S. McDougal, J. Mohr, J. Rlopelle, Wm. Stubbs, C. Smith, R. Nagle, E. Bonson, P. Thompson E. Griffin, John Poupore, Assa Gordon, J. R. Fleming, R. Klock, B. Cutler, James McLaren, H. Bronson and others. As before stated the terms of the sale were considered stiff, the property being sold en block, one half to be cash, and paper satisfactory to the vendor to be paid in three months. After Captain McCuaig had made all facts known bidding began. $10,000 was the first offer made followed by $15,000 and swiftly in succession bids to $28,000 at $1,000 a bid. Here they seemed to hang fire, but crept up slowly $1,000 at a time to what the auctioneer considered to be a bid of $38,000 from Mr. Lambert to whom he knocked them down. Mr. Lambert said there was some mistake about the matter as he had not made the bid.

Captain McCuaig then fell back on the next highest bid which was that of Mr. W. C. Edwards, $37,000 who accepted the offer. It was generally conceded by competent judges present that the purchaser had got a good bargain, and that nothing but a lightness of funds among the trade just now prevented their bringing a far higher price. Some of those well qualified to say said in conversation that $1,000 per mil would not be too great a price for them.

FORESTRY EXHIBITION.

Mr. Wm. Little, Secretary of the Forestry Association here, has just received from Mr. William H. Rider, the Official London agent of the International Forestry Exhibition to be held in Edinburgh next year, papers containing particulars of the projected exhibition. The list of the officers is a long and influential one. The Marquis of Lothian heads the list as President, and after him come eight dukes, six marquises, and any number of earls, viscounts, lords and barons. The Honorary Secretaries are Messrs. Robert Hutchinson, J. N. Menzies, H. Cleghorn and William Skinner, of Edinburgh, with Mr. George Cadell as Secretary. It is proposed to open the exhibition in August, and entries will be received until march, 1884. The exhibition is intended to include everything connected with and illustrative of the Forestry products of the world, and will be open to exhibitors from all countries. Special railway terms will be granted, and it is expected that the governments of the different countries exhibiting will lend their aid to make the exhibit the finest ever yet seen. Class 1 will be devoted to practical forestry and will include forest implements, models of huts, charcoal kilns, timber, slips, &c.; plans of river embankments and rafts; machinery for transplanting trees and transporting timber; saw mills and wood working machinery, and fencing materials of all kinds, including gates and stiles. Class 2 will be devoted to forest produce, raw and manufactured, such as collections of timber specimens; pavements, barrels, basket work, wood engravings, bamboos, tanning and dyeing substances, barks, corks, fibre, materials for paper, gums, resins, wood oils, charcoal for gunpowder, peat, cones, seeds and fruits. In class 3 scientific forestry is treated of. There will be displayed botanical specimens of forest *flora*, microscopic sections of woods, parasites and edible fungi, forest *fauna* injurious to woods; representations of forest entomology, various processes for preserving woods and fossil plants. Class 4 is taken up with ornamental forestry such as ornamental trees, rustic work and dried specimens. Illustrative forestry will be treated of in class 5. In this department will be exposed to view paintings and photographs of remarkable trees, delineations showing the effect of blight, accidents or any abnormal condition, sketches of practical works and operations in the forest. Class six will comprise forest literature of all kinds—reports, periodicals, manuels, treatises, charts, maps, book-keeping, etc. In class 7 will be exhibited essays and reports on forestry. Class 8 will be devoted to the loan collections. Class 9 to the economic condition of foresters and woodmen, and in class 10 will be placed the miscellaneous articles not included above.

The exhibition promises to be a remarkle one, and it is confidently expected that the Dominion Government will take a strong interest in the matter.—*Montreal Star.*

Forestry in Ontario.

Mr. Phipps is pushing his forestry work, as we see by the notices of newspapers in different localities where he pays flying visits. We hear of him week before last on the Blue mountains in Grey; last week we observe he was down at Leslie's large nurseries for a couple of days; this week he is going. as we see by the News, through the Niagara district, examining everywhere the methods and success of tree planting and other matters connected with forestry in the sections he passes through. Farmers will find some valuable experiences detailed in his next report.—*Toronto Report.*

Burnham Beeches.

An autograph letter of Lord Beaconsfield to Mr. Francis George Heath is prefixed to a new edition of his handbook to Burnham Beeches, in which the author of "Lothair," having mentioned that he passed part of his youth in the shade of Burnham Beeches. added, "I am not surprised that the ancients worshipped trees. Lakes and mountains, however glorious, in time weary. Sylvan scenery, never palls."

CANADIAN FORESTS.

The annual meeting of the Forestry Association of the Province of Quebec was held in the Forestry Chambers, St. James street, Montreal, on Thursday evening Nov. 8. The President, Hon. H. G. Joly, occupied the chair, and among those presont were Messrs. J. X. Perrault, J. K. Ward, G. L. Marler, William Little, Wm. McGibbon, G. W. Stephens, M. P. P., J. C. Chapais, Dr. Painchaud, J. C. Robillard, J. A. N. Provencher,—Leclerc, and others.

The Secretary, Mr. J. X. Perrault, read the minutes of the last annual meeting, which were confirmed.

The President, in presenting his annual report, said he would make his remarks as brief as possible, as they had in the room some fine specimens of tree culture, which had been grown by Mr. Wm. McGibbon, who would favor the meeting with some interesting particulars concerning them. He then read his annual report as follows:—

GENTLEMEN,—This Association was founded in October of last year. We have had no meeting since then, as it would have been difficult to collect our members, scattered as they are all over the Province, but when we parted, we all knew what each one of us had to do, and we can show some work.

This first year of our existence has been a good year for us and one of unexpected success, but has been darkened by the loss of a dear and valued friend, our Honorary President, Mr. James Little. He died full of years, knowing that the seed sown by his hand so many years ago, in what then appeared a hard and ungrateful soil, had sprung up at last, and bid fair to ripen and bear fruit bountifully, seeng that his warnings had awakened the country at last and that the danger of total destruction to our forests, first pointed out by him, had been admitted by the thinking men of this continent.

I will now briefly sum up the work of the year, merely reminding you, beforehand, that our association has no funds, or next to it, and that it relies on the personal exertions of its members for doing the work that the association has in view, planting trees as each member undertakes to plant or sow twenty-five forest trees every year.

We have been well supported by the Hon. W. Lynch, the Commissioner of Crown Lands; he has thrown himself, heart and soul, into the work, and we are deeply indebted to him, not only for the success of our first "Arbor Day," but for the introduction, in our Legislature, of laws which have for their object the carrying out of the views expressed by the American Forestry Congress and by us, for the protection of forests against fire and waste, and for the classification of public land in such a manner that settlements should be encouraged on the lands best fitted for agriculture, and that lands only fit for the growth of timber, and especially pine, should be reserved for that purpose, as long as it does not interfere with colonization.

Our first "Arbor Day" has been an unexpected success, not only in the large cities, like Montreal and Quebec, but especially in many of the country parishes, where it was most wanted, and where the clergy were most zealous in encouraging the people, in many cases setting the example by planting trees with their own hands.

The Council of Public Instruction are equally entitled to our gratitude for the way in which they have encouraged the observation of "Arbor Day" in all educational establishments under their control,

It will be a satisfaction for you to know that the news of the first "Arbor Day" in the Province of Quebec has reached such distant countries as Algeria, and that the example set by us is likely to be followed there.

In the absence of reports from all the different localities it is impossible for me to say how many forest trees have been sown or planted in the province by the members of our Association and by the people at large, on "Arbor Day." I hope we shall be able to devise means for securing all those reports for another year, and for publishing a summary of them, if not the whole. For the present we must rest satisfied with the reports that will be made here by the members of the general committee.

In the meantime I can take upon myself to state that many thousands of forest trees have been planted or sown since our meeting last autumn. There is one tree, however, upon which I can speak with a good deal of certainty; it is the *ash-leaved maple* (acer negundo, or box-elder or erable a giguieres.) During the last twelve or thirteen months from four to five hundred thousand seeds of that tree must have been sown in the Province of Quebec. I come to that conclusion from the number of pounds of seed that have been sold during that time, as reported to me by those who most largely deal in that article.

The extraordinary rapidity of growth of the ash leaved maple, the shortness of the time required before it can produce sugar (and thereby replace the old sugar orchards of the past) have acted as a wonderful stimulant on the minds of our people and done more for forestry than anything else could have done. In growing that tree people will learn how easy it is to grow forest trees; they will naturally take to the cultivation of more valuable trees, such as black walnut, butternut, elm, oak, ash, pine, spruce, tamarac, &c., according to the nature of the soil and other circumstances.

I think we can look, if not with pride, at least without shame, on the results of our first year's work; we have certainly got something to show for our money, twelve dollars—total reciepts, up to date.

You have doubtless heard that it is proposed to hold, next year, an International Forestry Exhibition at Edinburgh. I hope you will take this important matter into consideration this evening, as it is one in which we, as a Forestry Association, and the whole Dominion, are deeply interested.

We are particularly indebted to our Corresponding Secretary, Mr. E. Barnard, who has gratituously conducted for us a most extensive correspondence, notwithstanding the numerous calls from various sources upon his time.

Mr. J.X. Perreault, our Recordiug-Secretary, is also entitled to our thanks and so is our Treasurer, Mr. M. G. L. Marler whose plain and lucid financial expose must give you general satifaction.

The hall in which we are now meeting has been kindly placed at our disposal by Mr. Wm. Little, who has even gone to the trouble and expense of providing seats and getting the gas fixtures put up, to-day, and I now tender him our best thanks.

We must not forget the gentlemen of the press; they have considered our work as deserving of their support, they have given it to us in the most hearty and disinterested manner; the best way of showing our gratitude for their help in the past, is by deserving it in the future.

The whole respectfully submitted,

H. G. JOLY,
President.

After a long and interesteresting discussion. in which the Hon. W. W. Lynch, Commissioner of Crown Lands, took part, a motion to adopt the report was carried.

Hon. Mr. Lynch moved, seconded by Mr. J. K. Ward,

That the members of the Forestry Association of the Province of Quebec have heard with sorrow of the death of Mr. James Little, the Hon. President of the Association.

That his name will never be forgotten by those who take an interest in forestry, and that, as years go on in their course, the wisdom of his opinions and warnings will become every day more apparent.

That we heartily sympathize with the wife, who has been the companion of his life for so many years, and with his children in their sorrow.

That a copy of these resolutions be transmitted to Mrs James Little.

Carried.

Mr. Wm. Little briefly returned thanks for the kind resolution, and the President also bore testimony to the valuable work done by the late Mr. Little in the cause of forestry.

On motions of Mr. G. W. Stephens it was resolved that the old officers be all re-elected, as follows:—

Presidcut—Hon, H. G. Joly.

Vice-Presidents—Messrs. J. K. Ward and L. H, Massue, M. P.

Recording-Secretary—Mr. J. X. Perrault.

Corresponding Secretary—Mr. E. A. Barnard.

Treasurer—Mr. G. L. Marler.

The council was composed of sixteen members and the general committee of one hundred and ten members, and the President and Secretary were authorized to fill any vacancies caused by death.

It was moved by Mr. Wm. Little, seconded by Mr. G. L. Marler and resolved,

That a committee be appointed to memorialize His Excellency the Governor-General on the subject of the forests of the country, with the view of having a parliamentary enquiry made into their condition, especially with reference the white pine, respecting which it is said there is now a growing scarcity of the merchantable or first quality pine, a description of wood on which the prosperity of the country has greatly depended.

That the Chairman be requested to name the Committee, who shall be authorized to make what representations, enquiries or suggestions that to them may seem requisite in the premises.

The President appointed the following gentlemen as a committee:—Messrs. Wm. Little, L. H. Massue, M. P., J. K, Ward, J. X. Perrault and G. L. Marler.

On motion of the President, it was unanimously resolved:

That in view of the proposed International Exhibition, to be held in Edinburgh in 1884, respecting which full particulars have been received by the Association from the Executive Committee of this Exhibition, and the success thereof fully assured, this Association would respectfully urge upon the Government of Canada the great importance of having the Dominion represented at this International Forestry Exhibition by as full and complete an exhibit as possible of our Canadian woods, forest products, and the articles referred to in the circulars of the Exhibition Committee, and would further urge that such assistance be given to all contributors from Canada having articles of merit to exhibit who desire to compete for prizes as to enable them to do so

Considering how much the forests and the industries connected therewith have contributed to the prosperity of the country, it is to be hoped that such action may be taken by the Government as to make the Canadian exhibit worthy of the prominent position Canada occupies as a producer of forest products.

The President appointed as a committee, Messrs. Chapais, Little, Ward, Marler and Perrault.

On motion of Mr. Marler the meeting adjourned to meet again at the call of the President.—*Montreal Gazette.*

TREE CULTURE.

The fine hall of *La Patrie* office, on St. Gabriel street, Montreal, was filled to overflowing on the evening of November, 8th, on the occasion of a lecture by the Hon. H. G. Joly, M. P. P., on the subject "Is it wise to encourage the culture of trees in our Province." Mr. C. A. Geoffrion occupied the chair and among those present were Hon. Mr. Mercier, M. P. P,, Hon. Senator Thibaudeau, Ald. James McShane, M. P. P., G. W. Stephens, M. P. P., J. K. Ward, Joseph Doutre, Q. C., J. C. Robillard, D. Barry, J. E. Robidoux, Ald. Beausoleil, H. Dorion and Dumont. The chairman, in introducing the lecturer, dwelt upon the enterprise of Mr. Beaugrand in introducing such a course of lectures, which he was sure would prove very interesting.

Hon. Mr, Joly, in commencing his lecture, dwelt upon the great importance of this subject to the Dominion of Canada and especially to the Province of Quebec. There were two great objects that should be kept in view in this matter—first, to protect the existing forests, and secoudly, to cultivate new ones. The Provincial Legislature had already recognized the importance of the subject, and had adopted special legislation in regard to it. Its great importance would be seen when the fact was known that in the Province of Quebec our forests constituted one of the principal sources of revenue. He spoke of the devastation of the forests by fire and the means that had been taken to prevent their further destruction. He considered it was their duty to amply provide against the destruction of their forests. In the past the trees of the forests had been regarded as common prey, and every man's hands was against them until the ravages had become terrible. This, however, was gradually ceasing, and the people were recognizing the importance of their forests. He next spoke of tree cultivation, and advocated its promotion on a more extensive scale. There was nothing of very great difficulty in the cultivation of forest trees. France had seen the necessity of it, and thousands of trees had been planted. What had been done there could be done here. There was nothing that could be done with as little risk and with such a sure guarantee of profit. It should be started on a small scale and gradually worked up. He spoke of the different conditions of soil suitable for tree cultivation, and the ground adapted to each tree, and advocated the cultivation of the more valuable species of wood, alluding especially to black walnut, which would yield a very large profit. He considered however, that profit was not the one thing to be considered in this matter. They had a duty to perform to posterity, and they should perform it. Some would say that it was for the Government to carry out the work and not for individuals. The life of the individual, it might be contended, was too short to trouble with such matters. But the life of the Government was just as short. (Laughter and applause.) He referred to the services that the Hon. Mr. Lynch, Minister of Crown Lands, had rendered in the direction of tree cultivation, and spoke of the introduction of "Arbor Day," which had been attended with such success. This success should encourage them to make future efforts in this direction. The Province of Quebec, he was of opinion, had reason to be proud of the progress it had already made in the matter of tree cultivation. He had received communications from other countries inquiring what they had done, which showed that their actions were watched with great interest. He was in favor of having tree culture made a branch of the education of the youth of the land, as by this means an interest would be taken by the rising generation in this important matter.

Mr. H. Beaugrand proposed a vote of thanks to Hon. Mr. Joly for his interesting discourse, and said it was an encouraging sign when a gentleman with so much to attend to as Mr. Joly, took an interest in this subject.

The motion was carried amid great applause.

The Hon. Mr, Mercier, who was loudly called for, responded by saying that he had listened to the lecture with the greatest pleasure. Mr. Joly had praised the Government for the steps they had taken in the matter; but the real credit belonged to Mr. Joly himself, who had never ceased to press upon the Government the importance of the matter, and as usual the Government was forced to carry out the ideas of the Liberals. He congratulated Mr. Joly upon the success that had attended his efforts, and expressed the hope that the course of lectures inaugurated this evening would be eminently successful.

Messrs. Joseph Dontre, Q. C., and A. Buies also made a few remarks and a successful meeting was then brought to a termination.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., wil send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

A WONDERFUL RESULT.—A single bottle of Dr. Low's Pleasant Worm Syrup has frequently destroyed from 100 to 200 worms. It is pleasant to take—no other cathartic being required. Tape worms have also been removed by it, of 15 to 35 feet in length. It is effectual for all varieties of worms afflicting both children and adults.

A GOOD INTRODUCTION.—J. Kennedy, a merchant in Dixie, about three years ago introduced Hagyard's Pectoral Balsam to his customers by trying it in his own family for Coughs and Colds. Being pleased with results, large sales followed, and it is now the favorite remedy in that neighbourhood.

WOOD IN BRITAIN.

By the British Board of Trade Returns for September, it appears that the import of timber and lumber into the United Kingdom at the end of September exceeded that of the same date last year considerably, leaving the stock on hand some 73,726 loads greater. The figures for the nine months are: wood, to end September, 1883, 4,717,000 loads, hewn and sawn, value £11,731,000, being an increased import, accordiug to tho *Economist*, of 1·5 per cent. in quantity and 1·6 per cent. in value over the corresponding period of last year. The supply from Russia, Sweden and Norway was smaller this September than the one before, both in hewn and sawn wood, but from British America the quantity sent forward to the old country was more than doubled. "Canada, in the face of its threatened scarcity, has managed to spare us," says the *Timber Trades Journal* of 13th inst., "100,000 more loads in a single month than came thence last year at the same period; and, whatever price was paid for it, the value of the wood is lower in this country now than it was then. Spruce, the staple of the lower ports, is comparatively a drug in Liverpool now, as the demand is stated by our correspondent to be quite inadequate to the quantities injudiciously thrown upon that market. There has seldom been, we are told, any deficiency of transatlantic timber in Liverpool since steam has taken up the carrying trade and rendered it to a great extent independent of the winds." The journal considers that "our North American colonies had not contributed so large a quota in excess of their usual figures in September, there would have been a smaller importation last month than in the same month last year. The alleged shutting down of their saw-mills does not appear to have been decided upon a day too soon."

It appears that the import of pitch pine fell off during September. The United States sent that month 47,000 loads less than in the like month last year, which is some offset to the excess import of pine from Canada. The decline in Baltic timber shipments accelerated the demand for pitch pine, according to the London market report of the 12th instant.

The official figures of wood imports into the United Kingdom were as follows for the nine months ended 30th September of this and year:

	Quantity.	
Timber (hewn).	*1882.* *Loads.*	*1883.* *Loads.*
Russia	227,702	224,624
Sweden and Norway	494,108	470,893
Germany	224,992	264,031
United States	140,648	95,471
British India	30,664	36,660
British North America	151,187	211,767
Other countries	266,982	286,886
Total	1,536,283	1,590,314
Timber, (sawn or split planed or dressed).		
Russia	920,110	797,657
Sweden and Norway	1,271,281	1,285,520
British North America	623,542	765,693
Other countries	289,486	278,244
Total	3,107,419	3,127,114
Staves (all sizes)	94,967	102,600
Mahogany (tons)	21,675	33,996
Total hewn & sawn	4,643,702	4,717,428

Wo fiud the statement in the St. John *Telegraph* that operations in the woods of northern New Brunswick are to be decidedly curtailed during the coming winter, so that a comparatively light export may be anticipated for 1884. In view of what is said above a step in this direction is needed.

The shipments of lumber to the 12th October this year on the Miramichi, compared with same date last year, wore as follows:—

	1883.	1882.
Deals	104,333,165 spl. ft.	85,922,315
Scantling	4,794,926 "	3,485,824
Ends	5,275,333 "	4,100,944
Boards	4,265,843 "	1,959,932
Total spl.ft.	118,669,267	95,478,015

Sales in London up to the 11th ult, were slow, and although an improved tone was observable, yet it did not preceptibly affect prices. Good pine, however, brought very fair figures. Waney board brought £5 5s to £5 15s per load. some square pine went as low as £3 7s 6d to £3 12s 6d. Miramichi pine, best stuff, 12 to 20 ft. and 11 to 16 inches being sold without reserve at £12; with £10 10s for seconds. The wood, however, is described as being of a very coarse nature.

At Liverpool, on Friday 5th and Wednesday the 10th insts., auction sales had been made of Nova Scotia birch timber 34 inch and up deep at 23½ per foot, down to 13d, for under 15 inch. St. John spruce deals up to 27 feet, 3x11, brought £7. Hull report mentions the receipt of 17 tons of furniture wood from New York.

Accounts from the Clyde ports are that the consumption during the quarter ending 30th of September last, shows great activity, being about as follows; Quebec waney boardwood and yellow and red pine logs, 16,900 loads; Quebec oak logs, 1,800 loads; elm 980 loads; birch (all sorts), 725 loads; pitch pine logs, hewn and sawn, about 13,000 loads. Compared with like quarter in 1882 an increase is here shown to the extent of 9,000 loads. The stock of birch is very low, not much having roached there from lower ports.—*Monetary Times.*

A SIGNIFICANT WARNING.

WASHINGTON, October 18.— The Northwest Lumberman's Association, becoming alarmed at the rapid depletion of the forests of the Northwestern States, and at the falling lumber market, has resolved that the cutting of timber must be curtailed. Mr. William Little, of Montreal, who was actively engaged before Congress last winter during the discussion of the tariff on lumber, has contributed to an English magazine, just received here, an interesting article upon the alarming destruction of American forests. After quoting from the census reports of the United States to prove that, at the present rate of destruction, the entire white pine of the Northwost will be exhausted within seven or eight years; and from the report prepared by H. G. Joly, late Premier of the Province of Quebec, for the Dominion Council of Agriculture, in which it is shown that the supposed enormous territory of Canada is really confined to a comparatively small area, and that the best lumber is yearly becoming less accessible to the markets, Mr. Little continues:

"It has often been said that there would be found a substitute for wood; if so, it is quite time the discoverer brought it forward, for up to the prsent tho 'everlasting Yankee' has not even touched tho subject. Notwithstanding the fences of wire, the use of iron in building, the terracotta and straw lumber, the consumption of our old friend wooden lumber increased nearly 50 per cent. in the ten years from 1870 to 1880, the former being 12,755,543,000 and the latter 18,091, 356,000 feet. . . And yet we are informed that we are within seven years of the time when the supplies of white pine and spruce lumber must cease. . . . The value of the lumber now produced in the north exceeds $300,000,000 a year as it falls from the saw, and to replace it would cost from two to three times this sum, even if the same lumber could be obtained elsewhere, which it cannot be, and $600,000,000 a year would not replace it; so that in a very short time this section of the country, instead of having a great and profitable industry advancing and helping every interest will be called upon to pay out hunreds of millions of dollars annually for such material."

It has been estimated, says the writer, that it would take the entire sailing tonnage of the world to convey the amount of timber annually consumed in America from any foreign lumber port. But whore to get it at any price in the enormous quantities used in this country is a question that would puzzle those best informed on the subject to determine. Mr. Little commends the policy of the Province of Quebec in restricting the cutting of pine trees to those which measure more than twelve inches through at the butt, and in charging the same timber dues upon the small logs as on the larger ones, which has had the effect of curtailing the cutting of the small pine and spruce trees in that prominco.

With respect to forest fires, which are made an excuso for the ruthless destruction of the timber of the country, he says they are largely duc to the practice of leaving the branches, tops, and other refusal of the timber to become dry, and thus food for fires. As a remedy he suggests that if the timber-laden owner would annually spend the same percentage he is will ing to expend in insuring other property of like value toward putting his timber property in safe condition, he could so place it that it would be difficult to set it on fire so as to do any serious injury.

Returning to the annual product of sawn wood in the Northwest, and the increase in valne since 1878, he estimates $1,000,000,000 as the present annual value of the forest products of the United States at primary points of production or manufacture. When it is seen that this manufacture now stands at the head of the manufactures of the United States in value, and that the white pine, which has been in the past and is still the most important factor in this great industry, is rapidly approaching extinction, the writer feels that he cannot be far astray in concerning this, as regards America, what he has already called it—the most important economic question of the day. The confusion in names has led many people to suppose that the yellow or pitch pine of the South will make an excellent substitute for the white variety of the North. This he says can never be, for the woods are most dissimiiar. The Southern pine, although excellent for many purposes, is hard and resinous, about the same weight as white oak, or nearly double that of pine or spruce, and hence not so easily brought to the mills as the lighter varieties of timber, which are taken with but little difficulty from the most remote sections, wherever water-course exist.—*N. Y. Post.*

REDUCE THE CUT

A correspondent of the *Northwestern Lumberman*, writing from Grand Rapids, Michigan, says:—It is with pleasure we daily hear from different sources the intention of lumbermen to largely curtail their logging operations the coming winter, but we fear with many it is only talk, and for the purpose of inducing their brother lumbermen to do less, while they will put in their ordinary and full stock. We hope, however, such a policy will not be pursued by anyone. Yet, "actions speak louder than words," and when such men are operating side by side it is very easy to see their intentions from the force of men and teams employed by them to do their work. Never in the history of our lumber operations could conservatism in the winter's operations bring forth such favorable results as at present. We have been favored this year with a very large demand. Nevertheless prices have been gradually going down on all lower grades, which affects from 50 to 75 per cent. of the entire stock, from $2 to $3 per thousand, while at the same time grades of lumber have been going up, until to-day our No. 1 boards and strips equal our regular grade of common boards ten years ago, and other grades in like proportion. This, together with the reduction in prices, will show lumbermen, when they take their invoice of this year's business, why the result is so unsatisfactory. If it were possible to make this invoice to-day it would require but very little, if any, urging to induce them to reduce this cut largely; but after their men and teams have been sent to the woods we fear they will be disposed to leave them there and hope for "something to turn up" which will let them out. We see nothing in the past season's trade and the prospects for 1884 to warrant them the realization of any such hopes. Under the circumstances would it not be well for lumbermen to "look before they leap," and see their landing? What, with an actual shortage and subsequent advance for 1884, can they lose? Their small stock of lumber will sell for more money; they will be in better shape financially; have more standing timber, and of an increased value. When men have everything to gain and nothing to lose, they feel safe, and such is the condition of lumbermen to-day, providing they are found next spring with not to exceed 40 per cent. of their usual stock of logs.

FOREST CLEARING.

Those who are laudably endeavoring to stop the wholesale destruction which has been carried on in clearing out the forests of this country will be glad to hear that the lumber manufacturers of the North-West have decided that the work of cutting off the valuable timber of the Northwestern States must now be retarded. Their reasons for coming to this decision are not from any love of the beauty or the benefits which the forests confer on the country, but simply because they find it is not paying them to clear off the forests at the rate they have been doing, and that if continued it will pay them still less. They have over-stocked all the markets, and as a consequence prices have sunk so low that the trade has become comparatively unprofitable. In this way the destruction of the forests has unintentionally received a check, and before the havoc is resumed perhaps the matter of their better preservation may receive the attention of the National Legislature.

It is time that the subject did receive attention. The Commissioner of Agriculture has shown that the supply of various kinds of timber will be exhausted within a very few years if the present rate of consumption is kept up. In the State of Maine pine will only last four years, and spruce fifteen; and the pine forests of Michigan and Minnesota will be cleared out in ten years, and those of Wisconsin in twenty. Already lumbermen are turning their attention to other states. According to Governor Berry they "are pouring into the State of Arkansas every day from Michigan and Wisconsin." The sawmills in that State have more than quadrupled since 1880, and the production of lumber there is twenty times greater there than it was just seven years ago.

As we before pointed out, the question of preserving a proper proportion of forests for the benefit of the climate, the streams, the soil, and indeed the general good of the country, is a national one. Private individuals cannot reasonably be expected to sacrifice their rights and interests for the good of the community at large without due compensation. To the lumberman the forest is just so much money so soon as he can clear it out and place it in the market, but in the North-West he finds he cannot do that profitably, and so he has called a halt; however, he will be up and at it again so soon as the markets improve, quite regardless of any other result than simply what the lumber will bring. And no one can blame him; it is not his duty to preserve the forest, but that of the nation or the state.—*Scottish American.*

Timber Purchase.

A part of the Cassellman estate, consisting of 5,357 acres of heavy wooded land at Cassellman, situated 30 miles east of Ottawa, on the Canada and Atlantic railway, has been purchased by Flatt & Bradley, of this city, for $132,000. Mr. Flatt has gone to Cassellman, and is making arrangements for the immediate erection of two large saw mills and a general store. Men and teams are being sent from this city, and lumber operations will commence at once. The South Nation river flows through the property purchased and joins the Ottawa, giving a straight drive to Montreal.—*Hamilton Spectator.*

Decorative Tree Planting.

The Commissioners of the Woods and Forests, of England, are trying to plant a large extent of crown lands in the Isle of Man with forest and ornamental trees. The experiment, which is watched with interest not only by those who follow sylviculture as an art but by many who regard with apprehension the gradual denudation of forest and woodlands, leads *Land* to comment on the growth of a taste for planting; for transforming to artistic plots grounds which are ill-favored and uninviting; for digging lakes and forming cascades, resulting in splendid combinations of sylvan charms.—*American Garden.*

Purchase of Timber Limits.

W. E. Edwards paid $37,000 at Ottawa on Saturday for three timber limits, containing 100 square miles, situated near the head waters of Lake Des Quinze, near the boundary line between the provinces of Ontario and Quebec, on the upper Ottawa.

THE Winnipeg *Times* says that the machinery for a shingle mill recently brought in from Winnipeg by Messrs. Watson & Cowie to their mill near Rock Lake was found to be so badly damaged on arriving at its destination that the proprietors considered that it would be useless to put the machinery together.

WASTE OF TIMBER.

A correspondent of the *Northwestern Lumberman* writing in regard to the state of Maine, says:—Ship builders have to resort to Michigan, 1,200 or 1,500 miles to get timber suitable for masts, to Virginia for ship frames and to Florida for planking. There is a vast amount of timber land in Maine yet, but it is second growth. Having seen the extermination of the old growth there, and coming to the West some 30 years ago, I was prepared to watch the operations of the tree cutters here. My first observations were that the people were wasting their good timber, and told some of them so, but as usual, the only response was that the timber was inexhaustible. I have been observing from that day to this. I have seen the choicest walnut that ever grew sell for $12.50 per thousand in this place, and have been offered $45 for an average lot, I have also seen fine walnut logs four foot through, lying and rotting: also saw this summer a lot of old rotten walnut logs at a saw mill, that were to be cut into lumber, such stuff as very few men would have hauled up for firewood a few years ago. There was a lot of walnut lumber brought to this place last spring, amounting probably to 1,000,000 feet, out of which, I think, it would be hard to cull 50,000 feet of No. 1 lumber. Thus we see that what one generation with plenty wastes, the next with scarcity, will glean up and use. Having seen these things, and seeing nothing done to secure a future supply, I have come to the conclusion that with the enormous amount of lumber used, and also knowing that there is an immense tract of territory settling up that has no timber supply, and that must draw on the reserve of the older states for its building material, I can come to no other conclusion than that the next twenty years will wind up the business, as it is now carried on, unless there is a radical change.

Not Reducing the Cut.

It is very clear that some of the largest operators are going to take no steps to reduce their cut of logs the coming winter. They say they cannot afford to do it. Their money is invested in their business, and they know of no way but to keep things moving. Moreover they claim that they have made a good profit the present season, notwithstanding prices have ruled lower than last year. They bought their pine for little money, and are going to look out for No. 1 instead of the good of the trade at large. All this was foreshadowed at the recent meeting of the manufacturers in this city. They said in a resolution, "we recommend to all manufacturers of lumber in the pine producing regions, such conservatism in their endeavors during the coming winter as will tend to restrict the tendency toward an over supply of logs during the year 1884," but care was taken by some of the members of the association present that they should not pledge themselves to reduce their cut.—*Northwestern Lumberman.*

READERS of lumber journals are often puzzled by the use made of the word "deal" by nearly all foreign publications, and some home ones. As generally used it means simply a piece of softwood lumber; but the strict definition of the word, ae understood by the English timber merchant, is soft wood timber imported and sawn to the section of 9 by 3 inches, or 8 by 4 inches, or 10 by 4 inches. Similarly, "planks" are 12 by 3 inches or 12 by 4 inches, and "battens" 7 by 1½ inches or 7 by 3 inches, all irrespective of length, which varies considerably, and of the country or port they come from.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhœa, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle,

How Many Miles Do You Drive!

The

ODOMETER

Will Tell.

This instrument is no larger than a watch. It tells the exact number of miles driven to the 1-100th part of a mile; counts up to 1,000 miles; water and dust tight; always in order; saves horses from being over-driven; is easily attached to the wheel of a **Buggy, Carriage, Sulky, Waggon, Road Cart, Sulky Plough, Reaper, Mower,** or other vehicle. Invaluable to LIVERYMEN, PLEASURE DRIVERS, PHYSICIANS, FARMERS, SURVEYORS, DRAYMEN, EXPRESSMEN, STAGE OWNERS, &c. Price only **$5,00** each, one-third the price of any other Odometer. When ordering give diameter of the wheel. Sent by mail on receipt of price, post paid. Address

McDONNELL ODOMETER CO.,
2 North La Salle St., Chicago.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., NOV. 15, 1883.

A machine has been invented, and in successful operation at Glen Falls, N. Y., for making pulp for paper out of sawdust.

THE property of the Norwood Lumber Company was sold at auction in Norwood, N. Y., on the 8th, for $166,500, to A. O. Brainerd.

G. R. CASWELL has shipped over a million feet of spruce lumber from Cowansville, Que., during the past summer, and has 1,000,000 feet more ready to ship.

J. W. PORTER & SONS, of Strong, Me., will this winter get out the material for 50,000 croquet sets, to say nothing about what is required for an indefinite quantity of Indian clubs, ten-pins, chair bottoms, clothes pins, excelsior, etc.

THE *Timber Trades Journal* says:—Russia has been for a long time suffering the effects of reckless forest devastation. *Nevoe Vremya* says that the wanton destruction of timber threatens to turn some of the best wooded provinces iuto barren waste.

MESSRS. Brousseau and Godbout, of Danville, have started a tub and pail factory, in one flat of Loug & Bailey's new shop, where they intend to make everything in their line for the general trade. They will employ about eight hands at first, and increase as business requires.

AT San Francisco, Cal., there has lately been an increased export demand for lumber. Orders for building stuff from Australia have been good, and hardwood lumber and ship knees have been in rather extensive shipment to China, the Mexican trade being also on the increase,

THE logs that escaped from Grand Rapids, during the July disaster, have been brought back at a rate of 175,000 feet per day, by rail. There are 4,000,000 feet of the logs on the Comstock farm, near the river that have been left, because the high water of uext spring will float them off, aud there are 3,000,000 feet more below the city.

JOHN DUBOIS, of DuBois, Clearfield county, Pa., is, perhaps, the wealthiest lumberman in the world. His wealth is estimated at $14,000,000. He employs 500 men in his various lumber mills, and 1,000 in getting his timber from the woods; also 600 more in mining coal. He offers, if a new county is made of fractions of Clearfield, Elk, and Sefferson, and named from him, to build a courthouse and other public buildings at his own expense.

THE *Lumberman's Gazette* says:—There will undoubtedly be an enormous amount of lumber wintered over on the Saginaw River. The piles which line the docks for miles in almost unbroken courses at present, and the fact that the shipments will barely equal the output for the remainder of the season, indicates unmistakably that whether sold or unsold, there will be an enormous aggregate of lumber remaining here at the close of navigation.

THE London *Timber Trades Journal* of Oct, 20, under the hoad of that port says:—The Adolphus, from Quebec, besides her cargo of deals has oak, elm, ash, hickory, with staves, &c., which is to order, This is the second voyage of the first-nmed vessel, and her additions to the pine stocks this season amount to upwards of 2,000 standards. Spruce cargoes are dropping in, and already the list of vessels to London from the lower ports this season exceed those of a twolvemonth ago by ten cargoes.

THE London *Timber Trades Journal* says:—It was rather an amusing idea of the people of Kirkwall, in the Orkneys, which Mr. Gladstone visited the other day, that it would be necessary to be careful of their one tree in that town with such a dangerous feller among them, and Mr. Baillie Peace and the other gentlemen who escorted the right hon. gentleman guardedly piloted him along the other side of the way, in passing the tree, that he might not be tempted to inquire for an axe and request permission to cut it down.

THE Rat Portage *Progress* says:—We have it from good authority that the claim of the Keewatin Lumber Company to the islands in the Lake of the Woods has been relinquished. The Dominion Government has entered into agreements with the company to grant them certain additional timber limits on Clearwater and Ptarmigan bays in order to secure their release to the islands to facilitate mining operations. Heretofore this has been a great drawback to miuing ventures, but according to the new arrangements, parties are porfectly safe in locating and surveying islands.

THE clearing away of logs from Grandfather Bull Falls, about 40 miles above Merrill, Wis., has been very thorough. The logs had been accumulating for years, and were hidden away in all manner of crevices and holes, among the rocks for a distance of a mile or more. The contract to remove them was taken at $1,25 per thousand feet, with the understanding that it must be a clean job, and that a forfeit must be paid for all that was left. Between 3,000,000 and 4,000,000 feet of logs were taken off and boomed at Merrill, the most of them being owned by the Wausau mill men. Logs have not been so scarce around Grandfather Bull for years.

The *Monetary Times* says:—It is feared that the results of the failure of J. Daigueau & Co., bark dealers, St. Hyacinthe, Que., may be embarrassing to others, as that firm was the heaviest buyer and shipper of hemlock bark in the Eastern Townships, and its operatious were extended over a wide territory. Since two years ago the firm tried to "corner" the market, holding at one time 60,000 cords of bark, but, evidently did not calculate upon the large supplies that the Boston people could draw from Maine and New Brunswick. Iu consequence of this, the "corner" did not work just as wished. Their liabilities will exceed quarter of a million, and the estate will be liquidated under the supervision of Mr. Wm. Farwell, of the Easteru Township Bank, to whom an assignment has been made.

ANOTHER tree for which the usual claim is made that it is the oldest one extant in the United States, is an English elm, growing at Pettacauset, R, I. It is positively know to be 200 years old. At the butt the circumference is 26 feet, and it holds nearly the same measurement to the limbs 30 feet from the ground. The limbs are as large as a man's body, and very long and crooked, holding their full size nearly to the ends. This is accounted for from the fact of a gale once having broken the limbs off, causing them to grow on in a stubbed manner.

AN imitation of and substitute for mahogany, usoful in fine manufactures, is due to French ingenuity. The first operation is to plane the surface of any species of close-grained wood until it is perfectly smooth, and it is then rubbed with diluted nitrous acid, which prepares it for the materials subsequently to be applied. These consist of one and a half ounces of dragon's blood, dissolved in a pint of spirits of wine, and one-third of that quantity of carbonate of soda, mixed together and filtered, the liquid in this state being rubbed, or rather, laid upon the wood with a soft brush. This process is repeated with very little alteration, and in a short interval the wood possesses all the appearance of mahogany.—*Warren's Monthly Review.*

REVELATIONS OF SEPTEMBER.

The London *Timber Trades Journal*, commenting on the Board of Trade returns, says:—In regard to the timber importation for the month has, according to our anticipations, overrun tho imports of last year, up to the same period, but not to so great an excess as some calculators were prepared for. Up to the end of August there still remained some 10,000 loads to come forward to bring the supply up to the level of 1882, but the scale is now turned—something rather considerable—the other way, as the end of September left us with 73,726 loads more in haud than had come at the end of the September previous. Last year the importation of September rather exceeded that of August, but this year the supply in September fell behind that in August by over 90,000 loads; so that the ratio of importation may be said to show considerable abatement, and not likely now to be of a very overpoworing character. From Russia, Sweden, and Norway the supply was absolutely smaller this September than the one before, both in hewn and sawn wood, but from British America the quantity sent forward to this country was more than doubled. Canada, in the face of its threatened scarcity, has managed to spare us 100,000 more loads in a single month than came thence last year at the same period, and, whatever price was paid for it, the value of the wood is lower iu this country now thau it was then. Spruce, the staple of the Lower Ports, is comparatively a drug in Liverpool now, as the demand is stated by our correspondent to be quite inadequate to the quantities injudiciously thrown upon the market—the favorite emporium of the west for all waifs aud strays, iu the shape of timber ladeu ships, with uo fixed destination, except to call for orders. All the lesser ports may be jammed up with timber, but in Liverpool, as in London, there is always a price to be had if the importer is williug to take it, and its convenieuce to the Atlantic gives it the saue prefereuce from the American timber ports that London has from the Baltic. Thus there has been seldom any deficiency of transatlautic timber in Liverpool since steam has taken up the carryiug trade and rendered it to a great extent independent of the wiuds. Had not our North Americau colonies contributed so large a quota in excess of their usual figures iu September, there would have been a smaller importatiou last mouth than in the same month last year.

The alleged shutting down of their saw uills does not appear to have been decided upon a day too soon. When we hear such extreme measures talked about abroad, experienced meu in the trade generally look out for uuusually heavy supplies, aud such is the case from the western ports just now. The import of pitch pine seems to have fallen off in September, as the United States sent us in the uonth about 47,000 loads less thau last year, which is some offset to the excess from Canada; so that on the whole there was not much to depress the trade generally in the September returns, and there is every possibility that there may be no unreasonable accumulation of stock in this country when the season closes, and if that should really be the case prices are not likely to give way further this year, and everything might be hoped in the way of good trade at the opening of the ports next spring.

But the season of this year is not yet near its close. and last year the fall trade began to collapse about this time as regards the importation, which in October went back in comparison of September more than 100,000 loads; nor is it unlikely that something similar will take place now, though there is not quite the same check to the chartering department that there was then. But it is not from that source altogether that supplies are inflated. It happens more from the want of charters, as seeking ships then load on owner's account, to chance the market, while their owners or agents on this side are looking out for the best port to send them to on their arrival in order to make a tolerable freight. When we see many ships cleared to call for orders, it may be taken that they are loaded on speculation, and these are the cargoes that damage the market. The millowners abroad have also their agents in London and Liverpool, or perhaps a branch house of their own, who are kept well informed of the state of the stocks at the shipping ports, and authorized to charter for market when orders are slack. So that in point of fact there is nothing to regulate the market on this side as long as there are cargoes to ship and ships at a reasonable freight ready to load them.

In summing up for September the trade will probably be well satisfied to find that the importation was not larger, as it is not now likely that the usual fall routine will be materially departed from in the comparative quantities to come forward between this and Christmas. September, as we have shown, was far behind August in its supplies, October will probably be still further behind September, and by the time we have November upon us the arrivals are not unlikely to dwindle to something very inconsiderable. So that, after all, the importation may not be in excess of last year, or at any rate not to a larger figure than it had attained to at the end of last month, viz., abont 73,000 loads. But with this addition the timber supply from abroad in the present year of grace 1883 would be the largest recorded since 1877. There is small chance, however, of its coming within 500,000 loads of the importation of that extraordinary year when the total amounted to 6,652,321 loads, a greater quantity by 450,000 loads than has been brought into the United Kingdom in any one year since.

FORESTS AND STREAMS.

About two months ago we published an article on the effect of the removal of the timber from the headwaters of the Hudson river on the navigation of that stream at Troy, Albany and down as far as Hudson, showing that it caused unusual freshets in the spring with incalculable damage, in consequence of the removal of the timber permitting the free and uninterrupted flow of the rainfall and melted snow into the tributary streams and flooding them, and the combination of the same completely filling the bed of the Hudsou until its accumulated force swept everything before it, destroying property aud very often sacrificing human lives. While this is so, the subsidence of the overflow leaves the bed of the stream in midsummer nearly dry, because the supply which continued during the summer months, while the forests were standing, to distribute the outflow gradually, was exhausted, aud left nothing to feed the main streau except the springs and other natural resources of the rivulets at the headwaters. The result is that the navigation of the Hudson river from Hudsou to Troy is seriously endangered, and the immense traffic of that grand old stream, unless the legislature interferes to prevent such a consummation, by forest protection and an organized system of arboriculture, will soon be compelled to seek its destiuation by rail.

Since the publication of our article on this

subject, the New York *Sun* has discussed the question of the endangered condition of the grand old Hudson which has so long been the pride and boast, not only of New York state but of the nation, embodying all the facts presented by us, and painting it in a much stronger light than we presumed to, and also urging the law makers of the Empire state to immediate action, in preventing the slaughter of timber in the Adirondack region, and a systematic reforesting of the denuded land at the headwaters and around the tributary streams of the Hudson. Thus is New York and other states being aroused by this important question, which involves so much of the business and commercial prosperity of the nation.

The Penobscot river is also yearly suffering from the same cause, and the navigation of that stream is also annually threatened. A correspondent of the Boston *Post* reports that the loss to Bangor could not now be repaired before the close of navigation. The Penobscot at that point is so low that the Boston steamers can scarcely navigate it, and vessels lie around at many docks where there is usually deep water. The water opposite the city cannot be drunk, and boatmen have to get their supply elsewhere; and the boilers of the steam mills which use river water are coated with salt. Many of the water power mills have shut down and those still in operation are running slowly, curtailing the production of lumber 500,000 feet a day. It is many years, says the *Post's* correspondent, since the docks at Bangor were so cleared of manufactured lumber, and while possibly no single industry has suffered so materially from the prolonged drought in New England resulting from the various causes alluded to above, as the lumber business in all its ramifications, yet navigation, commerce, mercantile and manufacturing are all effected to a greater or less extent.

In alluding to the connection between forest and flood, the *Providence Journal* says that violent floods alternating with extreme and long continued low water each damaging to navigation and commerce, have been noticed in the Ohio valley now for some years, and with such regularity that they can no longer be ascribed to exceptional conditions. The river is more and more assuming the conditions of the Nile, or rather of those which flow through the treeless deserts of Arizona and New Mexico, which are raging torrents at one season and dry beds of sand at another. Nor is there any doubt that it is from the same cause. Whatever affects forests may have on the rainfall itself, and there is no doubt that it is very considerable, it is certain that its leaves and roots absorb and hold it in longer solution, and that instead of pouring down into the streams at once, it slowly percolates and its flow extends over days instead of hours.

We are pleased to notice that the regular news journals throughout the country are becoming so intensely interested in this subject, and that the labors of the few publications and prominent men of the United States and Canada who have taken the initiative in the movement, are at last being appreciated, and that the wanton and wasteful destruction of the forests, against which they have fought so strenuously stands some show of being finally successfully resisted by legislative action.—*Lumberman's Gazette.*

TRADE WITH FRANCE.

The London *Timber Trades Journal* says:—The importation of Canadian whitewood (spruce) has been somewhat below the average and considerably under last year's—the heaviest on record; but this decrease is due to the sellers, who, instead of accepting the prices offered them in the beginning, were pressing things too hard, thus allowing the importers to provide themselves with Swedish and Riga whitewood, which was being offered remarkably cheap, The only one who really seized the opportunity were an experienced firm of Paris agent, who, profiting by the activity of others, accepted the moderate prices offered at the commencement, and eventually took the business out of their hands in all that was required in the spruce trade on the Continent. The most important firm here, however, alarmed at the rapid fall of prices in the month of February last (having just purchased a large quantity of Swedish goods at fair prices), did not venture to deal in spruce goods until lately; but they have not been behind anywhere, having provided themselves with every description, as above remarked.

Speaking of Canadian goods we have had a cargo this year of Quebec spruce, which, however, was not approved of, the lengths being too short, and the quality contrary to expectation, and we do not think such goods will meet with favor here. The arrivals of pitch pine have been small, for it seems that class of goods too is not in great favor here.

British Forests.

The forests of the United States have been so mercilessly stripped of trees that a wood famine is almost inevitable in a few years. The lumbermen have been allowed to do practically as they pleased, and they have pleased to reap always and sow never. But an end is coming to that reckless method of procedure, and the lumbermen themselves are beginning to see that "something" must be done. That something can, of course, only be planting on a large scale. Happily, there is little fear of similar dearth in Great Britain; none, at any rate, until the great landlords are reformed out of existence. For almost the sole reason that England and Scotland are so thickly wooded is the perseverance of the landed class in tree planting. One family alone, that of the Dukes of Athole, has in a hundred years, planted scores of millions of trees. The "landed duke," who commenced operations in 1774, planted 27,000,000 trees, covering 15.000 acres, principally upon the Dunkeld hills and in their neighborhood. The present Duke of Athole plants from 600,000 to 1,000.000 trees every year. The terrible storm which destroyed the Tay bridge blew down 80,000 of the Duke's trees, but the loss was hardly noticeable.—*St. James Gazette.*

Commercial Value of California Redwood.

The California Redwood Company is the title of a Scotch company which has been started at Edinburgh, with the chief object of supplying the growing demand for redwood timber, suitable for high-class work, suce as interior house finishing and ornamentation, cornices, carvings, pillars, mantels &c., and which the California redwood is reported to be especially adapted for, having a fine texture without brittleness and of great durability. This company have recently bought forest lands in the Oregon district, and purpose carrying on extensive operations both in the home and foreign markets. Californian redwood, unlike many other kinds, has this recommendation, that the stumps can be utilized to profitable advantage, and for veneering purposes, slices from these stumps are said to be highly prized, and may by and by become yet more valuable. The capital stock of the company is nominally £900,000. It will have mills for the manufacture of the timber, and the stuff so prepared will be sent by rail to the various markets of the United States, as well as for shipment to those in Europe and the east.

Southern Pine Lands.

The Bay City *Lumberman's Gazette* says:—Some idea may be formed of the extent to which northern capital is seeking investment in southern pine lands, when it is understood that in three years a single firm, Messrs. E. A. & E. F. Brakenbridge, formerly of Oscoda and well known in this city, have located and sold three-quarters of a million acres of long leaf yellow pine. Some of the purchasers also are Bay City capitalists, and others well know hereabouts. The following are a few of the names: Fowler & Chapman, B. E. Warren, N. B. Bradley, W. C. Yawkey, George W. Pack, John L. Woods, W. B, Morley & Son, E. P. Barnard, M. R. Gay, Penoyer Bros., Alger, Smith & Co., Robt. Nason, Louis Penoyer, Benton Hanchet, Charles Green, Wm. Green, and others.

ANOTHER WITNESS.—A. Chard, of Sterling, testifies to the efficacy of Hagyard s Yellow Oil, which he used for a badly injured knee joint. It is now the great household remedy for inflammation, pain, soreness, lameness, etc., and is used both internally and externally with infallible success.

ST. LAWRENCE CANALS.

Notice to Contractors.

THE LETTING of the work at the upper entrance of the CORNWALL CANAL, and those at the upper entrance of the RAPIDE PLAT CANAL, advertised to take place on the 15th day of NOVEMBER next, are unavoidably postponed to the following dates:—

Tenders will be received until TUESDAY, the FOURTH day of December next.

Plans, specifications, &c., will be ready for examination at the places previously mentioned on and after TUESDAY, the TWENTIETH day of NOVEMBER.

For the works at the head of the Galops Canal, tenders will be received until TUESDAY, the EIGHTEENTH day of DECEMBER. Plans and specifications, &c., can be seen at the places before mentioned on and after TUESDAY, the FOURTH day of DECEMBER.

By order,
A. P. BRADLEY,
Secretary.

Department of Railways and Canals, Ottawa, 20th October, 1888. d103

THE FORESTS OF ONTARIO

Having given, from the report by Mr. R. W. Phipps on the necessity of preserving and replanting forests in Ontario, voluminous extracts as to the treatment of forests in other countries we now proceed to quote from the same authority information as to our existing forests and the localities where they should be preserved or reproduced:—

THE HEIGHTS OF LAND OF ONTARIO.

We will now proceed to consider, in the light afforded us by the preceding, what should be done to preserve the due proportion of forest and consequently regular summer rainfall in Ontario. My readers will have noticed of what vital importance it is to preserve the higher lands in forest. There are four elevated ridges or plateaux in Ontario. The first and nearest of these is that, well known as the Oak Ridges, north of Toronto about thirty miles, which passes round to the west, coming at Hamilton close to the Lake, going round the head of the Lake, and dying away in the Niagara Peninsula. Going eastward from the samo point, 30 miles north of Toronto, it gets much nearer to the Lake at Cobourg; passes on, strikes the Lake at the Trent and dies away there. This ridge being near the front, and entirely in the older settled portion of the Province, has probably long ago altogether passed out of Government hands. Much of it is by no means the best of soil, and could it havo been retained in timber, and the height of the trees increased by replanting, the benefit to the Province would have been incalculable; for this long belt of forest would have met, and precipitated into rain, the moisture of the southwest winds coming across Ontario and Erie, which rain would then have frequently and regularly fallen through the summer on the great cultivable area of land to the north, instead of passing, as it now does, largely on to the Nipissing forests. In any scheme of planting forests for the benefit of the Ontario climate, the reforesting of portions of these ridges would exercise an influence extremely valuable. I should therefore recomend that the possibilities of working in this direction should be carefully considered.

THE WATERSHED BETWEEN KINGSTON AND NIPISSING.

This is a true watershed, the rivers running both ways from its summit. The height of land extends, with a slight curve to the north, from Kingston to Lake Nipissing. To the east of this all streams flow into the Ottawa; to the west of it they flow into Lake Ontario. Much of the land on this ridge is still in the hands of the Government, and, both for purposes of increasing rainfall, and preserving moisture at the source of numerous and important streams, it would be well that large masses of forest were preserved along the whole line. Along this line, if possible, hundred of thousands, or even millions of acres might be left in forests; for this ridge soould be the preserver of fertility and source of moisture to the whole of eastern Ontario, from Toronto to the Ottawa. If this line should be allowed to become deforested, very injurious results may be expected throughout all Ontario, east of Toronto. On the other hand, if forest be maintained there, clearing can then be proceeded with along the whole northeast of the preserved forest, and this cleared region will then receive the spring and summer rain precipitated by the preserved line of forest along this watershed.

THE WATERSHED OF WESTERN ONTARIO.

This is a height of land about the centre of western Ontario, and is best known as the locality of the great Garafraxa Swamp, which contains many thousand acres. Such of this as is not in Government hands, might, no doubt, easily be obtained, and probably, much land in the neighborhood cheaply added thereto, and the timber on the whole reservation carefully preserved and increased by planting. This central point is a thousand feet above Lake Ontario, and from its four sides the rivers run to the Georgian Bay, to Lake Huron, to Lake Erie, and to Lake Ontario.

THE BLUE MOUNTAINS.

This is a ridge of mountains at the extreme north of peninsula, extending from near Collingwood, past Owen Sound, and to the northern point of the promontory extending between Lake Huron and Georgian Bay. Much of this is yet in the hands of the Government, and much of it should, if possible, be preserved in timber.

For the purpose of attracting rain in summer and spring, which would otherwise probably pass to the north on its way to the pole in the great equatorial air current, there is little reason to doubt that large masses or belts of forest, left standing on these ridges, would be more efficacious than a much larger amount left scattered through the country. Moreover, these elevations are the natural storehouses and reservoirs of moisture. The woods on their slopes were intended to hold the water of rain and snow from flooding the land when it was not needed, and to deal it out in creek, river and underground channel, as it should be needed throughout the year. Any one who has read the valuable records, examples and statements, collected and compiled in the preceding part of this volume, will need no further evidence, and will well understand, on being shown the heights of land and watersheds, what should be done with them. It is extremely desirabie that they be, where possible, maintained in a forest state, the manner of doing which had been previously explained; and that, whore disforested, they be, in preference to any other land, the scene of foresting operations.

It should be pointed out that it has been found in every country where forestry is practised, expedient to set in operation several nurseries for the purpose of raising the seedling trees adapted for planting, of such varieties as are most suitable. These should be selected, not necessarily in any of the localities described as heights of land, but as a small portion of land would be sufficient, in any part of the country, where the soil and situation are considered most favorable for the young plants, considered with regard to their future destination. This can be well learned by consultation with those who have made such experiments, of which some are reported in those pages. It may be remarked that, although it is recommended by some experimenters to rely on the forest for seedlings, yet in other countries, where equal or greater facilities exist in that respect, nurseries are always found necessary, and would, for various reasons, probably be so here.

It would appear that, in planting or preserving these heights of land, the trees chosen should be largely of the pine variety, In the first place, their height is of great additional service. 2nd. They are evergreen, and preserve deep forest shade and sheltor in summer and winter, spring and fall. 3rd. The soil of these localities is likely to resemble that found suitable to these trees in other lands. 4th. They may be relied upon for a paying return, year after year, if preserved with care, as this is the most valuable tree for commercial purposes. 4th. They will, many authorities say, grow to a size fit to cut much sooner than the hardwoods of equal value. 6th. They can be, it appears, very successfully interspersed with the hardwoods, especially the beech, which would add to the plantation all the advantages of a deciduous forest,

THE GREAT FOREST TO THE NORTHEAST.

As mentioned in the first part of this book, there is a great and largely untouched forest to the northeast of the Province of Ontario. The reason why this mass of forest has not been ere this more deeply penetrated by the settler is, that the land is not nearly so good for agricultural purposes as that in the older settled districts of the Province.

In one word, it is the Laurentian formation, an outcrop of the backbone of the world, and that backbone, unlike other bones, contains no lime; it is a granite formation, and, though there are in parts of it opportunities for obtaining lime from the gneiss rock, yet, do what you will with it, this district will never equal in an agricultural capacity (*caeteris paribus*) that based on a limestone formation. The detritus of granite is not, and in the nature of things cannot be, for agricultural purposes, in any respect the equal of the detritus of limestone. This great region is reached from Toronto at a point near Gravenhurst, and its border would be marked by a curved line from Gravenhurst to a point about five miles east of Kingston. To the northeast of all this line is a vast mass of forest, pierced in many points by colonization roads, and interspersed with clearings along its southern edge. To this district we may add the Muskoka and Parry Sound regions, which are, in many respects, similar. In these there are situated great pine districts, many of which have been cut over by the lumberman, while much is yet untouched and in the hands of Government. It is, it appears to me, a matter of great importance, to preserve many of the pine forests in these vicinities, and that for these reasons:—

1. They are the true reserves of the older districts of Ontario.

2. The land whereon they stand can never yield, for purposes of agriculture, anything like the return it is capable of producing if maintained in continual pine-bearing forest.

3. If proper care be taken these great districts can, by the adoption of European methods, be placed in a state of continual reproduction, which will allow, every year, a very large amount of valuable pine to be cut without clearing the land or in any way injuring the forest capacity for production.

4, It would be far better to commence the preservation of forest areas along the present existing line of clearing than to commence similar operations much farther back. If, as is stated, the land is much better farther to the north, it would be better to renew the clearing there, so as to leave a broad belt of forest to the south of the new settlements; for a forest district to the south (without prejudice to the height of lands considerations) will attract summer showers to the cleared land north of it, while from a north forest comes little rain at the season when most needed.

PROTECTION FROM FIRE.

The great difficulty in maintaining forests in this country lies in protecting them from the ravages of fire, to which they are peculiarly subject. Our hot summers dry the edge of the forest, the cuttings left by the lumberman greatly increase the danger, the cattle of the settler dry and impoverish the edge of the forest for many miles, a dry season comes, fire is ignited by the clearing fires of the settler, by those of the lumberman or the hunter, or it may be at some point where the railway has touched the forest line, by a spark from the locomotive. There are two seasons when fires are likely to run—the first is during the hot months of summer, the second late in a dry fall, when the fires run on the thick carpet of dry leaves. This last I think the more rapid of the two. I have seen it come miles abreast through the forest with the speed of a fast walker, firing every inflammable substance in its way. The terrible devastation caused by these fires when under full headway is ruinous beyond imagination. Hundreds and thousands of square miles of beautiful forest have been reduced to ashes in periods of a fortnight or even of a week. It has been well remarked by persons fully competent to express an opinion on the matter, that the fire destroys more timber in Canada than the axe. If, then, some means could be devised to check this devastation, the result would, no doubt, be extremely beneficial to the country.

The recommendation I have to make, with respect to these forests, is one based partly on the character of the soil, partly on the practice existing in India and in Europe, and pursued there with the same intention. It is impossible to preserve the extensive Canadian forests from fire without appointing extensive ranges, few or many, as may be judged expedient, whose business it shall be to carry out, in this country, as far as their numbers will allow them, the policy pursued in European countries of guarding against fire, giving warning where it occurs, and prosecuting all individuals who infringe the fire laws established by Government. To my own knowledge, the laws enacted by the Ontario Government with reference to the management of fires, their lighting and extinguishing, are carelessly observed, or even altogether ignored in the back districts through which I have travelled. I should, therefore, recommend that a certain number of men be appointed to watch breaches of these laws and institute the necessary prosecutions.

The East India practice to which I refer is this. In the vast Indian forests, under the careful supervision which has been established there by the Indian Government, every effort has been made to suppress or hold in check what with them is a still more dangerous enemy than with us, the ignition of the forests. The principal means used and recommended by them is, the cutting of what are called fire lines through the forests for long distances. These lines, it is recommended should be made two hundred feet wide, and be kept quite clear of brushwood, or any other inflammable matter.

In travelling through different parts of this northeastern district of Ontario, and having in successive years passed over several hundred miles of it in different directions, I became decidedly of the opinion, that the whole country was far better suited for extensive grazing grounds, interspersed with manufacturing villages, than to be given out in one or two hundred acre lots to the ordinary settler. Considering the character of the land, I am of opinion that many ordinary settlers will not be able to give it that care which alone can maintain its fertility; I fear they will in many instances, be obliged to overcrop it, to impoverish it, and to abandon it. The granite formation, I fear, will never show the staying qualities of the limestone-founded portions of Ontario. On the other hand, I think if much of this land were given out to men of capital, who would be willing to establish large grazing farms thereon, they would be able to cover the soil with a heavy clover sod, which, with careful management might be maintained for ever.

I will, then, suggest what would be my plan if some millions of acres of this vast forest were mine, and I were desirous of preserving it from the ravages of fire. I would cut the fire protecting lines, as used in India, through and through it at different points, clearing them thoroughly from brushwood, but I should make them wider, say, a hundred yards broad, and I should suggest that paths a hundred yards broad cut through these forests, and fenced at each side, would make excellent grazing runs for cattle, if got under grass, and would operate as most effectual firebreaks. I should think that an arrangement might be made whereby graziers would gladly lease these lines, undertake to seed them with grass and use them for the fattening of their cattle, which would readily find water at the numerous streams these firebreaks would necessarily cross. A portion of the consideration paid for the use of these grazing-lines, might well be the undertaking on the part of the grazier to send a certain number of men to extinguish any fire which might arise in his vicinity. In this manner, I conceive that, by the assistance and supervision of a small force of Government rangers, very large forests might be preserved from the ravages of fire.

In connection with the manufacturing capacities of this region of country, I would remark, that it possesses many and valuable watercourses, which would dry up were the country cleared, but which the retention of the forests will retain in full value. I would also state, that the quality of the water flowing over the granite bed, it being from lime, is remarkably well adapted to various textile manufacture, and would suggest that large manufacturing villages and towns might find occasion for profitable existance in the heart of the large forests which, I conceive, Government should retain in this part of the country.

I would also suggest that such towns and villages will by no means lack communication with other parts of the country, as the Canada Pacific, and its connecting railways, will pass through the present wilderness near the vicinity where it is desirable these forests should be maintained.

I would here suggest that large portions of forest might be presereed, let us say after the merchantable lumber has been carried off by the lumberman, by allotting them in free grants to persons who would undertake to maintain the land in its wooded condition.

The opinion of Mr. Ward, of Montreal, is, "To have our country remain well wooded for many years, it is but necessary to give the trees indigenous to our country leave to grow, and there will be no necessity to plant. I have no doubt but that much of the land that has been

denuded of its timber would in a few years be covered with a spontaneous growth of wood, and so prevent our country from becoming an arid waste, utilizing only that portion of it that can be profitably worked." Mr. Cleveland, of Chicago, remarks "A vast area of woodland is running to waste, yielding no revenue and promising nothing better in the future than firewood, of which a very large proportion is yet susceptible of redemption and conversion into timber of great value, at far less cost of time and labor than would be required for the planting and rearing of new forests." If then we give free grants of land where clearing and cultivation is desirable on condition that the land be cleared and cultivated, I should think it would be well to give free grants of forest where forest is desirable, on condition that the forest be kept in good order, that it be fenced against cattle and thinned as directed by regulations which should be laid down by a Government official of knowledge in such matters. This would give people who wish to acquire land, without being compelled to reside thereon, the opportunity of doing so, as they could hire the necessary labor and care, of persons in the neighborhood, and they would naturally see that their employees preformed their duty properly, since that would constitute their only right to the land, and their only protection against fire overrunning it.

THE NORTHWEST TERRITORY OF ONTARIO.

A word may well be said here on this subject. Full control of this territory is withheld from its proper possessers by the delay in ratifying the Boundary Award. It contains a large quantity of valuable timber, comprising one of the chief timber reserves in all the North-West, so far as present information is obtainable. This timber, in a position where it will always command ready sale, and comparatively untouched by the lumberman or settler, offers as yet a most excellent opportunity not only for procuring timber, but also for maintaining the supply. If this reserve were at once taken in hand and managed on the European or East Indian plan, those trees only cut which are of age and size, and cut so as not to injure others; and the whole forest then mapped into sections, each in charge of a competent forester, the forest could be maintained in perpetuity as good as, or better, than it now is, and a large supply of the best lumber yearly drawn therefrom.

Further hindrance of the right of control belonging to Ontario will be most prejudicial. For in the meantime the demand for lumber in the North-West will grow apace; private individuals, will commence to cut; lumbering operations will be carried on by rival parties; and as soon as these operations are proceeded with on a larger scale, and with the reckless haste which probably will characterize them, fire is certain to occur, probably at many points, and, in that region of rocky timbered slopes and ridges, fully open, too, to the sweeping prairie winds, it may well be expected from what has happened in far less exposed localities, that before the boundary is found, this great forest, of priceless value if properly used now, will be utterly lost.

Pacific Coast Timber.

The lumber trade direct between Puget Sound and adjacent territory and Australia has become important. The point, however, occurs whether it is not desirable to adopt measures for the preservation of the forest timber. The Pacific coast is being rapidly denuded of timber, and nothing is done to compensate for the loss by planting new forests. Climatic changes of very serious character may be anticipated from the wholesale destruction of growing timber. A correspondent writes to us from California stating that he had driven recently for days through the Sierra Nevada range, and that the usually bright atmosphere of that elevated region was so charged with smoke from burning pine trees that it was impossible to see for any considerable distance. Millions of dollars worth of valuable timber are thus annually destroyed on the Pacific coast. Sheep-herders and hunters are the greatest offenders, but as they are never prosecuted they continue their devastations year in and year out. It should be somebody's business to prevent this waste of national propert.—*Ex.*

Chips.

DENSE forests are increasing in Australia, the climato is growing more moist, and even the great central desert may become habitablc.

A CHARLOTTE, N, C., man years ago grafted a twig of English walnut on an American walnut tree, this year has a big crop of two kinds of walnuts.

JOHN DICE, of Thomastown, Michigan, struck a perfectly sound cedar limb, while digging a well, at a depth of 12 feet, in a bed of solid gravel.

COMPLAINT is made of the severe destruction of oak trees in Hetch-Hetchy valley, Nevada, by the Piute Indian, who recklessly fells them to get the acorns.

HEMLOCK bark is not yet "cleaned out" of the eastern townships, as the *Monetary Times* hears that 500 cords will be shipped from East Pottom this season.

A solution of bichromate of potash is often used for darkening mahogany. It converts the light-colored mahogany to the tint of the old mahogany furniture.

THE Forest Pulp Mills, of Yarmouth, Me., are making extensive improvements, which employ regularly about 150 hands. For fibre 1,000 cords of poplar are annually consumed.

THE tooth-pick factory at Harbor Springs, Mich,, which is being established by Cleveland, Ohio, capitalists, will consume 20,000 cords of wood annually. The building will be 30x124 feet.

KANSAS had on March 1, 1883, 9,341 acres of artificial walnut forests; 5,890 of maple; 1,691 of honey locust; 55,207 of cottonwood; and 50,589 of other varieties, making a total of 122,718 acres. At this rate of planting forest trees Kansas will soon have valuable timber, and not only that but plenty of wood for fuel.

PAINTED wood-work may be classed among the necessary evils of house decoration. No one in his sober senses will put paint on good wood-work if he can get an equal effect by the use of natural wood. But the costliness of hard wood, and especially the expense of working it, renders the use of pine practically inevitable.—*Carpenter and Builder.*

A FOLDING secretary for exhibition at the Louisville Exposition has been made by C. E. Hillard, of Faulkner county, Arkansas, the top of which is made of specimens of Arkansas woods, so arranged as to form a map of the United States, each state being of a different kind of wood. Forty-eight varieties of wood in the state are show in the construction of the secretary.

THE foreign countries are apparently not behind the United States in the matter of making paper from wood-pulp. Germany is said to have 500 mills for the manufacture of woodpulp, in which such a degree of perfection has been reached that for the better qualities of paper, even, it is a complete substitute for rags. Wood-pulp, it is said constitutes seventy-five per cent of the paper making stock in that country.

A COUPLE of Bostonians have lately completed a machine for manufacturing half-round barrel hoops. This machine will make from twenty to thirty thousand half-round hoops per day, cutting two, three or four from a pole, as occasion requires. This branch of barrel-making is thus placed on a level with all the others in which machinery is the principal agent of construction. One of the results of the introduction of this new machine will be the utilization of ironwood saplings for hoops,—*Journal of Progress.*

VIENNA bent wood so popular as furniture for offices and sitting rooms, is, as is well known, prepared by being steamed for taking the required shape. The opposite use is suggested for a steam process to take out dents or bruises in furniture. It is recommended to wet the part with warm water; double a piece of brown paper five or six times, soak it and lay on the place; apply on that a hot flat-iron until the moisture is evaporated. If the dent is not gone repeat the process. After two or three applications the dent will be raised level with the surface.—*Journal of Progress.*

Market Reports.

MONTREAL.

From Our Own Corresponden!

Nov. 10.—Our local market has been on the rhole very quiet since the date of our last re- ort, the weather not being very good for busi- ess, although, at the same time a good deal of imber is moving, chiefly for building purposes. 'here is no American demand at present and ot likely to be till nearer spring. Laths have ow advanced to $1.80 and is scarce at these gures, as at this season they cannot be made, nd higher prices are looked for in the near iture. Prices of lumber are unchanged and o advance is looked for, as there has been too iuch produced this season. Shipping is now bout over for the season and no more vessels ill now be here to load. We hope in next re- ort to give the total amount shipped for the eason with comparative figures for last year. 'he Forestry Association held a meeting here his week, but the attendance was small and ttle business was transacted beyond reading he annual report. Yard prices are as follows :

ine, 1st quality, ℞ M	$35 00@40 00
ne, 2nd " ℞ M	22 00@24 00
ine, shipping culls, ℞ M	14 00@16 00

CORDWOOD.

Wood is plentiful and the demand fair, but usiness is chiefly of a retail character, and onfined to the yards which as a rule are well tocked. Tamarac is scarce, and is dearer in roportion to hardwood, prices of which have ettled down considerably. Our wholesale rices ex cartage are as follows :—

ong Maple	$ 6 00
hort "	5 50
ong Birch	5 50
ong Beech	5 00
amarack	5 00

TORONTO.

From Our Own Correspondent.

A visit to the various retail yards in the city iows trade to be fairly active, and were it not r the strike on the part of journeymen plas rers, trade would be exceedingly hrisk, and ie effects produced by this strike will not pass way with its cessation, inasmuch as several ontracts which were in the hands of the archi- ects have been entirely withdrawn in conse- uence. It is to be regretted that arbitration not resorted to to settle all such disputes etween capital and labor.

The fine open weather of the past two woeks as been favorable to shippers. Large quanti- es of grain and considerable lumber having ft our port during that time, somewhere in the icinity of 3,000,000 feet of lumber and 500,000 iingles having passed over our docks, and sev- ral more cargoes yet to get away.

Things in general are looking gloomy for the 'holesale dealer just now, some of the banks aving refused to discount good commercial pa- er, which has had the effect already of closing up ne firm, and if this absurd course on the part f our banking institutions is persisted in it is nly a question of a little time when other firms 'ill have to follow that of A. K. McIntosh & 'o. It is quite a different thing to refuse mill ien accommodation wherewith to stock up heir mills, and so continue to glut the market, nd to deny a reasonable amount in discounts o the dealer to enable him to work off to ad- antage the stocks on hand, The former course commendable, the latter unjustifiable, and nly calculated to spread disaster through all he ranks of the middlemen, If the wheels of rade are to be clogged in this manner without ny warning on the part of our monetary istitutions it is high time that a better under- tanding on the part of both were arrived at. t really seems as if the railway companies and anking institutions had leagued together to rush out of existence the ever struggling mid- lemen, and yet they are the men who have cast more money into their coffers than any other class of traders.

I have just been informed that it has been fully brought home to Mr. Robt. Kerr, of the N. & N. W. R. R. Company, as having been the leading spirit in the inovation lately insti- tuted by the various railway companies. One of our leading lumbermon called on Mr. Kerr for an explanation as to why the charge for shunting was made. He quietly and suavely remaked that another railway company deser- ved the merit due for that brilliant stroke of policy, and that of course their company were perforce compelled to follow suit. Of eourse under such circumstances the gentleman had to retire rather discomfitted, but still not quite convinced, and the thought struck him that he might as well visit the freight agent of the other company named, which he accordingly did, and after airing his grievances was handed a letter from Mr. Kerr, urging the course of action which has since been carried out.

Now, to say the least about it, this was hard- ly a manly course on the part of the N. & N. W. freight agent, and he has other faults equally as glaring as that of prevarication. For instance, when a customer calls to see him on business, and after his wants have been made known, quite unlike many gentleman in similar positions, he will continue to read over his cor- respondence, occasionally replying in monosyl- ables, and in some cases seems to become quite oblivious of his visitors presence. Now with some of the heads of dopartments in the com- pany's service it is different, notably, the super- intendent and local freight agent, with whom it is a pleasure to do business, always that gentle- manly courtesy displayed by them which com- mands respect, and if Mr. Kerr will permit us we would set those two gentlemen before him after which it would be greatly to the public liking and the company's benefit for him to copy.

WINNIPEG.

The Winnipeg *Commercial* of Nov. 6, says : There is a still fairly active demaud, and will continue to be until the advent of winter puts a stop to building operations. The following are the quotations :—Pine lumber, 1st, com- mon boards, dressed, $26.50 ; 2nd, dressed, $25.50 ; 1st, do rough, $26.50 ; 2nd, do., $25.50 ; sheathing, rough, $25 ; timber, 16 feet and under, $24 ; do. over 16 feet, for each additional 2 feet, $1 ; dimension and joists 16 feet and under, $24 ; do. over 16 feet for each $1 ; fencing, $25 ; 2 and 3 inch batttens, $30 : A. stock boards, all widths, $50 ; B. do., $45 ; C. do., $40 ; D. do., $35 ; 1st clear. 1, 1¼, 1½, and 2 in, $60 ; 2nd do. $56 ; window and door casings, $50 ; base boards, dressed, $50 ; 1st pine flooring, siding and ceiling $40 ; 2nd do $35 ; 3rd do., $30 ; ½ inch split siding, dressed, $30. Spruce lumber —timber 16 feet and under, $22 ; do. over 16 feet, for each additional 2 feet, $1 ; dimensions and joists, 16 feet and under, $23 ; do. over 16 feet, for each additional 2 feet, $1 ; boards, $22 ; 1st flooring, siding and ceiling, $28 ; XX shingles, $5.25 ; Star A shingles, $5.25 ; X shingles, $5.00 ; A do. $4.50 ; lath $4.50.

BOSTON.

Cotton, Wool and Iron of Nov. 10, says :— There is nothing materially changed either in the volume of trade or the tone of the general market. Western pine is in good steady re- quest and values are quite firmly held, especially on good grades. Eastern lumber, pine, spruce, and hemlock are moving steadily at well sus- tained prices. Laths are held stiffly at the high prices lately current. Southern pine is in moderate and steady request at unchanged prices. Walnut, ash, oak, and cherry in choice grades are of good fair movement at well- sustained values. Our quotations are for cargo lots.

CHICAGO.

The *Northwestern Lumberman* of Nov. 20th, says :—The big fleet that the frequenters of the Franklyn street sales docks expected after the great gale last week did not swell to such im- mense proportions as was looked for. On Fri- day the port arrivals of lumber cargoes number- ing 97, of which 50 to 60 were tied to the market docks, the largest single day's offering of the week. Sales were made with fair facility, so that there was less dragging than was anticipated. After Friday arrivals fell off, and but a portion of these stopping at the market, there has been no banking up of offerings and no clog in movement. Cargoes of dimension that were at all desirable have been taken soon after the vessels reached the basin ; that which was indifferent like poor No. 2 inch lumber and dimension of undesirable quality, or size, going slower. Whenever fair to good 2x4 short lengths have constituted a large proportion of a cargo, there has been no hesitancy about purchasing. As a matter of fact the better cuts of lumber are being bought up at the mills, leaving all the poor stuff to come to this market. Yet the baiting process is going on, and in each day's arrivals there are straggling cargoes of quite good lumber. Inch lumber classed as No. 2, but out of which the better grades have proba- bly been pickod before shipment, arrives here looking rather tough, and lingers at the docks, and suffers a deal of kicking and pounding be- fore it sells. Long dimension and timbers are not arriving to a great extent, and shingles are coming slowly. There is next to no Lake Huron lumber putting in an appearance. The rush for the season is subsiding. A considerable proportion of the lumber now being sawed at the east shore mills is going into pile, values not being high enough to suit the manufacturers. Yet the commission men say that lumber will come along steadily, though moderately, till the close of navigation. The total for the week ended Wednesday was 224 cargoes—not a bad showing for this season.

There is no change in prices worthy of men. tion, $9 to $9.25 being still the range on piece stuff under 18 feet in length, and much depen- dent on the desirability of the stuff and the special nature of the schedule.

OSWEGO, N. Y.

From Our Own Correspondent.

Since our last report a steady and good busi- ness has been done. The weakness manifested by holders of common and cull lumber has stimulated trade, and large quantities have been sold at low prices. Dealers from the interior are stocking up ; receipts are light and the sea- son is drawing to a close. Stocks are large and a good assortment is in store for winter trade.

LIVERPOOL.

The *Timber Trades Journal* of Oct. 27 says:— The quantity of timber, deals, and other wood goods being sent into the country continues large, but without affecting prices in any mark- ed degree, as the import still keeps pace with the consumption. Buyers are no doubt stimu- lated to make their purchases now for several reasons, of which it is most likely the most prominent will be the continued low figures sales are made at, and the approaching termin- ation of the import season for Canadian and Baltic goods.

Spruce deals do not show signs of improve- ment in value yet, but with a greater scarcity of vessels, and termination of the time when deckloads are permitted, which has now nearly elapsed, it may not be far distant.

The failures reported to have taken place amongst the Swedish shipping houses will not affect this market, as the redwood business in Liverpool is only of secondary importance. Whilst on this subject it may be mentioned that a cargo of about 300 standards of deals from St. Petersburg has just been landed here, which show a decided improvement upon previous shipmeuts from that port, the bracking having seriously deteriorated during the past few years. The new shipment appears to be satisfactory to the buyers, and will probably lead to a resum- ption of business in this shipment.

Graving Dock at Quebec.

A new graving dock is being rapidly con- structed on the Quebec side of the river. It is

situated near Wolf's Cove, upon the property of Mr. Roche adjoining his steam saw mill. Mr. Roche has possessed, for a considerable time, excellent facilities for repairing ships and steamers, and is now, with commendable enterprise and a very considerable outlay, adding to these facilities by the building of a new dry dock, destined for the reception of steamships of the very largest class.—*Montreal Gazette.* The establishment of Mr. Roche, at Quebec, is one of the most important in Canada, comprising as it does extensive square timber booms for the dressing and delivering of timber intended for the English market, also large saw and planing mills, and a ship repairing yard of unequaled facilities on this continent. This last enterprise of Mr. Roche, is a huge one, and when completed will enable large iron steamships to be thoroughly repaired on this side of the Atlantic, which has been hitherto impossible.—*Ottawa Citizen.*

New Lumbering Company.

Mr. K. N. MacFee, who has been absent from this city about three months, has returned, after forming a syndicate of lumbermen at Eau Claire, Wis., for the manufacture of lumber in the Bow River country. The company is known as the Eau Claire and Bow River Lumbering Company, and it is organized under the laws of Wisconsin and formed for the manufacture of lumber in a section of country embracing 450 miles of territory on the Bow and Kannanaskis rivers. The syndicate numbers 16 members and includes Messrs. H. O. Ingram, President of the Empire Lumbering Company; J. G. Thorpe, President of the Eau Claire Lumber Company; W. A. Rust, vice-president of the same; J. C. Putnam, banker; H. M. Stocking, J. K. Kerr and F. C. Holman, of Eau Claire; and A. Bruce of Chippewa Falls. The capital stock is about $500,000. A mill to cost $75,000 will be erected at Calgary. Mr. MacFee will be manager of the company in Winnipeg.—*Winnipeg Times.*

A Lumber Railway.

The *Lumberman's Gazette* says—:The line of the Flint & Pere Marquette railroad has been extended to Houghton Lake, and is now open for business. The territory is heavily timbered and will afford the road an extensive traffic. On the Harrison branch 30 miles long, there are upwards of thirty miles of spurs, from half a mile to six miles long. The lumber traffic of the Flint & Pere Marquette, particularly in the transportation of logs, has been very great. Up to the first of October 115,000,000 feet of logs had been hauled to the mills and booms in Saginaw and adjacent towns. One can better judge of the enormous mass of timber these figures comprehend by understanding that it made 4,607 carloads hauled in 1,400 trains. The amount of the log traffic will probably reach 140,000,000 feet by the close of the year against 105,000,000 feet last year.

International Forestry Exhibition.

The *Timber Trades Journal* says:—In reply to several inquiries from intending exhibitors at the forthcoming Internationl Forestry Exhibition, we may state that the committee of which Mr. George Cadell is the secretary, has its office at 3, George IV. Bridge, Edinburgh. All further particulars may also be obtained from the London agent for the Exhibition, Mr. W. H. Rider, at the office of this *Journal.*

Sale of Timber Limits.

The following timber limits in the Georgian Bay, belonging to James McLaren and others, are reported sold:—Limit 48, sold for $30,000 to Thomas Kenny and also limit 56 for $36,000; limit 63 to James Worthington for $24,000; limit 64 to Thomas Kenny for $5,200; limit 72 to James Worthington for $5,000. The sale in all amounted to $110,700.

The Belleville *Intelligencer* of Nov. 1, says: A raft of ten drams of timber belonging to the Ontario Lumber Company, made at Belleville, and on Tuesday in tow of the Ontario, for Quebec, broke above Collinsby. Five drams were completely wrecked; the other five were towed into Collinsby. The loose timber floated to the bay, and has since been picked up all right.

REVIEWS.

FORESTRY.—We have received the September number of *Forestry*, a monthly magazine edited by Mr. F. G. Heath, and published by Wm. Ryder & Son, London, England. Among the prominent articles is a further contribution by Mr. Jas. Little, of Montreal, on "The Alarming Destruction of American Forests," a warning that is worthy of attontion on both sides of the Atlantic. Other articles deal with "A School of Forestry in England," "Excursion of the Scotish Arboricultural Society," "The International Forestry Exhibition," "Forest Rambles in Madeira," "Epping Forest and its Management," "Forest Work for the Month," &c., &c.

A QUERY ANSWERED.—People often ask when is the best time to take a blood purifier? We answer, the best time is now. Burdock Blood Bitters does its work of purifying, regulating, and toning the system at all times and all seasons. Purity in all things is always in order when required.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

GRATEFUL—COMFORTING.

EPPS'S COCOA

BREAKFAST.

"By a thorough knowledge of the natural laws which govern the operations of digestion and nutrition, and by a careful application of the fine properties of well-selected Cocoa, Mr. Epps has provided our breakfast tables with a delicately flavored beverage which may save us many heavy doctor's bills. It is by the judicious use of such articles of diet that a constitution may be gradually built up until strong enough to resist every tendency to disease. Hundreds of subtle maladies are floating around us ready to attack wherever there is a weak point. We may escape many a fatal shaft by keeping ourselves well fortified with pure blood and a properly nourished frame."—*Civil Service Gazette.*

Made simply with boiling water or milk. Sold in tins only (¼-lb. and lb.) by Grocers, labelled thus:

JAMES EPPS & Co., Homœopathic Chemists,

PRESERVING FORESTS AGAINST FIRE.

Whenever it is possible leave the trees standing in blocks. Between these blocks the land should be kept under cultivation by the plow, or pastured so closely as to prevent any grass from growing up and standing in high tufts, for such would enable the fire to run over the ground, and thus carry it from one block to another, to the destruction of their trees. The size of these blocks ought to be as small as possible; as a general rule, we would limit them to five to twenty acres, and never let one exceed fifty acres. The cultivated division between these should vary in breadth according to circumference, to be dicided upon by a government surveyor. As western winds are more generally prevalent during a dry time, when forests are most liable to be fired, the space ought to be broader betwcen the eastern and western lines than the southern and northern. As wood and timber are cut, they should be hauled out from the woods and piled on or ncar the centre of these spaces, and then, in case of fire, these at least would be saved from destruction.

Before commencing lumberiug in the forests, or clearing for cultivation, the tract of country subject to this ought to be surveyed, and the spaces lined out to be first cut over, and all the bush cleaned up and burned before dry weather sets in. In some instances, these spaces could be left safely to grow up a new forest, but it would be better to put them under cultivation or into grass. If suitable blocks of forest were left standing, the thinnings of these would go far to supply the country with a sufficiency of lumber. As soon as a tree here had attained a proper age and size, it might be cut down, hauled out, and turned into lumber, as is done in many of the European forests. This gives the younger trees near where they stood a chance for a better and more rapid growth, thus keeping the blocks up for a never failing supply of wood and timber for the annual wants of the country.

Forests are set on fire by so many various ways, that neither guards nor laws, however strict, can entirely prevent them. These are mainly done by hunters, picnic parties, brush burning, sparks from locomotives, or depraved people, delighting in the wanton destruction of valuable property belonging to others. The preservation of sufficient areas of forest where now standing, and the planting of others were needed, are important considerations, not only for our own United States, but for the whole continent of North and South America. This should now be made both a state and national subject, by passing such laws, and strictly enforcing them, as shall ensure them being properly cared for; and when we have done this for our own region of the western hemisphere, let us use our influence to have the same thing accomplished, where not already done, in all other portions of the American continent.

Fire and lumbermen are annually making a shocking waste of our forests. It is fully proved now, that where reservations havo been made of blocks from them by farmers, on the first settlement of their lands, the thinnings from these blocks for fire-wood, fencing, and lumber, have been more profitable to them than the crops gathered from the land entirely cleared up for cultivation; and the wooded portions of the former now are worth and would readily sell for two to five times the price per acre of the latter.

GROWTH AND AGE OF TREES.

We are apt to underrate the possible rate of growth where a tree meets with altogether favorable conditions. The silver fir was only introduced into England in the seventeenth century by Serjeant Newdigate; and one tree of his planting was 13 feet round when Evelyn measured it 81 years afterwards. A comparison of the statistics of growth, as above collected with reference to the oak, indicates with respect to most trees a more rapid rate than is generally supposed. Let us test the claims of some of the oldest limes. The Swiss used often to commemorato a victory by planting a lime tree, so that it may be true that the lime still in the Square of Fribourg was planted on the day of their victory over Charles the Bold at Morat in 1476. A youth, they say, bore it as a twig into the town, and arriving breathless and exhausted from the battle had only strength to utter the word "Victory!" before he fell down dead. But this tree was only 13 feet 9 inches in 1831 (*i. e.*, 355 years afterwards), and it would be extraordinary if a lime had not obtained in that period greater bulk than even an oak might have reached in a century. The large lime at Neustadt.in Wurtemberg, mentioned by Evelyn as having its boughs supported by columns of stone, was 27 feet when he wrote (1664), and in 1837 it was 54 feet, so that within a period of 173 years it had gained as much as 27 feet. Consequently, making allowance for diminished growth, we may fairly assume that 200 years would have been more than enough for the attainment of the circumferenco of the first 27 feet which it had reached in the time of Evelyn. No English lime appears to have reached such dimensions as would imply a growth of more than three centuries, though the lime of Depeham, near Norwich, which was 46 feet when Sir Thomas Browne sent his account of it to Evelyn, sufficiently dispels the legend that all limes in this country have come from two plants brought over by Sir John Spelman, who introduced the manufacture of paper into England from Germany, and to whom Queen Elizabeth granted the manor of Portbridge.—*Scottish American.*

Spruce and Hemlock.

The Chicago *Northwestern Lumberman* says: The eastern spruce trade is in a healthy condition. When the combination of spruce lumber manufacturers was formed some time ago there was no faith in the eastern markets that it would amount to anything. Some of the members of the organization cut prices as of old, but in order, seemingly, to make them stand up to their word, Providence stepped in and shut off the rainfall. There has not been water enough to float logs to any advantage and not enough to run the water-power mills. The result is that the production is greatly diminished, and prices are fairly sustained. Had it not been for this assistance which nature rendered there is no knowing how low values would have dropped. The pine lumber manufacturers of the Northwest may draw a lesson from this if they see fit. The markets will go into the winter with only moderately sized stocks of spruce on hand; the mills will have nothing to speak of in pile, and consequently the outlook for the coming year is brighter than it would otherwise be.

There is a good demand for hemlock in Pennsylvania at a reduction, in most markets, of $1 per thousand from last year's prices. The cut of the hemlock mills is increasing, but there is little prospect that the production will become burdensome, for with the difference there is in the price of pine and hemlock the people in the East find it to their interests to use the latter wherever practicable.

T. SHEPPARD, the manager of the Rainy Lake Lumber Company, at Port Francis, Man., says the company has rafted at present enough red and white pine logs to make 18,000,000 feet of lumber. Owing to the recent destruction of the company's Rat Portago mill very little of the amount will be cut this season. There is some white oak in the Rainy Lake region, but the birch, maple and other varieties are usually of poor quality. The land of the Rainy Lake region is of a rich sandy loam, with clay subsoil, and is easily cleared of timber. There has been an important agricultural effort in that region this year, and there is a good local demand for farm products. Port Fraucis is a town of about 50 houses, and is mainly maintained by the Rainy Lake Lumber company and the Hudson Bay company.

Falling Leaves.

"There is something inexpressibly touching in the fallen leaves," sighs an esteemed author. There is, there is, indeed. It's when you slip on one of the articles on a wet morning, and touch the unsympathetic pavement. But there is in reality touching language—language uttered from the heart, yes, from the depths of the soul, in the many thousands of testimonials and letters (unsolicited) that come from those who once were sufferers from lung diseases, asthma and consumption, and who have used N. H. Downs' Vegetable Balsamic Elixir, and have been restored to their wonted health and activity.

ROGERS' PATENT

SAW GUMMER and SHARPENER

The Handiest Machine for these purposes ever Invented.

Saw Mill Owners in providing for the season of 1884, ought not to lose sight of RGERS' AW GUMMER for it will save them more money in proportion to the amount invested than any other machine.

Only $30, including Emery Wheel; Table and Countershaft, $10 extra.

A few of ROGERS' SAW GUMMERS were put on the market last season, and we quote some of the commendations received:

JAS. HADDEN, Foxmead, says:—
"Your machine is all I expected."

CHAS. ANDERSON, Anton Mills, says:—
"I have given it a good trial, and am well pleased with it. "I find it is one of the indispensibles in a saw mill." * *

ROBT. R. WEIR, Orillia, writes:—
"It works like a charm, and is very accurate in its work."

CRONEN PATTON, Hoc Roc Mills, Gravenhurst, says:
"The Rogers' Saw Gummer purchased from you gives "good satisfaction, * * it cannot be beat."

D. DAVIDSON, Pentanguishene, writes:—
"We are well pleased with the Gummer."

W. W. BELDING, Wyevale, writes:—
"I have the Gummer running and it is giving good "satisfaction."

ADDRESS ALL ORDERS TO THE

Hart Emery Wheel Company, Limited - Hamilton, Ont.

THE LUMBER TRADE.

The state of the lumber market is tolerably satisfactory. Purchases have been made by country dealers for the most part cautiously and sparingly, and as a consequence the stocks in country yards are light. Although the demand from across the lines is at present more slack than is usual at this season, there is no serious accumulation anywhere, for the reason that no more was cut las season than is likely to be needed.

Some enquiry is heard for the better grades of stock, which are scarce among our American neigebours, and are thersfore firmly held here ; while, on the other hand, the coaser qualities of pine wood are plentiful and easier in value. With respect to production, the opinion is free-expressed thao only light stocks will be taken out of the woods this year. It is perhaps significant of restricts out-put and a lessened demand for labor to learn that saw mill hands, which were paid $18 to $20 per mhnth, were engaged las week at $16, and offered this week at $14. To offset whatever difference in the cut might be occasioned by the burning of the Gilmour mill, the British Canadian mill and others destroyed of late, we find that two or three new mills have been built pretty well north on the Georgian Bay. And there is, besides, less disposition on the part of the banks to make advances to a number of small operators.

As to prospects for the winter, if the weather continuer open building operations will be fully up to an average in extent, although the plasterer's strike in this city, affecting the market for that class of labor in Guelph and Hamilton as well as here, has put a damper on the plans of some intending builders. Already there is a good deal of activity in this direction, and appearances indicate a fair demand for all classes of building lumber for some months to come.—*Monetary Times*,

BOARD OF TRADE RETURNS.

The following are the returns issued by the Board of Trade, for the month of Sept., and for the first nine months of the year :—

MONTH ENDED 30TH SEPT., 1883.

Timber (Hewn).	*Quantity. Loads.*	*Value. £.*

LUMBERMAN'S DIRECTORY.

The well-know publishing house of Rand, McNally & Co., of Chicago, announce the early publication of a book which will be of a great importance to lumbermen, and all interested in obtaining the names and correct addresses of the owners or operators of saw, shingle, planing or stave mills, sash and door factories, and lumber dealers. It is to be called "The Lumberman's Directory and Shipping Guide," and besides a complete list of mills and dealers in the United States and Canda, it will give the names of all railways or express companies by which the various cities and towns, where the above interests are located, may be reached together, with colored maps of each state, territory and province in the United States and Canda, which will show the line of every railroad. It will contain statistical diagrams, similar to those used in Rand, McNally & Co's famous World's Atlas, which will illustrate the quantities of white and yellow pine timber remaining in the country, annual production, range of prices, etc., digests of the laws of mechanics' and log liens, laws governing the cutting of timber and use of streams for driving logs, with decisions of the courts, etc. It will be a very large volume, containing something like six or eight hundred pages of matter very valuable to lumbermen, or those who deal with them. The reputation of the great publishing house of Rand, McNally & Co. is sufficient guarrantee that the work will be well and thoroughly done. A prospectus or descriptive circular, with specimens of the maps and various pages, may be obtained by the publishers.

QUEBEC CULLERS' OFFICE.

JAMES PATTON,
Quebec, Nov. 9. Supervisor of Cullers.

A WRONG OPINION.—Many a dollar is paid for prescriptions for some disease that never troubled the patient, and when the sole difficulty was worms, which a few of Freeman's Worm Powders would remove. These Powders are pleasant, safe and sure, contain their own cathartic, and are adapted for children or adults.

BAD DRAINAGE.—There is nothing more productive of disease in a neighbourhood than bad drainage. Open the culverts and sluiceways and purify the locality. The objections in the human system may be remedied in a similar manner by Burdock Blood Bitters, which opens all the outlets of disease through the Bowels, Liver and Kidneys.

$72 A week made at home by the Industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfit and terms free. Money made fast, easily and honorably, Address TRUE & Co., Augusta, Maine.

FOR THE

Canada Lumberman

FOR THE FOLLOWING REASONS:

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

———CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM———

for placing your goods or wares before the saw mill men and lumber and timber dealers of the Dominion

The William Hamilton Manufacturing Co'y

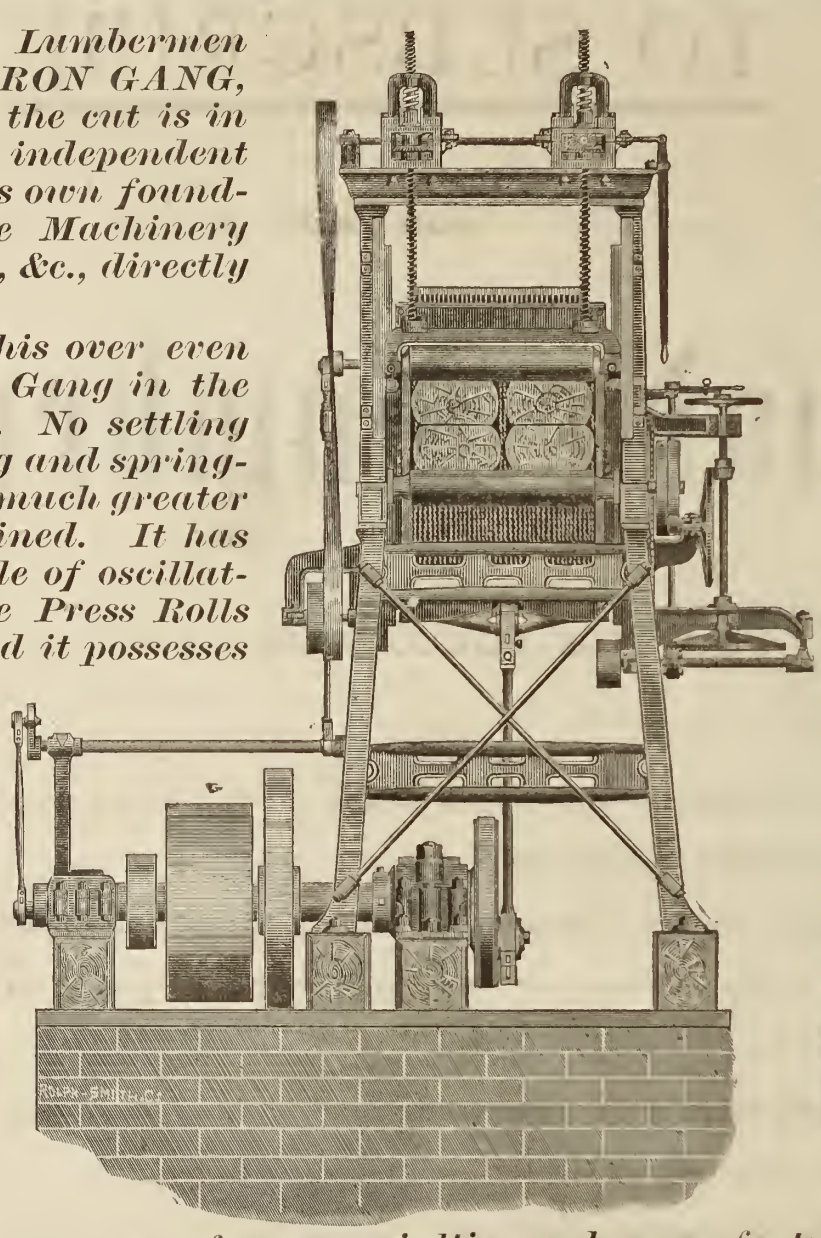
MANUFACTURERS OF (LIMITED,)

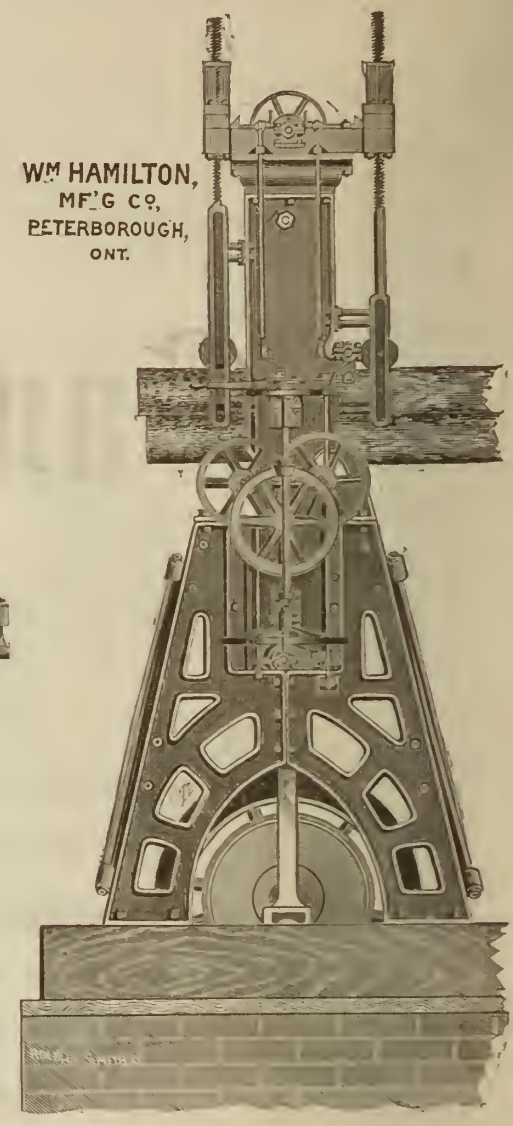
Saw Mills and General Machinery

PETERBOROUGH, - - - ONTARIO.

We introduce to the Lumbermen of Canada our New IRON GANG, which will be seen by the cut is in itself a complete and independent Machine, resting on its own foundations, having all the Machinery for operating, feeding, &c., directly attached.

The advantage of this over even a well built ordinary Gang in the mill frame is evident. No settling out of line, no yielding and springing of timber, while a much greater working speed is obtained. It has the most improved style of oscillating motion, it has the Press Rolls operated by power, and it possesses generally all the good features of best American Gangs, with heavier frame work and heavier shafting, all with a view to rapid, steady & correct working. A good look at one of these massive machines satisfies the sawmill man that they are in every way capable of continuously performing heavy duty throughout the season.

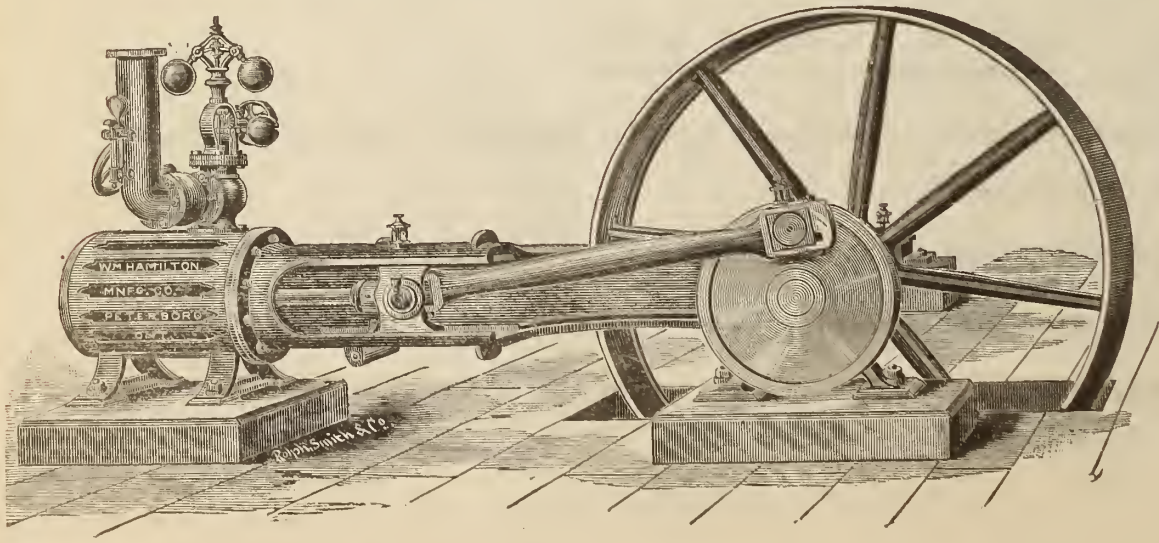




☞ *We make these Gangs one of our specialties and manufacture them of different sizes.*

—ALSO—

ENGINES AND BOILERS.



This cut represents our **SAW MILL ENGINE**, of which we make the following our Standard sizes, 12x16, 16x20, 18x24, and 24x30, built Strong and Substantial for Heavy Work. The Piston Rod, Cross-head Pin, and Wrist Pin, are made heavy and of the best steel; the Connecting Rod has solid ends and is tightened up by screw and wedge, avoiding all danger of keys getting out; the Slide Valve has a simple balance valve, requiring no attention from the Engineer, as it is self-adjusting. The Engine Shaft and Fly Wheel made very heavy. Belt Pulleys put on when required in place of Fly Wheel, and all regulated by the Judson Governor.

PUBLISHED SEMI-MONTHLY.

The only Newspaper devoted to the Lumber and Timber Industries published in Canada.

VOL. 3. PETERBOROUGH, ONT., DECEMBER 1, 1883. NO. 23.

WHICH WAY IS THE MARKET TENDING?

The *Timber Trades Journal* of Nov. 3, says: If any inquirer doubts the activity of the timber trade of the United Kingdom in a general sense, we commend to him the perusal of the provincial reports in our last impression. It is true they are not all equally favorable, but he would probably rise from the investigation with the impression on his mind that, whether people were getting money by it or uot there was certainly a great deal of business doing.

Liverpool has been for some months past on what may be termed "the croak," on account of the importation of wood goods being much in excess of the demand; but a more hopeful tone then began to prevail. Large quantities of goods were going away into the country, and the worst that could be said of the market was that "the imports kept pace with the consumption." So it will be admitted they ought to do, at this time of year, and something more, else where would be the stock to carry the building and other trades on till next season came around? There was no further retrogression in the price of spruce at the public sales, and it was admitted that buyers were coming forward more readily than had been their wont of late, for which sufficient reasons were assigned, chiefly in the tempting prices at which goods were to be secured, and the approaching close of the import season, when they will no longer be obtained so cheaply. Birch timber and sawn pitch pine, but especially the former, fetched fair prices, and showed that there were plenty of buyers still in the market.

Hull reported diminishing arrivals, but plenty of deliveries, as "the railway company and the river sloops were very busy." The same state of things was also announced from Hartlepool, which was "enjoying in most departments of the trade a fair amount of work;" and what can be pleasanter to record than this? "A very fair trade is doing in sawn wood goods, which are mostly going out of the stocks in the yard. A large number of orders for deals, battens, and floorings are daily loaded up, and are evidently intended for immediate use among joiners and builders, as distinguished from the huge quantities sent from time to time ex ship into the interior for stocking purposes;" and the saw mills of the neighborhood were said to be working very briskly.

No slackness of business, excepting in the import department, is reported from Grimsby, Sunderland, or Newcastle, and the abatement of the supply is likely to stimulate the demand. Only mining wood seems to be in excess about those regions, and a fair trade was doing in timber with the ironworks, collieries, and manufactories around. Leith was by no means overstocked, and the importation was slackening, while at Glasgow, which, as we stated last week, has been importing very freely, the prices realized at the public sales were such as to make a London importer's mouth water. Quebec 3rd pine deals of good sizes fetched £11 to £12 per standard at Messrs. Singleton, Dunn, & Co.'s sale of the 18th Oct., and Michigan, 1st £26 to £27, and 2nds £20 2s. 6d. at the sale by Messrs. Edmiston & Mitchell on the 24th—prices unknown to the London market, even when times were much better, and indicating that there is great life in the trade, notwithstanding the abundant rate of supply that has hitherto prevailed, and the expectation of a good deal more to come forward before foreign shipments cease for the year.

If we had only these reports before us, the unpaying prices of the London public sales would seem unaccountable, but other bodements are singing in the winds which it would be imprudent for the trade to ignore. An increasing number of vessels, our stockholm correspondent tells us, are arriving to load at the lower Gulf ports, and it is already preceptible that a considerable number of ships are still afloat, timber laden and destined for these islands, as well from America as from Europe. A single sentence sometimes divulges more than a whole column of beating about the bush; and such we find in the Cardiff report of last week. A number of market cargoes were then and there announced, with the following information added:—"Some have gone to Bristol, others to Sharpness, and some have been taken in here to be landed, we understand, for shippers account." Coupling this with the Swedish statement (under date of 20th October), wherein our correspondent expresses his belief that the fall shipments from the Gulf ports "will reach very near an average, in spite of assertions to the contrary so frequently heard a month ago," it may be safely inferred that there is yet a good deal of timber produce to come forward, and that the trade will be fortunate if it is not burdened with something more than an average fall importation ere the setting in of winter closes the timber shipping season. It is satisfactory though, in the midst of its unwonted importation, that the retail trade of Cardiff continues in a prosperous state, as confirmed by the following sentence:—"Retail business is very brisk; all our timber merchants are exceedingly busy, sending away as fast as they can deliver, and we hear of nothing but contentment regarding the trade." What more could be said, if we were in the midst of those good times which are always coming but never acknowledged till a succession of commercial disasters undeniably prove to us that they have just gone by.

Last week we traced briefly the progress of importation throughout the land, in comparison of 1882, and on the present occasion we have attempted to show what kind of markets the goods had come to; and so far from finding it in a normally depressed condition, there are not wanting evidences that it is maintaining its ground, and even going ahead through all the countervailing influences which were acting to its disadvantage, and were it for the rest of the year restricted to the legitimate business of buying abroad and selling at home by the established houses in the trade, there is nothing to show that is not in the way to a measure of prosperity quite equal to that of any period in the best records of the past.

The worst sign of the times may perhaps be found in these market cargoes, which are the bane of an established trade. When firms have imported all that they are likely to require for the connection they rely on, and by which they expect to realize a fair profit, nothing can be more vexatious than to see the cut from under them as it were by a crowd of cargoes sent into their port on speculation, which they have either to buy, at some inconvenience probably either as to money or space for storage, or to allow to be sold piecemeal to the very customers on whom they depended, to relieve them of the stocks they had already imported.

Money is however easy, and trade is evidently in good heart as a whole. Only in London do we see sacrifices made, which are quite inconsistent with the state of trade elsewhere; and even in London, should the supply not very much exceed moderate bounds, it will surprise nobody to witness a great change for the better, before the end of the year.

TAPER GROUND SAWS—THIN SAWS.

The majority of all millmen and filers know but little of the changes that have been made in saws in the last twenty-five years. When the circular saw was first introduced no one knew anything about hammering them open; it was thought the stiffer the plate the better. Then they were all made straight guage. Following came the taper ground saw, which has been in use twenty years, and is still in use by majority of mills. Now I would like for some one to bring proof that it is better to have the plate thicker in the centre than elsewhere, and convince me of any benefit to be derived therefrom. It would be much easier to convince me that I am wrong than to convince the great number of mill-men who are using taper saws that they are wrong. Since the motion of circular saws has been increased, the extra steel in the centre is a detriment instead of benefit. It is well known that a saw will not run well when it is stiff in the centre. I would by all means prefer it thinner there than otherwise. My reasons are these: First, a straight saw will run with less set; second, it requires less hammering to put the saw in good coudition for running. The less set the less power it takes to drive it, the lighter it cuts, and the less liable it is to buckle and dodge. Everything that will lighten the running of a saw should be sought for by all interested in its use. For a long time there were but few changes made, but within the last five years there has been much discovered that nearly doubles it capacity. And other things, when better understood, will add to this efficiency 25 per cent more than is now realized by the majority of mills.

Many mills are now running thinner and straight guage saws. Some are making a success of straight 8-guage 60-inch, and some do well with 10-gauge 72-inch. I have faith and confidence that five years hence 10-gauge saws will be run with as much success as 8-gauge saws now.

This using of thin saws is a subject of much interest to all persons engaged in the manufacture of lumber. Timber is becoming too scarce and expensive to waste 25 per cent of it in sawdust. All that can be saved by the use of thin saws over thick ones is clear gain. Many try to run thin saws, but fail for lack of knowledge how to run them and how they should be made. There are several causes why millmen are not running saws three or four gauges thinner than those now in use. Thin saws can be run if they are properly handled. One prominent cause of their failure to run satisfactorily is in not having the proper number of teeth. It is not all in filing; much depends upon the hammering of the saw. I have seen 10-gauge 72-inch saws run in hardwood and carry as much feed as as was carried ten years ago in soft timber by 8 gauge, and with good results.—*M. Covel.*

Conversion of Prairie into Forest.

Attention has lately been called to the fact that the numerous small prairies that were common in the Wabash basin at the time of its first settlement have become transformed into woodlands, and that owing to this gradual change of prairie to forest, the actual forest area of some of the counties of Southern Illinois is greater at present than fifty years ago. Extensive woods of oak and hickory more than eighty feet in height, and with trunks of nearly two feet in diameter, are now growing on what was open prairie within the memory of some of the present owners of the land. This is interesting as a slight indication of the solution of the mystery which involves the origin of the prairies; while the rapidity with which these new woods have spruug up, shows that the reproduction of our failing forests can be accomplished in a shorter time than is generally supposed, if proper consideratiou and attention can only be given to the subject.—*Lumber World.*

A Small Fortune at Twelve.

By the sale of timber limits on Saturday last, at Ottawa, from which the sum of $37,000 was realized, a young boy 12 years of age, named Taggart, becomes the possessor of about $15,000 in cash, besides a very valuable farm. He is a sou of the late Mr. Taggart, lumberman, Pembroke, who died seven or eight months ago. Young Taggart is at present in attendance at the Pembroke public school.

THE DEMAND FOR OAK.

Ten years ago it would hardly have been admitted by dealers who handled Michigan and Indiana oak that in a decade there would be a thinning out of the "monarchs" of the forest that a scarcity would be felt. Oak was in too great abundance in some sections of those states to suit the fancy of the owners of the land upon which it grew. Much of it was cut simply to get it out of the way, and the owners of it thought they were fortunate if they could sell it to mill men who would cut it, and thus, themselves, be saved that trouble. There was less call for it then than now. As the building of railroads has increased, the demand for oak increased proportionately, until now the once great oak states, Michigan and Indiana, can not justly lay claim to being called such. Oak in those states has not boomed in price like walnut—it is not an excessive price that bars a supply—but heavy contractors are looking elsewhere for it for the very reason that they are obliged to. There is a large amount of Tennessee and Kentucky oak, upon which heavy freight rates are paid, distributed from the Chicago market, and the amount coming forward from those states will increase year by year.

Fashion has little to do with the use of oak. From the start it has demanded to be used, and it holds its place with a grip as strong as the wood itself. The two kinds of pine may jostle each other; whitewood may take the place of white pine; walnut may be crowded out by the other kinds of hardwood, and often by soft woods; in fact, most of the woods, in their uses, are subject to the caprice of taste, but oak stands sturdily by and refuses to yield. For cars, staves, agricultural implements, for a hundred and one things, in fact, it must be had. The discovery of forests of other woods does not affect its value. There has never yet been any material discovered or invented that will take its place, and we feel tolerably safe when we say there never will be. It is one of the few indispensable woods.

We doubt if to-day there is a market in the world that is not demanding good oak. Throughout the foreign countries the call is so large that it cannot be filled. English car builders are buying car sills on track in Canada, and their operations would be extended to the States if they could find responsible parties with whom to make contracts. The inspection is severe, and that stands in the way of the American manufacturer, for, as a rule, he does not like to be bound by specific specifications. He delights to take a go-as-you-please gait and the result is that his lumber often is not up to the requirements of the purchaser. The exact methods of the white pine manufacturers of the Northwest he has not learned.

The oak of Arkansas, Mississippi, Tennessee and Kentucky will in large part, in the shape of timber and staves, find its way to southern ports, and thence to Europe. On the Mississippi river and its tributaries the stave business is picking up, and with cheap water transportation to New Orleans, the business will not only be a large one, but it ought to be very profitable. On the same rivers the getting out of oak timber for the foreign market will become a large business, spurred on by northern push and capital. Alabama, we believe, is yet destined to send a good deal of oak abroad. Some of the English dealers object to the oak of that state, but they must overcome some of their objections, for to get all the oak they want from Canada and Michigan is out of the question. There is certainly no tougher oak than grows in the South, and this quality is the one needed.

Red oak, a few years ago thought to be worthless, is no longer despised. Its value has become known, and the uses to which it will be put will increase. That the manufacture of it into staves for the West India market will grow into an important industry admits of little question. Taking everything in consideration, the owner of oak stumpage ought not to feel that he has a very big elephant on his hands.—*Northwestern Lumberman.*

THE St. John *Telegraph* learns that the Government of New Brunswick is preparing to have the province represented at the Forestry Exhibition in Edinburgh next year.

THE LUMBER TRADE OF RIGA.

From an article in *Le Marchand de Bois* on the lumber trade of Riga, Russia, we take the following: Of the ports of the Baltic provinces, Riga exports more lumber and timber than all the others, consequently a statement of the amount of this trade done at Riga will give some idea of the extent of the lumber trade of Russia in Europe. The details of the exports of Riga for a series of years from 1871 to 1882, are taken from a recent official document issued from the bureau of commerce. The timber and lumber reaches Riga by the Duña and its tributaries and comes from the provinces of Lovonie, Esthome, Courlande, Mahiten, Minsk, and Sithuanie. Notwithstanding the extensive devastation of the forests, carried on with no assurance of their renewal, the vast forests which formerly covered these provinces yet contain large reserves of timber of the best quality, but their continued depletion with no provisions made for their future restoration should give serious apprehension. The transportation of the wood from the forests to the rivers, which is made by log waggons during the snows and frosts of the winter season is attended with increased difficulties and costs when the winters are usually rainy, which are quite common; and the transportation by water is also difficult on account of the shallowness of the waters and strength of currents; and, additional to this it is peculiarly difficult to safely run the rafts which are constructed to suit the special navigation of the streams. The large timbers are bound together and form the raft proper. On these are then placed laths, staves, clapboards, etc. It is said the manufactured stuffs brought to market in this way are limited in quantity. This is to be regretted as persons who are acquainted with the interior of Russia state that it would be much to the interest of the proprietors if they would put more on their places in the interior the greater portion of the flooring, laths, deals, scantling, etc., as it is well known that large quantities of timber useful for these purposes are left to rot. It is also stated that the debris left by the loggers in the pine forests might be profitably distilled; but to bring about such necessary improvements and progress, the interior must have the benefit of better methods of communication with the markets than by the inefficient and tedious rafting system.

The rafts are formed on the ice before it begins to break up in order that advantage may be taken of the first rising of the waters. When this occurs the rafts usually arrive at Riga from eight to fifteen days thereafter.

During the period above mentioned from 1871 to 1882, there were exported from Riga 87,377,512 pieces of timber and lumber, or an average of 7,281,456 pieces per annum. The progress made in this trade since 1871 is shown by the fact that in that year only 4,542,155 pieces were exported; whereas, in 1882, 9,184,199 pieces were exported.

The total value, in silver, of the wood exported in that time was 122,342,708 roubles ($91,750,000); a yearly average of 10,195,225 roubles ($7,646,000). The value of the exports of 1882 was placed at 12,911,072 roubles ($9,683,000). A silver rouble is worth about 75 cents.

Of the leading articles exported during the twelve years, were in pieces, 3,651,095 staves and clapboards; 30,382,566 sleepers; 49,491,155 posts and flooring. With the exception of 47,769 pieces shipped to Africa, the whole amount was cleared for European ports. England received 58.7 per cent of the total exports; Holland 11.1; Germany 10.1; France 8.6; Belgium 5, and Portugal 2.2 per cent. The balance was taken by Denmark, Sweden, Norway, Spain and Italy. During the year 1882 the average charges, per St. Petersburg standard, to French ports were as follows: Dunkirk, Boulogne and Dieppo $9 to $9.50; to Havre, Honfleur and Rouen, $10.50@$11.50.

On the whole the timber and lumber trade of Riga, for the past several years, has made notable progress, and the movement in 1882 was especially favorable. The trade of France with this port, though not near so heavy as it is with Norway, yet it is of no mean importance as the transactions for 1882 reached the sum of about $835,000, and is susceptible of considerable expansion.

THE ADIRONDACK FORESTS.

The forest region popularly known as the Adirondack wilderness extends over a territory of nearly 2,500 square miles, including within its limits large areas of swamp, lake, and bare mountain tops. Nearly 1,000 square miles of this territory are probably already owned by the State of New York, which has gradually become possessed of the lands through the failure of former owners to pay taxes upon them.

It has long been the custom among owners of Adirondack forest property to cut off the forests as rapidly as a market could be found for the logs, and than abandon the worthless land to the State. It follows that the State lands are not in one or more large, compact bodies, but are widely scattered throughout the wilderness, and are not now covered with any considerable forest growth. The possessions of the State, therefore, great as they are in the aggregate, cannot at present greatly influence the water supply of the upper Hudson basin. In spite of the fires, however, which have swept over such portions of the wilderness as now belong to the State, destroying what little fertility the soil once possessed, forests will grow up again upon these lands in the natural course of events. Years, however, must elapse before these new forests, even if successfully protected from further damage by fire, can be expected to exert any considerable influence upon the water supply of the State.

The law which prohibits the sale of any portion of these lands is a step in the right direction. It is only a step however. In order to insure a permanent flow of water form the northern part of the State, the whole Adironack region must be preserved in perpetual forest. As long as bodies of timber, the property of private individuals, remain scattered among the State lands, it will be hopeless to undertake the preservation of the detached portions of the forest belonging to the state. Fire follows the axe of the lumberman, and nothing can prevent the spread of fire from private to public lands. If the private owners of the forest in the Adirondack region continue the lumbering operations now projected, the destruction of the entire wilderness is inevitable. The fires, which will find abundant material in the dry tops and branches of trees scattered by the lumbermen about their camps, will sweep year after year over the entire territory now occupied by the northern woods, gradually converting it into a barren desert, incapable of producing again even the most insignificant forests, until the growth and decay of generations of humble plants shall have returned to it some portion of its lost fertility. Nature heals such wounds made upon the earth's surface very slowly even in a climate of our own, and centuries, perhaps, will elapse before the forests of northern New York, once thoroughly destroyed by fire, can be made to flourish again. During such a transition period, possibly extending through centuries the Erie Canal will remain useless for the want of water; the upper Hudson will no longer be a navigable stream; towns and villages now rich and prosperous will be deserted; and the commerce of a mighty nation will be diverted from its natural channels.

If it is desirable to prevent such far-reaching calamities, no half-way measures should be adopted. If our water supply is to be maintained, the state must speedily acquire control of the whole Adirondack wilderness, and govern it in a manner to insure it against the danger of total destruction by fire. Nothing short of entire, absolute control can produce the desired results. The Erie Canal and the Hudson River cannot be placed beyond danger by any ill-considered measures or the makeshifts of mistaken economy.—*N. Y. Sun.*

GIGANTIC FAILURE.

MONTREAL, Nov. 21.—The news of the suspension of the oldest lumber firm in Canada, established over seventy-five years, struck financial circles here to-day as if a thunderbolt had fallen within their midst. No one could believe at first that the house of John Sharples, Son & Co., of Quebec, that had never in its long career been embarrassed, should be in financial trouble with half a million dollars liabilities. It was more than astounding, yet it was true. The cause of the sudden embarrassment arises out of the failure of the firm's agents in London and the downward turn of the English market for spruce deals, of which they have a quarter of a million dollars' worth awaiting sale in Liverpool and London. It appears that the English market has depreciated $6 per standard for the spruce, and if the house was compelled to sell the loss would be enormous, whilst by waiting some time the market is bound to return to its normal condition, and they would come out all right. The firm has shown the Merchants', the Union of Lower Canada, and the Quebec banks a statement with an estimated surplus of $90,000 of assets over liabilities, and asked for an extension, which was readily granted by all the banks interested to-day.

Mr. Charles Sharples retired in 1870, when the present firm was established, being composed of Mr. John Sharples, of Quebec, and Mr. George Oswald. Mr. Sharples died leaving a fortune of a quarter of a million of dollars, which was divided among his wife and family, and a large portion of which was invested in the present firm. The stock of the Union Bank, which is most largely interested, fell ten per cent. this afternoon. It is expected that more lumber firms in Quebec, New Brunswick, and Nova Scotia will have to succumb, as the English market is very depressed at present.—*Mail.*

LATER.

The Montreal correspondent of the *Mail*, writing under date Nov. 22nd, says:—Although commerce is dull here at present, yet business men and banks are cheerful, and take a sanguine view of matters coming out all right. It is true there is a shortage in the winter wheat crop, and that the lumber market abroad was against exporters, but these misfortunes must be borne. In an interview with a leading banker to-day, whose bank is interested in the failure of the old firm of Sharples, Son & Co., of Quebec, he assured me that a better or more satisfactory statement he had never seen presented to creditors in his career than had been furnished. At least 50 per cent. of the assets can be realized at once. The firm is only asking three months extension, and my informant hazarded the opinion I heard expressed by a leading merchant this morning that the extension would never have happened only to get rid of a partner in England whose social habits were such as to prevent their great business being looked after and pushed as vigorously as they required. One of the brothers has started already for Liverpool to take the management there. The liabilities are distributed among the following banks:—Union, $140,000; Nationale, $40,000; Quebec, $55,000; Merchants', $10,000. Added to this is the family claim, estimated at $110,000, which is not expected to be pressed. The firm's losses in England are reported to be very heavy.

SAVE THE FORESTS.

Our esteemed contemporary, the *Sun*, calls upon its associates of the press to come up and help save the forests of the country. We respond with pleasure. We welcome the light of the *Sun* on this point, and are willing to help get up a blaze on the subject. The importance of our forests cannot be overestimated. Their money value is enormous. The raw materials they yield—lumber, fuel, bark, etc.—are worth $800,000,000. No other single crop equals the forest crop in value. Two millions of working men are employed in harvesting this crop and working upon it. But the money value of the forests of the country, as shown by their annual products, is small when compared with their value as the great modifiers and equalizers of temperature and moisture. It is an unquestioned fact that, at the present rate of destruction, our great preserves of valuable timber will all pass out of existence within a few years unless some means are taken to moderate the consumption. It is equally true that the destruction of the forests is hastened by the waste of careless proprietors and by the failure of the Government to protect those still in its possession. There is not a great deal that can be done by law to preserve our forests, but there is something, and it should be done without delay, while we have left some forests to protect.

We have spoken of the duty on lumber that should be taken off at once. We ought to

encourage Canadian lumber to come in, instead of shutting it out. The Government, national or State, should preserve forests at the head of important streams like the Mississippi, the Hudson, Connecticut, Merrimac, Penobscot, Kennebec and Androscoggin, for instance, allowing the large lumber to be cut at stated periods, but leaving the smaller growth to cover ground and grow up. The forest lands in the possession of the Government, where such conditions do not exist, should be surveyed and sold at auction, because private proprietors will at least protect their property from waste. Where practicable, these timber lands might be sold with restrictions. The Timber Culture Act, which was an honest attempt to encourage the of forests on the naturally treeless plains, has yielded no fruit, and might as well be re pealed.

A wise measure would be the establishment of a Commission of Forestry, mude up of men who know something on the subject—of whom the number is so limited that selection would not be difficult—to consider the whole question and report what should be done. If at the head of such commission we could have such a man as Prof, Sargent of the Arnold Arboretum, assisted by the intelligent arboriculturist, Mr. Charles A. Dana, editor of the *Sun*, and others whose studies have been in this direction, we should be sure of a report of great valae, and so ably presented that even the average Congressman might be stirred to action for the preservation of our forests.—*Boston Herald*

READY MADE HOUSES.

The manufacture of ready-made houses is a business which has attained considerable prominence eastern and Canadian points. Few people unacquainted with the facts have an inteligent idea of this business, and the following concerning the Kennebec Framing Company, of Bangor, Maine, from a local journal, may be interesting.

Dwelling houses are made like boots and shoes—in any quantity or of any size or style, and for any market in the wide world. Not long since this firm received a shingle order for fifty houses for Cape May, to be delivered speedily and in complete finish, Those houses were not to be sheds, nor shanties, but regularly ordered dwellings, and they were made accordingly, and so delivered, and contain hundreds of occupants at this moment. An order will be received for a $50,000 hotel, or an ornate French roof cottage for a country estate,and these are as easily and expeditiously furnished as an ordinary boarding house for a country village or a barn for a ranch in Kansas or Colorado. It is not to be supposed that only a coarse, rough frame is thus sent out, to be trimmed into shape on the spot where it is delivered. On the contrary the house is complete when it leaves the factory, and as ready to go together as a musket when it leaves the armory in Springfield ; all the parts being found, even to the knobs for the doors, and the screens and shades for the doors and windows, according to specifications. Great trains of freight cars stand waiting about, and are freighted almost daily here. The refuse trimmings and edge cutting of the lumber are carted off to a neighboring pulp mill, and there speedily turned into material for paper, or other product. Machinery for almost every conceivable use in connection with wood is at hand, and house materials, of any kind, or size, or shape, seem to drop out like meal from a hopper. In a recent instance, where a large building was furnished for a southern order, the parts were thus made, and when put together in the city where the building is now standing, its length was found to vary not the eighth of an inch from the original specifications, although its length on the front numbered hundreds of feet. Every inch of this building, from the sill to last shingle, was sent ready prepared from the factory, and "set up," as readily and almost as quickly as a nail {cask.—*Wood-Worker*.

CARE OF SAWS.

Ewing D. Craddock, in a letter to the Cincinati *Artizan*, says:—The saw is one of the most essential and sensitive tools used. A saw to do the work required of it should be kept in a condition to do the work. First, the saw should be well balanced on the mandrel and hang true, presenting a straight face on the log side ; hang the saw plumb up and down ; second, keep your saw well pointed, so that every tooth will do the same amount of work that is required of it ; these are the first elements of a successful mechanic ; these, too should always be closely observed ; third, is the shape of the teeth, to which, as a rule, but little attention is paid by the majority of sawyers. Every man has his own ideas about putting his saw in order ; therefore, all cannot be right. My idea is this : A saw tooth should come in contact with the kerf that is to be removed at an angle of 45 degrees. This will produce a thin cutting edge, and will be found to produce the desired result, cutting with the least power, and to economize power is a matter of interest to all. It makes the lightest running saw. As to swaging the teeth, or spring them, I sometimes run one, then the other, but the spring tooth is, by far, the lightest running and cuts smoother lumber. The full swage, with plenty of power, will do as good work as any. The objections I have to the full swaged tooth is that it takes more power to drive it ; consequently there is more strain on the plate of your saw ; besides it cuts more kerf than the spring tooth, making your saw more liable to buckle. All sawyers know the wider the kerf the more power it takes to drive the saw, and the less feed can be carried ; but a spring-tooth will cut a quarter less than full swaged, and, as a matter of course, makes the lightest running saw. Still, each tooth cuts the same distance into the timber, and, therefore, I recommend the spring-tooth. I always spring the teeth at the extreme points, to prevent them from losing their set, for the nearer the point a tooth is set the longer it will retain its set ; and file the under sides of each tooth a little beveling, say 12 or 15 degrees, and the back straight, and you will find this kind of dress will give satisfaction in all kinds of timber. In this country, most all the sawyers run the chisel-tooth, or, as some call it the full swage, no set, and meet with good success, The reason of this is that a full swaged tooth is easier filed than a spring-tooth. Yet a spring-tooth does not require half the work to keep it up that a full swaged one does, and will make great saving in files and emery wheels.

The "Tribune" On Forestry Laws.

Speaking of the rapid destruction of forests, the New York *Tribune* says :—The usual practice appears to have been to cut down all the trees on a section, except the young shoots, and leave the bush and branches to dry, and most likely catch fire the next year. And thus what the axe may have left, the fire consumes, so that it really looks as though every precaution had been taken to destroy our forests as rapidly as possible. It is the custom of the Americans to speak rather patronizingly of the Canadians ; but in this matter they are wiser than we. There is a law in the Province of Quebec which forbids the cutting of pine trees unless they are 12 inches or over in diameter at at the butt, and the same timber dues are charged upon the small logs as upon the large ones, which has had the salutary effect of discouraging the cutting of small trees."

Our North-West Forest.

The Winnipeg *Times* of Nov. 17, says:—Mr. Robert Gunn, Crown Timber Inspector, has examined the Riding Mountain country, and says that it contains a plentiful supply of spruce, poplar and jack pine, which will be amply sufficient for the wants of Northwestern Manitoba for many years hence. He leaves on Monday to inspect the Duck Mountain country north of Birtle and Shoal Lake.

W. E. EDWARDS paid $37,000 at Ottawa for three timber limits, containing 100 square miles, situated near the headwaters of Lake Pdes Quinze, near the boundary line between the provinces of Ontario and Quebec, on the Upper Ottawa.

SINGERS and public speakers are always benefited by using DOWNS' ELIXIR, as it removes hoarseness and increases the power of the voice. Take small doses often. Price, 25c., 50c. and $1.00.

FOREST PROTECTION.

The following article by our esteemed correspondent Mr. Edward Jack appears in the St. John, N. B., *Globe*, and we are happy to reproduce it:—

During the present autumn, when in the forests of the interior of New Brunswick, my attention was arrested by the brownish red color of the tops of the spruce trees on a ridge not very far distant from the hill on which I stood. To my astonishment I found that fire had penetrated these woods for a distance of from 12 to 15 miles, its average breadth being 2 miles, involving the loss of at least $50,000 to the owners in the way of stumpage, to say nothing of that to the country in the money which would have been spent in hauling, driving, sawing and shipping so many trees.

The fire in this instance had been the result of carelessness of two men employed as cooks on a river drive. They had set it in a bush pile on the shore of Burnt Hill stream and neglected to extinguish it,

During the time when logs are being driven fires are very apt to run even in hardwood lands, owing to the masses of dry leaves which at that time cover the surface of the ground; when once plants and low shrubs are in full leaf, there is very little to dread from forest fires until late in the season, after long droughts when every green thing is dried and parched up.

Forest fires are usually started by river drivers, hunters, fishermen, or free grant and labor act settlers, who have allowed to occupy what is usually called, among lumbermen "black land;" in other words covered chiefly by a soft-wood growth.

To meet these special cases there is no legislation, although it is urgently demanded. I propose to take up each of these cases separately, and show, in so far at least as the valuable Crown Lands of the Province are concerned, how the danger of destruction from forest fires can be reduced to a minimum by wise legislation and the adoption of cheap precautionary measures.

Before doing so and by way of preface I will quote the words of W. Little, Esq., of Montreal, a gentleman who has ever been foremost in the advancement of forest interests:—

"If the timber land owner would annually expend the same percentage he is willing to spend to insure other property of like value, towards putting his timber property in safe condition, he could so place it that it would be difficult to set it on fire so as to do any serious injury."

First mentioned and perhaps as important as any in the subject of forest fires caused by careless river drivers, a class largely composed of reckless and sometimes unprincipled men. Log drives are yearly becoming more consolidated, and the work which was formerly undertaken by half a dozen parties, is now frequently executed by one, since the greater quantity of lumber driven, the cheaper the work can be done, all other things being equal.

Such being the case one expects the party in charge of a large drive to see that proper care be bestowed on his neighbor's property, through which he is passing, and here legislation should interfere and require him to do something like the following manner:

He should be required to appoint one trusty man to see that no fire be left burning when the driving parties leave the spot where they have been encamped over night or when the men leave the spot where any may have been kindled for the purpose of lunch, dinner or any other meal; should the chief river driver fail to make such appointment of fire ward he should in such case be liable to a penalty and be made chargeable by law for any loss through forest fires which might occur by or through the neglect or carelessness of his men. Further, if any forest fire should happen by or through the neglect of the driving crew, that the party or parties guilty of such neglect or carelessness should forfeit his or their wages, provided damage be done to the surrounding forest to the extent of $10 or more, such party or parties being also subject to fine or imprisonment.

In order to compel the holder of the timber license to take an interest in this matter a clause should be inserted in the same, that in case the whole or part of any logs cut on such lease should be driven without the appointment of such fire ward by the man in charge of the drive, that all the blocks on which such logs may have been cut shall, or may be, declared vacant, and be again offered for sale at public auction.

The next class of people who sometimes are the cause of forest fires are hunters. As this business is uncertain and precarious, it would be as well for the interest of the individual, as well as for that of the country, to discountenance the professional hunter as much as possible, more especially as he frequently kills moose and cariboo for their hides alone, leaving the carcass in the woods to rot.

It has been suggested by Mr. Henry Braithwaite, and I entirely concur in the idea, that it would be well for the Government to make a large game reserve of the forests on the north side of the South West Miramichi, extending to the Tobique and Nepisiguit, and to place the same under the mangement of some competent woodsman, with competent assistants, whose duty it should be is to see that the game on these be protected. There are yet in this part of New Brunswick plenty of cariboo and many moose, and protection of game means protection of the forest.

In order to meet the exposes attending such reserve and its protection, hunting and fishing permits could be issued to parties giving bonds to hunt according to law, such parties to pay such reasonable sum as might be demanded. I have no doubt but that in a short time permits enough would be sold to more than pay all expenses, while the game would suffer no decrease, the production keeping the stock up.

QUEBEC PUBLIC FORESTS.

We take from the report in the Montreal *Herald* of the proceedings at the annual meeting of the Province of Quebec Forestry Association the following extract from the discussion on the President's report. It will be seen that the Quebec Commissioner of Crown Lands takes an intelligent interest in the subject:

Mr. J. X. Perrault referred to the great importance of education in the matter of forestry, and expressed the hope that the association would encourage the distribution of forestry literature throughout the Province. He would like to know, from the Minister of Crown Lands, if his department intended taking any steps to assure a proper distribution of forests in districts, so that the cutting of the forests should be done systematically, and that when one portion was cut the lumbermen should not return to that district for say twenty years, when it would be restored. This was the system followed in Europe and he thought steps should be taken to procure the same here.

THE COMMISSIONER OF CROWN LANDS,

Hon. Mr. Lynch, in reply, said that the progress that had been made in forestry matters since last year must prove a source of the greatest encouragement and satisfaction to the members of the society, and especially to the president, Hon, Mr. Joly, who had gone to much trouble. He did not think that persons generally realized the difficulties that attended the foundation of this society and the establishment of what was known as "Arbor Day." When the idea of having such a day was inaugurated he himself had thought there was very little in it, that it was more of an idea that would never become a reality. Practical experience had, however, shown him that it was a reality which could not fail to be the source of much future good to the country. There had been not a few difficulties attending the inauguration of such a day, but he was glad to be able to say, that from one end of the Province to the other a beginning had been made, and not only in the large cities and districts, but also in the smaller hamlets and villages, had the day been celebrated with much success, This, he was pleased to notice, was one of the results of that combined associated effort that had led to the foundation of this Association, and to the adoption of legislation regarding the protection and separation of our timber and colonization lands. He firmly believed that the latter was one of those pieces of legislation that would be of great good to the country. The object of the legislation in question was in the direction to which Mr. Perrault had referred. He had only occupied, he might say, the position of Minister of Crown Lands for a few months, but in this short period he had learnt that it was a most responsible position and that upon it depended very greatly the future prosperity of this province. He thought that they should protect their natural resources; about all that they had now was their forests, and they were a legacy handed down to us to preserve, not to destroy. He might add that there was no legislation of the nature spoken of by Mr. Perrault, and he did not know that he was in a position to bring such legislation before the approaching session of the legislature for the reason that it covered the whole ground and had to be most carefully considered. The aim of the Association, he thought, should be to encourage whatever Government was in power to preserve and protect their forests, and he was in hopes that before long the Association would depute one of its members to co-operate with the Minister of Crown Lands, and in this way such legislation might be effected as would assure the object spoken of by Mr. Perrault. He referred to the great need there was for education on this subject, as there existed, to a great extent, in the minds of the masses, an idea that this movement was one of no practical effect, and this idea would have to be dispelled. It had been said that a conflict might arise between the Government and the lumbermen. He, however, believed that the great majority of the lumbermen would aid them, as it was to their interest to do so. The importance of the subject was great—so great, in fact, that when the meeting adjourned it would do so with the understanding that the members should meet again at an early date to discuss the question. Legislation was imperatively needed. He would like to see it well and carefully considered, but he would also wish to see it passed as speedily as possible. The future prosperity of the Province depended largely, he was convinced, upon the action they took now, and there should be no delay in the matter. (Applause.)

Mr. J. Y. Perrault suggested that a committee be appointed to take the matter of legislation into consideration and report to the Association.

THE FORESTRY EXHIBITION.

We referred a few days ago to the International Forestry Exhibition proposed to be held next year in Edinburgh, The forest productions of Canada are such as to enable her to take a very high place, if not the highest, in some of the departments embraced within the scope of the Exhibition. In this connection it may be interesting to refer to the report of the Royal Commissioners upon the exhibit made by Canada at the International Exhibition held in London in 1862. The Commissioners say that "in point of size of specimens, excellent selection and information given, the Upper Canada collection of models is undoubtedly the finest in the exhibition building. It is contributed by sixteen individuals, and consists of planks, logs, squared logs, transverse sections, polished specimens, veneers, and a very extensive series of scientifically collected and named leaves, flowers, shoots etc., etc," This collection the Royal Commissioners refer to in very high terms of praise, such as "magnificent," "beautiful," "noble specimens." Some of the wood specimens were five feet in diameter. One of white oak which reached London too late for exhibition, was six feet in diameter and six feet long, from a tree with a trunk sixty to the first limb. There were planks of extraordinary dimensions one of white pine and one of white oak, each fifty inches broad; black walnut thirty inches; hickory, thirty-six inches; and a beautiful plank of soft maple twelve feet long by forty-five inches broad. Of the scientific collection the Commissioners speak in equally high terms of praise. Amongst the exhibitors was the Hon. James Skead, of this city, who sent five specimens of timber from the Ottawa region. Samples of these were given to the leading Governments of Europe, to the scientific societies, to the Admiralty, to the British Museum, to Kew Gardens, to Lloyds, and Lloyds added several kinds of Canadian woods to their A No. 1 ships. The Kew Gardens' authorities erected a building expressly for the woods from the exhibition, giving the Canadian woods the place of honour. The Royal Commissioners state that the Canadian collection derived much of its exactness and scientific value to the exertions of the commissioner, Dr. Hurlbert, and they refer to the collection generally as one of the most complete illustrations of the resources of a colony ever exhibited. It is of the utmost importance that Canada's forest products should be properly represented at the Edinburgh Exhibition. There is not too much time at disposal for making the necessary arrangements and for urging those interested to go to work to prepare their specimens. If the Government decide that the country shall be represented on the occasion, and no doubt they will so decide, we feel sure that Parliament will cheerfully vote the necessary sum of money to pay the expenses of the exhibition. There never was a time in the history of our country when so much attention was paid to Canada and her resources as the present. The Dominion is being advertized in the United Kingdom and in Europe as it was never advertized before. The visits of prominent Englishmen; the favourable reports of agricultural delegates and of men of such high standing as Professor Tanner, which we have noticed recently; the varied services of our late Governor-General; the exertions of the Canadian Pacific Railway Company; and the Canadian display at the International Fisheries exhibition, all have had the effect of bringing Canada and Canadian affairs before the British public. The approaching Forestry Exhibition will afford another favourable opportunity for making the country still better known. Whatever is to be done for having the Dominion represented on the occasion should be done without delay.—*Ottawa Citizen.*

FORESTRY IN ENGLAND.

We take the following from the London *Forestry*:—

On Thursday, the 2nd of August, Sir John Lubbock found the opportunity he has for some time been seeking of calling attention, in the House of Commons, to the important question of establishing a forest school in England. He did so when the House went into Committee of Supply and the vote of £23,232 for the office of woods and forests came on for discussion. Sir John asked the Government to consider during the autumn the question of forest education in this country, and whether the natural forests might be utilized for this purpose. He said

"So much, indeed, had forestry been neglected, that in Scotland the words suggested deer, but no trees; while the idea of foresters in England was associated with the members of an excellent provident institution. Of course, the Crown forests formed but a small part of the subject. There were altogether, in round numbers, 2,500,000 acres of woods and plantations in this country, so that the subject was one of vast importance. Moreover, it was calculated that in Scotland and Wales they were 5,000,000 or 6,000,000 acres at present almost valueless, and which, if judiciously planted, would give large results. In the science of forestry we were, he feared, far behind, most foreign countries, especially France and Germany: and he was very anxious that our landed proprietors should benefit by the experience which other nations had acquired. But let him ask where was a country gentleman who owned woodlands to obtain information as to their management or to procure trained assistants? We had no forest school in this country: we had no class of persons specially trained and instructed in the formation and management of woods. It was, he feared, still true that, as the House of Commons' Committee of 1854 reported, timber is "everywhere worse managed than any other species of property." Unless something were done this state of things would continue. On the other hand, the highest authorities had expressed a very strong opinion that we might make our woodlands much more profitable: they show one step which was a necessary preliminary. The highest English authorities were strongly in favor of the establishment of a forest school, and had forcibly pointed out the loss which our present system of management, or rather mismanagement, entailed on landowners. Mr. Brown, in his standard work on forests, observed that "if our forests had been judic-

iously managed we should not find so great a part of the woodlands of Great Britain in the unprofitable state in which they are."

"We were the only important nation in Europe," argued Sir John Lubbock, "without a forest school, and yet, if we included our colonies, our forests were the largest and most valuable in the world. It appeared to be a very strong argument in favor of the establishment of a forest school in this country that at present the young men who were going out to manage our Indian forests had to be sent for instructions to the great French school at Nancy. No doubt that was a most excellent institution and we were indebted to the French Government for the courtesy with which they had received our English students; but the system of education given there naturally contained some branches, as, for instance, the study of French law, that were not adapted to English students. while there were many other considerations, such as climate, which rendered a Continental school less suitable for English requirements. He might add," he said, "that no young Englishmen, as a matter of fact, went there excepting those intended for the Indian service. For our colonies, again, the establishment of a good forest school would be of very great importance. A judicious management of their woods would add considerably to their income. French foresters had recently been sent to the Cape of Good Hope and Cyprus, it having been found impossible to obtain any countrymen of our own with the necessary knowledge. Perhaps, however, he should be asked why the establishment of such a forest school, if it were so urgently needed, should not be left to private enterprise. The reason was clear. A properly equipped forest school must have attached to it a large extent of forest in various stages, and having a variety of climates and soils. This, it was obvious, no private institution could supply. He did not, however, say that this would neccssarily involve the establishment of a Government school. He understood that the Government contemplated an arrangement with the Cooper's Hill College, but he trusted that before instituting a Government school they would inquire whether such colleges as Cirencester could be made available for the purpose, and possibly some arrangements might be devised by which, under careful regulations, the professors and students attached might periodically visit our national forests. He might mention, in illustration, that lately the Cape of Good Hope Government determined to appoint a Forest Commissioner, with an income of £800 a year. Thye could not, however find any qualified Englishman, and were obliged to appoint a French gentleman, even though he could not speak English. The Society of Arts had memorialised Her Majesty's Government on the subject, and the presence in this country of Dr. Brandis and Colonel Pearson rendered the moment one of which it was desirable to take advantage. He hoped, therefore, Her Majesty's Government would not think him unreasonable if he asked them to consider this important question."

TREE PLANTING.

A meeting, fairly attended by both ladies and gentlemen, was held last evening in the school room of St. George's Church, Carleton. The Rev. Mr. Dowling presided, and Mr. A. Rankine Bedell acted as secretary. Mr. Dowling, in an appropriate speech, put forward the object of the meeting which was to make arrangements for planting trees around the church grounds. He mentioned several matters of historic interest current with the affairs of the church. There are thirty-nine trees to be planted and thirty-six of them are already provided. Formal resolutions passed approving of the proposed memorial tree planting in the church grounds, providing that it should take place on Friday afternoon, weather permitting, at 2 o'clock, the committees and tree planters to meet at the school room at 1.30 p. m., to complete the final arrangements, and also providing for an appointment of a committee of five to arrange all details. The committee appointed were the churchwardens, and Messrs. Mosher, Cowie and Sewell. A vote of thanks passed to the rector and wardens of the Church for the use of the room and for their services in connection with the proceedings. It was decided that if Friday's weather is not favorable the tree planting shall take place on the first fine day afterwards. A very hearty feeling prevailed at the meeting. Trees are to be planted to the first bishop of New Brunswick, to the first rector, and the various rectors of the church, etc., but the list was not complete last evening.

The tree planting which was to be done on King Square on Nov, 26th, Evacuation Day, under the direction of the New Brunswick Historical Society, has been postponed until the 18th of May next. Two trees will be planted on the 26th—one to George III, and one to Queen Victoria.—*St. John, N. B., Globe.*

Arrivals in London.

The *Timber Trades Journal* of Nov. 3rd, says:—The arrivals this week to London are very heavy, evidently stimulated by the cheap freights we have commented on lately. Forty-six steamers and twenty-nine sailing ships with wood cargoes in the Thames the last week in October is something unusual in the annals of the timber trade. It all points to the immense difference steam has made in the carrying trade. Formerly the opportunity of chartering at a low rate, so near the close of the shipping season, would have been very rare, and the chance of getting the stuff home very doubtful, yet probably all the steam cargoes reported have been secured within the past few weeks, Of this week's London list Sweden contributes 25 cargoes, Russia comes next with 24, Canada 9, Norway 5, Germany 4, and other countries 8. Flooring cargoes are limited to two; of deals, &c., there are thirty-nine cargoes, 11 of firewood, and seven of lathwood, sleepers, mahogany, &c., completing the list. There is not a complete cargo of square timber among the arrivals.

THE timber is being dressed and foundation partly laid of the new Rainy Lake Lumber Co.'s mill at Rat Portage.

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

IF you are troubled with a "hacking cough," DOWNS' ELIXIR will give you relief at once. Warranted as recommended, or money refunded. Price, 25c., 50c. and $1.00 per bottle.

A QUERY ANSWERED.—People often ask when is the best time to take a blood purifier? We answer, the best time is now. Burdock Blood Bitters does its work of purifying, regulating, and toning the system at all times and all seasons. Purity in all things is always in order when required.

A GOOD INTRODUCTION.—J. Kennedy, a merchant in Dixie, about three years ago introduced Hagyard's Pectoral Balsam to his customers by trying it in his own family for Coughs and Colds. Being pleased with results, large sales followed, and it is now the favorite remedy in that neighbourhood.

How Many Miles Do You Drive!

The

ODOMETER

Will Tell.

This instrument is no larger than a watch. It tells the exact number of miles driven to the 1-100th part of a mile; counts up to 1,000 miles; water and dust tight; always in order; saves horses from being over-driven; is easily attached to the wheel of a **Buggy, Carriage, Sulky, Waggon, Road Cart, Sulky Plough, Reaper, Mower,** or other vehicle. Invaluable to LIVERYMEN, PLEASURE DRIVERS, PHYSICIANS, FARMERS, SURVEYORS, DRAYMEN, EXPRESSMEN, STAGE OWNERS, &c. Price only **$5,00** each, one-third the price of any other Odometer. When ordering give diameter of the wheel. Sent by mail on receipt of price, post paid. Address

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., DEC. 1, 1883.

ANNOUNCEMENT.

WE have for the last few days been sending out subscription and other accounts. There is a very large sum on our books in these small amounts, which, though of trifling importance, taken singly, make altogether a very considerable aggregate. We would therefore invite those who are in our debt for these small sums, which they can pay individually without inconvenience, to remit the amonnt to us promptly, and thus collectively give us the benefit of a very satisfactory account at our bankers'.

It may be seen how large the total of these comparatively insignificant amounts must be, from the fact that we have sent out about 1,500 of these amounts during the last fortnight.

Another reason why we desire a prompt settlement, is that in pursuance of the arrangement by which our business is to be conducted after the end of this year by the Peterborough Review Printing and Publishing Company (Limited), it is necessary that the books of our firm should be closed as soon as possible.

We feel confident that under these circumstances our request will meet with ready and speedy compliance.

TOKER & CO.

THERE is said to be a machine in Glenn Falls, N. Y,, which successfully makes pulp for paper out of sawdust.

CHARLES BARTLETT, of Hanover, and Mr. J. R. Hall, of Andover. Me., will put 2,000 cords of poplar into the east branch of Ellis river this winter.

THE Kingston *Whig* says:—The raft caught in the Rideau Canal ice is W. McRossie's and the timber is needed to fill his penitentiary contract. He will be a heavy loser and fervently pray for a thaw.

A LARGE timber-laden vessel has been lost on the Cape Breton coast, but no trace of the crew can be obtained, nor can the ships name or dimensions be made out.

JOHN H, MONTEITH of New York city, recently cut up a log of Mexican mahogany, which made 25,000 feet of veneers, and two other logs averaged the same.

THE superintendant of a large planing mill at New Haven, Conn., writes us that they have more orders for planed yellow pine lumber than they can fill in six months.—*The Wood-Worker.*

MCDONALD & SHIELDS' new mill at Vermillion Bay has been closed down for the season. Gangs of men will be put into the woods, and about six million feet of lumber will be taken out this winter.

CHAS. E. FRANCIS, of Cincinati, O., writes that his gravity cross-cut saw is becoming very popular. He lately sent one to a Minnesota firm, and received an order for two more from the same parties last week.

THE Napanee *Beaver* has this item from Queensborough:—The Rathbun Co. have now some four shanties located on the waters of Black Creek. The Gilmour Co. have stopped business in this district. It makes things dull.

THE *Wood-Worker* says:—For years past millions of feet of oak staves have been cut in Arkansas and shipped to Europe by way of New Orleans. The French and Germans think that in all the world there is nothing equal to Arkansas oak for making wine casks. It is stated that all other wine making nations use the same wood.

A Washington dospatch says that the attention of the Government has been invited to the International Forestry Exhibition to be held at Edinburgh in the summer of 1884. The exhibition will be open to contributors from all countries and is designod to include everything connected with or illustrative of the forest products of the world.

THE Indiana Lumber Co., whose saw and planing mill at Nashville, Tenn., was totally destroyed by fire last month, has taken steps toward the immediate eroction of an extensive mill. The new saw mill will contain both circular and band saws. It is proposed to make the new establishment one of the most complete in that vicinity.

TEXAS, Arkansas and Louisiana are said to contain 190,000,000,000 feet of standing pine. If this is so, a timber famine is not probable in this generation at least, when we remember that soveral other southern states are well timbered. In comparison with these states the stock of timber in Michigan, Wisconsin and Minnesota, the three great lumber producing states sink into something approaching insignificance.

ENGINEERS at Mayence have met with remains of the bridge erected over the Rhine at that point by Charlemagne near the close of the eighth century. It rested on 28 buttresses, and was destroyed by lightning, burning down to the level of the water. The engineers have removed over 50 piles of from 15 to 18 feet in length, and the timbers are well preserved, though nearly 1,100 years old. In fact, the timber is still fit for use in building. The same is true of the iron which was rivited to the posts.

TWO St. John gentlemen, Capt. Calhoun and Mr. Wm. Hanson, have purchased a tract of timber land in the vicinity of Spruce Lake, St. John county, New Brunswick. They intond to set up a steam saw mill on the lot between the outlet of Ludgate and Spruce Lakes, and cut dimension timber for the American market. There is, says the St. Croix *Courier*, an abundance of spruce and cedar on the properpty surrounding these lakes, and good facilities are afforded by the Grand Southern Railway for getting it to market.

THOUGH considerable yellow pine is shipped from South Mississippi to Boston and other eastern ports, yet the largest part goes direct to foreign ports, Europe, England, Africa, Central and South America and Mexico.

THE *Timber Trades Journal* says:—The shipments of spruce at St. John, N. B., seem to be dwindling away. Sellers are of opinion that it would be a sound speculation to buy what remains there at the present market price. They believe the time is not remote when there will be an active demand for these goods. Nor is that opinion singular. It is whispered in other quarters that the price of spruce must go up and that soon.

A SUPERINTENDENT writes:—"The best workmen I have ever known are those who give a little attention to their machinery after stopping time, just as a good groom takes the best care of his horse when it is the hardest worked, seeing that it is cared for before he gets his own supper. The result in the one case is that the horse is always fresh and ready for hard work, while the machine is always turning off a good quantity and a good quality of work."

THE Laminate Wood Company of Chicago, is about to introduce some specialties that are of interest to dealers in that line. They will consist of the French scoop for grocers, druggists, and millers; the Chapman elevator bucket, for flour and grain; and the Caldwoll pulley, for all mechanical purposes. These goods are made of layers of veneers peculiarly built up according to several patents lately issued, so as to make light, strong, cheap and durable goods,

A PROPOS of the recent cotton failures, the *Timber Trades Journal* says:—Though there is no great affinity between the cotton and the timber trades, we do not hear unconcernedly of large failures in the former, because in point of fact important suspensions in any trade unfavorably affect every other, as they tend to destroy commercial credit and render the necessary accommodation which trade requires more difficult to obtain, and have a generally depressing influence.

GRAVENHURST.

From Our Own Correspondent.

Nov. 24.—The weather set in very severe here about two weeks ago, accompanied by a a heavy fall of snow, in consequence of which the saw mills have all shut down. The weather has, however, moderated since and the snow has all disappeared. The following is a list of the saw mills in Gravenhurst and the immediate neighborhood, and the quantity of lumber and shingles cut by each during the season just closed:—

Name.	*Lumber.*	*Shingles.*
G. W. Taylor & Co	5,000,000	
Chas. Mickle	5,000,000	2,500,000
Woodstock Lumber Co	5,000,000	
H. DeBlaquic	1,500,000	9,000,000
J. Cockburn	5,000,000	3,500,000
Thompson & Baker	3,000,000	
Crone & Patton	2,000,000	3,000,000
J. Davidson	1,000,000	
Tasker	2,500,000	1,000,000
T. H. Carr & Co	2,000,000	
J. H. Hull	1,000,000	7,000,000
Hazzard		1,500,000
T. Tait		4,000,000
King		1,000,000
P. Bartholomew		7,000,000
Eatle		3,000,000
Sundry small mills		2,500,000
Total	33,000,000	45,000,000

Besides the above there are a number of small mills up the lakes which send their lumber to this point in scows to be shipped hence by rail. The amount cut by these mills will be about 4,000,000 feet of lumber and 15,000,000 shingles, making the total amount shipped, or to be shipped, from this point 37,000,000 feet of lumber and 60,000,000 shingles. Of the above amounts nearly all the shingles have been shipped, and about one-fourth of the lumber, leaving about 27,000,000 feet of lumber to be shipped. Should this move off very slowly during the winter (as there seems every prospect of) there will be a great rush to ship in the spring, and a repetition of the old cry "no cars," the rolling stock of the Northern & North Western Railway being totally inadequate to meet the extra demands made upon it at that season of the year. Looking back, the past season may be said to have been rather an unfavorable one for mill men. In the first place owing to the severity of the winter and the high rate of wages then prevailing, stocks cut at $1 per M more than on any previous season. Wages have also continued high during the past summer, thus adding materially to the cost of manufacture, while those mill men who have sold their stocks *en bloc* have had to accept prices ranging from $1 to $2 per M less than last season. Over production seems to have been the main cause of this, and it will be well for the lumbermen, if, taking a lesson from the past, they confine their operations during the coming winter, and each one take out one-half, or even less, of what they have been accustomed to take out, for, unless the production is largely curtailed, the prospects are that prices will rule even lower next year. The pine in this section of the country is generally of poor quality only a small percentage of it being suitable for the American market, thus throwing the great bulk of it on our local markets, and as our markets are naturally limited over production immediately makes itself felt by causing a glut, and down come prices. There is, however, a class of lumber the demand for which always seems to exceed the supply; I refer to bill stuff, and it seems to me that mill men would be wise in turning their attention more to the manufacture of this kind of stuff, as they can always command a ready sale for it at good prices, with the advantage that it can be immediately turned into cash, without having to carry it for eight or ten months after it is manufactured as has generally to be done under the present system.

WHITE CEDAR BARK.

To the Editor of the Canada Lumberman.

SIR,—We have a little industry here, just started—that of making paper from the bark of conebearing trees—principally the white cedar bark. Can you give me, or put me in the way of getting, any statistics as to the amount of cedar sawed in the different States and in Canada? As we rely on the bark that is a waste at the mill, incidental to the sawing or getting out of the cedar lumber, we might get some idea of the amount of bark if we knew the amount of wood used or manufactured. Our process is patented in Canada, and we are showing a very fair business here, with bark brought from Maine by vessels. A mill in Canada ought to do very well.

Yours truly,

JOHN M. ALLEN.

343 Purchase street, New Bedford, Mass.

OUR WOODS AND FORESTS.

Now that by gracious permission of the Toronto *Globe* the subject of forestry is open for discussion, we beg to call attention to one important branch of this question, not, however, for the first time. In spite of the great inroads that have been made upon the forests of Ontario, and, in spite of the large expanse of woodland that has been alienated from the Crown, there still remains a vast extent of land more or less valuable for its timber. In fact this class of property is a very large asset in the capital of the Province.

It cannot be said that this public property has been well managed in the past, or that it is being well managed now. It is not a party question, for with the exception of the point of treating the proceeds of sales as income instead of capital, the same want of good management has existed under both political parties. The property has not been utilized to the best advantage or to the greatest profit posssible.

It seems to us, as we have already suggested, that there should be, if not a separate department, at least a distinct sub-department or bureau of Woods and Forests for Ontario. One of its first duties should be to subdivide, in consultation with the Crown Lands Department officials, the public domain yet remaining unappropriated. After the necessary surveys and examinations are made the Crown Lands should be divided into areas open for agricultural settlements and areas to be reserved for forest. Of course this division need not be

permanent in its details, for it may hereafter be found advisable to open forest land for agricultural purposes, or to withdraw additional areas from settlement to extend the forest. But from time to time the limits should be fixed and should not be encroached upon irregularly.

This system would offer several advantages of importance.

1. It would open the way for the scientific cultivation of our public forests and for their permanent preservation, a policy that should be at once adopted.

2. It would facilitate the treatment of these public forests as real estate expected to produce an annual crop—as capital from which a yearly income should be derived—and not as a source from which might be derived casual receipts to be treated as revenue, even though the property is alienated.

3. It would diminish the risk of fires spreading through our present forests or those to be planted—a risk against which it is very hard to guard under the ordinary method of clearing land—so long as agricultural settlements are interspersed with forest.

4. It would put an end to much of the divergence of interests, the disputes and contentions between settlers on wooded land and holders of timber limits and licenses. The lumberman need not intrude on the settler's lands or the settler upon the lumberman's limits.

5. It would prevent settlers from being tempted to clear and expend their energies, time and money upon land that is poorly fitted for agriculture, and that would be far more economically and profitably devoted to the production of timber.

Without the adoption of some such system Ontario will soon experience the financial disadvantage of having a large portion of its capital, its forests, vanish for ever, to the impoverishment of the country, with nothing to show for the receipts that had been used to meet current expenditure. It will also experience the economic disadvantage of no longer having any timber to export or even for its own use, but will on the contrary have to import from abroad.

It is urgently necessary that our remaining forest should be reserved and in part renewed before it is too late, and we would invite thoughtful consideration of the policy we have outlined. —*Peterborough Review.*

WASHINGTON TIMBER.

The Seattle, W. T., *Post Intelligencer* thus describes the timber of a locality in Washington Territory: "A man from Illinois, who recently visited the Quileute country with a party of land seekers, returned a day or two ago, and called to tell us what he found there desirable to seekers of government land. A number of little prairies were seen that for beauty and fertility cannot be excelled, while the bottom land is as rich as the best anywhere. Game and fish are also very abundant, so that a settler of very ordinary ability as a sportsman need not trouble about meats for his table. The timber, though, is the crowning glory of that country. It consists of fine maple, cedar, alder, fir, and spruce—principally the two latter varieties. Our informant saw great tracts of spruce that average four and a half feet in diameter, with trees here and there nine and 10 feet through. Trees rise 250 and 200 feet above the ground. Altogether, it is the best timber country he ever saw or heard of, the only disadvantage to it, or depreciation of its value, being the absence of saw mills and local demand and the lack of an outlet to the trade abroad. A continuance of immigration there, however, will greatly change matters and appearances during the next two years.

NORTH OF LAKE SUPERIOR.

A reporter of the Ottawa *Citizen* has had an interview with Mr. H. J. Hubertus, an old journalist, who has been taking a trip on the C. P. R., north of Lake Superior. From the published account we take the following extracts:—

"Did you learn anything as to the extent of the timber district remaining?"

"No. Nothing definite. Still it must be enormous, as the headwaters of the streams emptying into the Ottawa and Lakes Nipissing and Huron are not yet encroached on. Mr. Klock is making a raft of square timber near Veuve Station, and Mr. James Worthington is making two rafts of square timber at Sudbury Junction, for shipment by rail."

* * *

"Where do the Construction Company get their timber?"

"They have erected two portable steam mills west of the Sturgeon and saw the boards and dimension timber required. They own oak and other timber lands near there, and it is thought will also erect car works at Sturgeon Falls, where there is good water power."

* * *

"The country is all under timber license along the line of railway, I believe?"

"Yes, along the stream emptying into Nipissing and French rivers. Worthington has the license of McKim township at Sudbury Junction. The licenses do not extend very far back, however."

"Will not this interfere with settlement?"

"I think not; rather otherwise. The timber will be cut, and the settler will work for the lumberman in the winter and on his own land in the summer, and all his farm produce will be immensely valuable."

CHOICE LUMBER.

One of the choicest lots of lumber that has been brought to the Chicago market for many a month, and we might reasonably say year was seen upon the docks of Messrs. Cutler, White & Boice. It had just been received from the mills of White, Friant & Co., Grand Haven, Michigan, and comprises upwards of a million feet which is running 75 per cent. better than common, Chicago yard grading. Fully 40 per cent. of it is thick uppers, and 45 per cent is grading better than C. The lumber bears the "diamond o" brand adopted by the manufacturers and was sawed from Grand river stock, which, according to the timber statistic sharps, should be entirely played out. The rule was laid across any number of pieces of three-inch plank, from 24 to 28 inches wide, clear as a quill and handsome as a piece of rough lumber could well be. The lot contains a very desirable 1¼-inch stuff that is especially sought after in this market and altogether it ought to prove a veritable bonanza to its holders. They may be confidently assured of one thing, which is, that every inch of it will not only be wanted, but eagerly sought after before the saws that made it get half their next season's revolutions made. The yard of Messrs. Cutler, White & Boice presents altogether one of the finest and best selected stocks of lumber we have ever seen in pile. The amount now in hand is about 9,000,000 feet, and so well arranged that an order for anything that enters into the construction of a building can be filled to the last stick without going off the premises for any of it.

Forests Laid Flat.

BANGOR, Me., Nov. 15.—The first reports of the damage by the gale gave but a slight idea of the havoc wrought. The calamity appears to be of great magnitude. The greatest damage appears to have been within a belt some miles wide crossing Piscatigins county and northern Penobscot into Aroostook. Great stretches of forest were levelled to the ground and millions upon millions of valuable timber destroyed. Whole townships in some instances are said to be nearly flat. The loss is certainly several hundred thousand and one well known lumberman estimates the total damage throughout the state at a round million.

THE Cardiff correspondent of the *Timber Trades Journal* of Nov. 3, says:—This week we have again had a large number of arrivals with Canadian goods. A good many of the deal vessels, both from the Baltic and Canada, have had to wait four to six days in the roads before they could be admitted into dock, as our docks are so crammed, that it is even difficult for vessels to move in them. Of course this is very detrimental to the trade, and shipowners demand higher rates of freight than otherwise would be the case. Business is good; all our importers are very busy, both in receiving and delivering, and the prospects appear to be very satisfactory.

THE Madoc *Review* says:—Mr. Blount informs us that Gilmour & Co.'s suspension of the past few weeks was only temporary, and they are again going on with work both at headquarters and in the woods. Large gangs have gone to the shantics during the past day or two, many men having never come out when work stopped, expecting to go to work again shortly. The firm's operations this year will be quite as large as usual. This will be very gratifying news. We regret, however, losing Mr. Blount and the company's office from Madoc, both of which will be severely felt.

FOR SALE.
SPALT MACHINE
For saving Lumber refuse, second hand, but all complete and in good order, taken out to replace one of greater capacity.
Address,—
THE RATHBUN COMPANY,
6L19 DESERONTO, Ont

$72 A week made at home by the industrious. Best business now before the public. Capital not needed. We will start you. Men, women, boys and girls wanted everywhere to work for us. Now is the time. You can work in spare time, or give your whole time to the business No other business will pay you nearly as well. No one can fail to make enormous pay, by engaging at once. Costly outfits and terms free. Money made fast, easily and honorably. Address TRUE & Co., Augusta, Maine.

ST. LAWRENCE CANALS.

Notice to Contractors.

THE LETTING of the work at the upper entrance of the CORNWALL CANAL, and those at the upper entrance of the RAPIDE PLAT CANAL, advertised to take place on the 15th day of NOVEMBER next, are unavoidably postponed to the following dates:—

Tenders will be received until TUESDAY, the FOURTH day of December next.

Plans, specifications, &c., will be ready for examination at the places previously mentioned on and after TUESDAY, the TWENTIETH day of NOVEMBER.

For the works at the head of the Galops Canal, tenders will be received until TUESDAY, the EIGHTEENTH day of DECEMBER. Plans and specifications, &c., can be seen at the places before mentioned on and after TUESDAY, the FOURTH day of DECEMBER.

By order,
A. P. BRADLEY,
Secretary.

Department of Railways and Canals,
Ottawa, 20th October, 1883. d103

FOR SALE.
A LATH TRIMMER,
NEW, and in good order, will be sold Cheap. Address,

MACHINERY,
ENGINE, BOILER,
ROTARY MILL, &c.,
IN THE
St. Martins Manufacturing Co's Factory and Saw Mill at St. Martins,
CONTAINING
A Waterous 80 H.P. Engine and Boilers, Rotary Saw Mill,
Saw Tables, Planers, Shafting, Hangers, Pulleys, Belting, Lathes, Pumps, etc.
One Fleming & Sons' 50 H.P. Engine and Boiler,
Waterous Saw Mill, Daniel Planer, Band Saw, Planer and Matcher, Saw Tables, Shafting, Belting, etc.
If not sold *en bloc* by the 10th of October, will be sold in lots to suit purchasers.
Catalogues giving particulars of the Machinery, etc., can be had from the liquidators, or at the offices of W. H. OLIVE, No. 167 Prince William Street; T. McAVITY & SONS, 13 King Street, St. John; and W. E. SKILLEN, St. Martins. 4L21

FORESTS OF ONTARIO.

We continue our extracts from Mr. R. W. Phipp's report:

THE POSITION IN WHICH FORESTS WOULD BEST EFFECT THE ONTARIO CLIMATE.

To produce their best effect on climate, three points are to be observed, 1st. To occupy the heights, firstly that they are generally of poor land well spared for that purpose; secondly, that wooded elevations preserve rain, feed springs, and continue water-courses in regular action. 2nd. They should be of considerable depth as well as length, as a thin line of forest will not by any means preserve the moist and humid atmosphere within their bounds on which their beneficial action depends. For such purposes, they should not, if it could be avoided, be less than a mile in depth from front to rear, and they had better be ten or twenty. To act as reservoirs of humidity they must be of fair extent, otherwise they will neither be able to feed the water-courses, nor to send upwards to the clouds those moist currents which, it appears by all experiment, meeting with a differently constituted atmosphere of the air, produce rain at those seasons when it is most needed. 3rd. If possible, such forests should stretch across Ontario in lines from northwest to southeast.. They would then be in position profitably to intercept the southwest wind, which is the great bearer of moisture hither from the Gulf of Mexico and the tropical seas. For instance, as has been observed, the great forest northeast of Ontario does not bring much rain relatively to Ontario. Most of the rain a forest obtains will fall northeast of that forest. The exceptions are when an east or northeast wind, meeting the southwest current, produces rain, and is sufficiently strong to carry before it the rain bringing current; but this is not to be depended on, the intention in endeavoring to preserve the forest in the line mentioned, being that the ascending currents shall meet and produce rain from the moisture-bearing winds, which are mostly southwest in reality, though often deflected and turned away by local or other influences. Of course it is not expected that Ontario can be mapped out in field and forest at this late day. But we can know in what direction to strive here, and where forest overspreads the whole country, as in part of our territory elsewhere, very much indeed can be done.

It must always, however, be remembered that east, and even northeast winds, can and do bring rain of their own force from the Atlantic direction. But the southwest wind is the chief rain bringer. The others may be called with reference to Ontario, local. The southwest wind brings moisture to the whole northern hemisphere.

TREES BY THE ROADSIDE.

Premiums have been very properly offered here, in a Bill just passed through Parliament, to those farmers who shall plant and maintain in growth certain descriptions of trees. The Bill refers principally to lines of trees set along the highway and the dividing lines of farms. These, or small plantations of any sort, are valuable, but by no means fulfil the functions of deep belts of forest. Their great value is, if planted over sufficient sections of country, that they preserve the land from drying winds, and in that way, if they do not, as the forest does, bring rain, they preserve the effects of rain for a much longer period. Secondly, and a very important benefit indeed, they prevent the wind from drifting the snow off the fields they inclose, and the roads bordering them. Left evenly on the ground, the snow is a vast benefit to the soil and the coming or existing plant; driven into great heaps by the wind, it not only injures both, but also renders transport over the roads difficult or impossible.

A WORD ON THE PRESENT AMOUNT OF FOREST IN ONTARIO.

It will be seen by the accompanying list that the state of Ontario, as regards possession of forest land, is as follows:—On the northeast she has a large forest, and in Muskoka and Georgian Bay District forests of some size. These are all the Province possesses to feed the streams, we may say, east and northeast of Toronto, and they largely at present perform that function. But the whole great peninsula to the west is destitute of most of the original forests on the elevated lands which gave her rivers water, and has little in the way of woods save the small reserves farmers have kept for themselves on their farms. As I pointed out previously, these are being rapidly used; one after another they fade away from the land and are not replaced. The accompanying lists will show exactly the acreage under wood still left in each county, and when we remember that but a century ago all was forest, we shall be amazed at the rapidity of destruction; and, noticing how fast the small reserve is disappearing, we shall be quite convinced that in a very few years, unless remedial measures are successfully applied, the great peninsula of Ontario—our chief territory in a farming sense—will be to all intents and purposes a deforested land. And I may here observe the fallacy of the statement sometimes ventured, "Oh, we cannot be in want of forests, there are so many million acres in Ontario, and of them only so many are cleared!" May I ask what this has to do with the question? Neither the woods of Keewatin nor Muskoka can in any degree assist the farmers of the great Ontario peninsula, from Windsor on the west to Toronto and Collingwood on the east. Nor will the small patches left on each farm assist them. They are too small and too isolated, and far too certain to vanish, to maintain the proportion of shaded land necessary for climatic influence. But these districts, it is said, give fair crops now. They do not yield so easily as once, nor is the sky so propitious now, as the careful investigations of Dr. Bryce and Prof. Dewey, some pages back show. But the great point is this,—they soon will, in all human calculations, suffer severely. Now, if the matter be commenced in time, we have yet space, before it be too late, to carry out what all civilized countries have acknowledged the necessity of and are to-day engaged in,—the work of making provision for a continuous forest area, and constant supply of merchantable timber.

Something can be done, and no doubt should be done, in certain parts of Ontario towards replanting our destroyed forests—destroyed in localities where forest, to improve climate and subserve agriculture, should especially be allowed to remain. But the great opportunity which yet remains is that of preservation. This is found to be the case in India. The Government of that great country, expending yearly its hundreds of thousands of pounds sterling for preservation and replanting, has not yet planted a hundred thousand acres, while it has improved, is improving, and has to a very great extent, already changed for the better, the character of many millions of acres of forest land. If we pass through much of the forest which Ontario still retains in governmental hands, we shall find, here and there, many a large expanse desolated by fire and growing up again, a brushwood choking itself to uselessness, covering a burnt and impoverished soil. We shall find great areas of forest the lumbermen have culled of pine and spruce, of ash and oak. Every here and there are the relics of their operations—the close hewn stump, and, a goodly distance therefrom, the great pile of decaying branches where the head of the tree had fallen; while the whole distance between, if round timber had been got out, shows nothing but a few scattered side limbs, but if square it is paved with immense pine fragments—short thick slabs whose deep clean cut show the force of the scorehacker's arm, and long lengths of those peculiar chips, slightly connected, thin and broad, smooth on one side, the depth and straightness of which show how deftly the the handler of the broad-axe has plied his unwieldy tool; and if you come near the stump, and it has been heavy timber squared for the English market, you will find in great masses, hewn off, thrown away and rotting, as much clear timber as, sold at Toronto prices, would go far towards the whole sum the lumberman will ever get for the log. The piles of *debris* are everywhere, and form a most inflammable portion of the touchwood of a forest. Then before the strong oxen could drag the great log to the river down which it had to be floated an avenue of smaller trees had sometimes to be cleared from the way, and these likewise piled in desicating heaps, their skelton branches protruding among the green undergrowth, like the ghastly relics of mortality on a forgotten battlefield, cumber the forest floor.

You will find many places where trees are choking one another for want of air and light, until in lapse of years some stronger one will tower above their fellows. You will find places where hurricanes have cut their way through the forest, and the trees lie for miles, as the ranks mown down by the mitrailleuse. You will pass the solitary bush road, the trees which once grew therein chopped right and left into the forest by the makers of the track, where they lie in a dry heap for miles on miles, forming as pretty a fire-track as one could wish to see. And everywhere you will find millions of of young trees giving full promise, if spared axe and fire, of becoming trees as sturdy as any the lumberman has carried away, but nevertheless, the impression produced on you by the whole pilgrimage will be that, if no preventive measures be used, the fire which has taken so much already will sooner or later take the rest. When one compares the state of our forests with that of those in some parts of Europe, and thinks of the long avenues of fire-breaks, the forest-rangers on the watch, the careful management, the incessant thinning and replanting, the long succession of goodly trees yearly ready for the axe, and the certainty, with equal care, of such a succession for all time to come, one is apt to think it full time that some such system were introduced here.

RAVAGES OF FIRE.

To show what loss is being incurred by the fires which run through our forests, let us take up the report of the Commissioner of Crown Lands for 1882. There are 9 reports of surveys. Let us see what they say in succession:—

TIMBER BERTHS NORTH OF FRENCH RIVER.—The greater part of my line passed through a burnt country, the fire having gone over some parts a second time. Over this burnt country all the timber has been killed."

"TOWNSHIP OF DUNNET.—Over one-half of this township has been burnt."

"TOWNSHIP OF HUGEL.—The greater portion of this township has been overrun by fire and the timber destroyed."

"TOWNSHIP OF RATTER.—About one-sixth of the township has been burnt over, all the timber being destroyed by fire."

"TOWNSHIP OF KIRKPATRICK.—Nearly the whole of the township has been burnt over."

"TOWNSHIP OF HAGAR.—Bush fires have destroyed nearly all the timber."

"TOWNSHIP OF FIELD.—No mention of fire."

"TOWNSHIP OF DRYDEN.—The greater portion of the timber has been destroyed by fire."

"TOWNSHIP OF WILKES.—Not injured by fire."

In last year's report, out of fifteen surveyor's statements eleven speak of the ravages of fire.

THE PINE LUMBER REMAINING.

The latest opinions of value procurable on this head are perhaps those given by Messrs. Drummond, Little, and others who have studied this subject, at the last year's Forestry Convention. Maine and Michigan were mentioned. At Bangor, long famed for vast lumber mills, only fourteen million feet were procurable in 1877, against over one hundred million in 1856. The whole Saginaw valley, Michigan, the very home of the lumber trade, is nearly culled. What this means may be imagined when we learn that it has been cutting with mills of six hundred million feet capacity. Their lumber journals declare that in all Michigan, Wisconsin and Minnesota—the western pine States. there is not ten years' supply with the present demand. We may, I think, consider that the demand is likely to increase, perhaps to double. With this, and especially if they have a recurrence of their terrible fires, there may not be five years' supply. Concerning Ontario, we are told that Mr. Little has consulted the best authorities, and is persuaded that in Canada (5,000, Quebec: 3,500 Ontario; N. B. and N. S. 1,500) we have but ten thousand million feet of pine, while we are at present cutting a thousand million feet yearly, leaving ten years' supply. Consider this in the same light, and look at some Canadian fire statistics further on, and we may well doubt whether we have five years' supply. In Newfoundland there is little good pine left. It must be noted that a well-known lumberman, Mr. J. K. Wood, puts the amount manufactured yearly in Canada at nearly two thousand million feet, adding to pine spruce and other woods. If we count the pine timber remaining in the States, we shall find that, after Michigan, Minnesota, and Wisconsin are exhausted, say in seven years, there will probably be twice as much, say fourteen years' supply in the other States, such as the large and slowly decreasing forests still standing in Arkansas, Louisiana, and California.

In view of these facts, let us observe what will, in a few years, be our position in Ontario, or even in Canada. We have but between five and ten years' supply. The Americans have their Southern and Pacific States as a reserve, where, though at great cost of carriage, they may obtain pine. But Ontario has no such reserve. In a few years we shall have but some districts of woodland to our north and northeast, culled of their best pine, and alternated with great sections over which the fire has swept, while the rest but wait for it to arrive, that the destruction may be complete. At one of the late forestry conventions, Mr. Thistle, a lumberman and surveyor, gave it as his decided opinion that ten times as much lumber was destroyed by fire as by the axe. Let us carry this to its conclusion. We have been exporting perhaps twenty million of dollars worth yearly. What if we have been losing two hundred millions? Is it not time—would it not pay fifty-fold—would it not still pay—to give the care to preserve our forests that Europeans give theirs? It was thought that this was a wooded country, and that there was no such danger. I would ask my readers to study the descriptions of European forestry in other of these pages. They will not be able to avoid the conclusion that, in a few years, Germany, Prussia, and other European countries will be better wooded than Canada. We will glance a moment at what is told us of the forest when the lumbermen have culled it. Here is one description by Mr. Ward, a Canadian lumberman:—"To the uninitiated traveller through the woods, after the shantymen have taken all they think worth taking, he would hardly notice the chopper had been there, except for seeing an occasional stump, a few chips, or the top of a tree." Now we will take another, Mr. Smith, in the "Flora of Michigan":—"The valuable trees were felled years ago, and the lumbermen moved on to fresh spoils, leaving behind an inextricably confused mass of treetops, broken logs, and uprooted trunks. Blackberry canes sprang up everywhere, forming a tangled thicket, and a few scattering poplar, birch, and cherry trees serve for aboreal life, above which tower the dead pines, bleached in the weather, and blackened by fire, destitute of limbs, and looking at a distance not unlike the masts of some great harbor. Thousands of such acres, repellant alike to botanist and to settler, can be found in any of our northern countries." What we had better conclude, I fancy, concerning the difference between the two, is that the second had undergone a second and yet sharper and more reckless culling, after it had passed the stage described by Mr. Ward. It is evident that the time has passed when it was a matter of choice to attend to forest preservation in Ontario. If we are to retain any, it is now an affair of immediate necessity.

In fine, if we wait longer, our forests will be gone, and can then not be renewed, except at the vast expense of time and money required in planting.

If we move energetically now, we can preserve great forests, the maintenance of which is most necessary to our prosperity, and shall also have time to plant, where no other means exist.

FOR a hard cold, with pain in the head, bones, or through the chest, take DOWNS' ELIXIR, at once and in liberal doses, cover up well in bed, and our word for it, you will soon be well.

BAD DRAINAGE.—There is nothing more productive of disease in a neighbourhood than bad drainage. Open the culverts and sluiceways and purify the locality. The objections in the human system may be remedied in a similar manner by Burdock Blood Bitters, which opens all the outlets of disease through the Bowels, Liver and Kidneys,

THE OTTAWA VALLEY CUT.

In summing up the lumber trade of last year it was said to exceed by far that of any previous season. This was caused by the early breaking up of the ice, steady flow of water, brisk demand and long open season. This supplied the mill owners with plenty of water and opportunity to get their logs down, which was all they wanted for a good season's harvest. Favorable as last year was, it was hardly more so than this, though the season opened a little later in '83 than the previous season. Since last year, only one serious misfortune has occured; viz: the burning of Messrs. Gilmour & Co.'s steam saw mill, acerοss the river, on the evening of the 8th of August last. By this conflagration the firm lost directly in the neighborhood of $125,000, partly covered by insurance, and in addition to this large amount have lost ten weeks of their season's cut. To counter balance, in this advance, as it were, extensive improvements have been made. Mr. E. B. Eddy, whose establishments were burnt on the 3rd of November 1882, has rebuilt on a grander scale and can if he chooses double his last year's capacity. Messrs. Bronson & Weston built a new dam during the winter and made other valuable improvements. Messrs. Sherman, Lord and Hurdman erected another mill, and have doubled their capacity, while all other mill-owners added more or less to the working arrangements of their mills, The demand for lumber has been somewhat duller than last year though a larger quantity has been shipped. The piling ground has been extended and at the present time there is more lumber in the city and suburbs than at any previous time. Below will be found estimates of the year's cut by the principal mills in this vicinity, the figures being obtained after diligent search by a reporter of this paper among those who have a good opportunity of knowing the state of the trade:

Sherman, Lord & Hurdman's mill, Hull	35,000,000
E. B. Eddy's, Hull	80,000,000
Bronson & Weston's, Ottawa	60,000,000
J. R. Booth, Ottawa	55,000,000
Perley & Pattee Ottawa	40,000,000
Capt. Young, Ottawa	20,000,000
Rochester's, Ottawa	10,000,000
McLaren's, New Edinburgh	20,000,000
McClymonts, New Edinburgh	25,000,000
Gilmour & Co., Hull	40,000,000
Conroy Bros., North Shore	35,000,000
Allan Grant's South Shore	10,000,000
McLaren's Carleton Place	30,000,000
McLaughlin Bros. Arnprior	30,000,000
Gillies Bros. Braeside	35,000,000
Pembroke Mills	28,000,000
W. C. Edwards & Co. Rockland	50,000,000
McLaren & Co	65,000,000
Gilmour's Gatineau Mill	25,000,000
Hillman's Rock Cliff	4,000,000
Total	747,000,000

There are a number of other mills, whose cut could not be accurately estimated, but with the cut will doubtless equal that of last year which was estimated at 800,000,000 feet. The estimate on an average is probably lower than the actual figures, and as none of the mills have stopped running yet the quantity at the close of the season, may be much larger, as the mills cut 30,000,000 per week. In last year's estimate the production of the North Nation mill was given as 25,000,000. During the winter this mill was demolished, Mr. Edwards having decided to work the Rockland mills only.—*Free Press.*

The Coming Forestry Exhibition.

The regulations of the Forestry Exhibition to be held at Edinburgh next year state that the exhibition is intended to include everything connected with, or illustrative of, the forest products of the world, and that it will be open to exhibitors from all countries; that the enrries will close on the 1st of March, 1884, and that exhibitors will be charged 1s. per square foot of floor space. Arrangements will be made by the committee for the reception of exhibits at a date to be fixed, but all fulminating and explosive substances all dangerous materials will be absolutely forbidden to be sent. Medals, money prizes, and deplimas for exhibits and essays will be awarded by competent jourors. Contributors to the loan department are requested to communicate with the secretary Mr. G. Cadwell, 3, George IV. Bridge, Edinburgh, who will supply special forms to be filled up, The committee, it is further stated, will endeavor to obtain from the various British railway companies special terms for the conveyance of exhibits to and from the exhibition, and such arrangements as will be duly intimated to to exhibitors.

St. John, N. B.

The *News* says:—From information of a reliable character at the *News* command, it would appear that the lumber harvest for the present season will not exceed 225,000,000—a falling off of fully 33⅓ per cent from the usual crop. The above quantity is made up as follows:—Upper St. John 15,000,000; Aroostook 40,000,000; Tobique, Meduxnakeag and other streams, 25,000,000; Nashwaak 20,000,000; St. Croix, 15,000,000; Bay of Fundy, 12.000,000; Miramichi (N,W. & S.W. branches), 80,000,000; scattering lots on north shore. 18,000,000. Total, 225,000,000. Last season, 358,000,000 comprised the total output. In 1874, 389,000,000 of spruce were cut in this Province and Aroostook, Maine, townships, which was almost entirely handled by provincial operators who in recent years have almost monopolized the rich Aroostook log aroas.

Joinery in New South Wales.

There are in this colony, says a contemporary, several large joinery works, fitted with the best labor-saving machinery and the most modern appliances used in the trade. The establishments of Messrs. Hudson Bros., Messrs. Goodlet & Smith, and Mr. John Booth, at Sydney, employ a large number of hands to meet the requirements of the colonial contractors. At Messrs. Goodlet & Smith's establishment about 100,000 feet of timber are sawn weekly, nine-tenths of which consist of colonial hardwood, cedar, beech and pine. Nearly every sort of building materials is manutactured by the firm. They have two large potteries, where sewage pipes from 3 in. to 24 in. in diameter, building and paving brick, and all descriptions of stoneware are made. The total number of saw mills, &c., rose from 112 in 1871 to 213 in 1880.

Submerged Forests.

The Mississippi river runs through a delta of made soil from Cairo to the mouth, 180 miles below New Orleans. This has all been formed by deposits of silt, or soil from the upper rivers, Close geological explorations disclose the fact that for hundreds of miles through these deposits, immense forest trees are buried, one over the other, with interspaces of sand. Ten distinct forest growths have thus been observed which it is thought have succeeded one another. Of those known as the baldheaded cypress, some have been found more than 25 feet in diameter. One contained 5,700 rings. In other cases huge trees have grown over the stumps of others exactly as large. Taking these facts for data, the antiquity of the whole is estimated at 100,000 years, or an age of ten thousand years for each forest.—*Lumber World.*

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., wil send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

ANOTHER WITNESS.—A. Chard, of Sterling, testifies to the efficacy of Hagyard's Yellow Oil, which he used for a badly injured knee joint. It is now the great household remedy for inflammation, pain, soreness, lameness, etc., and is used both internally and externally with infallible success.

A WRONG OPINION.—Many a dollar is paid for prescriptions for some disease that never troubled the patient, and when the sole difficulty was worms, which a few of Freeman's Worm Powders would remove. These Powders are pleasant, safe and sure, contain their own cathartic, and are adapted for children or adults.

A WONDERFUL RESULT.—A single bottle of Dr. Low's Pleasant Worm Syrup has frequently destroyed from 100 to 200 worms. It is pleasant to take—no other cathartic being required. Tape worms have also been removed by it, of 15 to 35 feet in length. It is effectual for all varieties of worms afflicting both children and adults.

Market Reports.

TORONTO.

From Our Own Correspondent.

Nov. 23.—The lumber trade in this city is at the present time exceedingly dull, at the retail yards men and horses standing idle, and, as a necessary consequence, wholesale dealers are in about the same depressed condition. Retail men say, as a matter of course, as we are unable to sell it is useless to buy, and by the time the plasterers' union and the masters come to an arrangement the winter will have settled the difficulty for them, so far as this season's work is concerned. There are still some shipments being made from the docks, which may, if the weather keeps fine, continue to the end of the month. I will then endeavor to give you the total amount of shipments for the season or as near as it is possible to collect them.

The amount of lumber arriving by rail is quite small and the roads dependent on the lumber traffic for a large portion of their earnings will make a poor showing for the remaining portion of the year, and before the end of the coming year, 1884, I venture to predict, without laying claim to the title of prophet, that the petty question of charging one dollar for shunting cars to the various sidings within the city limits, will be overlooked by the more serious and imperative considerations of how to make both ends meet. The mileage made as lumber earnings by the roads mainly dependent on that industry have not come nearly up to the expectations formed at the commencement of the season, so that some idea may be easily formed as to the result of next season's earnings now that the banks have declined to advance to mill men to enable them to stock up for the next season's cutting. The number of manufacturers who are able stock up independently from outside assistance are extremely small, and north of this place the largest operators have their mills situated in positions where the water routes come into competition with the rail traffic and the wants of the western trade will be mainly filled by the water routes from the places indicated. Through overgrasping the railway companies have lost the bulk of this western trade never to return again. Now to come to the small operators, denied that assistance from the banks extended to them in former years, they can only produce to a limited extent, and, in numerous cases, not at all, so that the amount of decrease in the lumber carrying trade for the season of 1884 may be safely set down as not less than 50 per cent. of that of the present year. This may be a blessing in disguise, time alone can determine that.

Prices at the yards are nominally the same, at all events so far no cutting in figures that would justify me in altering previous quotations:

Mill cull boards and scantling	$10 00
Shipping cull boards, promiscuous widths	14 00

MONTREAL.

From Our Own Correspondent

Nov. 24.—As the dullness consequent upon the coming of winter is again upon us, business has been pretty slow for the past two weeks. Navigation is now closed for this year and nothing but a retail trade is looked for till spring. During the year business has not been considered satisfactory and not equal to last year's, for, although a good deal of lumber has been moved, prices have not left so much margin. We have again to notice an advance in the price of laths, which are selling at $2.00, but $2.25 is expected to be the price in future. The work on the new lumber basins on the canal has ceased for the season. In order to facilitate business the G. T. R. Co. are thinking of bringing their track down William street in front of the new basins, which will be of immense benefit to the lumber trade. With the exception of laths our quotations ex yard are unchanged:—

Pine, 1st quality, ₩ M	$35 00@40 00
Pine, 2nd " ₩ M	22 00@24 00
Pine, shipping culls, ₩ M	14 00@16 00

CORDWOOD.

The weather for the past two weeks has been very mild and there has been very little demand for wood, but prices, though unchanged, are firm, and are quoted ex cartage as under:

Long Maple	$ 6 00
Short "	5 50
Long Birch	5 50
Long Beech	5 00
Tamarack	5 00

SHIPMENTS.

The shipping season is now over and we expected to have been able to give the totals of shipments both to South America and Britain, the latter we cannot give till next report. The exports by the Export Lumber Co. from the St. Lawrence to the River Platte during 1883 were as follows:—

Pine	12,438,647
Spruce	6,330,005
Ash	10,000
Total 1883	18,778,652 feet
1882	21,419,827 "
1881	16,147,911 "
1880	10,420,080 "
1879	12,476,150 "
1878	10,855,246 "
1877	8,787,928 "
1876	3,437,000 "
1875	10,123,000 "
1874	16,262,293 "
1873	36,073,919 "
1872	28,234,968 "
1871	16,005,935 "
1870	25,115,183 "

LIVERPOOL MARKET.

The consumptive demand for the month of October was considered satisfactory, but great caution is recommended on the part of shippers here, owing to the shadow hanging over the political atmosphere. Spruce deals from St. John, N. B., sold at £6 15s. per standard, ex quay, and in some instances a little more was obtained. The following are quotations for Quebec pine deals, &c.

DEALS.

		£	s.	d.	£	s.	d.

MUSKOKA.

Nov. 14.—The weather in this district has been very wet for some time past. Smith river is much higher now than it was last spring, and is a very great hindrance to improvements in the rapids and shoots of that stream.

Mr. David Moore has a gang at work here who seem to progress notwithstanding the great floods.

There is a considerable amount of lumbering carried on here. Mr. W. Allen is getting out a large raft of square timber, and he has now two shanties at saw logs. He will fill the river himself. He cuts his lumber in the township of Hemsworth. Mr. P. H. Colton is a piece further up the river in Laurier, cutting and making square timber, which promises to be a superior article.

Mr. David Moore is getting out a raft in the Township of Gurd, which no doubt will be a large one. The Messrs. McLean are cutting logs still further up; also Messrs. Sereny and Fraser at saw logs, and a concern from the Georgian Bay, the Boyd Bros. are making a great raid on the pine up South River. There is scarcely any red pine in this locality. Settlers are still shoving in from the outside world, and commencing a life amongst the maples. In some places here they have to build the walls of their house with maple, for want of small pine or any other sort of soft wood. Snow fell yesterday and last night about eight inches, which will probably compel the runners to take the place of wheels and will be a godsend to the horses of this country.—*Ottawa Free Press.*

BOSTON.

Cotton, Wool and Iron of Nov. 24, says:—There is no particular change in the market, but a little lull is noticeable, probably preparatory to arranging business on a winter basis. Arrivals at the roads have been large in view of the advance in freights, but mainly it is believed on orders. Western pine of medium and choice grades holds steadily, with dry stock quite firm. Eastern lumber is steady and in fair demand. Southern pine moves along at just about previous prices, with orders mainly for small lots. Good desirable walnut sells quite well, as does also ash. Whitewood moves slowly, with an over supply. Oak is rather dull. Really choice select cherry finds a ready market. Clear maple for flooring is in request. Clapboards are going well. Laths continue pretty firm as yet, but the supply is improving.

CHICAGO.

The *Northwestern Lumberman* of Nov. 24th, says:—The sudden termination of active shipping operations on the lakes, consequent on the disastrous gales last week and the week before, has given a quiet appearance to the market docks the present week. The total of cargo arrivals for the week ended Wednesday was but 64, the larger proportion of which went directly to the yards. The lumber coming to the market has been largely inch stuff, mostly green, and has sold at prices a shade stiffer than values prevalent before the great blow. There has been nothing like an assortment offered, and few buyers could get what they wanted, and purchases have been made by those who needed what was offered to patch out stocks for the winter, and have been willing to forego insisting on concessions for the sake of getting the lumber. The season is acknowledged to be closing. Not much more lumber will be offered on the market, and dealers who lack anything in stock will have some difficulty in laying it down. A number have dry lumber over the lake to come forward, and were counting on a continuance of navigation season to get it over here, and now find themselves in rather bad shape. The demand for dry common stock is so active, and it is generally so meagre in supply, that the difficulty of procuring vessels to bring over the little remaining at east shore ports is likely to be seriously felt.

OSWEGO, N. Y.

From Our Own Correspondent.

The receipts of lumber since our last have been very light, lake rates having advanced beyond the views of dealers. Vessels are now fully occupied in the grain trade. Canal shipments have about ceased. Sales have been very light for the past week; collections have been good. The stock is ample for winter trade and holders are firm at the prices named in our quotations. Receipts for 1883, 180,000,000 feet, for 1882, 207,000.000 feet.

LEITH.

The *Timber Trades Journal* of Nov. 10, says: The only arrival of importance during the past week is the Nicksburg, from Quebec, for Messrs. Park, Dobson & Co., with an assorted cargo of waney yellow pine and American hardwoods. This will be the only importation of American goods to this market during the autumn, thus showing that the demand for waney yellow pine in this district is light, though, of course, it must be taken into consideration that pitch pine is in many instances used where previously nothing but waney pine was put in. No sales by public auction have taken place during the past week; several, however, may be expected about the end of the month. The demand for Baltic goods is fair and prices are being maintained.

LIVERPOOL.

The *Timber Trades Journal* of Nov. 10, says: The import during the past week has again been moderate, and the quays are beginning to wear a bare aspect compared with the busy and overcrowded condition which they have shown for some time. The deliveries appear to be large, and this points to an amount of business doing that can only be characterized as being large, at the same time it is very doubtful whether much of it is of a profitable nature to the dealer.

Prices of all kinds of goods remain unchanged, which may be attributed to the fact that the unsatisfactory state of the staple manufactures of this neighborhood continues in a languid

condition, and hence the consumers are inclined to go on purchasing only for their immediate wants, so long as the market here remains in its present steady position, rather than lay in stocks and hold them, with their accumulating charges of interest, rent, and other expenses.

Spruce deals show no further advance in price, at the same time shippers appear to have confidence in the future, and are looking forward to an increase in prices.

On Wednesday Messrs. James Smith & Co. offered by auction a cargo of Bathurst pine and spruce deals now landing, and a cargo of sawn pitch pine timber and planks about now due, together with sundry other parcels of wood in store.

The attendance of buyers was very meagre, and there was no bid for any portion of the deals in the former cargo, only a few spruce deal ends being sold at £5 7s. 6d., and pine deal ends at £5 per standard, and of the pitch pine cargo only about twelve lots found buyers at from 15½d. to 17½d. per foot.

GLASGOW.

The *Timber Trades Journal* of Nov. 10 says: Transactions during the past week by public auction have been to a fair extent, as will be observed from the statement under noted. At the sale on the first inst. (Messrs. Edmiston & Mitchells, brokers) a good company was met, and a large quantity of square timber and deals changed hands, a portion of the catalouge being exposed without reserve.

With reference to the American pine wood trade it is to be noted that stocks are certainly accumulating, and prices over all are rather lower. Deck plank wood is not moving off so freely, as fewer new shipbuilding contracts are being made now in this district.

On 1st Nov., at Greenock, Messrs. Edmiston & Mitchells, brokers :—

		Per cub ft
Quebec waney boardwood—		
59 c ft av per log		1s 6d

9 to 18 ft	6/21×3	9d
Do. 4th pine deal ends—		
6 to 8 ft	7/17×3	7d

On 6th Nov., at Glasgow, Messrs. Edmiston & Mitchells offered some States black walnut, and sold a few lots (av. square 15¾ in.) at 3s. 10d. to 4s. 3d. per cubie foot.

LONDON.

The *Timber Trades Journal* of Nov. 10, says: The tone of the timber market is undoubtedly bolder than it was a short time ago. People give a favorable opinion of the future without fear of being heard with sneers or met with smiles, for the belief is becoming pretty general that affairs are mostly on the mend. If they do not actually advance, the time for making concessions in prices has evidently passed, and those who hold good stocks can sooner or later depend on getting their price, if they do not look too high,

No attempts on the Stock Exchange seem to succeed in making money dearer, and when this latter commodity is cheap trade ought to flourish. Neither is there any excess of imported timber as yet in the country to make its weight felt. The supply has been plentiful, but so have the deliveries to the consumers, and few seasons have perhaps shown a steadier demand throughout than that which is now hastening to its close. There has been a good deal of bad business doing among builders, and the suspension of some large firms has stayed the hands of many smaller ones, which reflected unfavorably on the timber merchants, but there has been so much good and legitmate business done that the other was only a drag on the wheels of the

THE AUSTRALIAN TRADE.

Messrs. N. Roberts & Co.'s report on the timber trade of Melbourne, just received, under date September the 19th, says :—Timber continues very dull, and we have no hope of an improvement unless shipments should prove to be very moderate indeed.

The arrivals of flooring boards have been excessive, and as importers show no inclination to hold, prices are declining. Red deals.—Imports "nil." The cargo ex Monarch, which has been in store for six months, was sold on 10 inst. by auction, at an average of 5d, per foot 9x3, and to day several parcels of deals ex London vessels were sold at an average of 4d. per foot 9x3. Russian deals ex Noel a few were sold at 5 5-16d. for deal sizes, and 4 5-8d. for battens. As the stocks in hand are very large the prospect for cargoes arriving is not a good one. Spruce deals.—Imports, 3,453 pieces. The parcel ex Scottish Prince from Boston was sold at from 4¾d. to 4d. per foot 9x3, ex Freeman from Boston, deals 11x3 fetching 4⅝d, to 4 1-16d. The bidding for 9x3 being only 3½d. they were withdrawn from sale.

Under date Sydney, August 23rd, the report says :—The unsatisfactory position of Scotch and Baltic timber, reported for some time past still continues, and the sales during the month are unimportant. In American timber there is a good demand for redwood, both rough and dressed. On July 25th, at auction, the following prices were realized :—Spruce deals, 3x9 to 11, 12s. 9d. per 100 ft. ; white lining, t. g. & b., 6x½, 10s, ; Baltic, t. & g.. 6x¾, 13s., 8x¾, 13s., chamfered weatherboards, 6s. 6d. ; red Baltic doors 6 ft. 6x2 ft., 6x1¼, s. m., 6s. 9d., 6 ft., 6x2 ft., 6x1½, 8s., 6 ft., 6x2 ft,, 6x1½ d, m., 9s. 3d. On the 1st inst, Baltic deals sold at 13s. 6d. to 17s. 6d. ; spruce deals, 10s. 6d. to 10s. 9d. ; white Baltic flooring, 1¼x6, t. & g., 20s. On the 8th inst., t. g. & b, white lining, 6x½, 10s. ; white laths, 6 ft., 4s. 3d., 4½ ft. 3s. 9d. ; Baltic deals, 7x3 13s. 3d., 8x3 13s,

QUEBEC CULLERS' OFFICE.

JAMES PATTON,

Quebec, Nov. 23. Supervisor of Cullers.

RAFTS ARRIVED.

The *Chronicle* gives the following list of rafts, etc., arrived at Quebec :

Nov. 15.—Price Bros. & Co., pine lumber, Town Wharf.

O. Latour (2), white pine, &c., Cap Rouge.

B. C. L. & T. Co., white pine, &c. St. Michael's cove.

S. J. Bennett, deals, &c., Mill cove.

Cook & Bros., white pine, &c., St. Michael's cove.

J. J. Calvin & Co. (2), oak, &c., sundry coves.

Stokes & Son, staves, Bowen's cove.

Price Bros. & Co., deals, Trois Saumons.

Ross Bros., deals, Montreal.

Lumber Yards on Fire.

OSHKOSH, Nov. 15.—The lumber yards of Stanhiller, Arnos & Co., and A. D. Peck caught fire this evening, and a fire broke out in the Morgan block near by. The flames got beyond control, and the Mayor telegraphed to Fond du Lac for aid. It burned over a large territory and consumed a large amount of lumber, G. W. Pratt's yard was consumed. Their loss is $75,000. The other losses are unknown.

Canadian Timber Sales.

The *Ottawa Citizen* says :—One of the best sales in timber this season was that made recently by Messrs, Barnard & Mackay, of Pembroke, who disposed of a white pine raft consisting of 24,000 sticks to Dobell & Co., of Quebec at 29⅓ cents per toot.

New Brunswick Lumber.

The St. John, N. B., *News* reports that the lumber harvest for the present season in that province will not exceed 225,000,000 feet, a falling off of fully 33⅓ per cent. from the usual crop. The total is made up as follows :—Upper St. John, 15,000,000 ; Aroostook, 40,000,000 ; Tobique, Meduxnakeag, and other streams, 25,000,000 ; Nashwaak, 20,000,000 ; St. Croix, 15,000,000 ; Bay of Fundy, 12,000,000 ; Miramichi (northwest and southwest branches), 80,000,000 ; scattering lots on North Shore, 18,000,000.

WISE people are always on the lookout for chances to increase their earnings, and in time become wealthy ; those who do not improve their opportunities remain in poverty. We offer a great chance to make money. We want many men, women, boys and girls to work for us right in their own localities. Any one can do the work properly from the first start. The business will pay more than ten times ordinary wages. Expensive outfit furnished free. No one who engages fails to make money rapidly. You can devote your whole time to the work, or only your spare moments. Full information and all that is needed sent free. Address STINSON & Co., Portland, Maine.

SAW MILLS!

Having POLE ROADS to their Timber keep up the Mill Stock and run the year round.

Pole Roads are Cheap, Durable and Speedily built. The Cars can be built by any handy man in a couple of days, and will carry 2,000 feet of Hardwood Logs at a Load, drawn by one Span of Horses.

The Wheels are adjustable on the Axles to accommodate themselves to any bend in the poles.

The Iron Work complete, including Bolts and Washes, with a diagram of Car, are supplied by the undersigned. Prices on Application.

As to cost and utility of Pole Roads we will refer without permission to E. WATT, Gesto, P.O.; W. EDGAR, Kilroy, P.O.; DUNSTAN & IRWIN, Essex Centre, and JAMES NAILOR, Oil City, who are now running respectively 10, 8, 5 and 3 miles, and are stocked with our Cars.

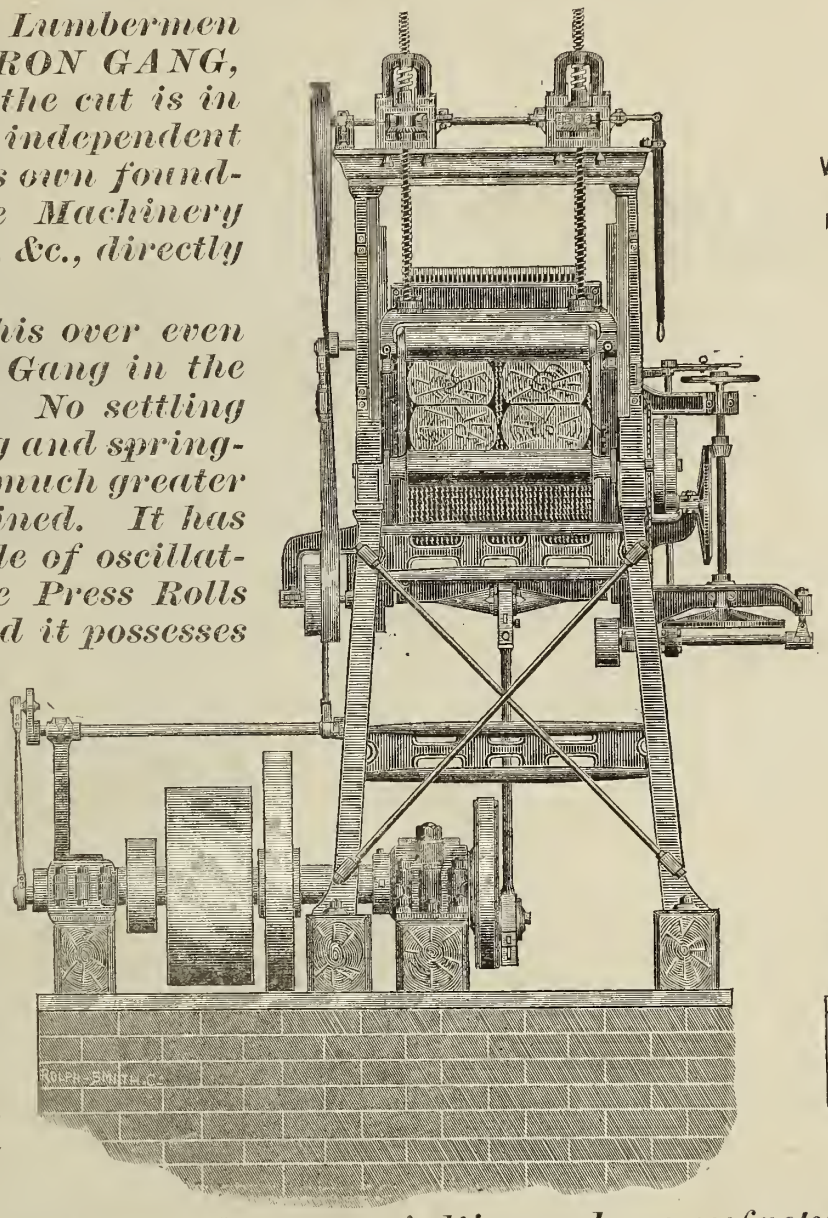
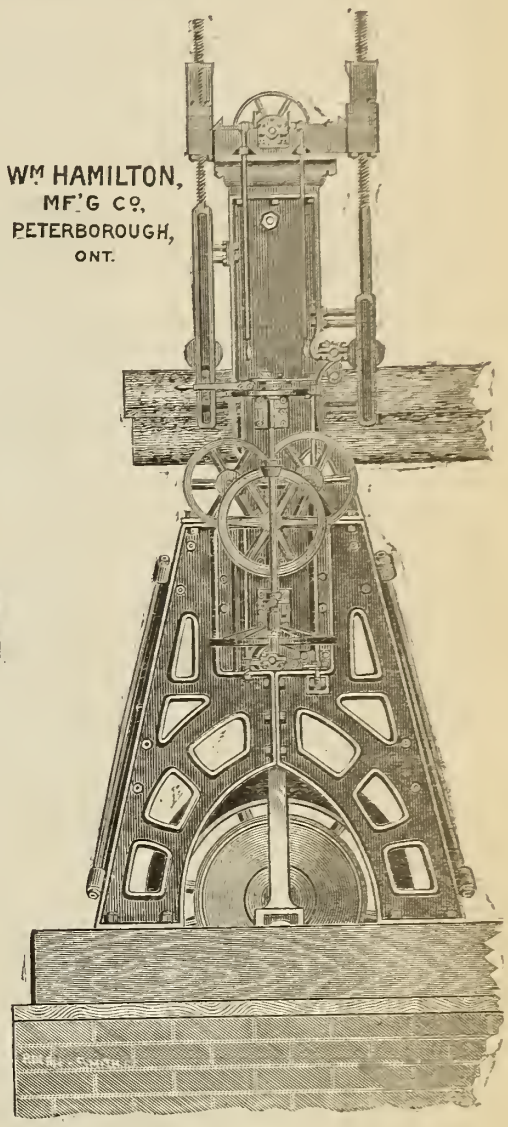
Saw Mills and General Machinery

PETERBOROUGH, - - - ONTARIO.

We introduce to the Lumbermen of Canada our New IRON GANG, which will be seen by the cut is in itself a complete and independent Machine, resting on its own foundations, having all the Machinery for operating, feeding, &c., directly attached.

The advantage of this over even a well built ordinary Gang in the mill frame is evident. No settling out of line, no yielding and springing of timber, while a much greater working speed is obtained. It has the most improved style of oscillating motion, it has the Press Rolls operated by power, and it possesses generally all the good features of best American Gangs, with heavier frame work and heavier shafting, all with a view to rapid, steady & correct working. A good look at one of these massive machines satisfies the sawmill man that they are in every way capable of continuously performing heavy duty throughout the season.

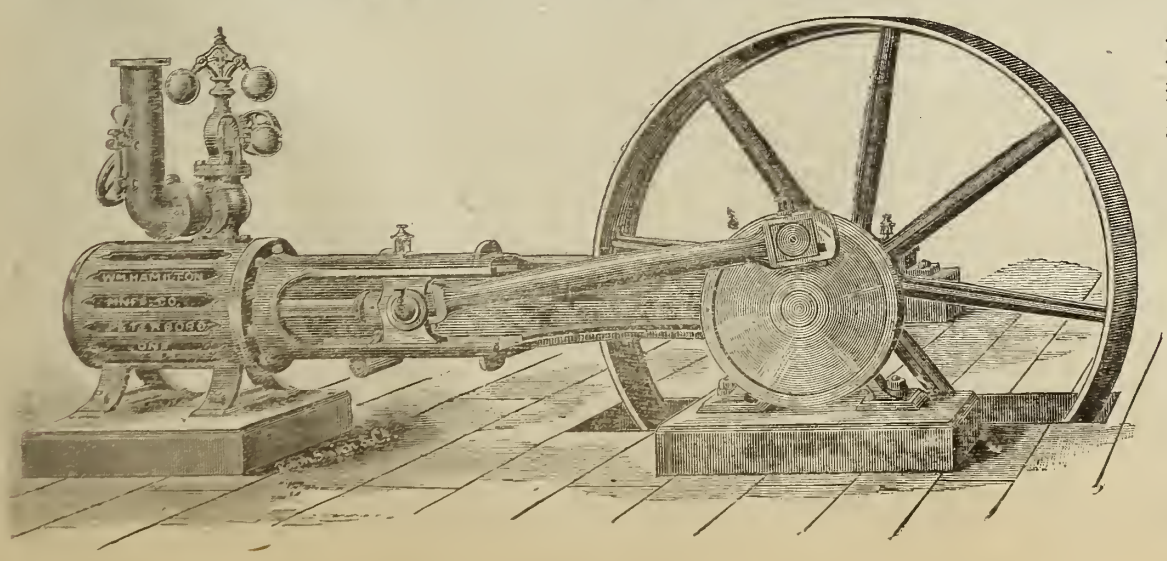




☞ *We make these Gangs one of our specialties and manufacture them of different sizes.*

—ALSO—

ENGINES AND BOILERS.



This cut represents our **SAW MILL ENGINE**, of which we make the following our Standard sizes, 12x16, 16x20, 18x24, and 24x30, built Strong and Substantial for Heavy Work. The Piston Rod, Cross-head Pin, and Wrist Pin, are made heavy and of the best steel; the Connecting Rod has solid ends and is tightened up by screw and wedge, avoiding all danger of keys getting out; the Slide Valve has a simple balance valve, requiring no attention from the Engineer, as it is self-adjusting. The Engine Shaft and Fly Wheel made very heavy. Belt Pulleys put on when required in place of Fly Wheel, and all regulated by the Judson Governor.

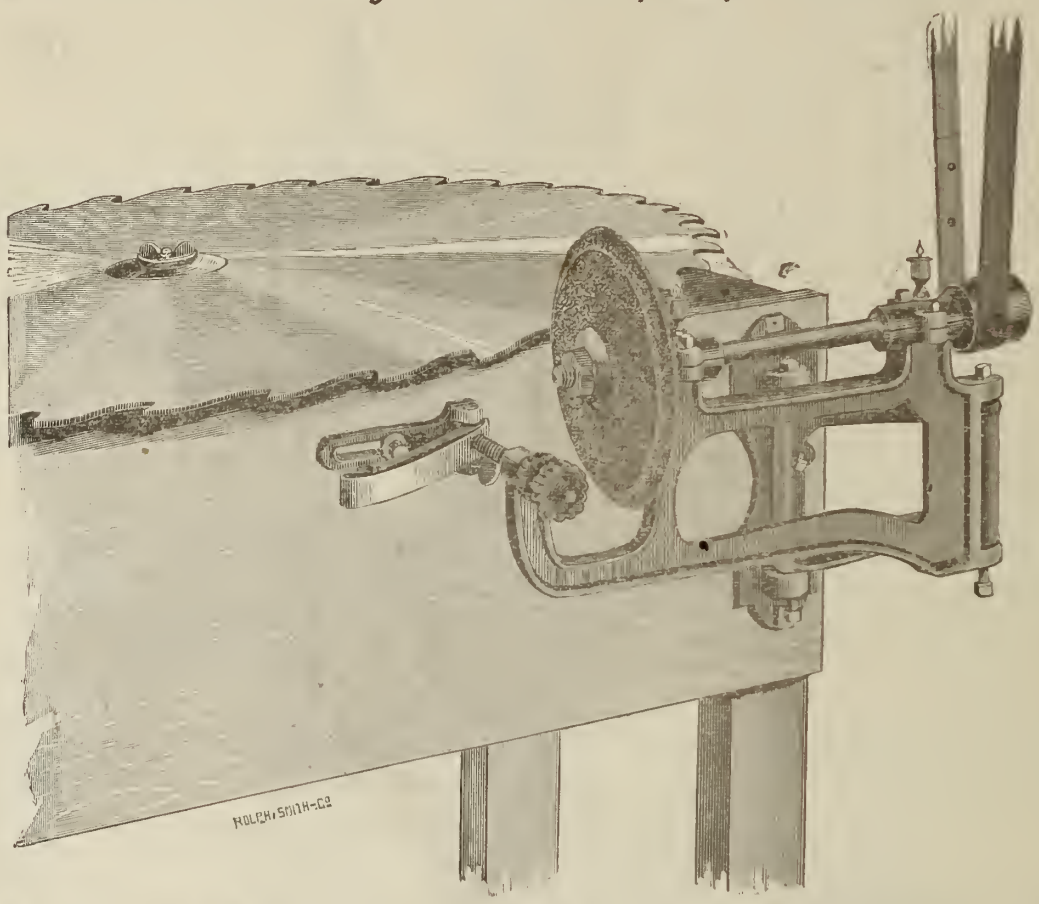
ROGERS' PATENT
SAW GUMMER and SHARPENER

The Handiest Machine for these purposes ever Invented.

Won't Heat!

Cheap!

Very Simple!



Accurate!

Works Fast!

Complete!

Lumbering Season, 1884

Saw Mill Owners in providing for the season of 1884, ought not to lose sight of ROGERS' SAW GUMMER for it will save them more money in proportion to the amount invested than any other machine.

Only $30, including Emery Wheel; Table and Countershaft, $10 extra.

A few of ROGERS' SAW GUMMERS were put on the market last season, and we quote some of the commendations received:

JAS. HADDEN, Foxmead, says:—
"Your machine is all I expected."

CHAS. ANDERSON, Anton Mills, says:—
"I have given it a good trial, and am well pleased with it. 'I find it is one of the indispensables in a saw mill." * *

ROBT. R. WEIR, Orillia, writes:—
"It works like a charm, and is very accurate in its work."

CRONE & PATTON, Hoc Roc Mills, Gravenhurst, says:
"The Rogers' Saw Gummer purchased from you gives "good satisfaction, * * it cannot be beat.'

D. DAVIDSON, Pentanguishene, writes:—
"We are well pleased with the Gummer."

W. W. BELDING, Wyevale, writes:—
"I have the Gummer running and it is giving good "satisfaction."

FOR THE

Canada Lumberman

FOR THE FOLLOWING REASONS:

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

☞TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

THIN

SOLID SAWS

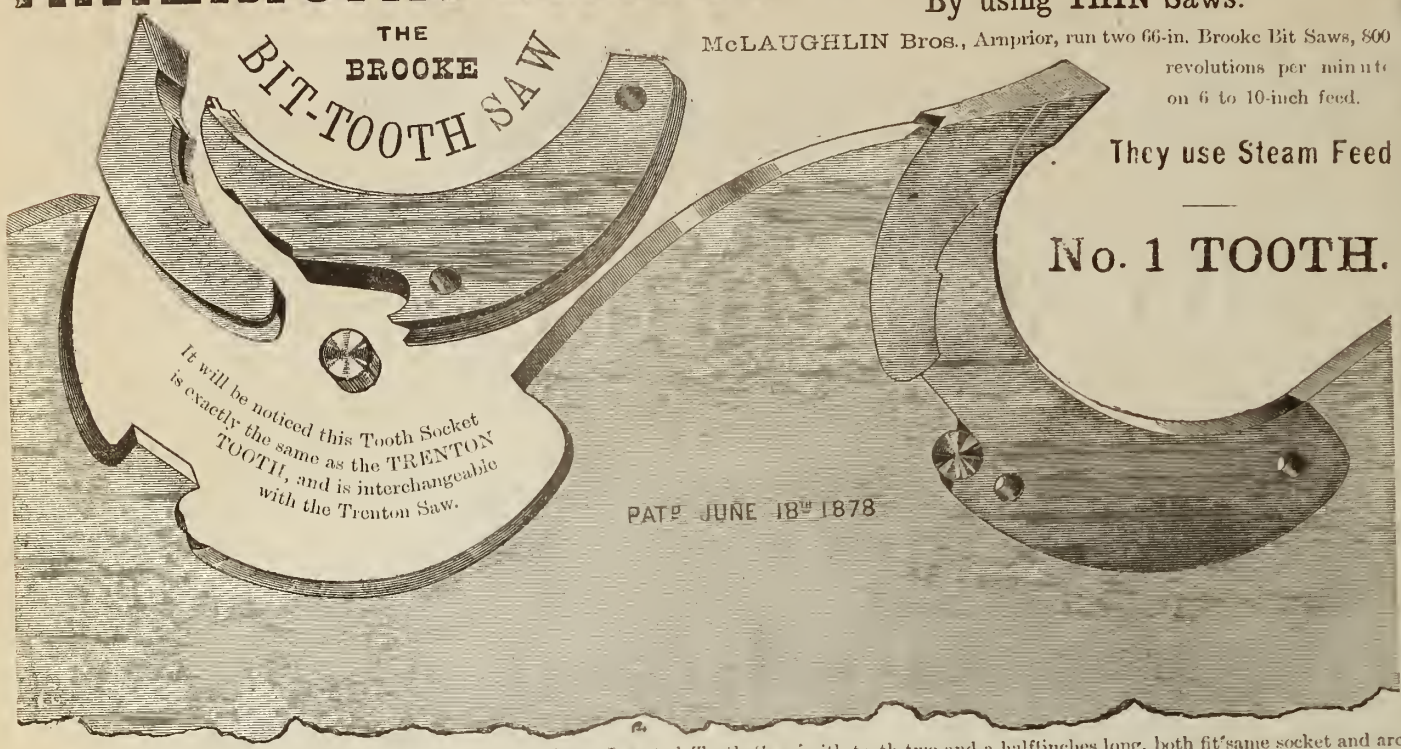
SAVE YOUR TIMBER

By using THIN Saws.

McLAUGHLIN Bros., Arnprior, run two 66-in. Brooke Bit Saws, 800 revolutions per minute on 6 to 10-inch feed.

They use Steam Feed

THE BROOKE BIT-TOOTH SAW



No. 1 TOOTH.

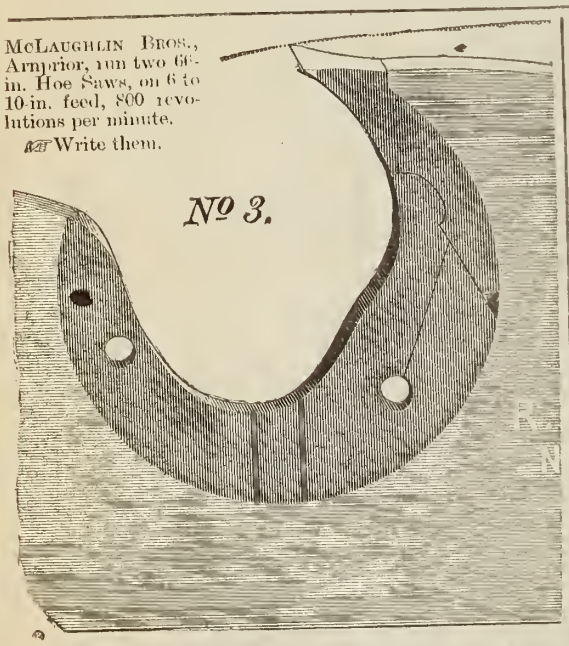
With this Saw you have either a Bit Tooth Saw or ordinary Inserted Tooth Saw, with teeth two-and-a-half inches long, both fit same socket and are interchangeable in a few minutes. These Bits require no gumming, and very little filing; are so firmly held that they will stand all necessary swaging, and can be worn down to dotted line shown in cut: they rest on lugs, saving the strain on the rim of the saw. For these reasons they will cut more and better timber at less cost than any other tooth. EXTRA BITS (per 100) No. 1, $9; No. 2, $8.—(per 1000), No. 1, $80, No. 2, $70.

Two sets No. 1 Bits have cut 500 m. feet pine, in 60-inch saw, running 800 revolutions per minute, on 6-inch feed. E. E. PARSONS, Arnprior.

We run 60-inch to 72-inch Solid Saws, as thin at center as 10 guage at rim—saving, over a 7 guage saw—1000 feet of lumber in every 25,000 cut.

McLAUGHLIN BROS., Arnprior, run two 66-in. Hoe Saws, on 6 to 10-in. feed, 800 revolutions per minute.

☞Write them.



HOE'S PATENT BIT SAWS.

One of the best Bit Saws made, above cut represents usual size tooth one size larger and smaller made. ☞Send for particulars and prices.

GROW RICH

EMERSON'S EXTRA THIN SOLID SAWS

Having special facilities for the manufacture of extra thin saws for board mills, we are prepared to receive orders for Circular Saws as follows:—54 inches in diameter, as thin as 12 guage at rim and 11 at center, 54 to 56; 11 guage at rim, 10 at center, 66 to 72; 10 at rim, 9 at centre. Our unparelleled success with thin saws during past few years has induced us to recommend them to our customers. Our superior facilities are:—1st, Evenness of Temper; 2nd, Perfect Accuracy in Thickness, Saw balances perfectly; 3rd, Properly Hammered, to have equal strain in all its parts and at same time run true. This department is under the special supervision of J. E. Emerson, who has had 30 years experience and is without doubt the most successful circular saw maker in the world.

☞NO EXTRA PRICE FOR THIN SAWS.☜

EMERSON'S LUMBERMAN'S CLIPPER SAW

Can insert one tooth for every inch in diameter of Saw.

Extra Teeth 25c each

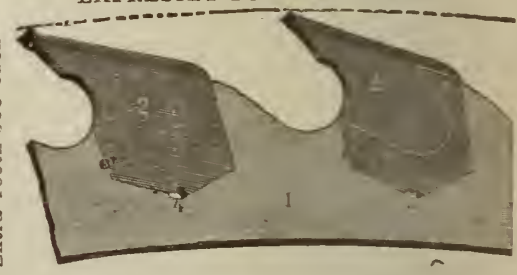
Extra Teeth 25c each

Designed specially for Thin Saws not thicker than 6 gauge at rim, or thinner than 15 guage at rim.

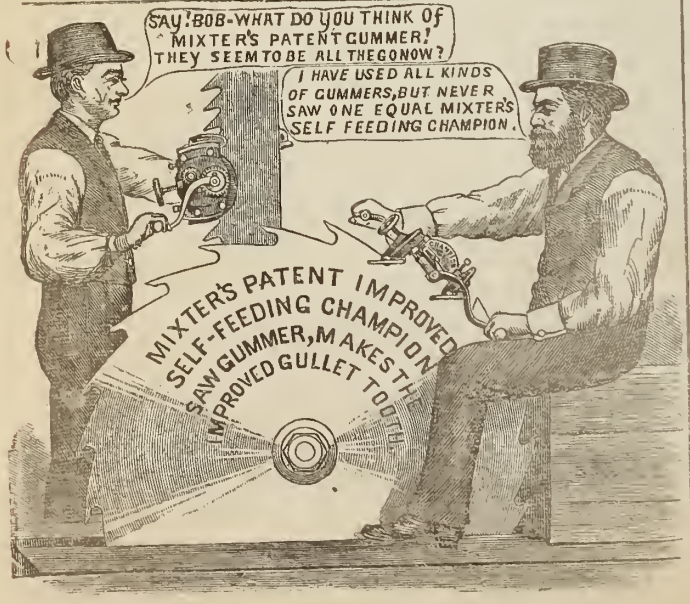
The CLIPPER FLANGE SAW

EXPRESSLY FOR HEAVY FEED.

Extra Teeth 50c each

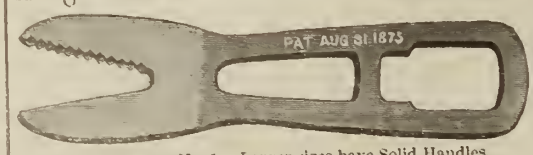


Two and a half inches long



Alligator Jaw Wrenches

5 sizes, grip from ½ to 3 inches, Iron. Solid Steel Jaw. Price 50c. to $5.50.



Cut represents No. 1. Larger sizes have Solid Handles.

VOL. 3. PETERBOROUGH, ONT., DECEMBER 15, 1883. NO. 24.

A MAMMOTH BUSINESS.

A special correspondent of the Toronto *Globe* writing from Deseronto gives the following account of the great lumbering establishment there :—

In the evening I went out to obtain an idea of the appearance of a town. which had struck me so oddly at first acquaintance, I didn't get over it ; it seemed to cover much ground. The streets run at right angles, the north and south ones terminating in a ridge overlooking the town. The buildings are very scattered, apparently quite as much so on the main street as in the outskirts. Young trees are planted along some of the streets. The residences, several of which are large and of good architecture, are of wood and very new, the town having grown up from a very small village to a population of two thousand in a few years. There are several good hotels, full of boarders, for the Messrs. Rathbun, whose lumber and other business is centered here, employ 600 or 700 men, many of them young mechanics. Progress is visible everywhere. Several commodious and even expensive churches has been erected within the last few years ; the latest, a R. C. Church, the site of which was donated by the Messrs. Rathbun, who have exercised a wise generosity in various ways in the community.

The business carried on by this firm of millionaires space does not permit me to describe. It includes the manufacture of fifty million feet of board and square lumber annually, 50,000 doors for export to Britain, ship building, shingle making, flooring, the manufacture of chemicals from wood, and of gas from sawdust. In fact provision has been made for the most economical use of all the fragments left in sawing up the the timber. The firm have also large saw mills at the Trent and near Belleville. The wood is floated down the Trent, Moira, and other rivers. In all there are nearly 2,000 men employed in winter by the firm, either in Deseronto and at the other mills along the bay, or up in the woods. The versatility of the enterprising firm is shown in other respects, for a little out of town they have a stock farm of 250 acres, on which shorthorns have been raised for a time, and latterly a fine herd of Jerseys, imported from the United States, and in charge of the manager, Mr. Howatt, a young American.

An interesting experiment, to learn the results and methods of which was my chief object in visiting Deseronto, is being conducted here in the manufacture of gas from sawdust, under an invention of Mr. George Walker, the foreman of the chemical works. Notwithstanding the extent and variety of the mills here, the quantity of wooden refuse is immensely superabundant, and how to profitably consume it was for many years a problem with the Messrs. Rathbun. The establishment of chemical works for making tar, methyllated spirits, and acetate of lime, disposes of part of the refuse, the consumption of sawdust and wood in creating steam power to work the chemical work and flouring-mill get rid of still more, but a cumbersome surplus yet remains. The material being thus almost worthless, a better place for the experiment in making sawdust gas could not well be found. Success in its fullest extent is not yet demonstrated to the satisfaction of the public, but is claimed will be in a few days when a number of the mills and buildings of Deseronto are to be lighted by the new gas, preparatory to its introduction in a general system of lighting for the whole town.

To see the appliances for manufacture, I visited the chemical works at early hour in the morning, in company with Mr. French, a young New York chemist, employed here in assisting to perfect the chemical operations. The first process in gas-making, as well as in the manufacture of chemicals, is undertaken in the end of the larger building, where the refuse of the saw mills is consumed. In this building, about ten feet below the side platforms up on to which a railway carries many steam cars and cart-loads of saw-dust, earth, and slabs every day, are four brick furnaces, and above these an equal number of large boilers. The car loads are dumped over into the great space before the furnaces from the track platform above, the wheels and gearing being kept from falling over, too, by a clamp device which holds the car on to the outer rail.

A little further on the platform stands above a sheet-iron floored receptacle, into which only saw-dust is dumped. Thence it is shovelled by a man into a box descending below the floor. Then an endless chain furnished with pails conducts the sawdust up and pours it on the top of a dryer made of horizontal iron plates, or rather flat inverted cones, raised one above the other. Steam passes up a tube in the central part of this dryer, and is distributed through the hollow of the cones. Around each cone revolves a steel bar, which for lack of a technical term to describe it, I will call a brush. From the topmost cone the sawdust is brushed over the edge, and falls upon the flat upper surface of the next lower cone, where a brush differently arranged sweeps it inward, to fall through on the third cone and be swept outward again. After passing over the hot suaface of these ten cones, and coming up by a bucket chain enclosed in a long hollow box, most of the fifty per cent. of water contained in new sawdust is gone.

From the boiler-room the sawdust is carried by a bucket across into the chemical works and droped into the range of deep iron receptacles in front of the retorts and above the front of furnaces. The close packing of sawdust several feet deep suffices to exclude the air from the retorts. Through the retorts which are horizontal cylinders, the sawdust is carried backward by archimedian screws, and discharged into an air-tight box. When this box is opened, as it is every few minutes, after turning a screw to close the pipe connected with it against the admission of air, the contents are found to be very fine charcoal, resembling coarse powder. The charcoal finds a ready market at all the powder factories.

In passing through the retort, vapor composed of various gasses is expelled from the sawdust. This vapor is conducted by a large pipe into a condensing reservoir, after passing through which the tarry fluid condensed from the vapor is set free and flows off from the end of a pipe into a large tank. Further processes, not differing in essentials from those in use in other chemical works, separate the various chemicals. The pyroligneous gas expelled from the retorts is carried by a pipe to the gas works, where it undergoes similar processes to those followed in coal gas factories. The illuminating gas thus produced is then conveyed for a storage to an immense isolated tank of 20,000 cubic feet capacity. Here, as the turpentine present interferes with the illuminating power of the gas, a light hydro-carbon is introduced from a naphtha reservoir, and the gas thus improved is conveyed to the mills and houses.

Of the quality of the gas I cannot speak definitely, as the only light burning the night of my visit was one in Mr. E, W. Rathbun's residence, and I was informed that certain little mechanical details not being satisfactory, the proper mixture of gases and an exhibition of the illuminating power of the article had to be deferred for a few days. The flame in the light which I saw was, where issuing from the burner, of a beautiful blue color, shading off into the light yellow of the flame above. This light blue color is ascribed to turpentine. and it is said interferes with the illuminating power, but is easily got rid of sufficiently by adding the napthous gas. As it was, however, I do not think that the light was any less brilliant than that of Toronto water gas. The heat thrown out by the flame was very marked. This was claimed as a merit, as the gas could be used to advantage in cooking and heating as well as for illuminating purposes.

It is proposed to light the mills, and in fact the whole town, with this gas early this winter. The charge per 1,000 feet will be the same as that charged by the Belleville Gas Company. The cost of production, the managers estimate to be almost nothing, owing to the fact that sawdust is a superabundant commodity here, and the processes of manufacture up to the time the pyroligneous gas leaves the chemical works are such as must be undergone in order to produce the other chemicals. Theoretically a share of the cost of these main processes is chargeable to the gas ; practically, however, the only expense is in the simple processes of the gas building, and interest on the investment. The chemical works are said to have cost $30,000—some say more. Any kind of sawdust is suitable for gas-making.

Messrs. Walker & French do not think the manufacture of gas from sawdust can be carried on economically except in lumber towns or in cities close to gigantic saw mills, as sawdust is a bulky product which can not be handled as cheaply as coal. To towns favorably situated, however, and to saw mills and to saw mill villages, they expect the invention to be a great boon. Wood gas, they think will pay much better than coal gas under those favorable circumstances, even where it is the only product ; and if combined with works for the manufacture of tar, methyllated alcohol, or acetic acid it would cost very little.

The manufacture of gas and chemicals is not, however, the only use to which sawdust is being applied at Deseronto, It is converted into fuel for shipment. The sawdust under the blows of a steam hammer is compressed into solid and adhesive blocks. The cast-iron moulds are so arranged as to fall into place filled, as rapidly as the hammer rises. The adhesiveness of the sawdust when thus compressed is great. The bulk is remarkably small, 60 pounds of sawdust being required to make a cubic foot of the fuel. It is proposed further to add tar to the sawdust. The fuel, it is thought, may come into extensive use ; and it is barely possible that it may even be used in the manufacture of gas for towns removed a considerable distance from lumber mills.

AITKIN, Minn., is forging ahead as a lumber producing point. A couple of years ago it was but a settlement, and now it claims 1,000 inhabitants, has three saw mills, one planing mill, while the second planing mill and a sash, door and blind factory will go up in the spring. The last accession to the saw mill is that of Messrs. Parker, Hazelton, & Co., the firm being composed of Messrs. G. W. Parker, ex-congressman G. C. Hazelton, and another gentleman named Hazelton, who resides at Boscobel, Wis. The capacity of the mill will be 50,000 feet daily, and the combined capacity of the three mills, 130,000.

THE manufacture of wood-working machinery has developed at a wonderful rate during the past ten years. Where, formerly, the business was mainly confined to a number of large concerns, there are now a great many small establishments engaged in the business. It is safe to say that no line of machinery has made greater strides towards perfection than this, and many of these small establishments will probably ere long develope into wealthy corporations. The manufacture of lumber and its subsequent manipulation, are properly recognized as among the leading industries of the United States.—*Wood-Worker.*

CONCENTRIC RINGS OF TREES.

In the December number (1812) of the *Monthly*, you published an article prepared by me, on the "Annual Growth of Trees," which has been somewhat largely commented upon, in the periodicals and press of the day, as also by the *American Congress of Forestry* at St. Paul, I am glad to note this interest in the subject, as it will cause more accurate observation of the facts in the case. As many of my critics have apparently read only extracts from the article, and have accordingly drawn very incorrect inferences as to my views, I wish to restate some of the more important points, and the evidence sustaining them.

In June of 1871 I planted a quantity of seed as it ripened and fell from some red maple trees. In 1873 I transplanted some of the trees from these seeds, placing them on my city lots in Plattsmouth, Nebraska. In August, 1832, finding them too much crowded, I cut some out, and, the concentric rings being very plain and distinct, I counted them. From the day of planting the seed to the day of cutting the trees was two months over eleven years.

On one more distintly marked (although there was but little difference between them), I counted on one side of the heart 40 rings. Other sides were not so distinct; but in no part were there fewer than thirty-five. There was no guess-work about the age of this tree. A daily record of the meteorological events for the Smithsonian Institution and Signal-Office for over twenty years, and a life long habit of daily record of all important events, had led to much care and caution in such matters. Hence, from my record, I *knew* the tree had but twelve years of growth; and yet, as counted by myself and many others, it had 40 clear concentric rings.

Here permit me to quote a few lines from the original article, which, so far as I have seen, have been entirely ignored or overlooked by all commentators: "I could select twelve more distinct ones (rings) between which fainter and narrower, or sub-rings appeared. Nine of these apparently annual rings on one section were peculiarly distinct; much more than the sub-rings, But, of the remaining, it was difficult to decide which were annual and which were not." When first cut, and while the wood was green and the cells filled with sap, these rings were very clear and plain; but as the water evaporated and the wood contracted, they showed less plainly, I have a section of it now before me, and I cannot make out clearly more than 24, where, when green, forty were clearly visible. This section was not at first so distinctly marked as a section forwarded to Professor Cleveland Abbe, of the Signal-Office, at his request; although that, when forwarded, showed the rings much less conspicuously than when fresh and green.

Mr. P. C. Smith, in the August (1883) *Monthly*, supporting the commonly received reliability of the rings, as an index to the age of the tree, refers to certain disputed corners and lines marked by hacks on trees, and the agreement of the number of the subsequent rings with the record of the surveyor. This indicates an uncertainty in the matter which is hardly receivable as scientific proof. If the record was reliable, why question the hack? If only for confirmatory evidence, how identify the one hack among the many which on old lines invariably accumulate in the vicinity of disputed lines by many resurveys? Is it not a mere assumption that the rings do indicate a like number of years; and that, as the record agreed with these rings, therefore, that hack was *the one*? Mr. Smith says, "It will be very difficult to convince an old surveyor, or an old lawyer, who has tried many of these land cases, that each concentric ring on an oak tree, at least, does not indicate a years growth only of such tree." Well, I am an old surveyor, having followed the business for upward of fifty years, and the evidence before me admits of but the one possible conclusion; and, had Mr. Smith or any other intelligent man the same evidence, I am sure there could be no disagreement between us on the subject.

The Hon. James J. Wilson, of Bethel, Vermont, an "old lawyer" and late Senator in the State Legislature, writes me, under date of August 15th, that at a trial in the District Court at Woodstock, Vermont, on a disputed line based upon a cut in a hemlock tree, a section of the tree embracing the cut was produced in court, and the rings outside the cut counted up from forty to fifty, while those on the opposite side were only nine or ten! The verdict of the court was, that "the rings were not a sure indication of the age of the tree"

Hon. Robert W. Furness, late Governor of Nebraska, so well known as a practical forester, has kindly furnished me with several sections of trees of known age, from which I select the following: A pig hickory eleven years old, with sixteen distinct rings; a green ash eight years old, with eleven very plain rings; A Kentucky coffee tree ten years old, with fourteen very distinct rings, and, in addition to these, twenty-one sub-rings; a burr oak twenty-one years old, with twenty-four equally distinct rings; a black walnut five years old, with twelve rings. Governor Furness adds that he has a chestnut of four years, with seven rings; a peach of eight years, with six rings; and a chestnut oak of twenty-four years, with eighteen rings. He attended the recent meeting of the American Association for the Advancement of Science, at Minneapolis, Minnesota, and presented this question and his specimens to the section on forestry. He reports that Professor Budd, of the Iowa Agricultural College, presented also a specimen spruce from Puget Sound, of known age, or nearly fifteen years old. The section was twelve inches in length, and on one end had eighteen rings and on the other end had only twelve. Commissioner Loring expresses the opinion that "this settled the question, that rings at all times could not be relied upon as an index of the age of trees."

Hon. J. T. Allen, of Ohmaha, superintendent of tree-planting for the Union Pacific Railroad Company, in a recent letter says:—"Any intelligent man, who has given any attention to this matter of yearly tree-growth, knows that the rings are no index of a tree's age. H. P. Child, superintendent of the Kansas City stock-yards, shows me a section of pine eight years old, with nineteen rings, and a soft maple of nearly fourteen years, with sixteen very distinct rings, in addition to which there are forty-seven less distinct sub-rings."

In conclusion, that the more distinct concentric rings of a tree approximate, or in some cases exactly agree, in number with the years of the tree, no one, I presume will deny; but that in most and probably nearly all trees, intermediate rings or sub-rings, generally less conspicuous, yet often more distinct than the annual rings, exist, is equally certain: and I think the foregoing evidence is sufficient to induce those who prefer truth to error to examine the facts of the case.

These sub-rings or additional rings are easily accounted for by sudden and more or less frequent changes of weather and requisite conditions of growth—each check tending to solidify the newly deposited cambrium, or forming layer; and as long intervals occur of extreme drought or cold, or other unfavorable cause, the condensation produces a more pronounced and distinct ring than the annual one. Query: Has a tree grown in a conservatory, or place of unchanged conditions of heat and moisture, any concoutric ring?—*Popular Science Monthly.*

HOW CREOSOTED TIMBER BURNS.

One objection which has been urged against creosoting as a means for preserving timber, in addition to its expensiveness and the difficulty in the way of thorough injection, has been the alleged inflammability of wood treated by the creosoting process. As the creosote is in the form of dead-oil or tar the burning quality of wood impregnated with it would, inferentially, be excellent. Yet it is claimed that in a recent case this theory was substantially demolished by results. An establishment for creosoting piles and planks was burned in New York a few days ago, to which the presence of creosote afforded considerable protection against the fire. The fire is thus described: The building was of pine and spruce in their natural state, except the sills, which were made of creosoted pine. The latter were set on posts and raised about a foot above the ground, so that the flames had a chance to get under them; they were charred, yet retain their form and a certain amount of strength, whereas not a piece of the untreated lumber could be found. Scattered over the premises were numerous creosoted piles and several thousand feet of plank all charred, but the pieces mostly retained their original form and a certain degree of usefullness. Where the flames could reach the comparatively uninjected heart wood, they ate into it, leaving a charred creosoted shell. In all the above charred pieces the fire went out of itself; creosoted wood burns with a dense black smoke, which has a smothering effect.—*Northwestern Lumberman.*

SAWS.

The improvements made in saws constitute one of the most important steps in modern progress. It is now practicable to run circular and band saws with a capacity of 4,000 feet per minute. Circular saws have been run in soft wood with a circumferential velocity of 9,000 feet (nearly two miles) per minute, but the difficulties, says the *Engineering Times*, of any higher rate than that we have indicated as the ordinary maximum are due to heating and trembling, especially if the parts are the least dull and unbalanced. Band saws dodge; they can be made to bear a great number of the moderate flextures required by sufficiently large wheels, and can be guided very successfully at the points of entering and emerging, but no practicable amount of skill can make them saw in absolute planes through thick and knotty wood. Circular saws heat and buckle in working, unless just enough distorted when cold to allow it. Reciprocating saws cannot work with a speed satisfactory for modern progress. The teeth of power saws may hook, and draw the wood indefinitely. Hand saws cannot be shaped for unless the cut is gauged they will take hold too rank.

The saws made by three layers, each side cast steel and the inner layer tough iron, are very serviceable. For woods of a woolly fibre, such as poplar, the teeth of the saw should be of coarse space and set, to effect a clearance and overcome its clearing properties. For cutting the harder and close-grained woods, such as oak, beech, etc., the saw should be increased one gauge, the teeth should be more upright and spaced finer, and the set also should be reduced. A cross-cut saw must be sharpened with reference to the wood, whether hard or soft. If not properly set, it is evident it will take increased power to drive it. For sharpening cross-cut saws for hard wood the file should be at an angle of 45 degrees; for medium wood at an angle of 35 degrees, and for soft wood at 12½ degrees. So much for position. There is no difference in the angle of a small or large file; difference of action in working depends on the fine or coarse cut of the file. We prefer for the purpose of sharpening a good sized file, not less than four and a half or five inches, if it is cut equally fine and sharp on the corners. The cutting angles and the tops and faces of the teeth should be beveled exactly alike, and the gullets also should be of even depth, the saw working freer and with less power if the teeth are allowed to get short and stumpy. In clamping a saw for sharpening, the jaws of the vice should be covered with sheet lead, about one-quarter inch thick. If not so covered, the saw will vibrate in sharpening, and most probably strip the file.

In setting saws with a hammer, the best plan is to fit the saw horizontally on a stud fitted in a wooden frame having a transverse movement. A small steel anvil with a beveled face should be placed at one end of the frame, and the saw traversed backward or forward for the teeth to overlap the anvil centre the distance of the set required. A series of short, sharp blows should be given to the hammer in preference to a heavy one.

For setting saws, several different machines have been patented by which the teeth may be set to a uniform level, one of which is made in the form of pliers.

The object of setting saws is to lessen friction. The reason of greater power being requisite for cross-cutting than for ripping is that the former is not parallel to the grain. In filing, the edges are, of course, beveled opposite ways. The sharp beveled edge will be outward on the side to which the tooth is bent.

In sawing a large amount of lumber, the thickness of the saw, as affecting the saving of wood, is a matter of consideration; the thinner the saw, too, the less is the power required to drive it. An objection, however, against thin saws, worked in tension is, that from their pliability the cuts are apt to diverge from a straight line. On the other hand, with a thick saw-blade, the thrust tends to bend it, whilst the pull on the thin saw straightens the blade. The thin blade in tension must be considered as preferable for hand and machine frame saws as well as band saws.

In scroll bands, the thickness and narrowness of the band permit the saw to cut out corners, and segments of circles of extremely sharp curvature.

In hand saws the teeth and blades are solid,

A great improvement in the circular saw is the application of inserted teeth, this allowing of ready renewal in case of any being broken, and that, through renewals, the diameter of the saw is not permanently reduced by the process of sharpening.

In the use of saws, care must be taken that the teeth are on the same general level; if the opposite be the case, proper action of all the teeth cannot be secured, they will become more readily blunted, and through the longer teeth being drawn more deeply into the timber than the others, they will be apt to be broken off; power, too, will be lost in driving the saw.—*Cotton, Wool and Iron.*

THE CREOSOTING OF TIMBER.

As is well known, the preservative properties of creosote are owing to its preventing the absorption of the atmosphere in any form, or under any change of temperature. It is noxious to animal or vegetable life; and it arrests all fermentation of the sap, which is one of the primary causes of dry rot and species of decay in timber. The action of creosote—says Mr. Bale, in his work on "Saw Mills—Their Arrangement and Management"—may be thus described: When injected into a piece of wood, the creosote coagulates the albumen, thus preventing any putrefactive decomposition; and the bituminous oils enter the whole of the capillary tubes, incasing the woody fibre as with a shield and closing up the whole of the pores, so as to entirely exclude both moisture (water) and air. By using crosote, inferior porous timber and that cut at the wrong season, and therefore sappy, may be rendered durable. The Bethell system of creosoting is as follows: The timber is first thoroughly seasoned and cut to the required dimensions. It is then placed in a wrought iron cylinder, fitted with doors that can be hermetically closed by means of wrought iron clamps. The air and moisture contained in the wood are then exhausted from it, and from the cylinder, by means of a powerful air pump. The pores of the wood being now empty, the preservative material (creosote oil) is admitted into the tank. When the wood has received all that it will after this manner, more oil is forced into it by means of hydrostatic pumps, exerting a pressure of 120 pounds to 200 pounds per square inch. This pressure is maintained until it appears that the proper quantity of creosote oil has been absorbed by the wood, which is determined by a gauge. Timber intended for railway sleepers, bridges, etc., should absorb 7 pounds of oil per cubic foot: and timber required to be protected against marine insects, etc., requires at least ten pounds of oil per cubic foot. The cost varies from 4d. to 5d, per cubic foot, according to the quantity of oil required.

On Thirty Days Trial.

The Voltaic Belt Co., Marshall, Mich., will send Dr. Dye's Celebrated Electro-Voltaic Belts and Electric Appliances on trial for thirty days to men (young or old) who are afflicted with nervous debility, lost vitality and kindred troubles, guaranteeing speedy and complete restoration of health and manly vigor. Address as above.—N.B.—No risk is incurred, as thirty days' trial is allowed.

BE CAREFUL WHAT YOU EAT—The best medical authorities declare that worms in the human system are often induced by eating too freely of uncooked fruit and too much meat, cheese, etc. Whatever may be the cause, Freeman's Worm Powders are speedy and safe to cure; they destroy the worms, and contain their own cathartic to expel them.

A TREELESS COUNTRY.

"I had a dream which was not all a dream?"
A great State was a desert, and the land
Lay bare and lifeless under sun and storm,
Treeless and shelterless. Spring came and went,
And came, but brought no joy; but in its stead
The desolation of the ravening floods
That leaped like wolves or wildcats from the hills
And spread destruction over fruitful farms,
Devouring as they went the works of man,
And sweeping southward nature's kindly soil
To choke the watercourses, worse than waste.

The forest trees that in the olden time—
The people's glory and the poet's pride—
Tempered the air and guarded well the earth,
And under spreading boughs for ages kept
Great reservoirs to hold the snow and rain,
From which the moisture through the teeming year
Flowed equally but freely—all were gone,
Their priceless boles exchanged for petty cash,
The cash had melted and had left no sign;
The logger and the lumberman were dead;
The axe had rusted out for lack of use;
But all the endless evil they had done
Was manifested upon the desert wasts.

Dead springs no longer sparkled in the sun;
Lost and forgetten brooks no longer laughed;
Deserted mills mourned all their moveless wheels;
The snow no longer covered as with wool
Mountain and plain, but buried starving flocks
In artic drifts; in rivers and canals
The vessels rotted idly on the mud
Until the spring floods buried all their bones,
Great cities that had thriven wondrously,
Before the source of thrift was swept away,
Faded and perished, as a plant will dis
With water banished from its roots and leaves;
And men sat starving in the treeless waste,
Besides their fruitless farms and empty marts,
And wondered at the ways of Providence!

—*N. Y. Sun.*

WOODS IN SURGERY.

Wood is being employed scientifically in surgery in a different form from ordinary splints. A foreigner has introduced wood-wool as a cheap and useful dressing for wounds, and it is being prepared extensively as a commercial staple for surgical dressings. It is finely-ground wood, such as is extensively used in the manufacture of paper. It is a clean-looking, delicate-fibered, soft, yellowish white substance, having an odor of fresh wood, and absorbs an immense quantity of liquid. The best wood-wool was found to be that which was obtained from the *pinus picea*. The wood-wool thus procured was first pressed, passed through a sieve, then dried and impregnated with a solution containing ½ per cent. of sublimate and 10 per cent. of glycerine. The advantages claimed for this dressing are numerous. It is cleanly, fresh, and of a whitish color; it is at the same time soft and delicate in texture as cotton, and "extraordinarily cheap,' The actual price is, however, not stated. It possesses some antiseptic properties naturally, has an agreeable odor, and is exceedingly elastic even in thin layers, so that bandages can be put on more lightly with this than with any other dressing. Its absorbent properties are so high that it takes up 12 times its own weight of water, so that 10 ounces of well-dried wood-wool after complete saturation attain a weight of 120 ounces.

EFFECT OF A HURRICANE.

A party of hunters who returned to Chatham last night brought very startling reports of the damage wrought by the recent gale in the forests in Chatham, this town, and in towns over the border in Maine. They saw tens of thousands of acres of valuable forest trees wholly destroyed. All of the old and a good deal of the new is practically destroyed. Where the timber is not broken it is so torn and matted in the debris as to be at least worthless. In many instances the homes of woodchoppers have been ruined and much suffering among them will ensue this winter. In confirmation of the above, J. E. Clay, representative to the legislature from Chatham and probably the largest owner of timber land in New England, telegraphs as follows: "Explorers just come in report that the havoc and destruction by the late hurricane are far worse than we had expected. The loss in Chatham alone will reach 100,000. It will take a century to fully restore our forests. The loss falls very seriously on the owners of woodlands, while the lumber business will be crippled for years."—*Chicago Herald.*

THE PROSPECTS.

The season of lumber manufacturing is rapidly closing, and probably but few of the mills will be in operation after this week, There is nothing doing in the market, says Quiz of the Saginaw *Courier*, and there is considerable uncertainty as to the future of prices for the coarser grades, in view of the action that tariff agitators in congress threaten. Fully one-half of the Michigan members manifest a disposition to crush the lumber industry of the state by unwise legislation. Coarse lumber, at present prices, and a dull market, cannot be manufactured so as to leave a reasonable profit upon the capital invested, and if prices should be reduced a couple of dollars per M. feet, the coarse grades will be left to rot and burn up in the woods, hundreds of men will be forced to seek employment elsewhere, and the production will be confined to the best grades. Should there be no agitation tending to unsettle values, it is believed there will be a good winter trade, and manufacturers enabled to work off coarse stocks now piled upon the docks, inasmuch as the impression exists that the winter will be open and mild, in which event building operations will be carried on upon a scale more extensive than usual. The stocks in the Chicago yards are estimated to be 100,000,000 feet less than at this date last season, and a comparatively small proportion of it is dry. Trade at the east is reported good for the season. There is nothing worth relating doing in shingles in the valley. In the woods the weather continues favorable for cutting and skidding, but reports indicate that operators are not crowding matters. —*Lumberman's Gazette*

The Best Time to Cut Timber.

A correspondent of an Eastern journal says: "For strength, beauty and durability, I have found August, September and October the best and Feburary, March and April the worst months to cut wood. A red maple, cut in September, will keep in a round log perfectly white and sound until the next August; while one cut in March will begin to blacken and decay by the middle or last of June. This is not copied from any scientific work, but is what I have found to be a fact by many practical tests. Gray birch cut in September will keep in a good condition until the next September if left in the woods cut in four-foot lengths; while if cut in March and left in the same way it will be nearly worthless by the first of August, at least such is the result on my land. White pine like red maple, keeps white much longer if cut in September than if cut in March, and is not injured by the worms as much. I have found that wood dried slowly in a low, cool place is better than dried quickly in the hot sun, even though cut in summer. May this not in a measure account for wood being better cut in autumn, it having the long cold winter to dry in?

Advice to Mothers.

Are you disturbed at night and broken of your rest by a sick child suffering and crying with pain of cutting teeth? If so, send at once and get a bottle of Mrs. Winslow's Soothing Syrup For Children Teething. Its value is incalculable. It will relieve the poor little sufferer immediately. Depend upon it, mothers, there is no mistake about it. I cures dysentry and diarrhoea, regulates the stomach and bowels, cures wind colic, softens the gums, reduces inflammation, and gives tone and energy to the whole system. Mrs. Winslow's Soothing Syrup for Children Teething is pleasant to the taste, and is the prescription of one of the oldest and best female physicians and nurses in the United States, and is for sale by all druggists throughout the world. Price 25 cents a bottle.

If you are troubled with a "hacking cough," Down's Elixir will give you relief at once. Warranted as recommended, or money refunded. Price 25c, 50c, and $1.00 per bottle.

How to Treat Weak Lungs--Always breathe through the nose, keeping the mouth closed as much as possible. Walk and sit erect, exercise in the open air, keep the skin scrupulously clean, and take Hagyard's Pectoral Balsam for coughs, colds, and bronchial troubles.

The Best Proof.—The Globe.—"I sell more Burdock Blood Bitters than I do any other preparation in stock," says B. Jackes, druggists Toronto. If the reader will ask any druggist in the city he will get a similar answer to his query—a proof that it is the most popular medicine for the blood, liver and kidneys known.

Railway Ties for France.

The *Minerve*, which speaks of the scarcity of timber in France being so great that iron is coming into use for railway ties, adds: "But if timber is scarce in France, it is not so in Canada. As far as wooden railway ties are concerned we are able to supply the whole of Europe. In fact, some of our business men have already had this point under consideration in so far as France is concerned."

United States Minister Foote says that Corea, Asia, is fairly wooded, and the government exercises much care in maintaining the forests. In the north there are large forests of timber.

For a hard cold, with pain in the head, bones or through the chest, take Down's Elixir at once and in liberal doses, cover up well in bed, and our word for it, you will soon be well.

A Paralytic Stroke—W. H. Howard, of Geneva, N.Y., suffered with palsy and general debility, and spent a small fortune in advertised remedies, without avail, until he tried Burdock Blood Bitters. It purified and revitalized the blood, caused it to circulate freely, and quickly restored him to health.

TRADE NEWSPAPERS.

There is now and then a person so stupid as to believe that advertisements in trade newspapers are not generally read, and that money expended in advertising this way is practically wasted. Then there is another class who, if a map, or poster is presented to them, will readily give their advertisement to help form a frame around the same. Also when the directory man comes around, they must have a card at the top of the page, or perhaps a full-page advertisement, and they are willing to pay a big price for this class of advertising. What good does it do him? None whatever, for it is not seen, and does not reach the class they desire.

Now a good trade journal, published directly in their interest, goes directly to the class of trade they wish to influence.

If a hundred men of polite address, of fluent speech and ready wit, were to call, weekly or monthly, each upon a hundred others and get the attention of each long enough to say John Smith has made a great improvement in such and such a machine, or that Jones, or Brown, at such a place, have a complete and full line of wood-working machinery, we will readily concede that the services of these one hundred men would be of great service to Smith and Jones, and great advantage to the party to whom the statement was made. The hundred men could not be employed to go from place to place—some small and distant places—and make this statement to five or ten thousand people at less than a cost of several thousand dollars each trip. All this is done by the trade newspaper at the cost of a few hundreds at the most, and the visits are made weekly or monthly as the case may be. The messenger who travels, addresses himself to to the ear, and takes the party addressed when he may have his thoughts absorbed in business or other matters; but the trade newspaper reaches the party sought through the eye, when the reader has his thoughts solely fixed on the paper before him. But those who affect to believe that there is little use in advertising urge, as an objection, that advertisements are not read. They can easily be convinced of their error in this repect by making inquiry. Let them insert an advertisement offering to purchase some article that is tolerable plenty in the market, and they will be flooded with offers to sell before the ink of the advertisement is dry. An enterprising trade newspaper, with an extensive circulation, is in a position to do the advertiser great good. In in its sphere, the trade newspaper is worth a dozen New York *Heralds* or *Tribunes*, with their circulation of hundreds of thousands, to an advertiser in whose interest the trade journal is published. A man's sign offers a mute invitation to those only who pass his place of business; his circulars can only reach those to whom particular attention is given; but his advertisement, in a trade newspaper, goes into the highways and byways, finding customers and compelling them to consider his argument.

Advertisers sometimes say "Well, I cannot afford a large advertisement, and a small one won't do me any good," Now, our advice is: Don't be afraid to have a small advertisement by the side of a large competing one. The big one can't eat it up.—*Journal of Progress.*

A QUESTION OF FUTURE COMPETITION.

The owner of an immense quantity of standing pine in Michigan is naturally interested in the effect the opening of the Northern Pacific and Canadian Pacific roads will have on the value of white pine. He propounds the question in the following terms:

"It is yet to be seen and experienced what effect the completion of the Northern Pacific and Canadian Pacific railroads will eventually have as tending to lessen the value of Michigan Wisconsin and Minnesota pine lumber; as those roads may meet us on the western prairies, and largely furnish them the lumber they require, thereby mostly excluding our pine, thus largely curtailing the area for the sale and consumption of Michigan and Wisconsin lumber. For some time past this question has met me square in the face, as an element to be considered in my purchases and sales of pine lands. Perhaps you, with your eye over the whole business horizon, can give me some light on this subject.

Without a doubt the lumber of western Washington Territory and Oregon, as well as that of the mountain regions of upper Idaho and Montana, will seek a market, to some extent this side of the mountains in Dakota, and possibly as far south as Nebraska. But this is to be said about the probability: It will be several years to come before the Northern Pacific road has a competitor in the lumber traffic from Puget Sound or the Pend d'Oreille sources of supply eastward. Until there are rival lines it need not be feared that the lumber trade of the northwest will be greatly broken into by western manufacturers. The one line cannot attend to the amount of traffic necessary to do that. Besides, if our querist will refer to back numbers of the *Lumberman*, even so recently as Nov. 10, he will see that there is an organization called the Montana Improvement Company, that has a close relation with the Northern Pacific road, and that this company will virtually control the lumber business along that line from the Dalles, in Oregon, to the eastern limit of Montana, and probably further eastward in Dakota. The traffic that this company is likely to put on the road will be all that the Northern Pacific management will want to handle, in the direction of lumber, for years to come. The Puget Sound branch of the Northern Pacific is not yet completed, and when it is the treeless grain region of Eastern Washington will need all the Puget Sound lumber that does not go by sea, for years to come. We must reflect that Washington and Oregon territories are empires within themselves, that their eastern portions are without forests, and present a vast area of good wheat and grazing land, that is bound to be settled. It will keep the eastern Washington and Oregon mills busy for years to supply this demand alone. Then there is middle and southern Idaho to be supplied from either the Pacific side, or the mountains in the northern part of the territory. It is not possible that the territory tributary to the Pacific coast supply will be so filled up with lumber within the next ten or fifteen years that manufacturers will seek a market east of the mountains.

As to the Canadian Pacific road, there is nothing to be feared from that quarter, because the Bow River region, under the Rocky Mountains, has to be reached before manufacture begins, and the prairies to the eastward, hundreds of miles in extent, must be supplied before the output will seek a market across the border, in Dakota. There is, in fact, more danger from Lake Winnipeg pine and spruce than from western lumber, from the Canadian Pacific road. But it will be a cold day when the northern Wisconsin or the northern Minnesota Lumbermen allow either the Canadian or the Pacific coast lumber to get away with the demand in Dakota, Wyoming, Nebraska or Colorado.

When we consider the eastern side of the question we must certainly conclude that there is no danger of white pine being driven out of the western field by Pacific coast or Rocky Mountain lumber. A single factor would prevent such a thing, and that is transportation. The railroad lines out of northern Wisconsin to the westward have been, and are being, constructed with a special reference to the lumber traffic. Be sure that no Pacific coast lumber will be allowed to come this side the mountains on a competitive freight rate. The Omaha "lumber line" and other railroad lines will see to that matter. The roads were built partly, or largely, to carry the white pine of Wisconsin westward, and they will do it. As for Michigan pine, the time is right here, when all that is better than common, and much of the remainder, will be wanted east of the Mississippi river. Michigan lumber will not much longer have to compete for trans-Mississippi trade. This may be considered a "too previous" proposition, but it is the most prominent feature of the near future pine problem, and one that will upset much of the calculation that pine men are now making. Men of affairs are prone to miscalculate the future. They are much given to "hindsight," and regard the forecasting of the future as visionary and useless. The lumbermen of the country are fond of recounting the marvelous changes that have taken place in the pine business within the past twenty years, but shut their eyes to the twenty that are to come. Even now selects and clears are sought after throughout Wisconsin, and even as far away as Duluth. The day is near when Chicago will absorb much of the Chippewa valley, Wis., pine that now goes westward, and the woods of north Minnesota will before long contribute to the supply of good lumber in this market. Instead of the lumber of the Pacific coast meeting white pine on the prairies and thus reducing the value of eastern lumber, there will come a time when Michigan and Wisconsin can withdraw from the trans-Missouri territory entirely, and let the Pacific long-haulers have it and welcome.—*Northwestern Lumberman.*

LUMBER SUPPLY AND ITS EXHAUSTION.

On this subject the Bay City *Lumberman's Gazette* has the following:—The opinion of men and newspapers, even those supposed to be posted on the question of the exhaustion of our timber supply, are as wide apart as the east is from the west. Some are inclined to take the government reports as conclusive, and rely wholly thereon, while others deem them completely and utterly worthless, so far as statistical authority is concerned. One writer furnishes figures to prove that a single decade is the utmost limit of the lumber business in this country if carried on as extensively as at present, unless an extensive system of arboriculture is at once inaugurated to replace the timber which is under a system of such rapid exhaustion; while others furnish figures to establish the fact that Texas alone has sufficient forest timber to satisfy the demands of the entire country for at least a century, to say nothing of the redwood forests of California, which it is again claimed have sufficient timber in a single county to prevent a timber famine until the present generation shall have passed off the stage of human activity. This subject is one which is of interest not to lumbermen alone, but to the entire population of this country and Europe. The diversified views of our contemporaries are almost as thick as the autumn leaves of the forests to which they refer, and are put forth, one is sometimes inclined to think, with about as much lack of actual fact as do the leaves of the forests lack some settled purpose in their flutterings in the wind. In order that our readers may have some idea of the diversity or divergence of opinions on the subject, we will publish the following from the Minneapolis *Tribune*. It may prove interesting to our readers, not only because of the existing difference of opinion between Major Camp and the *Tribune* itself, but because of some other suggestions which are thrown out by the former:

"The question of future timber supply is one in which not only the northwest but the entire country, is virtually interested, and during the last quarter of a century it has been at frequent intervals discussed in all its bearings, but a yet without any satisfactory solution. That the supply of pine timber in the northwest will, at the present rate of consumption, be soon exhausted, is a fact which all conversant with the situation now admit, but just how soon the end will be reached is a point upon which experts do not wholly agree. The *Tribune* this morning gives the result of several interviews with local authorities. Major Geo. A Camp, who is probably as well informed on the subject of timber supply of the upper Mississippi as any man in Minnesota, estimates the available supply in the country tributary to Minneapolis of five and a half billion feet, and thinks twenty years will see it practically exhausted. In this connection Major Camp makes the interesting and not unreasonable prediction that before the period of exhaustion shall have arrived the manufacture of paper lumber will have reached a degree of perfection which shall permit of its use for all inside finishing work in the construction of buildings, and that for heavy and outside work we shall be compelled, as all long settled countries have been, to resort to brick, stone and iron—the first two of which materials, at least, are inexhaustible and reasonably inexpensive.

There is one source of supply—and the *Tribune* looks upon it as a very important one to this section—which Mr. Camp has left entirely out of his calculations. We refer to the great timber preserve of the North Pacific coast, which is opened up to us by the construction of the Northern Pacific railway. The extent of this supply is difficult to estimate, but it is probably safe to assume that it would, if properly guarded, furnish the entire half of the United States with manufactured lumber for one hundred years after the supply elsewhere is exhausted. There are other facts which are sufficient of themselves to allay any tendency to panic during the next quarter of a century. The southern states have a timber supply which their own moderate demands in a mild climate would not consume in 500 years. This is already being made available for northern uses. Again, it is to be remembered that there is no such thing as an entire exhaustion of merchantable timber in any timbered section. Whenever the lumber supply in this northwest begins to approach extinction, prices will go up and consumption through the employment of other and lower grades and species of timber; pine will give place to less valuable varieties, and the change from the present flush times in choice building material will be gradual, and not abrupt. Just how much importance is to be attached to the growing of timber is yet a question, and in any case a question in which future generations, and not the present will be mainly interested.

SOUTHERN PINE.

The Chicago *Northwestern Lumberman* says: A writer to a newspaper over in Michigan deprecates the southern pine boom on account of the immense quantity of it abounding in seven states, and predicts that the supply will last a century. He alleges that the men who have bought southern pine lands expecting to realize an advance on them while they are yet alive, have made a mistake. Perhaps they have counted on realizing too quickly, but the *Lumberman* cannot regard it as much of a mistake when a man buys southern pine land at a "bit" to 50 cents an acre. The man who thinks he knows all about the future had better not talk about centuries in this swift age of the world. He should remember that this nation is but a little over a century old, and not only has a large part of twenty states been denuded of timber, for agricultural purposes, but the end of the northern pine supply is seen in the dim distance. He should also reflect that only about forty years have elapsed since Michigan pine began to be slaughtered, and the country was for years afterwards but sparsely settled west of the lakes. He should besides have foresight enough to see that this country, taken as a whole, will use vastly and increasingly more lumber in the future than it has in the past—a fact that prognosticators about the lumber supply usually take into the account. That is to say the country will demand increasingly more as long as the supply holds out, and is reasonably cheap. The new iron and the tile age has not put in an appearance yet, and will not while our forests last. Where one thousand feet of white or yellow pine is now used two will be needed twenty-five years from now. This all-knowing man of whom we speak, should reflect on the large amount of yellow pine that is now going to the eastern seaboard and England, and the large increase of the trade northwestward. As white pine diminishes the demand for the yellow variety will increase without a calculable limit.

LOGGING ROADS.

The handling of logs by rail has greatly increased through the northern lumber regions, and particularly in Michigan. The number of private roads which enable timber owners to get their logs to water-ways is in itself large, and in addition to this are several main lines, with innumerable spurs, which traverse regions which afford an almost exclusively log traffic. The business of these roads is immense, as is shown by the following record of logs hauled in 1882: The Flint & Pere Marquette road, 95,294,620 feet; the Michigan Central, 60,000,000 feet; the Saginaw Bay & Northwestern, 86,039,768 feet; the Tawas & Bay County road, 38,486,570 feet. Total, 279,825,953 feet. These logs were hauled to terminal points, and are not counted

among those which went into streams and through booms. The log traffic of the Flint & Pere Marquette road has much increased this season, which is an important reason why the generally prevailing low water has not resulted more seriously to the interests of lumber manufacture. During the month of October the road last mentioned hauled 11,581,000 feet of logs, of which amount 9,582,369 went to Saginaw, as compared with 5,114,951 feet for the same month last year, of which 2,294,900 feet went to Saginaw. The general increase in the movement of logs over this line is shown by the following statement, given for the past two years, up to November 1:

	1882.	1883.
January	12,267,900	16,468,744
February	8,851,620	11,246,888
March	11,147,610	16,504,470
April	11,266,675	17,194,461
May	11,135,638	21,580,221
June	8,003,758	15,954,202
July	3,210,838	5,490,627
August	3,733,256	6,541,454
September	4,243,201	4,454,442
October	5,114,951	21,581,002
Total feet	78,975,447	127,016,511

These figures show an excess for 10 months of this year over correspondiug period last year, of 31,721,890 feet.—*Northwestern Lumberman.*

Good Advice.

Canada should take a prominent part in the forestry exhibition which is to be held in Edinburgh. Edinburgh was fixed upon because it was a sort of half-way meeting ground for the Scandanavian and Canadian lumbermen. Only one local government has so far taken action, that of New Brunswick, which has decided to have its timber wealth exhibited. It might be well, perhaps, for each of the Provinces to take the matter up, as timber matters come within their province, and not within that of the Dominion. At the same time, the Dominion Government should also take action, as it possesses control of immense timber tracts in territories disputed and undisputed, and a better display, as a whole, could probably be made if the Dominion Government undertook a supervision of the whole, and the Local Governments submitted to it.—*Brantford Courier.*

Cement for Leather Belting.

An ordinary cement for leather belting is wheat flour boiled in oil of turpentine; but the ends must be secured by rivets, or it is not reliable. A better cement is made by soaking six ounces best glue in one pint of ale, then boil, add one and a half ounces of boiled linseed oil, and stir well. Another prescription is to take dissolved glue in the form as the cabinet makers use it, and add tannic acid till creamy and ropy. Make the leather surfaces to be united rough, apply the cement hot, let it cool and dry under pressure and it will not need riveting. For rubbing belting, take pure rubber in thin slices, two ounces, dissolve in one pound bisulphide of carbon; this a good cement, but if kept, thickens very soon. In order to prevent this add a solution of pure rubber, resin and turpentine.—*Age of Steel.*

Durability of Timber.

Beneath the foundation of Savoy Place, London, oak, elm, beech, and chestnut piles and planks were found in a state of perfect preservation, after having been there for 650 years. While taking down the old walls of Tunbridge Castle, Kent, there was found in the middle of a thick stone wall a timber curve, which had been enclosed for 700 years. Some timber of an old bridge was discovered while digging for the foundations of a house at Ditton Park, Windsor, which ancient records incline us to believe were placed there prior to the year 1396. The durability of timber out of ground is even greater still. The roof of the basilica of St. Paul's at Rome, was framed in the year 818; and now, after more than a thousand years, it is still sound, and the original cypresswood doors of the same building had been in use more than 600 years.

AN AFFLICTED CLERGYMAN.—The Rev. Wm. Stout, an English clergyman, of Wiarton, was for 23 years a terrible sufferer, with Scrofulous Abscess, which the best medical skill failed to cure. The internal and external use of Burdock Blood Bitters cured him, and for nearly three years he remained hale and hearty.

Desoronto Gas Works Burned.

Early on Thursday morning the inhabitants of Desoronto were startled by the cry of "fire!" when it was discovered that the Gas works were being rapidly destroyed by fire, without a chance of saving them. It is about three years since the Messrs. Rathbun began the experiment of manufacturing gas from sawdust, by a patent process of their own. The experiment was partially successfully at first, as the illuminating power was not satisfactory; but after three year's experimenting and an outlay of a large sum of money, they had gradually increased the illuminating power until the gas works had proved a success. The night before the fire, the village had been lit very satisfactorily. The fire is supposed to have started near the boilers, and could not be subdued. The entire works, except the gasometer, were destroyed, entailing a loss of $30,000. It is believed that the works will be at once rebuilt. The loss is stated at $10,000 to $12,000; insured for $6,000.—*Intelligencer.*

How Many Miles Do You Drive!
The
ODOMETER
Will Tell.
This instrument is no larger than a watch. It tells the exact number of miles driven to the 1-100th part of a mile; counts up to 1,000 miles; water and dust tight; always in order; saves horses from being over-driven; is easily attached to the wheel of a **Buggy, Carriage, Sulky, Waggon, Road Cart, Sulky Plough, Reaper, Mower,** or other vehicle. Invaluable to LIVERYMEN, PLEASURE DRIVERS, PHYSICIANS, FARMERS, SURVEYORS, DRAYMEN, EXPRESSMEN, STAGE OWNERS, &c. Price only **$5.00** each, one-third the price of any other Odometer. When ordering give diameter of the wheel. Sent by mail on receipt of price, post paid. Address

Special rates will be made for page, half page and column advertisements.

Advertisements intended for insertion in any particular issue should reach the office of publication at least four clear days before the day of publication, to insure insertion

All communications, orders and remittances should be addressed and made payable to TOKER & Co., Peterborough, Ont.

Communications intended for insertion in the CANADA LUMBERMAN, must be accompanied by the name of the writer, not necessarily for publication, but as a guarantee of good faith. Communications to insure insertion (if accepted) in the following number, should be in the hands of the publishers a week before the date of the next issue.

The CANADA LUMBERMAN is filed at the Offices of MESSRS. SAMUEL DEACON & Co., 154 Leadenhall Street, London, England, who also receive advertisements and subscriptions for this paper.

PETERBOROUGH, Ont., DEC. 15, 1883.

A NEW shingle mill is to be put into Hargrave's mill, South Bay City, Mich., that will have a capacity of from 100,000 to 125,000 shingles per day.

THE Belleville *Intelligencer* says :—The Rathbun Company have secured the contract for three more station buildings on the Ontario and Quebec Railway, making ten in all.

A MAN in Oshkosh, Wisconsin, while sawing wood, a local report says, found in a hole in one of the sticks, five ten dollar gold pieces and two twenty dollar pieces, besides some small coins.

THE Winnipeg *Commercial* of Nov. 27, says : Business has fallen off considerably during the past week or ten days, and will in all probability continue quiet during the balance of the winter season.

HENRY DISSTON & SONS recently sold through the Chicago branch house a bill of saws for two complete circular mills, to go to Bolivia in South America. The shipment was quite recently made from the Philadelphia house, and it is estimated that it will take the goods something like eight months to reach their destination.

IT is stated that Prussia has the most complete system of state forestry in the world. In this branch of state servico she has several thousand officials and notwithstanding the cost for maintenace of this large staff, the revenue accruing from tho sale of timber not only meets all expenses, but returns annually a large revenue to the state.

FURNITURE in bedrooms should be as light in construction as is consistent with the strength required, and made of light wood. Ash furniture, oak, and satin wood are very suitable. Whenever possible it is much to be desired on the score of health, that furniture should always be made in such a manner as to be easily moved. It might well be raised clear of the floor, so as to avoid anything like dust traps.

IN England thin shavings of veneers of different kinds of wood are coming into use for book covers. The woods now mostly in use are our American black walnut, lime, oak, holly, etc., but all woods may be used. After being placed upon the wood the veneers can be either rubbed down with oil or French polished.

President Arthur in his annual address refers to the necessity of protecting the forests situated upon the public domain, and suggests that, as the northern portion between the United States between the Blackfeet and Flathead reservations is unsuitable for setttement, it be withdrawn from sale and converted into forest preserve.

A PROCESS of impregnating wood for its preservation has been patented in Germany. This consists in first treating the wood with a solution of zinc vitriol, and then with a solution of chloride of calcium, so that the preservative coating is formed upon the wood by the chemical action of both substances on one another.

THE *Northwestern Lumberman* says :—On the farm of J. E. Baker, of Naples, Me., is a large and dense growth of tall pines. About 40 years ago the spot where they grow was being mowed and yielded a good crop of hay. A few acres of these pincs are quite high, but they are too thick to grow very large. Five years ago a tree was cut out of which a 27 foot sill was made which squared seven inches. There wero numerous trees as large as that one.

COTTONWOOD, it is said, will make four rails in seven to nine years, and maple the same in from eight to to ten years. Cottonwood, soft maple and California redwood are regarded by many as the best trees for forest planting when quickness of growth is dosired, and also when shelter belts around orchards, gardens, barns and stock yards are necessary. Many farmers have learned from sad experience that by cutting down their forests indiscriminately they have made the way clear for chilling, biting winds and frosts to nip their growing fruit.

THE Bay City *Lumberman's Gazette* says :—The year 1883 has been exceptionally disastrous in the matter of fires in wood-working establishments. For the first ten months of the year over one hundred million dollars was wiped out out, went up in smoke as it were, and the necessity becomes app--ent for every precaution on the part of owners to prevent the continuance of such enormous destruction. One hundred million dollars in ten months is too great a business calamity to be longer endured. The most prefect precautionary measures should be adopted by every wood-working establishment in the country.

A FRENCH journal tells of two exactly similar pieces of land, one cleared and the other wooded, where the wooded piece yielded ten times as much water as the open. The latter had an irregular flow, while the woodland yielded an even, regular supply, Another fact is given relating to America. A stream which for years and years, without failing, had supplied soveral mills with power, finally gave out. It not only failed to fill the ponds, but actually dried up. An investigation showed that the woods through which it flowed had been cut down. Subsequently these woods were allowed to grow up again, and for the past ten years, in spite of droughts and other troubles, the stream has flowed without interruption.

MANITOBA FORESTRY ASSOCIATION.

The Winnipeg *Times* of Dec. 4, says :—A meeting of the Manitoba Forestry and Aboricultural Society was held at the Department of the Agricultural offices yesterday afternoon. Present : Mr. Acton Burrows, second vice-president in the chair ; C. N. Bell, secretary-treasurer ; W. B. Hall, of Headingly, and R. R. Keith, Mr. Wagner, M. P. P., of Ossowa, who is making extensive experiments in tree growing, was present as a guest.

Mr. W. B. Hall reported that the special committee had held one meeting and that its members were now engaged in preparing lists of the trees aud fruit indigenous to Manitoba. They had also, through the press, asked for correspondence from persons engaged in tree and fruit growing in the province as to the result of their experiments.

They were also in correspondence with the secretaries of several States, in preparation of a Forestry Manual for this province. They had also decided on a recommendation for the establishment of a annual Arbor Day here.

A letter was read from Mr. A. M. Brown, offering the society the free use of twelve acres of ground for six years for experimental purposes. Action was deferred on Mr. Brown's letter until the next monthly meeting of the directors, and the president of the society Attorney-General Miller was requested to take such steps as he may think necessary to procure a proper ground, adjacent to the government buildings at Fort Osborne for the use of the society. It was decided to send an order to Russia for a selection of fruit and tree seeds, and Messrs. Burrows, Keith and Hall were appointed a sub-committee to select the varieties to be ordered.

The meeting then adjourned.

AUSTRALIA.

The monthly circular of Messrs. Lord & Hughes, Melbourne, dated Oct. 24th, says :—

Since our last on the 22nd ultimo, the offerings at auction of most descriptions of timber have been heavy, and the pricss realized all that could have been anticipated considering the large quantities known to be on the way.

The cargo of Oregon, ex Matilda, was offered at auction yesterday, and about half of it was sold at £6 15s to £7 2s 6d, averaging about £6 18s 6d, the squarc timber not being sold.

There is a good demand for American lumber, at advancing prices.

Sales from the Yards have been active the trade doing a large business, which is likely to continue.

The arrivals have been—Adele e Sabina, from Laurvig ; Charlotte Lange," from Drammen ; Schwanden and Thor from Frederickstad ; Governor Wilmot, Greta, General Pictou, Loch Rannoch, North American, Essex, Mirzapore, Sikh, Bowden, Ivanhoe, Carclisle Castle, Normanton, Lock Etive, and Winifred, from Great Britain : Ghazee and Marsala, from Antwerp and Hamburg, and Salazie, from Marscilles, with white deals, red deals, flooring galvanized iron, and cement ; Matilda and Nanaimo, from Burrard Inlet, with Oregon timber, laths and pickets ; Alice Reed, from Boston, and Alert, from Now York, with clear pine, shelving, ceiling, spruce deals, laths and plaster ; Jules Marie, from Kaipara, Killarney, from Monganui, Grassmere, from Wanganui, and Kentish Lass, from Hokianga, with Kauri pine ; Lady Franklyn, Konoowarra, Lindus, Cheviot, and Rodondo, from Sydney, with cedar ; Wendouree and Leura, from Sydney, with laths ; Claud Hamilton, from Adelaide, with slates ; John Lewis, from Adeliade, with spruce deals ; and Ly-ee-moon, from Sydney, with galvanised iron.

RED DEALS.—Imports : 3,814 pieces. The arrivals have been Governor Wilmot and North American, from London. Sales by auction have been made of parcels ex Frigga, Noel, and Kamfjord, from the Baltic, and ex various ships from Great Britain. FWT, 11x3 realizing $4\frac{5}{8}$d to $4\frac{3}{8}$d ; 9x3 $4\frac{1}{2}$d to $4\frac{1}{4}$d ; TWF, 11x3 $3\frac{1}{2}$d ; 10x3 $3\frac{1}{2}$d ; 9x3 3 9-16d : WK, 11x4 4 15-16d ; 9x4 4 13-16d ; 11x3 4 7-16d ; 9x3 $4\frac{7}{8}$d to 4 11-16d ; 8x3 4 9-16d. to $4\frac{1}{2}$d ; DDD, $7x2\frac{1}{2}$ 4d. to 4 1-16d ; Crown Gromoff, 9x3, $4\frac{5}{8}$d to 4 9-16d at per foot running of 9x3.

SPRUCE DEALS.— Imports : 14,056 pieces. The arrivals have beeu Alice Reed, from Boston ; John Lewis from Adelaide ; Adele e Sabina, from Laurvig ; Governor Wilmot and North American, from Londou. The parcel, consistiug of 11x3 and 9x3, ex the Alice Reed, from Boston, was sold by auction on 16th inst. realizing $3\frac{5}{8}$d. per running foot 9x3. Sales have also been made at auction of Baltic white deals, ex Captain Peter Dahl. Adele e Sabina and Frigga, from the Baltic, and ex various vessels from Great Britain.

OREGON TIMBER.—Imports : 1,179,982 feet super. The arrivals have beeu Matilda, and Nanaimo. The cargo ex Matilda was offered at auction on the 23rd inst., when about half of it was sold at an average of about £6 18s 6d. or £6 19s. The cargo ex Nanaimo has not yet been offered at auction. Sales by auction also comprise parcels ex Chrysolite and Oriental.

LUMBER.—Imports, Clear pine, 154,941 feet super ; white pine shelving, 130,977 feet super ; T. and G. ceiling, 34,918 feet super. The arrivals have been Alice Reed, from Boston, and Alert, from New York. The shipment ex Alice Reid was sold at auction on 16th inst., prices showing an advance on last month's rates. Michigan clear pine realized £18 12s 6d to £16 17s. 6d. White pine shelving (Peabody brand), £13 5s to £13 ; T. and G. Ceiling, £9 7s 6d to £9.

PITCH PINE.—Imports : *Nil.*

REDWOOD.— Imports : *Nil.*

FLOORING AND WEATHERBOARDS.—Imports : 7,038,048 feet lineal. The arrivals have been Adele e Sabina, from Laurvig ; Charlotte Lange, from Drammen ; Schwanden, and Thor, from Fredericstadt ; Governor Wilmot, General Pictou, Loch Rannock, North American, Ivanhoe, Carlisle Castle, Lock Etive, and Winefred, from Great Britain. Sales by auction have been made ex Frigga, Union, Adele e Sabina, Captain Peter Dahl, Thyatira, General Picton, and Loch Rannock, when the following prices were realized :—Red $6x1\frac{1}{8}$, 10s 3d to 9s ; 6x1, 8s 6d to 8s 3d ; $6x\frac{7}{8}$, 8s 9d to 7s 3d ; $6x\frac{3}{4}$, 6s to 5s 9d ; $6x\frac{5}{8}$, 5s 6d to 5s ; $6x\frac{1}{2}$, 5s to 4s 6d ; white $6x1\frac{1}{8}$, 9s 3d to 9s ; $6x\frac{7}{8}$. 7s 9d to 7s 3d ; $6x\frac{3}{4}$, 5s 9d to 5s 6d ; $6x\frac{5}{8}$, 5s 3d to 4s 11d ; $6x\frac{1}{2}$, 4s 7d to 4s 3d ; 4-out weatherboards. 5s 9d.

KAURI PINE.—Imports : 925,646 feet super. The arrivals have been Killarney, Jules Marie, Grassmere and Kentish Lass. Sales by auction have been made during the month of cargoes ex Robin Hood, Jules Marie, Killarney, Grassmere and Kentish Lass ; Hewn logs realizing 13s 3d to 11s ; sawn flitches, 16s 6d to 14s 6d.

CEDAR.—Imports : 209,962 feet super. The arrivals have been "Lady Franklyn, Konoowarra, Lindus, Chevoit, and Rodondo, from Sydney. Sales have been made by auction during the month ex Lady Franklyn, Lindus, Konoowarra, and Rodondo ; logs realizing from 58s 6d to 36s 6d per 100 feet super.

RED AND WHITE PINE (Colonial).—Imports : *Nil.* The cargo ex May was sold by auction on 2nd inst., at extremely low rates. There is no demand for this description of timber.

DOORS.—Imports : *Nil.*

WOODEN COLUMNS.

A series of experiments have been conducted on the testing machine at the Watertown arsenal by Prof. Lanza, of the department of mechanical instruction of the institute of technology. The object in view was to ascertain the strength of wooden coluuns of the size and length commonly used in the construction of cotton and woollen mills. The experiments were made at the instance of the Boston Mannfacturers' Mutual Fire Insurance Company, of which Edward Atkiuson is president. This testing machine was recognized as an invention of the greatest importance in the bestowal through a committee of experts, of the gold medal the highest award of recent mechanics' fair. Although it has been for some time in operation for scientific and other tests, it gains through this fact a new interest for the public. A part of the columns thus tested was yellow or hard pine, and a part oak. About a dozen thus far have been subjected to the process of compression in the machine, the strain having been brought upon them endwise for the purpose of ascertaining what is called the "crushing strength" of the timber. Outside of these experiments, and a few others at Watertown, none have been made on wooden columns of sufficient size to furnish reliable data for practice. The experiments made elsewhere, and those on which the formula in text-books on mechanics and the hand-books are based, have been upon columus of about two inches on a side and of four or five feet in length. From the results thus reached the strength of columns of dimensions actually used in building has been computed. It is plain that a series of experiments conducted under the direction of experts, and by them authoritively recorded will consti-

tute much more satisfactory data for the text-books. The experiments, therefore, have a significance beyond the nowise unimportant one that pertains to them in the matter of mill construction. All but two of the columns experimented on were round, hollow columns, of from eight to eleven inches in diameter, the two being about nine inches square. The greatest amount of pressure exerted in any case was 250,000 pounds. The tests have disclosed frequent instances of defective boring in the columns. The object in boring is to open an air passage through the heart of the stick for the prevention of dry rot after it is in position in the building. It is essential, of course, that the bore should extend from end to end, but this has not always been effected. The sticks were bored first from one end then from the other, and the borings have sometimes failed to meet in the middle of the stick. The tests also show that to taper the sticks is a mistake, inasmuch as it weakens the column more than it has heretofore been estimated. Reasons for exercising more caution in other respects in the construction and adjustment of wooden columns in building have also been disclosed.—*Lumberman's Gazette.*

EFFECT OF FROST ON TREES.

It is a prevalent opinion that during cold weather, the liquid in vegetable tissues congeals as ordinary liquid does, and expanding, often causes trees to burst with an explosive sound. In order to test the truth of this opinion, careful experiments were made last winter in Philadelphia, by T. Meehan, with young and vigorous trees, varying from one to three feet in circumference. They were carefully measured in early winter when the thermometer was at 40 degrees, and again after they had been exposed for many days to a temperature below freezing point, but in no case was there the slightest evidence of expansion. In dead wood, however, soaked with water, the expansion was well marked, and the cleavage, with explosion, sometimes noted in the case of forest trees in high northern regions, may result from the freezing of liquid in the centre or less vital parts of the trunks of the trees.

In some hardy succulents, however, instead of expansion under frost, there was a marked contraction. The joints or sections of stem in some of the Cactus plants, shrink remarkably with the lowering of the temperature, As soon as the thermometer passes the freezing point, the shrinkage is so great that the whole surface has the wrinkled appearance presented by the face of some very aged person. The contraction amounts to about 12 per cent., but a knife penetrates the tissues in winter just as easily as in summer, and no trace of congelation of the juices can be found in the plant. Other succulents exhibit more or less shrinkage under extreme cold, and sometimes present the appearance of being withered or dead. They, however, expand again in a few days of warmer temperature.

Assuming from these facts that the liquid in plants which are known to endure frost without injury, did not congeal, it might be a question as to what power they owed this successful resistance. It is probably some vital power, for the sap of plants, after it was drawn from the tree congealed easily. In a large maple tree, which was included in these tests, the juice exuded from wounded portions of the branches and then froze, hanging down icicles often six inches long from the tree.—*Lumber World.*

A National Forest.

The following extract from the message of President Arthur shows that our neighbors are becoming impressed with the necessity for scientific forestry and the conservation of national forests:—

"In my last annual message I called attention to the necessity of protecting by suitable legislation the forests situated upon the public domain. In many portions of the West the pursuit of general agriculture is only made practicable by resort to irrigation, while successful irrigation would itself be impossible without the aid afforded by forests in contributing to the regularity and constancy of the supply of water. During the past year severe suffering and great loss of property have been occasioned by profuse floods, followed by periods of unusually low water in many of the great rivers of the country. These irregularities were in a great measure caused by the removal from about the streams in question of the timber by which the water supply had been nourished and protected. The preservation of such portions of the forests on the national domain as essentially contribute to the equable flow of important water courses is of the highest importance. Important tributaries of the Missouri, the Columbia and the Saskatchewan, rise in the mountain region of Montana near the northern boundary of the United States, between the Blackfeet and Flathead reservations. This region is unsuitable for settlement, but upon the rivers which flow from it depends the future agricultural development of a vast tract of country. The attention of Congress is called to the necessity of withdrawing from public sale this part of the public domain and establishing there a forest reserve.

A Large Contract.

The largest single lumber contract ever made by St. Croix lumbermen is that entered into between Messrs. F. T. Todd & Sons, of the one part, and Messrs. Tracy, Murchie & Love, of the other part. for the cutting and yarding of 7,000,000 feet of logs during the coming winter. The ground to be operated upon covers a block six miles square on the Wissattaquoik stream, in Piscataquis county, Maine, and is bounded on the northest corner by Traveller's mountain, on the northwest by a lake called Big Pond, on the southeast by Turner's mountain, 3,500 feet high, and on the southwest by a spur of Mount Katahdin. It is estimated that there are 100,000,000 feet of lumber in the block, the land being what is known as black land and covered with a splendid growth of spruce, cedar, fir and pine. Sub-contracts for 5,000,000 feet of the lumber specified in the original agreement have been let—to William's & Pattingill for 2,000,000 feet, to McLaughlin & Stewart for 1,500,000 feet and to Smith, Allen & Co., of Machias, Me., for 1,500,000. The remainder will be handled by Tracy, Murchie & Love themselves. —*St. Croix Courier.*

The Poisonous Cocobola.

The *Scientific American* has the following: "The use of wood from Panama called cocobola in the manufacturing interests in Bridgeport, is attracting the attention of the Connecticut state board of health. The wood is cheap, takes a brilliant polish, is easily worked, and is used extensively for knife handles and ornamentation. Workers in the material are poisoned somewhat after the manner of sumac, although some are free from any effect. Swelling of the face, closing of the eyes, appearances of being burned on the hands, are usual symptoms. Some are attacked with distress in the stomach with loss of appetite. One person, who was a confirmed smoker, after being poisoned, has been unable to smoke or even stay in a room where there is any tobacco smoke. Children playing in the saw-dust of this wood, which had been dumped, were badly poisoned about their feet. At a large factory on Elm street, where this wood is extensively worked, chickens in the adjoining yards are said to have all died from eating the dust that settles on the grass."

Cherry Wood.

Cherry wood, filled and not varnished, has a soft glow not possessed by any other, and has none of those distortions of grain that are so unpleasant in mahogany. The timber is chosen from the wild cherry, which in New England and the North generally does not usually grow to a girth of more than 20 inches, but in some of the Western States and in the South frequently attains a diameter of 24 inches. The domestic fruit cherry gives some good specimens of small timber, but as the tree is rarely sacrificed until it is past bearing and is decayed, this source of supply is precarious. The facility with which cherry can be worked makes it a favorite with the cabinet-maker.

State Forestry.

Senator Lynde, chairman of the committee appointed to investigate the denudation of the Adirondack region, in reply to the question of a N. Y. *Herald* representative, "What report will your committee make?" answered as follows:

"I have not consulted with my colleagues on the subject, but personally I shall favor a forestry commission, with authority to trim the woods, of course, judiciously, and sell the lumber for the state. No such devastation has been made as the people are led to believe. The trees are so thick that they stunt each other's growth, and should be cut out and trimmed. Forests grow rapidly and can be easily overgrown. Prussia earned $4,000,000 in one year by the sale of lumber, and the diminution of trees in her forests was hardly preceptible."

Our Trade with France.

OTTAWA, Dec. 11.—The Ottawa correspondent of the *Mail* says that when Mr. Chapleau, was in Paris he had several conversations with the French Premier and others in relation to the increase of trade between Canada and France, and paved the way for the exertions of Sir A. T. Galt, which, however, were not successful. Sir Charles Tupper subsequently took up the subject and received assurance of favorable regard on the part of the Government of France. He will be in Ottawa during the latter part of next week.

A Four Hundred Thousand Dollar Fire.

GLOUCESTER, Mass., Dec, 9.—Annisquam mill at Rockport caught fire this morning from a lighted lantern coming in contact with lint on the belt in the engine room. The fire spread rapidly, completely enveloping the interior. The Rockport fire department was unable to cope with the conflagration, hut with assistance rendered from Gloucester and Salem, the picker room and storehouses were saved. The loss is estimated at $400,000; insured for $300,000.

SPALT MACHINE
For saving Lumber refuse, second hand, but all complete and in good order, taken out to replace one of greater capacity.
Address,—
THE RATHBUN COMPANY,
6L19 DESERONTO, Ont

REST not, life is sweeping by, go and dare before you die, something mighty and sublime leave behind to conquer time." $66 a week in your own town. $5 outfit free. No risk. Everything new. Capital not required. We will furnish you everything. Many are making fortunes. Ladies make as much as men, and boys and girls make great pay. Reader, if you want business at which you can make great pay all the time, write for particulars to H. HALLETT & Co., Portland, Maine.

FOR SALE.
A LATH TRIMMER,
NEW, and in good order, will be sold Cheap. Address,
THE RATHBUN COMPANY,
6L19 Deseronto, Ont

WATER POWER
TO LEASE.
THE UNDERSIGNED having largely extended their raceway at Lakefield, are desirous of corresponding with parties who wish to go into manufacturing, and they are prepared to sell or lease water power on the most favorable terms, or would erect buildings of any size suitable for factories.
R. & G. STRICKLAND

6L19 DESERONTO, Ont.

SAW MILL MACHINERY FOR SALE.
STEEL AND IRON
Slabbing and Stock Gang Gates
WITH OSCILLATING MOTION, ALSO,—
IRON PITMANS, FLY WHEELS, Driving Pulleys, and other Saw Mill Machinery,
In Good Order, which has been taken out of Mills that have been closed. Address,
The RATHBUN COMPANY,
8L20 DESERONTO.

MACHINERY,
ENGINE, BOILER,
ROTARY MILL, &c.,
IN THE
St. Martins Manufacturing Co's Factory and Saw Mill at St. Martins,
CONTAINING
A Waterous 80 H.P. Engine and Boilers, Rotary Saw Mill,
Saw Tables, Planers, Shafting, Hangers, Pulleys, Belting, Lathes, Pumps, etc.
One Fleming & Sons' 50 H.P. Engine and Boiler,
Waterous Saw Mill, Daniel Planer, Band Saw, Planer and Matcher, Saw Tables, Shafting, Belting, etc.
If not sold *en bloc* by the 10th of October, will be sold in lots to suit purchasers.
Catalogues giving particulars of the Machinery, etc., can be had from the liquidators, or at the offices of W. H. OLIVE, No. 167 Prince William Street; T. McAVITY & SONS, 13 King Street, St. John; and W. E. SKILLEN, St. Martins. 4L21

HOW WOODEN SPOOLS ARE MADE.

The birch is first sawed into sticks four or five feet long and seven-eighths of an inch to three inches square, according to the size of the spool to be produced. These sticks are thoroughly seasoned. They are sawed into short blocks, and the blocks are dried in a hot air kiln. At the time they are sawed a hole is bored through them. One whirl of the little block against sharp knives, shaped by a pattern, makes the spools at the rate of one per second. A small boy feeds the spool machine, simply placing the blocks in a spout and throwing out the knotty or defective stock. The machine is automatic. but cannot do the sorting. The spools are revolved rapidly in drums and polish themselves. For some purposes they are dyed yellow, red or black. They are made in thousands of shapes and sizes. When one sees on a spool of thread "100 yards" or "200 yards" these words do not signify that the thread has has been measured, but that the spool has been guaged and is supposed to contain so much thread. When a silk or linen or cotton firm wants a spool made it sends a pattern to the spool-maker. This pattern gives the size or shape of the barrel and of the head and bevel. These patterns determine the amount of thread that the spool will hold. Mr. Dwelley's factory turns out 100,000 gross of spools per day, and consumes 2,500 cords of birch annually. His year's spools are worth $40,000. Thirty hands are employed in the mill. During the winter, 250 wood choppers are sometimes employed. Mr. Dwelley is an inventor and a machinist. He invented, designed, and made every machine in his shop. It is a large brick building. Mr. Dwelley also has laths which turn out large quantities of pill boxes and blueing boxes. He, too, says, "I have more orders than I can fill." —*Lewiston (Me.,) Journal.*

FORESTS OF ONTARIO.

Mr. Phipps concludes his report on Ontario forests with the following details as to the different counties :—

FORESTS EXISTING IN ONTARIO COUNTIES.

PRESCOTT AND RUSSELL :—About forty-sevon and a half per cent. of the entire area is under timber, consisting of hemlock, cedar, tamarac, beech, birch, elm, basswood, ash, balsam, pine, spruce, walnut, butternut, whitewood, dogwood, solt maple, and red and black cherry; used principally for lumber, fencing, firewood, railway ties and saw logs.

GLENGARY, STORMONT AND DUNDAS :—Probably about thirty per cent. of the entire area of these counties is still timbered with hard and soft maple, beech, birch, ash, tamarack, elm, basswood, hemlock, spruce, balsam, and some pine ; used for fuel, lumber, railway ties, telegraph posts and shingles.

CARLETON :—About 287,000 acres of land in this county are still uncleared.

LEEDS AND GRENVILLE:—In all the townships except South Burgess and North Crosby, which have suffered from the ravages of fires, there is a large amount of standing timber, consisting mainly of hard and soft woods ; used for firewood, fencing, lumber, buckets and pails.

LANARK :—About twenty-four per cent. of the uncleared land is covered with timber or bush. The timber is chiefly pine. beech, maple, basswood, ash, birch, cedar and tamarack. A considerable export trade in hardwood is carried on. and there is a large local consumption for railway ties, fencing, fuel, etc. A great destruction of pine took place from tho fire in 1870.

RENFREW :—About forty-six per cent. of the entire area is still timbered. Red and white pine exist in large quantities. There is also an abundant supply of ash, elm, maple, basswood, spruce, cedar, tamarack, balsam, poplar, beech and hemlock, Lumbering is extensively carried on for exportation to European and American markets. The hard woods are chiefly used for fuel and cedar for fencing.

FRONTENAC :—As nearly as can be computed, about fifty per cent. of the land in Frontenac is still timbered with pine, basswood, ash, hemlock, beech, balsam, tamarac, cedar and maple ; principally used for lumber, fencing and fuel.

LENNOX AND ADDINGTON :—Owing to the returns being in several instances obviously inaccurate, the extent of land in the counties under timber cannot be estimated. Four-fifths of Denbigh and associated townships are, however, reported to be under pine, maple, beech and cedar, and lumbering is extensively carried on. There is also a considerable quantity of timber in North and South Fredericksburg, in Camden and in Sheffield.

PRINCE EDWARD COUNTY :—About sixteen per cent. of the entire area is still covered with timber, consisting of beech, maple, elm, cedar, oak, black ash and some pine ; used for lumber, fuel, coopers' staves, fencing and building.

HASTINGS :—A large proportion of the acreage is still covered with timber—in some townships to the extent of seventy-five per cent.

HALIBURTON :—About eighty per cent. of the entire area is still covered with timber, consisting mainly of maple, beech, birch, hemlock, basswood, elm, ash, pine, tamarac, and cedar ; used for lumber, fencing, railway ties, telegraph poles, shingles, bolts, sawlogs, etc.

PETERBOROUGH :—A large proportion—not far short of one half of the area—is under timber, consisting of pine, cedar, beech, maple, hemlock, basswood, tamarac, birch and ash ; used for timber, fencing, firewood, shingles, bolts railway ties and telegraph poles. Bush fires have destroyed large tracts, particularly in the township of Harvey.

NORTHUMBERLAND AND DURHAM :— About eighteen per cent. of the total acreage is still timbored with hardwood, cedar, pine, hemlock, and tamarack. The former is used principally for fuel, the latter for building, fencing, and barrel staves.

VICTORIA :—Probably about fifty per cent. of the unclearcd land is under timber, consisting of cedar, pinc, hemlock, maple, birch, bcech, basswood, black ash, mountain ash, balsam, tamarac, oak and elm ; used for lumber, fuel, building and fencing.

ONTARIO :—About seventeen per cent. of the area of Ontario is still under timber excepting the township of Reach, (which returns no percentage), The timber consists of pine, maple, beech, basswood, tamarac, balsam, cedar, black ash, hemlock and elm ; used mainly for lumbor, fuel fences, staves, and domestic uscs.

YORK :—Aout twenty-two and a half per cent. of the area of York is still under timber, consisting of bccch, maple, elm, basswood, pine, homlock, cedar, tamarac, and birch ; used for building purposes, fencing and firewood.

SIMCOE :—It is impossible to glean from the returns the total acreage under timber, but probably over one-half of the entire county area is under maple, bcech, basswood, tamarac, pine, hemlock, ccdar, balsam, birch, ash and oak. Lumbering operations are very extensively carried on in scveral of the townships, and there is a largo amount of business done in hemlock bark (which is largely used within the county, and also exported for tanning purposes), and in railway tics, telegraph poles and shingles. The hardwoods are principally used for fuel, and the soft woods for building and fencing.

PEEL :—About eleven per cent. of the entire acreage is stil under timber, consisting of beech, maple, hemlock, cedar, white aud red oak, ash, elm, hickory and basswood, A few pines are scattered in Chinguacousy and Toronto townships. The timber is generally used for fuel, fencing and domestic purposes.

HALTON :—About seventeen per cent. of the entire area is still timbered, chiefly with hard wood and a limited amount of pine. The timber is principally used for lumber, fencing, and fuel.

WENTWORTH :—Fourteen and a half per cent. probably under timber, consisting of pine, beech, maple, elm, black ash, cedar, tamarack, oak, hickory, walnut, and chestnut ; used for lumber, firewood, fencing, building and general purposes.

LINCOLN :—Exclusive of the township of Caistor, which does not report the area of land still timbered, Lincoln has over 24,400 acres still covered with beech, black ash, maple, elm, oak, hickory, and some pine ; used for firewood, fencing, building and mannfacturing purposes, also for ship timber and railway ties.

WELLAND :—About eighteen per cent. of the area is still under timber, consisting of beech, maple, oak, ash, basswood, elm, hemlock, popular, birch, chestnut, walnut, and butternut ; used for shipbuilding, housebuilding, fencing, and fuel.

HALDIMAND :—About twenty-four per cent. of the acreage is still timbered, consisting chiefly of hard woods ; used for fencing, fuel, and building purposes.

NORFOLK :—About twenty-four per cent. of the entire area is still timbered. and the standing timber consists chiefly of pine, oak, maple, chestnut, black and white ash, elm and cedar ; used for railway ties, lumber, fencing, firewood and general purposes.

BRANT :—About twenty-five per cent. is yet in timber of maple, beech elm, oak, pine, cedar, basswood, tamarac, hickory, and ironwood.

WATERLOO :—About twenty-two and a half per cent. of the area is still timbered with pine, oak, beech, maple, cedar, ash and hemlock.

GREY :—About thirty-four per cent. of the land is still timbered chiefly with hardwood. Very little pine exists and only sufficient cedar for fencing purposes.

BRUCE :—About twenty-five per cent. of the land is timbered. Maple, basswood, elm, hemlock, cedar, ash, beech, and birch predominate ; there is also some pine.

HURON :—About twenty-nine per cent, is covered with timber ; hard and soft woods.

PERTH :—About twenty-one per cent. is covered with timber, consisting of bcech, elm, basswood, black and white ash, pine, hemlock, cedar, birch and tamarac.

OXFORD :—Seventeen per cent. under pine, cedar, beech, maple, elm, ash, basswood and oak.

ELGIN :—Thirty per cent. is timbered with most of the indigenous woods excepting cedor.

MIDDLESEX :—Thirty-five per cent. under hardwood and some pine.

LAMBTON :—Forty-eight per cent. covered with oak, ash, elm, beech, maple, basswood, hickory and somo pine.

KENT :—Thirty-seven per cent. in oak, black and red ash, hickory, hard and soft maple, cherry, and sycamore, some black walnut, and some tulip.

ESSEX :—Two-thirds still under bush, consisting chiefly of whitewood, oak, ash, elm, hickory, bass, sycamore, and other woods.

WELLINGTON :—About fifteen per cent. is still timbered with beech, maple, elm, cedar, hemlock, basswood, ash and balsam.

FORESTRY IN AUSTRALIA.

The *Lumberman* has received the annual progress reports upon the State Forest Administration in South Australia, for 1882-3, by J. Eduie Brown, F. L. S., conservator of forests. This gentleman has the immediate control and management of all details connected with the forest reserves, the selling of timber and produce, etc. The rules regarding the reserves are very strict. Before a sale of any portion of the timber on a reserve, all live trees are officially marked by chipping of the bark and cutting the initials F. D., and the trees must be cut above that mark. It is required that in the felling of trees great care should be taken to avoid injuring the smaller growth, assessments being made against the offending parties in case of damage. The theft of timber or other productions results in prompt prosecution. From October to May no fires are allowed in timber except in the case of parties who have obtained an official permit to establish camps upon such sites as may be pointed out, and a space of 30 feet must be cleared around the camp fires, which must be extinguished upon leaving. The work in progress and proposed for the year 1883-4, is briefly reviewed as follows : The stock in the combined nurseries of the department at the beginuing of the current season's plantiug, amounted to over 600,000 trees. About 280,000 trees will be planted in the plantations this year. The railroads have gone extensively into the planting of forest trees and wattles. The trees set out generally consist chiefly of different varieties of pine, gum, cedar, elm, poplar, sycamore, larch and American catalpa. Of last year's plautiug all the trees in some localities survived, and in others the range of those surviving was all the way from 15 to 90 per cent. Of the trees distributed last year about 80,000 are living, which under existing conditious has proved very satisfactory. These trees cost the government about two cents each, American money. "Looking at the fact," says the conservator, "that a large proportion of this country is destitute of trees ; that a general distribution of those over the length and breadth of the land is absolutely necessary for the proper regulating of our climate, and hence for our agricultural prosperity as a nation ; that the matter, therefore, must be looked upon more from a national point of view than an individual advantage ; and finally that many of our landowners will not and cannot purchasettrees, I think the giving of them away in the manner referred to is a wise piece of political economy upon the part of the government, and should therefore be continued for at least some years to come."

But, while great care is taken of the reserves, a great deal is still said about "the wholesale destruction of Australian forests." It is said that thousands of acres of trees are annually killed by girdling. The wood is either cut into or a ring of bark removed. The trees are killed to improve the pasturage, and miles and miles of dead and bleached trees are the result. No use is put to the destroyed timber, which is left to rot. It thus appears that the government could accomplish more in five minutes by legislating against a criminal slaughter of its natural forests, than it could in a century by "reserve" legislation and planting.—*Northwestesn Lumberman.*

SWEDEN.

The Stockholm correspondent of the *Timber Trades Journal* under date Nov. 10, says :—The usual monthly statistical return of the exports from Sweden for the first nine months of the year having been published, I give the same as compared with a similar period of the three years preceding, viz. :—

Sawn and planed wood.

1883.	1882.	1881	1880.
672,735	597,606	427,442	485,234 stds

Square and partly square timber, &c.

13,183,836 14,126,800 10,435,979 12,396,267 c ft

From these figures it appears that the exports of sawn wood during September have been no less than 123,930 Petersburg standards, against a nearly similar quantity in September, 1882, of 121,810 standards. The figures of the present year are by far the largest on record, and decidedly stultify the estimates of f.o.w, stock made in January by the Society of Saw-millowners. There is now almost the certainty of exports of sawn and planed wood from Sweden figuring up to over 800,000 Petersburg standards this season, and yet there is no appearance of sawn or even log stocks being abnormally low on this side. These latter are doubtless less than they were at this time last year, but when we are informed that one concern alone in Sundswall district has a log stock of over 400,000 sticks within reach, one may be pardoned for attaching but little importance to the assertions so frequently heard on this subject.

Notwithstanding the heavy consumption of the season now passing, and the undoubted vitality of the trade, it is evident that consumers in both France and England must have heavy stocks whatever may be the case at the distributing centres. That importers abroad are aware of this fact, and that consequently prices will be difficult to lift upwards at the turn of the year, we may be well assured of. I can, therefore, only repeat what has been frequently pointed out, viz., that only a substautial reduction in the "log-get" of the incoming winter will prevent the trade from falling still further into the Slough of Despond.

Sawdust to be Made Useful.

There is good reason to believe that sawdust will eventually be fouud of some better service than that of choking up and pollutiug the waters of our rivers. It has already been applied to several purposes in a compressed form, and we uow learn of a still new use to which it has been put. Au exchange says : Pine sawdust, highly compressed, has been successfully used to make up centre frames of carriage wheels. It is said to be so solid that it will bear a pressure equal to 23 tons per square inch. As sawdust has also been used for partitions and bricks, its application to the production of complex carvings and mouldiugs does not seem to be far off.—*Scientific Journal.*

Chips.

THE Milwaukee & St. Paul Railroad Company has issued a notice to railroad contractors that hereafter it will accept only sawed end ties, eight feet long, and up to standard specifications otherwise.

MR. W. S. GILBERT, the dramatic author, has just built for himself a dwelling house in Harrington Gardens, South Kensington, on which it is said he has expended £30,000 on the house alone, before an article of furniture is put into it.

THE Oconto Lumber Company proposes to buy a tug to tow its lumber from its Sturgeon Bay mill through the canal and across Green bay to Oconto for western rail shipment. The move is significant. The company will handle 40,000,000 feet next season.

A rather curious story is told of how a workman in the saw mill of Prewitt, Spurr & Co., Nashville, Tenn., was by some means thrown towards the circular, and evidently thinking he was going upon it, died from fright, which was the verdict of the coroner's jury.

A LOCAL paper at Manistee, Mich., estimates the amount of logs in the waters tributary to that point as follows: In Manistee Lake, 30,000,000 feet; in the river, 30,000,000; in south branch of the Manistee, 16,000,000; and 12,000,000 in Little Manistee, or 80,000,000 feet in all.

THE Orillia *Packet* under the heading Waubaushene, says that a boom containing about thirty thousand logs broke away from its moorings by the force of the big storm, on the night of the 11th Nov. The logs in many places were carried high up on the shore by the waves. It will require a great amount of labor to float and gather them all up again. The logs belonged to the G. B. C. Lumber Co.

THE wholesale destruction of forests in Australia is bitterly complained of by scientific observers. Thousands of acres of timber land are annually killed by cutting a ring around the trees, either into the wood or else by taking a ring of the bark off. Miles and miles of country can be travelled where nothing is found but bleached and dead trees, killed in this manner to "improve the pastures," as the inhabitants think. The wood of these trees is not used, for the dead trunks are allowed to decay on the spot unless burned by some accident.

THE *Timber Trades Journal* of Nov. 17, says:—There is another long list of arrivals to record this week to London; no less than 75 of one sort and another putting in an appearance. The sailing ships are one ahead this time, being 38 eight to 37 steamers. There is not such a great quantity of deal and batten cargoes in the list, but, nevertheless, sufficient to keep the docks active for some time to come. Sweden contributes a dozen complete cargoes out of the 21, and the other Baltic ports with Canada make up the balance. It is expected that when the dock returns are made up we shall still be about a million pieces short. Last year at this date we had to record 54 arrivals to London, but then the freight was quite different to what it is now. The winter promises to begin early, and frost appears to have set in, and a telegram from one of the Gulf ports stated that snow was falling.

THE *Timber Trades Journal* of Nov. 17, says: At Messrs. Churchill & Sim's sale last Wednesday, the 3rd pine, ex War Spirit from Quebec, which fetched a uniform price of £9 10s., may be reckoned as well sold, but the 2nd quality spruce 3x7 by the same ship did not go nearly so well, and must have sunk money at £7 and under. The River Ouelle 3rd pine, we understand, was not a very first-class lot, and at £8 15s. for wide stuff and 5s. less for regulars fetched its full value. The low prices which the Miramichi spruce ex Winchester, described as 1st, 2nd, and 3rd, realized was no surprise to those who had inspected the goods. In fact, they have been mentioned to us as one of the worst cargoes of spruce that have been shipped, and though it was said that the 4ths had been taken out the appearance of the stocks did not seem to warrant the statement.

IT is estimated that 29 per cent. of the acreage of Europe is still in timber. Forty per cent. of the enormous territory of Russia is in forests, and of this 200,000,000 acres are in pine woods. Thirty-four per cent. of the territory of Sweden and Norway is occupied with woods of useful timbers; twenty-six per cent. of Anstralia, 27 per cent. of Germany, 17 per cent of France, seven per cent. of Spain, the timber being cork, oak and chestnut, 5 per cent. of Portugal and four per cent. of Great Britain. Scotland is the only part of the British Empire (including the colonies) in which the planting of timber is going on to any considerable extent. Sweden is now the country from which the world's supply of fir timber and deals chiefly comes.

A remarkable instance of the rapid growth of the forest trees recently came to light, which was the result of a search for the original survery marks, placed upon a beech tree by the surveyors about twenty-seven years ago. Messrs. Jos. Russell and W. N. Marr were searching for a corner of section 7, town 17 north, range 2 west, and found it by chopping into the side of the tree about three inches and splitting a section off which uncovered the original mark, which shows the letters "N. T. B." which were indented in the flatted surface by the government surveyors, The wood is perfectly sound and solid, and the black paint still adheres to the surface. The specimen will be placed on exhibition to satisfy the curiosity of the public. —*Lumberman's Gazette.*

THE London *Canadian Gazette* of October 19 says:—Holders of New Brunswick Land and Lumber Company's bonds will be interested in hearing what the directors of the parent company have to say concerning the Lumber Company. The Railway Company own all the Lumber Company's shares (14,000), and they guarantee the bonds. The Lumber Company own 1,650,000 acres "of the best farming and lumber land in tht Province of New Brunswick," and by reason of the increased facilities which the railway now offers for transportation, as well as of other advantages leading to the better marketing of lumber, the shares of the company are expected to prove a valuable asset. To date, the Lumber Company owes to the Railway Company $145,810.

THE *Northwestern Lumberman* says:—There recently arrived in this city from Humboldt county, California, the largest plank ever seen in Chicago. It is 52 inches wide, three inches thick, 14 feet long, and was cut from one of the monster redwood trees. Accompanying the plank were several bunches of shingles, and the perfection of their manufacture shows that on the Pacific coast they are not behind their Eastern friends in shingle making. Some of the shingles are of the regulation pattern, while others have rounded and pointed butts, fitting them for use where fancy work is wanted on spires, mansard roofs, or on houses on the Queen Anne style of architecture. It is probable that a redwood lumber yard will be established in Chicago in the near future.

THE first semi-annual meeting of the National Association of Lumber Dealers, says the *Northwestern Lumberman*, will be held Wednesday, December 5, at the Tremont House, Chicago. It will be remembered that at the last annual meeting, held in May, it was decided to meet twice a year, on the ground that a more frequent coming together of the members would increase their zeal, and have a generally beneficial result. From appearances there will be a well attended and interesting meeting, and judging from the questions that have been agitated, and the complaints and inquiries which have for some time flooded the *Lumberman* office, there will be several grievances and a kick or two to spice up the proceedings. It will at least furnish opportunity for the members to have an understanding on various important points, and those who have any matters to adjust or discuss should make it a point to be on hand for that purpose.

HE SPEAKS FROM EXPERIENCE.—R. N. Wheeler, of Everton, some six years ago was attacked with a severe form of inflammation of the lungs, leaving him with a severe cough. He speaks highly of Hagyard's Pectoral Balsam, which cured him, the complaint not having troubled him since.

Market Reports.

MONTREAL.

*From Our Own Corresponden*t

DEC. 8.—Business done during the past two weeks has been quite of a hand to mouth character and no change is expected until after stock taking and the holiday season. As we anticipated in last report laths have again advanced in price and are held firmly at our quotations. The quantity of lumber which arrived here by the canal during the past season was brought by 304 vessels and amounted to 42,655,000 feet. This was entirely for city consumption and does not include what passed through for shipment. The arrivals by rail will not be made up till the end of the year, when we hope to be able to give a complete statement of both arrivals and shipments for 1883. There is some idea of Congress taking the duty off lumber ($2 per M feet), which would create a large demand from the Canadian manufacturers, but it is not thought probable that it will be agreed to,as manufacturers in the Western States and manufacturers of spruce lumber in the State of New York are decidedly opposed to the movement. With the exception of laths our quotations ex yard are unchanged :

Pine, 1st quality, ℔ M	$35 00@40 00
Pine, 2nd " ℔ M	22 00@24 00

CORDWOOD.

There has been a fair business done in wood during the past two weeks, but the mild weather of the last day or two has caused it to fall off again, Prices are unchanged and are still quoted from the yard ex cartage as follows :

Long Maple	$ 6 00
Short "	5 50
Long Birch	5 50
Long Beech	5 00
Tamarack	5 00

TORONTO.

From Our Own Correspondent.

DEC. 10.—The demand from the retail yards during the past two weeks has been quite spasmodic in character, for a few days some dealers would have all they could do to supply the wants of their customers and again become quite slack, but some dealers, favorably situated as to location, where buildings are being erected more thickly, have kept busy right along, and, in consequence of the continued open weather, the building season is being prolonged beyond the usual period. so that all things taken into consideration. I fancy that dealers will not have much to complain of at the close of their season's business.

In consequence of the now absolute certainty of small stocks being got out this winter prices have stiffened to some extent. Some kinds of bill stuff sold by wholesale dealers two weeks ago at $11.50 per M. by carload, is now held firmly at $12 per M., and the quantity coming in by rail is quite small which will give dealers the opportunity of clearing off some of their surplus stock piled on the dock and in the railroad yards.

On going to the various retail yards to find the amount of trade done by each one during the year, I find it utterly impossible to give reliable figures by that method as most of the dealers do not keep any track of the quantity sold by them, except as to the dollars and cents. So I have taken the only course available, viz., by computing the entire quantity which found its way into our city during the year, and deducting the shipments by water, leaving the balance as being the amount handled by the retail dealer, but it must be borne in mind that probably one-fifth of the remaining balance has been sold by the middlemen direct to the con sumers.

During the year the total quantity arriving by rail foots up a total of 132,000,000 feet of pine lumber and about 1,000,000 feet of hardwood, and of shingles about 5,000,000, sawn lath about 10,000,000 pieces ; and of this amount 52,000,000 feet of lumber, 2,500,000 shingles and 3,000,000 lath have passed over our docks chiefly to American ports, and if we assume that 1,000,000 feet of lumber has been transhipped for points west the quantity consumed here during the season would be in round numbers 79,000,000 feet of lumber, 2,500,000 shingles and 7,000,000 pieces of lath. The most of the hardwood has been shipped or is now in stock here, and the quantity piled in yards and on docks will vary but slightly from that piled at this time last year, so that the total volume of trade done on the local market is fairly good.

The manager of the Midland Railroad has performed a graceful act in so far meeting the wishes and interest of the lumbermen here by throwing off the charge formerly collected for shunting cars to the different siding in this city, and the cordiality heretofore existing between the manager of that line and the lumbermen will be more fimly cemented thereby, and it is certainly not anything to the credit of the N. & N. W. R. R. magnates that they should hold so tenaciously to that which they know to be so obnoxious to the parties affected thereby. It may not be amiss to compare the rates now levied by the two roads. Taking Gravenhurst and Midland as the two starting points and Parkdale as the ultimate destination for a car of lumber of 2,400 lbs. weight. The N. & N. W. charge $21.60 to Toronto and $2 to shunt to Parkdale, making a total of $23.60. The Midland charge is $20.40, deduct from this $1 paid by them to the G. T. R. R. for shunting, and $1.50 to the C. V. R. R. for the use of their siding at Parkdale, leaving them $17.90 net as a freight charge, and $5.70 less than the charge made by the N. & N. W. R. R., and for shunting to Stachan avenue siding, midway between the city and Parkdale, the latter company collect $22.60 for the same service, and the Midland R. R, $19,40,

It has been charged by some people, but not by many I am happy to say, that I am actuated by malice in bringing forward these charges against the management of the N. & N. W. R. R. This I deny. I speak of facts as I find them, deny them who can.

BOSTON.

Cotton, Wool and Iron of Dec. 8, says :—About all that can be said for trade in our market is that it is moving along quietly and pretty steadily. Good dry stock is well in hand and holds its own, while coarse and poor grades are rather dull and weak in some cases. Advices from Chicago are that list prices for December on pine have been advanced one dollar per 1,000 feet on most grades by the trade. Western pine here is quiet but pretty firm for desirable grades. Eastern pine and hemlock are quiet and steady, Spruce is pretty firm for random cargoes. Laths have rather an easier tone. Yellow pine is in limited call at about steady prices. Hardwoods are rather quiet, but choice stock is so well in hand that prices seem to fully hold their own on such.

CHICAGO.

The *Northwestern Lumberman* of Dec. 8th, says :—The pleasant weather characteristic of the past weak has given opportunity for bringing forward the fag ends of shipments, and though the season was virtually closed a week ago, a large quautity of lumber has arrived for December. The total number of cargoes arrived up to Wednesday was 98, the majority going directly to the yards, the regular barge lines, of course, figuring the most heavily in arrivals. Each day cargoes have been sold at the docks, but the offerings have been too few to make a market, as the frequenters there understand the term. Whenever a cargo has been offered there were a dozen buyers ready to take it, and prices have as a necessity been tending toward an advance. Short piece stuff has sold for $10 a thousand during the week, that a month ago would have sold for $9 to $9.50, The advance in freights has contributed to higher prices for lumber. Rates from Muskegon are now $2.25, and from Manistee $2.50, with few vessels willing to go out. Another storm, which at this writing seems imminent, would wind up the marine business for the season. One prominent commisssion firm has but one cargo more coming, and another has but three. The end is right here, and the commission men will soon have hold of it. It is probable that with an open December, an effort will be made to bring over lumber that has been bought to fill up yard stocks, but the success of such ventures will altogether depend on the weather.

Quotations are as follows :—

LIVERPOOL.

The *Timber Trades Journal* of Nov. 24th, says :—The tone of the market continues upon the same dead level that has marked it for some time past, nor are there any indications of an advance in price for the immediate future, as with some few exceptions our market is supplied more freely than is desirable. The impending strike of coal miners will have no inconsiderable effect upon the timber trade of this district if it should eventually assume the widely-spread proportions that are at present indicated, and apart from this the unsatisfactory condition of the shipbuilding trade will also, in a minor degree, tend to restrict business. At the same time the fact cannot be disguised that a considerable quantity of goods of one kind and another is being turned over, but it must be done on the barest margin of profits, so keen is the competition for orders.

The arrivals of spruce deals have somewhat diminished, but the market has not been strengthened thereby, although it is more than possible that some cargoes may be stored, on account of the importers, who have faith that there will be an improved condition of things after the turn of the year.

LONDON.

The *Timber Trades Journal* of Nov. 24th, says :—If we have a sharp winter—a long one we cannot have, as we are already near the end of November and no appearance of frost—there may be time for prices to recover, and we are glad to note that the dock deliveries keep active, which will tell its tale when the supplies from abroad have ceased.

There can be no doubt that prices have reached a very low ebb ; in fact, we should have to go back several seasons to match them, and any alteration can hardly help being for the better.

There is one thing in respect to the forest productions from the Baltic which gives to the market prices of the manufactured timber an uncertain tone, and that is the difficulty always experienced in arriving at something definite in

respect to the log cuttings over there. When we hear that the log crop will be short—and statistics, so far as they can be obtained, are furnished which go to sustain the statement—it as often happens as not that the shipments to this country are of an excessive character, and, instead of the expected limitation, the market is glutted with wood of every description.

This is not the case with Colonial goods, and when it is currently reported that stocks at the mills will not be large, the results of the season's shipments generally bear it out.

GLASGOW.

The *Timber Trades Journal* of Nov. 24, says: Results of two public sales held within the past week are noted below. Quebec timber and deals, also pitch pine, were disposed of at the Greenock sale, which was fairly attended; and at the sale here on the 21st inst. the catalogue comprised New Brunswick birch and spruce logs, and Quebec and New Brunswick pine and spruce deals. The attendance was large. Standard-sized deals are still held at firm rates. The other and smaller dimensions are let go at slightly reduced rates. Competition at public sale being languid, of the goods catalogued a large proportion was withdrawn.

As wood importations to Glasgow this year have been larger than usual, the harbor authorities have made vigorous efforts to meet the demand upon them for accommodation on the north side of the river; but the space available is found rather limited, the quays being now much hampered, and it is evident that means must be taken to provide more adequate storage for imports of wood at Glasgow.

AUCTION SALES.

On 15th Nov., at Greenock, Messrs. Allison, Cousland & Hamilton, brokers:

Quebec waney boardwood—		per cub ft
57 c ft av per log		1s 8d
Do. red pine—		
30 to 40 "		1s 3½d to 1s 5d
Do. oak—		
34 "		1s 7½d to 1s 8d
Pitch pine planks 3 &4 in.		1s
Quebec 3rd spruce deals—		
12×9×3		9¾d
15×9×3		10d

On 21st Nov., at Glasgow, Messrs. Singleton, Dunn, & Co., brokers:—

Campbellton, N. B., pine deals—		
9 to 24 ft	10/16×3	11½d
9 " 25 "	7/9×3 & 2½	10d
Do. spruce deals—		
9 to 24 ft	9/16×3	10½d & 10d
13 " 24 "	7×3	9¾d
9 " 12 "	7×3	9½d
9 " 24 "	6×3 & 2½	9½d
Miramichi spruce (1st, 2nd & 3rd)—		
10 to 20 ft	10×3	10¾d
13 " 23 "	7×3	9½d
10 " 25 "	6/7×2½	9¾d & 9½d
12 " 20 "	3/6×3 & 2½	8d
Quebec 3rd spruce deals—		
12 ft	11×3	11d
Do. 3rd pine deals—		
16 ft	11×3	11d
Do. 1st pine deals—		
12 ft	5×3	2s 3d
10 & 11 "	6×3	2s 1½d
New Brunswick birch timber		1s 6½d to 1s 8d
Do. spruce and pine "		1s 1½d
Do. poplar "		1s 2d

TYNE.

The *Timber Trades Journal* of Nov. 24th, says:—During the last seven days we have to chronicle the largest arrivals of wood goods there have been for several weeks past, a considerable number of vessels having arrived from the Baltic with deals and battens, one cargo from Miramichi, a cargo of dressed boards from Drammen, a cargo of battens from same place, and several cargoes from Norway and Sweden with pit-props. These arrivals will bring up the importation nearer to that of last year, though it will still be a good way behind that of last season; up to end of October, the quantity of loads was 208,618 as compared with 229,966 in the same period of 1882.

Your readers will notice that West Hartlepool is also about 11,000 loads short of 1882, whilst Sunderland is 9,000 loads over; the latter is accounted for partly by the fact that the industry of sleeper preserving has been a little more developed, and also that some merchants who were formerly importing pitwood to Tyne Dock for South Durham colleries, now import to South Dock, Sunderland, and deliver from there.

Trade is still fairly active throughout this district, though certainly not so much doing as a month or two ago. Stocks are not increasing in any wood goods except mining timber and pitwood, of which there is still too much on hand. Prices remain in much the same condition.

RECEIPTS FOR DYING WOOD.

ROSEWOOD.

Boil a half a pound of logwood in three pints of water till it is of a very dark red; add one-half ounce of carbonate of potassa. While boiling hot, stain the wood with three coats taking care that it is nearly dry between each; with a stiff, flat brush form streaks with a black stain made by boiling one pound of logwood in four quarts of water, then adding a double handful of walnut shells, boiling it up again, taking out the chips and adding pint of vinegar—to be applied hot. If carefully executed it will give the appearance of dark rosewood.

OAK STAIN.

Two quarts of boiled oil; half a pound of ground umber, mixed in oil by colorman; one pint of liquid driers, turbine; one pint of turpentine; mix. After cleaning and planing your boards, lay this on with the grain of the wood. If required lighter add naphtha till the required shade is attained; it darkens with age. Give it twelve hours to dry; then varnish with wood varnish, or use only beeswax and turpentine. The result is good in time, but slower than varnish.

MAHOGANY.

Wash over the wood with strong aquafortis, and when dry apply, boiling hot, a stain made of two ounces of logwood, eight ounces of madder, one ounce of fustic, one gallon of water; boil two hours.

EBONY.

Wash the wood with a solution of sulphate of iron; repeat two or three times; when dry apply three coats of a strong, hot decoction of logwood; when dry wipe it with a wet sponge and polish with linseed oil.

BROWN STAIN.

Paint the wood with a solution made by boiling one pot of catechu with thirty parts of water and a little soda; when dry paint over with another solution made of one part bichromate of potash and thirty parts water. By a little difference in the mode of treatment, and by varying the strenth of the solutions, several shades of color may be given.—*H. L. D., Rhode Island.*

Wood Pulp.

In the first stages of manufacture of wood pulp for paper, poplar was pre-eminently adapted for the purpose, and for a good while it was thought that only this wood, basswood and a few other kinds could be ground into a suitable pulp. Now, however, machines are made which turn out pulp with equal facility from all kinds of wood. The longest fibre is made from willow, basswood and poplar ranking next respectively. Cedar, fir and hemlock are said to work about alike; maple has a fibre shorter than that of either spruce or pine, and is quite hard to grind; birch is very hard and grinds quite short. Poplar and buckeye pulps remain white for a considerable time, other woods changing color; birch becomes pink, maple turns purple, and basswood takes a reddish hue.

Water in Timber.

The amount of water present in freshly cut wood is very different as is shown by the following table by Scheubler and Hartig: Hornbeam contains 18.6 per cent of water; willow, 26 per cent.; ash, 28.7 per cent.; birch, 30.8 per cent.; oak, 34.7 per cent.; pine, 39.7 per cent.; red beech, 39.7 per cent.; elm, 44.5 per cent.; larch, 48.6 per cent.; and white poplar, 50.6 per cent. Wood, when dried at 266 F., at which temperature all of the hygroscopic water is expelled, is composed of 50 parts carbon (inclusive of one part of ash) and 50 parts of chemicals.

SINGERS and public speakers are always benefitted by using Down's Elixir, as it removes the hoarseness and increases the power of the voice. Take small doses often. Price, 25c, 50c, and $1.00

LIVERPOOL STOCKS.

We take from the *Timber Trades Journal* the following Comparative Table showing Stock of Timber and Deals in Liverpool on Oct. 31st, 1882 and 1883, and also the Consumption for the month of Oct, 1882 and 1883:—

	Stock, Nov. 1st, 1882.	Stock, Nov. 1st, 1883.	Consumption for the month of Oct., 1882.	Consumption for the month of Oct., 1883.

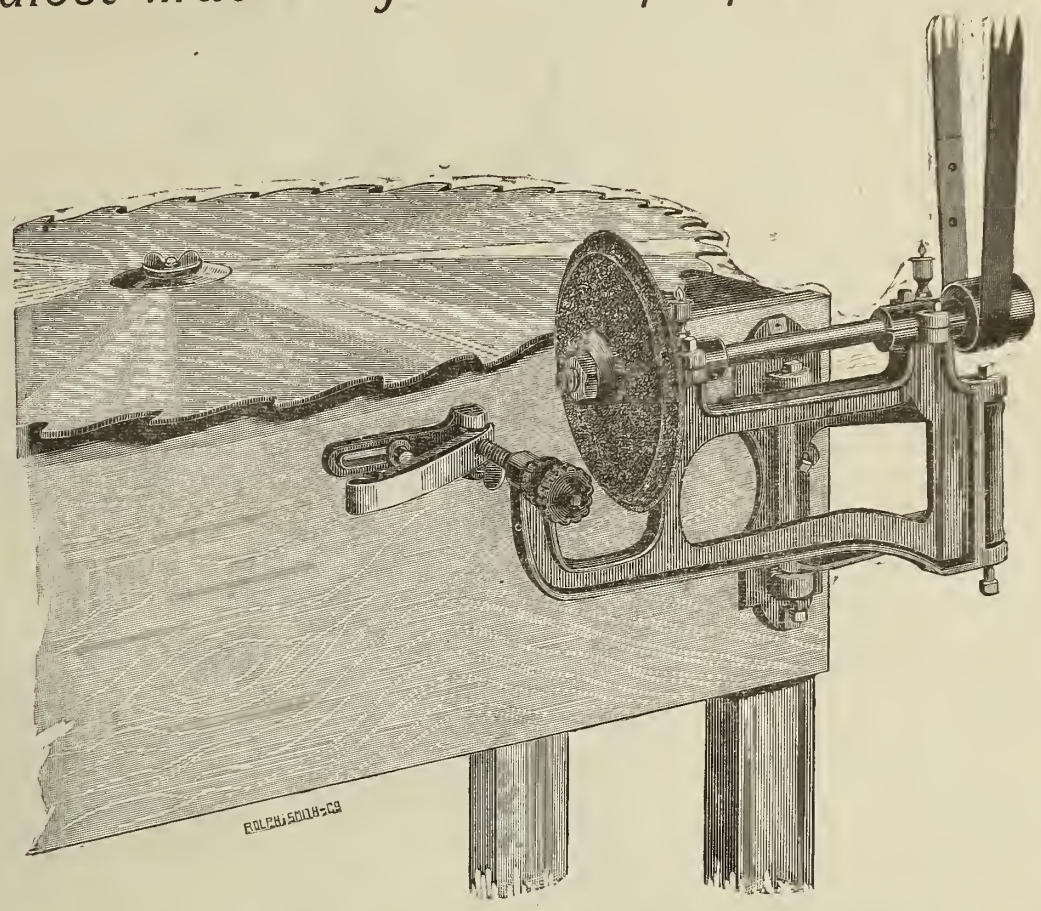
ROGERS' PATENT
SAW GUMMER and SHARPENER

The Handiest Machine for these purposes ever Invented.

Don't Heat!

Cheap!

Very Simple!



Accurate!

Works Fast!

Complete!

Lumbering Season, 1884

Saw Mill Owners in providing for the season of 1884, ought not to lose sight of ROGERS' SAW GUMMER for it will save them more money in proportion to the amount invested than any other machine.

Only $30, including Emery Wheel; Table and Countershaft, $10 extra.

A few of ROGERS' SAW GUMMERS were put on the market last season, and we quote some of the commendations received:

JAS. HADDEN, Foxmead, says:—
"Your machine is all I expected."

CHAS. ANDERSON, Anton Mills, says:—
"I have given it a good trial, and am well pleased with it. "I find it is one of the indispensables in a saw mill." * *

ROBT. R. WEIR, Orillia, writes:—
"It works like a charm, and is very accurate in its work."

CRONE & PATTON, Hoc Roc Mills, Gravenhurst, says:
"The Rogers' Saw Gummer purchased from you gives "good satisfaction, * * it cannot be beat."

D. DAVIDSON, Pentanguishene, writes:—
"We are well pleased with the Gummer."

W. W. BELDING, Wyevale, writes:—
"I have the Gummer running and it is giving good "satisfaction."

ADDRESS ALL ORDERS TO THE

Hart Emery Wheel Company, Limited - Hamilton, Ont.

☞Manufacturers of Hart's Celebrated Patent Wire Strengthened Emery and Corundum Wheels.

The William Hamilton Manufacturing Co'y (LIMITED,)

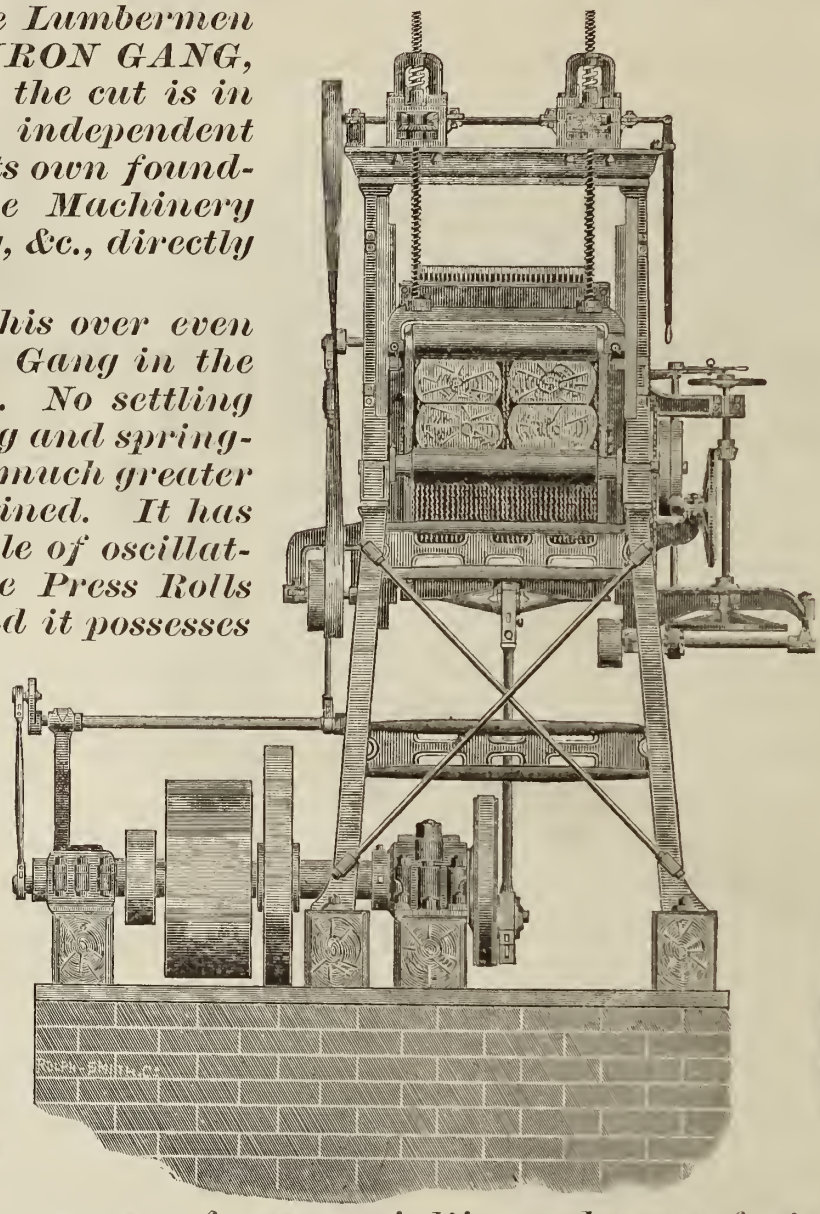
MANUFACTURERS OF

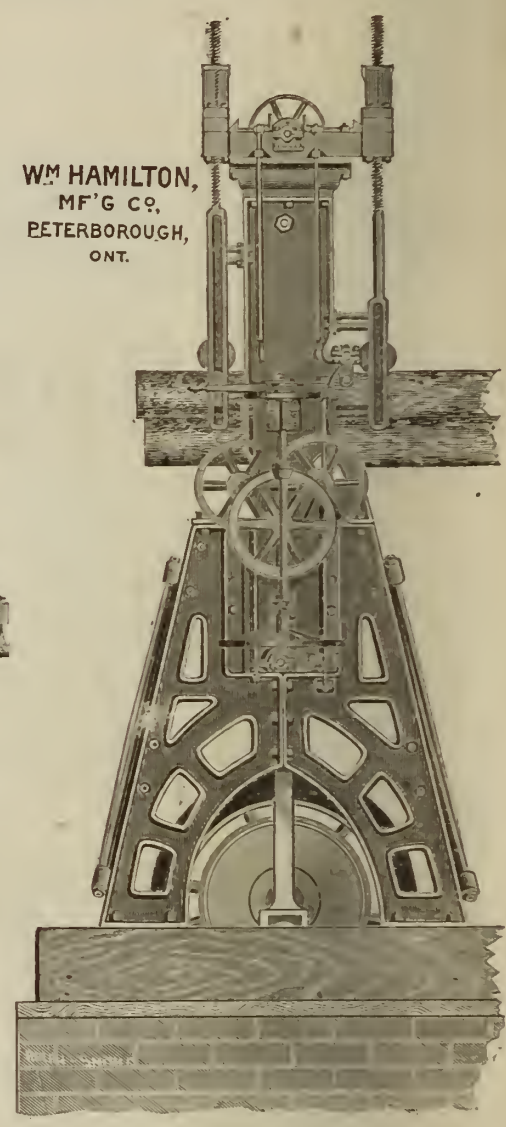
Saw Mills and General Machinery

PETERBOROUGH, - - - ONTARIO.

We introduce to the Lumbermen of Canada our New IRON GANG, which will be seen by the cut is in itself a complete and independent Machine, resting on its own foundations, having all the Machinery for operating, feeding, &c., directly attached.

The advantage of this over even a well built ordinary Gang in the mill frame is evident. No settling out of line, no yielding and springing of timber, while a much greater working speed is obtained. It has the most improved style of oscillating motion, it has the Press Rolls operated by power, and it possesses generally all the good features of best American Gangs, with heavier frame work and heavier shafting, all with a view to rapid, steady & correct working. A good look at one of these massive machines satisfies the sawmill man that they are in every way capable of continuously performing heavy duty throughout the season.

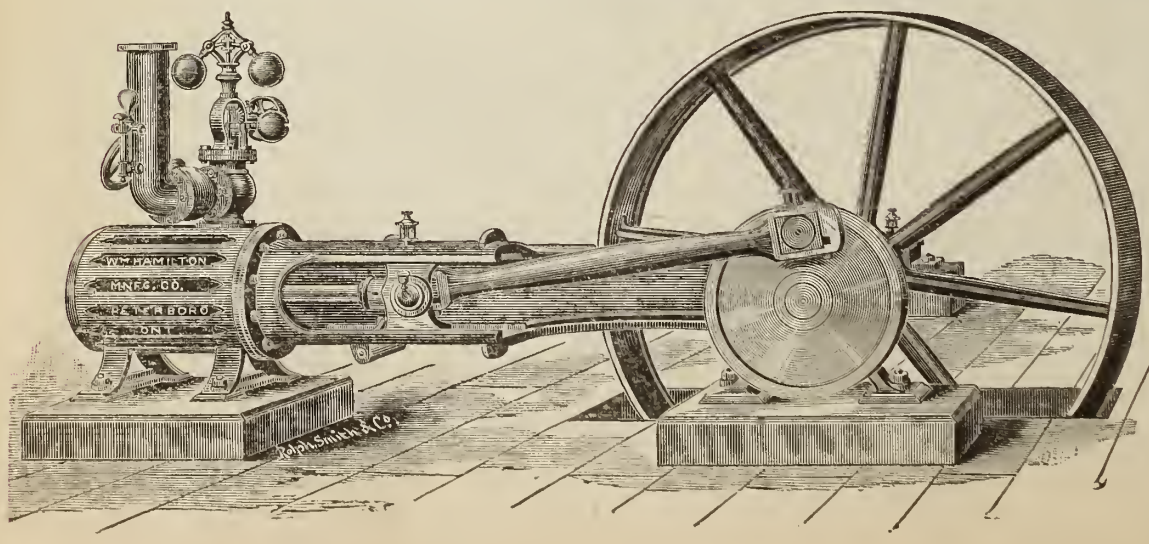




☞ *We make these Gangs one of our specialties and manufacture them of different sizes.*

—ALSO—

ENGINES AND BOILERS.



This cut represents our **SAW MILL ENGINE**, of which we make the following our Standard sizes, 12x16, 16x20, 18x24, and 24x30, built Strong and Substantial for Heavy Work. The Piston Rod, Cross-head Pin, and Wrist Pin, are made heavy and of the best steel; the Connecting Rod has solid ends and is tightened up by screw and wedge, avoiding all danger of keys getting out; the Slide Valve has a simple balance valve, requiring no attention from the Engineer, as it is self-adjusting. The Engine Shaft and Fly Wheel made very heavy. Belt Pulleys put on when required in place of Fly Wheel, and all regulated by the Judson Governor.

—IT WILL PAY YOU—

TO SUBSCRIBE

FOR THE

Canada Lumberman

FOR THE FOLLOWING REASONS:

1. It is the only newspaper published in the Dominion of Canada devoted to the lumber and timber industries.
2. It is devoted to the development and utilization of our forest wealth.
3. It furnishes complete and reliable quotations of prices of lumber in all the leading markets.
4. Its columns are filled with interesting reading matter, valuable alike to the land owner, manufacturer or dealer.
5. It costs only $2.00 per year to have it sent, post-paid, to any address in Canada, and no land owner, lumber dealer, manufacturer or individual in any way connected with timber industries, can afford to do without it.

TO ADVERTISERS.

It has a circulation among saw mill owners, manufacturers, lumber and timber dealers and all classes connected with the timber business.

Examine the field, count the cost, and you will at once decide that the CANADA LUMBERMAN is the

—CHEAPEST, BEST, MOST RELIABLE and ONLY TRUE MEDIUM—

for placing your goods or wares before the saw mill men and lumber and timber dealers of the Dominion

☞ *SAVE YOUR TIMBER*
By using THIN SAWS!

16 Horse-Power Sawmill, driving a 48-in. 10-Gauge Trenton Saw.

GEORGE A. DOUGHERTY writes from Leamington, Ont., 12th May, 1883:

Gentlemen,—I would say that my 16 horse-power Champion Engine drives the thin saw, 48 inches in diameter, 8 and 10 gauge, with 40 teeth, (No. 2 Trenton short teeth), admirably. Our speed is 360 revolutions of the saw per minute. We have sawn over 50,000 feet of white ash in ten days; often having to stop on account of belt breaking; never hurrying at all, but taking great pains to saw the lumber to the best advantage; nor did we commence before seven a.m. or work after six p.m. During this time the saw has not made one bad run, or spoiled one foot of lumber, or once been hot. In maple, black ash or elm, I can, without pressing matters at all, cut 600 feet per hour into inch boards. One half day, running from eight a.m. till 12 noon, we sawed bill stuff, 1 in. x 12 in. and 2 in. x 4 in., 12 feet long; and joists 2 in. x 5 in. and 2 in. x 7 in., 22 feet long, making no effort to work fast, yet we cut 3,053. When cutting into inch lumber, we save at least 1,000 feet in every 16,000; besides, we cut more than when using the 6 and 7 gauge to amount to at least $5.00 per day for sawing. If our belt could stand it, we could run most of our time on 3½ inch feed. I think I would have no difficulty in running a 10x12 gauge.

9-Gauge Damascus Tempered Saw gives best of Satisfaction.

A. CALDWELL & SON write from Almonte, 12th June, 1883:

The saw we got from you recently (60-inch solid 8 and 9 gauge 60 teeth Emerson Damascus tempered saw) is giving the best of satisfaction, and is undoubtedly a great saving of lumber compared with the heavy gauge saws we used last summer, and runs with less strain on our engine, it being rather too small for the work it has to do. Send us by express a new Dominion Gummer and an Elliott 1880 Lacecutter.

Damascus Tempered 60-in. 10-Gauge Saw on 6-in. Feed.

RALPH MATHER writes from Ruscom, Ont., May 14th, 1883:

I have yours of the 10th inst., and in reply would say, that the 60-inch 10 gauge solid saw I bought from you gives every satisfaction. The inserted tooth saw I have is gauge 5. The new saw cuts nearly an ⅛ less kerf, and saves about 1,000 in 10,000; makes better lumber, and runs with one-third less power. Where a high and uniform speed can be obtained, a good sawyer will have no trouble with one of the same size as thin as gauge 12 at the edge. I feed this one as high as 6 inches to each revolution in sycamore.

50-in. Lumberman's Clipper 10-Gauge Saw.

SIMON PROCTOR, sawyer and manager for W. C. V. Hall & Co., Quebec, writes from Lyster Station, Quebec, November 19, 1883:

The Lumberman's Clipper, 50-inch Saw that I ordered from you is giving the best possible satisfaction. I have been running it six weeks in large **Rough Twisty Spruce Logs**, and must say it does better work than any other saw I have ever run, and it takes less power to drive it than any saw of same size with less teeth and thicker blade. I run it on one of your 30 horse-power Portable Mills—Locomotive Boiler—and have cut 50 logs with it without using a wrench on either arbour or guides, without filing, and never made a bad board, all inside of four and a half hours. You need not be afraid to recommend that kind of a saw to your customers.

Send for Sawyers' Hand Book; Illustrated Saw Circular; Large Lithograph to hang in your Mill.

Waterous Engine Works Company, Brantford, Canada
